- **FATAL**: critical error log level. After this parameter is set, only logs of the **FATAL** level are printed.
- **ERROR**: error log level. After this parameter is set, logs of the **ERROR** and **FATAL** levels are printed.
- **WARN**: warning log level. After this parameter is set, logs of the **WARN**, **ERROR**, and **FATAL** levels are printed.
- **INFO** (default): informational log level. After this parameter is set, logs of the **INFO**, **WARN**, **ERROR**, and **FATAL** levels are printed.
- **DEBUG**: debugging log level. After this parameter is set, logs of the **DEBUG**, **INFO**, **WARN**, **ERROR**, and **FATAL** levels are printed.
- **TRACE**: tracing log level. After this parameter is set, logs of the **TRACE**, **DEBUG**, **INFO**, **WARN**, **ERROR**, and **FATAL** levels are printed.

The log levels of components are different from those defined in open-source code.

4. Download and view logs to verify that the log level settings have taken effect. For details, see **Downloading MRS Cluster Logs (MRS 3.x or Later)**.

Changing the Service Log Level and Log File Size

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Cluster** > **Services**.

Step 3 Click a service in the service list. On the displayed page, click the **Configuration** page.

Step 4 On the displayed page, click the **All Configuration** tab. Expand the role instance displayed on the left of the page. Click **Log** of the role to be modified.

Step 5 Search for each parameter and obtain the parameter description. On the parameter configuration page, select the required log level or change the log file size. The unit of the log file size is MB.

- The system automatically deletes logs based on the configured log size. To save more logs, set a larger log file size. To ensure the integrity of log files, you are advised to manually back up the log files to another directory based on the actual service volume before the log files are cleared based on clearance rules.
- The log level of some services cannot be changed on the console.
- The log level and log file size of KrbServer, LdapServer, and DBService cannot be changed.

Step 6 Click **Save**. In the **Save Configuration** dialog box, click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Download and view logs to verify that the log level settings have taken effect.

----End

9.8.10 Configuring the Number of Local Backups of MRS Cluster Audit Logs

Audit logs of cluster components are classified by name and stored in the **/var/log/Bigdata/audit** directory on each cluster node. The OMS automatically backs up the audit log directories at 03:00 every day.

The audit log directory on each node is compressed and named in the *<Node IP address>***.tar.gz** format. All compressed files are compressed and named in the *<yyyy-MM-dd_HH-mm-ss>***.tar.gz** format and saved in the **/var/log/Bigdata/audit/bk/** directory on the active management node. In addition, the standby management node saves a copy of the file.

By default, a maximum of 90 OMS backup files can be retained. This section describes how to configure the maximum number.

Notes and Constraints

This section applies only to MRS 3.*x* or later.

Configuring the Number of Local Backups of MRS Cluster Audit Logs

Step 1 Log in to the active OMS node in the cluster as user **root**.

WARNING

Change the number of audit log backup files only on the active OMS node. If you change it on the standby OMS node, the cluster may fail to work properly.

Step 2 Run the following command to switch to user **omm**:

```
su - omm
```

Step 3 Run the following command to switch to the required directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

Step 4 Run the following command to change the maximum number of audit log backup files to be retained:

```
./modifyLogConfig.sh -m Maximum number of audit log backup files that can be retained
```

The default value is **90**. The value ranges from **0** to **365**. A larger value means to consume more disk space.

If the following information is displayed, the operation is successful:

```
Modify log config successfully
```

----End

9.8.11 Configuring Dumping for MRS Cluster Audit Logs

The audit logs of FusionInsight Manager are stored in the database by default. If the audit logs are retained for a long time, the disk space of the data directory

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

may be insufficient. To store audit logs to another archive server, administrators can set the required dump parameters to automatically dump these logs. This facilitates the management of audit logs.

If you do not configure the audit log dumping, the system automatically saves the audit logs to a file when the number of audit logs reaches 100,000 pieces. The path is **${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog** on the active management node. The file name format is **OperateLog_store_***YY_MM_DD_HH_MM_SS***.csv**. A maximum of 50 historical audit log files can be saved.

Archived audit logs will not be displayed on FusionInsight Manager. Instead, only new audit logs generated after the old logs are automatically saved are displayed.

Configuring Audit Log Dumping to an SFTP Server (MRS 3.*x* or Later)

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Audit** > **Configuration**.

Step 3 Click the switch on the right of **Audit Log Dumping Flag**.

Audit Log Dump is disabled by default. If  is displayed, **Audit Log Dump** is enabled.

Step 4 Set dumping parameters based on **Table 9-91**.

Table 9-91 Audit log dump parameters

Parameter	Example Value	Description
SFTP IP Mode	IPv4	Mode of the destination IP address. The value can be **IPv4** or **IPv6**.
SFTP IP	192.168.*xxx.xxx*	SFTP server for storing dumped audit logs. You are advised to use the SFTP service based on SSH v2 to prevent security risks.
SFTP Port	22	Connection port of the SFTP server for storing dumped audit logs
Save Path	/opt/omm/oms/auditLog	Path for storing audit logs on the SFTP server
SFTP Username	root	User name for logging in to the SFTP server
SFTP Password	-	Password for logging in to the SFTP server
SFTP Public Key	-	(Optional) Public key of the SFTP server. Set this parameter to the public key of the SFTP server; or, there may be security risks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Example Value	Description
Dumping Mode	By Quantity	Dump mode. Value options are as follows: • **By Quantity**: If the number of pieces of logs reaches the value of this parameter (**100000** by default), the logs are dumped. • **By Time**: specifies the date when logs are dumped. The dumping frequency is once a year.
Dumping Date	11-06	This parameter is available only when **Dumping Mode** is set to **By time**. After you select a dump date, the system starts dumping on this date. The logs to be dumped include all the audit logs generated before January 1 00:00 of the current year.

If the SFTP public key is empty, the system displays a security risk warning. Evaluate the security risk and then save the configuration.

Step 5 Click **OK** to complete the settings.

Key fields in the audit log dump file are as follows:

- **USERTYPE** indicates the user type. Value **0** indicates the **Human-machine** user, and value **1** indicates the **Machine-machine** user.
- **LOGLEVEL** indicates the security level. Value **0** indicates Critical, value **1** indicates Major, value **2** indicates Minor, and value **3** indicates Warning.
- **OPERATERESULT** indicates the operation result. Value **0** indicates that the operation succeeded, and value **1** indicates that the operation failed.

----End

Configuring Audit Log Dumping to OBS (MRS Versions Earlier Than 3.*x*)

Storing MRS audit logs in the system may result in insufficient disk space of the data directory. To facilitate audit log management, you can enable automatic export of audit logs to a specified directory on the OBS server.

Audit logs exported to the OBS server include service audit logs and management audit logs.

- Service audit logs are automatically compressed and stored in the **/var/log/Bigdata/audit/bk/** directory on the active management node at 03:00:00 every day. Log files are named in the format of *<yyyy-MM-dd_HH-mm-ss>***.tar.gz**. By default, only log files generated within the past seven days are stored, while those generated beyond seven days are automatically deleted.
- Management audit logs are exported to OBS starting from the date of the last export until the current execution date of the export task. When there are 100,000 entries in a management audit log file, the system automatically dumps the first 90,000 entries to a local file and keeps the remaining 10,000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in the database. Dumped log files are saved in the **${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog** directory of the active management node. These files are named in the format of **OperateLog_store**_*YY_MM_DD_HH_MM_SS*.**csv**. A maximum of 50 historical audit log files can be saved.

Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

Procedure

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Click **System**.

Step 3 Choose **Export Audit Log** under **Maintenance**.

Table 9-92 Parameters for exporting audit logs

Parameter	Example Value	Description
Export Audit Log	On	(Mandatory) Whether to enable audit log export. The options are: • **On**: Audit log export is enabled. • **Off**: Audit log export is disabled.
Started	07/24/2017 09:00:00	(Mandatory) Start time for exporting audit logs.
Period	1 day	(Mandatory) Interval for exporting audit logs. The interval ranges from 1 to 5 days.
Bucket	mrs-bucket	(Mandatory) Name of the OBS file system to which audit logs are exported.
OBS Path	opt/omm/oms/auditLog	(Mandatory) OBS path to which audit logs are exported.
AK	-	(Mandatory) User's access key ID.
SK	-	(Mandatory) User's secret access key.

Service audit log files and management audit log files are stored in **service_auditlog** and **manager_auditlog** on OBS, respectively.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

9.9 MRS Cluster Security Configuration

9.9.1 Cluster Mutual Trust Management

9.9.1.1 Overview of Mutual Trust Between MRS Clusters

Function Description

By default, users of a big data cluster in security mode can only access resources in the cluster but cannot perform identity authentication or access resources in other clusters in security mode.

Concepts of Cluster Mutual Trust

- **Domain**

  The secure usage scope of users in each system is referred to as a domain. Each MRS Manager must have a unique domain name. Cross-Manager access allows users to use resources across domains.

- **User Encryption**

  Mutual trust can be configured across FusionInsight Managers. The current Kerberos server supports only the aes256-cts-hmac-sha1-96:normal and aes128-cts-hmac-sha1-96:normal encryption types for encrypting cross-domain users, and the encryption types cannot be changed.

- **User Authentication**

  After cross-Manager mutual trust is configured, if a user with the same name exists in two systems and the user in the peer system has the permission to access a resource in that system, this user can also access the remote resource.

- **Direct Mutual Trust**

  The system saves the mutual trust ticket of the peer system in two clusters with mutual trust configured and uses the mutual trust ticket to access the peer system.

9.9.1.2 Changing the System Domain Name of an MRS Cluster

Scenarios

The secure usage scope of users in each system is called a domain. Each system must have a unique domain name. The domain name of FusionInsight Manager is generated during installation. The system administrator can change the domain name on FusionInsight Manager.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

WARNING

Changing the system domain name is a high-risk operation. Before performing operations in this section, ensure that the OMS data has been backed up by referring to **Backing Up Manager Data (MRS 3.x and Later Versions)**.

Notes and Constraints

This section applies only to MRS 3.1.0 or later.

Impact on the System

- During the configuration process, all clusters must be restarted and will be unavailable while the restart is in progress.
- After the domain name is changed, the passwords of the Kerberos administrator and OMS Kerberos administrator will be initialized. You need to use the default passwords and then change the passwords. If a component user whose password is generated randomly by the system is used for identity authentication, see **Downloading MRS Cluster User Credentials** to download the keytab file again.
- After the domain name is changed, passwords of the **admin** user, component user, and human-machine user added by the system administrator before the domain name change will be reset to the same one. Change these passwords. The reset password consists of two parts: a system- generated part and a user- defined part. The system- generated part is **Admin@123**, which is the default password. For details about the user-defined part, see description of **Password Suffix** in **Table 9-94**. For example, if the system generates **Admin@123** and the user sets **Test#$%@123**, the new password after reset is **Admin@123Test#$%@123**.
- The new password must meet the password policies. To obtain the new human-machine user password, log in to the active OMS as user **omm** and run the following script:

  sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh *Password suffix user_name*

  - *Password suffix* is a parameter set by the user. If it is not specified, the default value **Admin@123** is used.
  - *user_name* is optional. The default value is **admin**.
  - Commands carrying authentication passwords pose security risks. Disable historical command recording before running such commands to prevent information leakage.

  Example:

  sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh Test#$%@123

  ```
  To get the reset password after changing cluster domain name.
    pwd_min_len     : 8
    pwd_char_types  : 4
  The password reset after changing cluster domain name is: "Admin@123Test#$%@123"
  ```

  In this example, **pwd_min_len** and **pwd_char_types** indicate the minimum password length and number of password character types respectively defined

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in the password policies. **Admin@123Test#$%@123** indicates the human-machine user password after the system domain name is changed.

- After the system domain name is changed, the reset password consists of two parts: a system- generated part and a user- defined part. The new password must meet the password policies. If the password is not long enough, one or multiple at signs (@) are added between **Admin@123** and the user-defined part. If there are five character types, a space is added after **Admin@123**.

  When the user-defined part is **Test@123** and the default user password policy is used, the new password is **Admin@123Test@123**. The password contains 17 characters of four types. To meet the current password policy, the new password is processed according to **Table 9-93**.

  Table 9-93 Password processing

Minimum Password Length	Number of Character Types	Processing Against the Password Policy	New Password
8 to 17 characters	4	The user password policy is met.	Admin@123Test@123
18 characters	4	Add an at sign (@).	Admin@123@Test@123
19 characters	4	Add two at signs (@).	Admin@123@@Test@123
8 to 18 characters	5	Add a space.	Admin@123 Test@123
19 characters	5	Add a space and an at sign (@).	Admin@123 @Test@123
20 characters	5	Add a space and two at signs (@).	Admin@123 @@Test@123

- After the system domain name is changed, download the **keytab** file for the machine-machine user added by the system administrator before the domain name is changed.
- After the system domain name is changed, download and install the client again.

Prerequisites

- The system administrator has clarified service requirements and planned domain names for the systems.

  A domain name can contain only uppercase letters, numbers, periods (.), and underscores (_), and must start with a letter or number.
- The running status of all components in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in Manager is set to default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Changing the System Domain Name

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **System** > **Permission** > **Domain and Mutual Trust**.

Step 3 Modify required parameters.

Table 9-94 Related parameters

Parameter	Example Value	Description
Local Domain	**MRSTEST.COM**	Planned domain name of the system.
Password Suffix	**Admin@123**	Part of the password set by the user after the password of the human-machine user is reset. This parameter is mandatory. The default value is **Admin@123**. This parameter takes effect only after **Local Domain** is modified. The following requirements must be met: • The password contains 8 to 16 characters. • The password contains at least three types of the following: uppercase letters, lowercase letters, numbers, and the following special characters: `~!@#$%^&*()-_=+|[{}];:',<.>/? and space.

Step 4 Determine whether to set up mutual trust between managers across cluster.

- If yes, perform operations by referring to **Configuring Mutual Trust Between MRS Clusters** and skip subsequent steps in this section.
- If no, go to **Step 5**.

Step 5 Click **OK**. Proceed with the subsequent steps only after the modification is complete.

Step 6 Log in to the active management node as user **omm**.

Step 7 Run the following command to update the domain configuration:

sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh

The command is executed successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log in to FusionInsight again.
```

After the restart, some hosts and services may be inaccessible and an alarm is generated. This issue can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is executed.

Step 8 Log in to FusionInsight Manager using the new password of user **admin** (for example, **Admin@123Admin@123**). On the dashboard page, click or **More** and select **Restart**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In the displayed dialog box, enter the password of the current login user and click **OK**.

In the displayed dialog box, click **OK**. Wait for a while until a message indicating that the operation is successful is displayed. Click **Finish**.

Step 9 Log out of FusionInsight Manager and then log in again. If the login is successful, the configuration is successful.

Step 10 Log in to the active management node as user **omm** and run the following command to update the configurations of the job submission client:

sh /opt/executor/bin/refresh-client-config.sh

----End

9.9.1.3 Configuring Mutual Trust Between MRS Clusters

When clusters in different Manager systems with security modes need to access each other's resources, system administrators can establish mutual trust between the systems, allowing external system users to access resources in the local system.

Without configuring cross-cluster trust, resources in each cluster can only be accessed by local users. The secure usage scope of users in each system is referred to as a domain. Each MRS Manager must have a unique domain name. Cross-Manager access allows users to use resources across domains.

Notes and Constraints

In MRS 3.*x* or later, a maximum of 500 mutual-trust clusters can be configured for a cluster.

Impact on the System

- Once cross-Manager cluster mutual trust is configured, users from an external system can be utilized in the local system. The system administrator should regularly review user permissions in Manager to ensure they align with enterprise service and security requirements.
- If you set up mutual trust between clusters, affected services need to be restarted and services will be interrupted.
- After cross-Manager cluster mutual trust is configured, internal Kerberos users **krbtgt/***Local cluster domain name***@***External cluster domain name* and **krbtgt/***External cluster domain name***@***Local cluster domain name* are added to the two mutually trusted clusters. The internal users cannot be deleted.
  - For MRS 2.*x* or earlier, the default password is **Crossrealm@123**.
  - For MRS 3.*x* or later, the system administrator should regularly update the passwords of the four users in the mutually trusted systems and ensure they are consistent. For details, see **Changing the Passwords for MRS Cluster Component Running Users**. When the passwords are changed, the connectivity between cross-cluster service applications may be affected.
- For MRS 3.*x* or later, after cross-Manager cluster mutual trust is configured, the clients of each cluster need to be redownloaded and reinstalled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- After cross-Manager cluster mutual trust is configured, you need to check whether the system works properly and how to access resources of the peer system as a user of the local system. For details, see **Configuring User Permissions for Mutually Trusted MRS Clusters**.

Prerequisites

- The system administrator has clarified service requirements and planned domain names for the systems. A domain name can contain uppercase letters, numbers, periods (.), and underscores (_), and must start with a letter or number.
- The domain names of the two Managers are different. When an ECS or BMS cluster is created on MRS, a unique system domain name is randomly generated. Generally, you do not need to change the system domain name.
- The two clusters do not have the same host name or the same IP address.
- The system time of the two clusters is consistent, and the NTP services in the two systems use the same clock source.
- If the two clusters for which mutual trust is configured are MRS 3.5.0-LTS or later, ensure that the encryption algorithms and modes used by the two clusters are the same.

  You can run the **cat ${CONTROLLER_HOME}/inst/conf/oms-config.ini | grep "krb5_supported_enctypes"** command in the MRS cluster and determine the encryption type based on the value of **krb5_supported_enctypes**.
  - If this parameter is left blank, the default encryption algorithm and mode are used, that is, AES256-CTS-HMAC-SHA1-96 AES128-CTS-HMAC-SHA1-96.
  - **aes256-sha1,aes128-sha1** indicates that the encryption algorithm and mode are AES256-CTS-HMAC-SHA1-96 AES128-CTS-HMAC-SHA1-96.
  - **aes256-sha2,aes128-sha2** indicates that the encryption algorithm and mode are AES256-CTS-HMAC-SHA384-192 AES128-CTS-HMAC-SHA256-128.
- The running status of all components in the Manager clusters is **Normal**.
- For MRS 3.*x* or later, the **acl.compare.shortName** parameter for the ZooKeeper service in all clusters within Manager should be set to the default value of **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

Configuring Mutual Trust Between MRS Clusters (MRS 3.*x* or Later)

Step 1 Log in to the MRS Manager of either cluster.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Choose **System** > **Permission** > **Domain and Mutual Trust**.

Step 3 Modify **Peer Mutual Trust Domain**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-95 Parameters

Parameter	Example Value	Description
realm_name	**MRSTEST.COM**	Enter the domain name of the peer system.
ip_port	**10.0.0.1:21732,10.0.0.2:21732**	Enter the KDC address of the peer system. Value format: *IP address of the node accommodating the Kerberos service in the peer system:Port number* ● In dual-plane networking, enter the service plane IP address. ● If an IPv6 address is used, the IP address must be enclosed in square brackets ([]). ● Use commas (,) to separate the KDC addresses if the active and standby Kerberos services are deployed or multiple clusters in the peer system need to establish mutual trust with the local system. ● You can obtain the port number from the **kdc_ports** parameter of the KrbServer service. The default value is **21732**. To obtain the IP address of the node where the service is deployed, click the **Instance** tab on the KrbServer page and view **Service IP Address** of the KerberosServer role. For example, if the Kerberos service is deployed on nodes at **10.0.0.1** and **10.0.0.2** that have established mutual trust with the local system, the parameter value is **10.0.0.1:21732,10.0.0.2:21732**.

If you need to configure mutual trust for multiple MRS Manager systems, click + to add a new item and set parameters. Click — to delete unnecessary configurations.

Step 4 Click **OK**.

Step 5 Log in to the active management node as user **omm** and run the following command to update the domain configuration:

sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh

The command is executed successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log in to FusionInsight again.
```

After the restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

Step 6 Log in to FusionInsight Manager and restart the cluster or configure expired instances:

Check whether the system domain name of Manager is changed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the system domain name is changed, click ··· or **More** on the home page, click **Start**, enter the password, select the checkbox for confirming the impact, and click **OK**. Wait until the cluster is started successfully.
- If the system domain name is not changed, click ··· or **More** on the home page and select **Restart Configuration-Expired Instances**. Enter the password, select the checkbox for confirming the impact, and click **OK**. Wait until the service is restarted.

  If the Doris service is installed in the cluster, choose **Cluster** > **Services** > **Doris**. On the **Dashboard** page, choose **More** > **Restart Service** in the upper right corner, enter the password, and click **OK**. Wait until the Doris service restarts.

WARNING

Restarting a cluster or a role instance in a cluster will interrupt services. Perform this operation during off-peak hours or after confirming that the impact on upper-layer services is limited.

Step 7 Log out of FusionInsight Manager and then log in again. If the login is successful, the configuration is successful.

Step 8 Log in to FusionInsight Manager of another cluster and repeat the preceding steps.

----End

Configuring Mutual Trust Between MRS Clusters (MRS 2.*x* or Earlier)

Step 1 On the MRS management console, query all security groups of the two clusters.

- If the security groups of the two clusters are the same, go to **Step 3**.
- If the security groups of the two clusters are different, go to **Step 2**.

Step 2 On the VPC management console, choose **Access Control** > **Security Groups**. On the **Security Groups** page, locate the row containing the target security group, click **Manage Rule** in the **Operation** column.

On the **Inbound Rules** tab page, click **Add Rule**. In the **Add Inbound Rule** dialog box that is displayed, configure related parameters.

- **Priority**: The value ranges from 1 to 100. The default value is **1**, which indicates the highest priority. A smaller value indicates a higher priority.
- **Action**: Select **Allow**.
- **Protocol & Port**: Choose **Protocols** > **All**.
- **Type**: Select **IPv4** or **IPv6**.
- **Source**: Select **Security group** and the security group of the peer cluster.
  - To add an inbound rule to the security group of cluster A, set **Source** to **Security group** and the security group of cluster B (peer cluster).
  - To add an inbound rule to the security group of cluster B, set **Source** to **Security group** and the security group of cluster A (peer cluster).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For a normal cluster with Kerberos authentication disabled, perform step **Step 1** to **Step 2** to configure cross-cluster mutual trust. For a security cluster with Kerberos authentication enabled, after completing the preceding steps, continue with the subsequent steps for configuration.

Step 3 Log in to MRS Manager of the two clusters separately. Click **Service** and check whether the **Health Status** of all components is **Good**.

- If yes, go to **Step 4**.
- If no, contact O&M personnel for troubleshooting.

Step 4 Query configuration information.

1. On MRS Manager of the two clusters, choose **Services** > **KrbServer** > **Instance**. Query the **OM IP Address** of the two KerberosServer hosts.
2. Click **Service Configuration**. Set **Type** to **All**. Choose **KerberosServer** > **Port** in the navigation tree on the left. Query the value of **kdc_ports**. The default value is **21732**.
3. Click **Realm** and query the value of **default_realm**.

Step 5 On MRS Manager of either cluster, modify the **peer_realms** parameter.

Table 9-96 Parameter description

Parameter	Example Value	Description
realm_name	**MRSTEST.COM**	Domain name of the mutual-trust cluster, that is, the value of **default_realm** obtained in step **4**.
ip_port	**10.0.0.1:21732,10.0.0.2:21732**	KDC address of the peer cluster. Format: *IP address of a KerberosServer node in the peer cluster:kdc_port* The addresses of the two KerberosServer nodes are separated by a comma. For example, if the IP addresses of the KerberosServer nodes are 10.0.0.1 and 10.0.0.2 respectively, the value of this parameter is **10.0.0.1:21732,10.0.0.2:21732**.

- To configure mutual trust for multiple clusters, click  to add a new item and set parameters. To delete an item, click .
- A cluster can establish mutual trust relationships with up to 16 clusters. By default, no trust relationship exists between clusters that are trusted by the same local cluster.

Step 6 Click **Save Configuration**. In the dialog box that is displayed, select **Restart the affected services or instances** and click **OK**. If you do not select **Restart the affected services or instances**, manually restart the affected services or instances.

After **Operation successful** is displayed, click **Finish**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **WARNING**
>
> **Restarting a cluster or a role instance in a cluster will interrupt services. Perform this operation during off-peak hours or after confirming that the impact on upper-layer services is limited.**

Step 7 Exit MRS Manager and log in to it again. If the login is successful, the configurations are valid.

Step 8 Log in to MRS Manager of the other cluster and repeat step **Step 5** to **Step 7**.

Step 9 Perform subsequent operations by referring to **Updating the Client Configuration of Mutually Trusted Clusters (MRS 2.x or Earlier)**.

----End

Updating the Client Configuration of Mutually Trusted Clusters (MRS 2.*x* or Earlier)

After cross-cluster mutual trust is configured, the service configuration parameters are modified on MRS Manager and the service is restarted. Therefore, you need to prepare the client configuration file again and update the client.

Scenario 1:

Cluster A and Cluster B, which are peer clusters with mutual trust established, are of the same type (for example, analysis or streaming). Update the client configuration files by referring to **Updating Client Configurations (Version 2.x or Earlier)**.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Scenario 2:

Cluster A and Cluster B, which are peer clusters with mutual trust established, are of different types. Perform the following steps to update the configuration files:

- Update the client configuration file of cluster A to cluster B.
- Update the client configuration file of cluster B to cluster A.
- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Step 1 Log in to MRS Manager of cluster A.

Step 2 Click **Services**, and then **Download Client**.

Step 3 Set **Client Type** to **Only configuration files**.

Step 4 Set **Download to** to **Remote host**.

Step 5 Set **Host IP Address** to the IP address of the active Master node of cluster B, **Host Port** to 22, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to cluster B using SSH is changed, set **Host Port** to a new port.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The value of **Save Path** contains a maximum of 256 characters.

Step 6 Set **Login User** to **root**.

If another user is used, ensure that the user has permissions to read, write, and execute the save path.

Step 7 Select **Password** or **SSH Private Key** for **Login Mode**.

- **Password**: Enter the password of user **root** set during cluster creation.
- **SSH Private Key**: Select and upload the key file used for creating the cluster.

Step 8 Click **OK** to generate a client file.

- If the following information is displayed, the client package is saved. Click **Close**.
  Client files downloaded to the remote host successfully.
- If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to **Step 2** to download the client again.
  Failed to connect to the server. Please check the network connection or parameter settings.

Step 9 Log in to the ECS of cluster B using VNC. For details, see **Instances** > **Logging In to a Windows ECS > Logging In to a Windows ECS Using VNC** in the *Elastic Cloud Server User Guide*.

Step 10 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 11 Run the following command to update the client configuration of cluster A to cluster B:

sh refreshConfig.sh *Client installation directory Full path of the client configuration file package*

For example, run the following command:

sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS_Services_Client.tar

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.
Succeed to refresh components client config.
```

NOTE

You can also refer to method 2 in **Updating Client Configurations (Version 2.x or Earlier)** to perform operations in **Step 1** to **Step 11**.

Step 12 Repeat step **Step 1** to **Step 11** to update the client configuration file of cluster B to cluster A.

Step 13 Refer to **Updating Client Configurations (Version 2.x or Earlier)** to update the client configuration file of the local cluster.

- Update the client configuration file of cluster A.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Update the client configuration file of cluster B.

----End

9.9.1.4 Configuring User Permissions for Mutually Trusted MRS Clusters

Once cross-Manager cluster mutual trust is configured, grant user access permissions on FusionInsight Managers to enable them to perform service operations in the mutually trusted Managers.

Prerequisites

The mutual trust relationship has been configured between two clusters (clusters A and B). The clients of the clusters have been updated.

Configuring User Permissions for Mutually Trusted Clusters (MRS 3.*x* or Later)

Step 1 Log in to MRS Manager of the local cluster.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Choose **System** > **Permission** > **User** to check whether the target user exists.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Click ⌄ on the left of the target user, and check whether the permissions assigned to the user group of the user and the roles meet service requirements. If not, create a role and bind the role to the user, or modify the user group or role permissions of the user.

Step 4 Create a user required by the service operations and associate the required user group or role. For details, see **Creating a User (MRS 3.x and Later)**.

Step 5 Log in to the other FusionInsight Manager and repeat **Step 2** to **Step 4** to create a user with the same name and set permissions.

----End

Configuring User Permissions for Mutually Trusted Clusters (MRS 2.*x* or Earlier)

Step 1 Log in to MRS Manager of cluster A and choose **System** > **Manage User**. Check whether cluster A has accounts that are the same as those of cluster B.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Click ⌄ on the left side of the username to view detailed user information. Verify if the user's group and role meet the service requirements.

For example, user **admin** of cluster A has the permission to access and create files in the **/tmp** directory of cluster A. Then go to **Step 4**.

Step 3 Create the accounts in cluster A and bind the accounts to the user group and roles required by the services. Then go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Choose **Service** > **HDFS** > **Instance**. Query the **OM IP Address** of **NameNode (Active)**.

Step 5 Log in to the client of cluster B.

For example, if you updated the client on the Master2 node, you must log in to the Master2 node to use the client.

Step 6 Run the following command to access the **/tmp** directory of cluster A.

hdfs dfs -ls hdfs://192.168.6.159:9820/tmp

In the preceding command, **192.168.6.159** is the IP address of the active NameNode of cluster A; **9820** is the default port for communication between the client and the NameNode.

Step 7 Run the following command to create a file in the **/tmp** directory of cluster A:

hdfs dfs -touchz hdfs://192.168.6.159:9820/tmp/mrstest.txt

If you can find the **mrstest.txt** file in the **/tmp** directory of cluster A, the cross-cluster mutual trust is successfully configured.

----End

9.9.2 MRS Cluster Security Hardening

9.9.2.1 MRS Cluster Security Hardening Policies

Hardening Tomcat

Tomcat is hardened as follows based on open-source software during FusionInsight Manager software installation and use:

- The Tomcat version is upgraded to the official version.
- Permissions on the directories under applications are set to **500**, and the write permission on some directories is supported.
- The Tomcat installation package is automatically deleted after the system software is installed.
- The automatic deployment function is disabled for projects in application directories. Only the **web**, **cas**, and **client** projects are deployed.
- Some unused **http** methods are disabled, preventing attacks by using the **http** methods.
- The default shutdown port and command of the Tomcat server are changed to prevent hackers from shutting down the server and attacking servers and applications.
- To ensure security, the value of **maxHttpHeaderSize** is changed, which enables server administrators to control abnormal requests of clients.
- The Tomcat version description file is modified after Tomcat is installed.
- To prevent disclosure of Tomcat information, the Server attributes of Connector are modified so that attackers cannot obtain information about the server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Permissions on files and directories of Tomcat, such as the configuration files, executable files, log directories, and temporary folders, are under control.
- Session facade recycling is disabled to prevent request leakage.
- LegacyCookieProcessor is used as CookieProcessor to prevent the leakage of sensitive data in cookies.

Hardening LDAP

LDAP is hardened as follows after a cluster is installed:

- In the LDAP configuration file, the password of the administrator account is encrypted using SHA. After the OpenLDAP is upgraded to 2.4.39 or later, data is automatically synchronized between the active and standby LDAP nodes using the SASL External mechanism, which prevents disclosure of the password.
- The LDAP service in the cluster supports the SSLv3 protocol by default, which can be used safely. When the OpenLDAP is upgraded to 2.4.39 or later, the LDAP automatically uses TLS1.0 or later to prevent unknown security risks.

Hardening JDK

- If the client process uses the AES256 encryption algorithm, JDK security hardening is required. The operations are as follows:

  Obtain the Java Cryptography Extension (JCE) package whose version matches that of JDK. The JCE package contains **local_policy.jar** and **US_export_policy.jar**. Copy the JAR files to the following directory and replace the files in the directory.

  - Linux: *JDK installation directory*/**jre/lib/security**
  - Windows: *JDK installation directory***jre\lib\security**

  NOTE

  Access the Open JDK open-source community to obtain the JCE file.

- If the client process uses the SM4 encryption algorithm, the JAR package needs to be updated.

  Obtain **SMS4JA.jar** in the *client installation directory*/**JDK/jdk/jre/lib/ext/** directory, and copy the JAR package to the following directory:

  - Linux: *JDK installation directory*/**jre/lib/ext/**
  - Windows: *JDK installation directory***jre\lib\ext**

9.9.2.2 Configuring Hadoop Data Encryption During Transmission

Configuring Security Channel Encryption for Hadoop Components

Encrypted channel is an encryption protocol of remote procedure call (RPC) in HDFS. When a user invokes an RPC, the user's login name will be transmitted to RPC through RPC head. Then RPC uses Simple Authentication and Security Layer (SASL) to determine an authorization protocol (Kerberos and DIGEST-MD5) to complete RPC authorization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

By default, the communication between components in the big data cluster is not encrypted. However, the communication can be encrypted to prevent data interception on the Internet or an untrusted network.

To do this, you just need to set related parameters to control whether to encrypt RPC channels of all Hadoop modules. The settings take effect globally.

RPC channels in Hadoop include:

- RPC channels for clients to access HDFS
- RPC channels between HDFS modules, for example, between DataNode and NameNode
- RPC channels for clients to access YARN
- RPC channels between NodeManager and ResourceManager
- RPC channels for Spark to access YARN and HDFS
- RPC channels for MapReduce to access YARN and HDFS
- RPC channels for HBase to access HDFS

On FusionInsight Manager, choose **Cluster** > **Services** > *Target service name*. Click **Configurations** and then **All Configurations**. Enter the parameter name in the search box and **restart the corresponding service for the configuration to take effect**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-97 Parameter description

Service	Parameter	Description	Default Value
HDFS	hadoop.rpc.protection	Whether to encrypt the RPC channels of each module in Hadoop. • **privacy**: indicates that the RPC channels are encrypted, and the authentication, integrity, and privacy functions are enabled. This mode may degrade the performance. • **integrity**: indicates that the RPC channels are not encrypted, and only the authentication and integrity functions are enabled. To ensure data security, exercise caution when using this mode. • **authentication**: indicates that the RPC channels are not encrypted, and only the authentication packet is required. The integrity and privacy are not required. This mode ensures performance but has security risks. This parameter applies to the RPC channels of all modules in Hadoop. • The setting takes effect only after the service is restarted. Rolling restart is not supported. • After the setting, you need to download the client configuration file again. Otherwise, HDFS cannot provide the read and write services.	• Security mode: **privacy** • Normal mode: **authentication**
HDFS	dfs.encrypt.data.transfer	Whether to encrypt the Data Transfer (DT) channels through which the client accesses DataNodes and the data transmission channels between DataNodes. This parameter is used only when **hadoop.rpc.protection** is set to **privacy**. Note that enabling encryption by default may severely affect performance when a large amount of service data is transmitted. If data transmission encryption is configured for one cluster in a pair of trusted clusters, data transmission encryption must also be configured for the peer cluster. • **true**: indicates that the channels are encrypted. • **false**: indicates that the channels are not encrypted.	false

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Service	Parameter	Description	Default Value
HDFS	dfs.encrypt.data.transfer.algorithm	Indicates the encryption algorithm of the HDFS data transfer channels and the channels for clients to access HDFS. This parameter is available only when **dfs.encrypt.data.transfer** is set to **true**. • **3des**: default value, which indicates that the 3DES algorithm is used to encrypt data. • **rc4**: indicates that the RC4 algorithm is used to encrypt data. This value is not recommended because it may cause security risks.	3des
HDFS	dfs.encrypt.data.transfer.cipher.suites	The password suite for data encryption. This parameter can be left empty or set to **AES/CTR/NoPadding**. If this parameter is left empty, the encryption algorithm specified by **dfs.encrypt.data.transfer.algorithm** is used to encrypt data.	AES/CTR/NoPadding
HBase	hbase.rpc.protection	Whether to encrypt HBase channels, including the RPC channels for HBase clients to access the HBase server and the RPC channels between the HMaster and RegionServer. • **privacy**: indicates that the RPC channels are encrypted, and the authentication, integrity, and privacy functions are enabled. • **integrity**: indicates that the RPC channels are not encrypted, and only the authentication and integrity functions are enabled. • **authentication**: indicates that the RPC channels are not encrypted, and only the authentication packet is required. The integrity and privacy are not required. The privacy mode encrypts transmitted content, including sensitive information such as user tokens. This mode ensures the security of transmitted information, but has a great impact on performance. Compared with the other two modes, this mode reduces the read/write performance by about 60%. Modify the configuration based on the enterprise security requirements. The configuration items on the client and server must be the same.	• Security mode: **privacy** • Normal mode: **authentication**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting the Maximum Number of Concurrent Web Connections

To ensure web server reliability, new connections are rejected when the number of user connections reaches a specific threshold. This prevents DDOS attacks and service unavailability caused by too many users accessing the web server at the same time.

On FusionInsight Manager, choose **Cluster** > **Services** > *Target service name*. Click **Configurations** and then **All Configurations**. Enter the parameter name in the search box and **restart the corresponding service for the configuration to take effect**.

Table 9-98 Parameter description

Service	Parameter	Description	Default Value
HDFS/Yarn	hadoop.http.server.MaxRequests	Specifies the maximum number of concurrent web connections of each component.	2000
Spark/Spark2x	spark.connection.maxRequest	Specifies the maximum number of request connections of JobHistory.	5000

9.9.2.3 Configuring Kafka Data Encryption During Transmission

Scenario

Data between the Kafka client and the broker is transmitted in plain text. The Kafka client may be deployed in an untrusted network, exposing the transmitting data to leakage and tampering risks.

This topic is available for MRS 3.x or later.

Configuring Kafka Data Encryption During Transmission

The channel between components is not encrypted by default. You can set the following parameters to enable security channel encryption.

To modify parameters, log in to FusionInsight Manager, choose **Cluster** > **Services** > **Kafka**, click **Configurations** then **All Configurations**, and enter a parameter name in the search box.

NOTE

After the configuration, restart the corresponding service for the settings to take effect.

Table 9-99 describes the parameters related to transmission encryption on the Kafka server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-99 Parameters relevant to Kafka data encryption during transmission

Parameter	Description	Default Value
ssl.mode.enable	Indicates whether to enable the Secure Sockets Layer (SSL) protocol. If this parameter is set to **true**, services relevant to the SSL protocol are started during the broker startup.	false
security.inter.broker.protocol	Indicates communication protocol between brokers. The communication protocol can be PLAINTEXT, SSL, SASL_PLAINTEXT, or SASL_SSL.	SASL_PLAINTEXT

The SSL protocol can be configured for the server or client to encrypt transmission and communication only after **ssl.mode.enable** is set to **true** and broker enables the **SSL** and **SASL_SSL** protocols.

9.9.2.4 Encrypting Data Transmission Between the Controller and Agent

Scenario

After a cluster is installed, Controller and Agent need to communicate with each other. The Kerberos authentication is used during the communication. By default, the communication is not encrypted during the communication for the sake of cluster performance. Users who have demanding security requirements can use the method described in this section for encryption.

Notes and Constraints

This topic is available for MRS 3.x or later.

Impact on the System

- Controller and all Agents automatically restart, which interrupts FusionInsight Manager.
- The performance of management nodes deteriorates in large clusters. You are advised to enable the encryption function for clusters with a maximum of 200 nodes.

Prerequisites

You have obtained the IP addresses of the active and standby management nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Encrypting Data Transmission Between the Controller and Agent

Step 1 Log in to the active management node as user **omm**.

Step 2 Run the following command to disable logout upon timeout:

TMOUT=0

NOTE

After the operations in this section are complete, run the **TMOUT=***Timeout interval* command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

Step 3 Run the following command to go to the related directory:

cd ${CONTROLLER_HOME}/sbin

Step 4 Run the following command to enable communication encryption:

./enableRPCEncrypt.sh -t

Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHAStatus** of the active management node Controller is **Normal** and whether you can log in to FusionInsight Manager again. If yes, the enablement is successful.

Step 5 Run the following command to disable communication encryption when necessary:

./enableRPCEncrypt.sh -f

Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHAStatus** of the active management node Controller is **Normal** and whether you can log in to FusionInsight Manager again. If yes, the enablement is successful.

----End

9.9.2.5 Configuring a Trusted IP Address to Access LDAP

Scenario

By default, the LDAP service deployed in the OMS and cluster can be accessed by any IP address. To enable the LDAP service to be accessed by only trusted IP addresses, you can configure the INPUT policy in the iptables filtering list.

Notes and Constraints

This topic is available for MRS 3.x or later.

Impact on the System

After the configuration, the LDAP service cannot be accessed by IP addresses that are not configured. Before the expansion, the added IP addresses need to be configured as trusted IP addresses.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Prerequisites

- You have collected the management plane IP addresses and service plane IP addresses of all nodes in the cluster and all floating IP addresses.
- You have obtained the **root** user account for all nodes in the cluster.

Configuring a Trusted IP Address to Access LDAP

Configuring trusted IP addresses for the LDAP service on the OMS

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **System** > **OMS** and choose **oldap** > **Modify Configuration** to view the OMS LDAP port number, that is, the value of **LDAP Listening Port**, which is 21750 by default.

Step 3 Log in to the active management node as user **root** using the IP address of the active management node.

Step 4 Run the following command to check the INPUT policy in the iptables filtering list:

iptables -L

For example, if no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
```

Step 5 Run the following command to trust all IP addresses used by the cluster. Each IP address needs to be added once.

iptables -A INPUT -s *Trusted IP address* **-p tcp --dport** *Port number* **-j ACCEPT**

For example, to configure **10.0.0.1** as a trusted IP address and enable it to access port **21750**, you need to run the following command:

iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21750 -j ACCEPT

Step 6 Run the following command to untrust all IP addresses. Trusted IP addresses are not affected by this rule.

iptables -A INPUT -p tcp --dport *Port number* **-j DROP**

For example, to disable all IP addresses to access port **21750**, run the following command:

iptables -A INPUT -p tcp --dport 21750 -j DROP

Step 7 Run the following command to view the modified INPUT policy in the iptables filtering list:

iptables -L

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
ACCEPT     tcp  --  10.0.0.1             anywhere            tcp dpt:21750
DROP       tcp  --  anywhere             anywhere            tcp dpt:21750
```

Step 8 Run the following command to view the rules and rule numbers in the iptables filtering list:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

iptables -L -n --line-number

```
Chain INPUT (policy ACCEPT)
num target     prot opt source               destination
1   DROP       tcp  --  0.0.0.0/0            0.0.0.0/0           tcp dpt:21750
```

Step 9 Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

iptables -D INPUT *Number of the rule to be deleted*

For example, to delete rule 1, run the following command:

iptables -D INPUT 1

Step 10 Log in to the standby management node as user **root** using the standby IP address. Repeat **Step 4** to **Step 9**.

Configuring trusted IP addresses for the LDAP service in the cluster

Step 11 Log in to FusionInsight Manager.

Step 12 Choose **Cluster** > **Services** > **LdapServer**. Click **Instance** and view the LDAP nodes.

Step 13 Go to the **Configurations** page, and view the LDAP port number of the cluster, that is, the value of **LDAP_SERVER_PORT**, which is 21780 by default.

Step 14 Log in to the LDAP node as user **root** using the LDAP service IP address.

Step 15 Run the following command to view the INPUT policy in the iptables filtering list:

iptables -L

For example, if no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
```

Step 16 Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

iptables -A INPUT -s *Trusted IP address* **-p tcp --dport** *Port number* **-j ACCEPT**

For example, to configure **10.0.0.1** as a trusted IP address and enable it to access port **21780**, you need to run the following command:

iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21780 -j ACCEPT

Step 17 Run the following command to untrust all IP addresses. Trusted IP addresses are not affected by this rule.

iptables -A INPUT -p tcp --dport *Port number* **-j DROP**

For example, to disable all IP addresses to access port **21780**, run the following command:

iptables -A INPUT -p tcp --dport 21780 -j DROP

Step 18 Run the following command to view the modified INPUT policy in the iptables filtering list:

iptables -L

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source               destination
ACCEPT     tcp  --  10.0.0.1            anywhere            tcp dpt:21780
DROP       tcp  --  anywhere            anywhere            tcp dpt:21780
```

Step 19 Run the following command to view the rules and rule numbers in the iptables filtering list:

iptables -L -n --line-number

```
Chain INPUT (policy ACCEPT)
num target     prot opt source               destination
1   DROP       tcp  --  0.0.0.0/0            0.0.0.0/0           tcp dpt:21780
```

Step 20 Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

iptables -D INPUT *Number of the rule to be deleted*

For example, to delete rule 1, run the following command:

iptables -D INPUT 1

Step 21 Log in to the LDAP node as user **root** using the IP address of another LDAP service, and repeat **Step 15** to **Step 20**.

----End

9.9.2.6 Configuring the IP Address Whitelist for Modifying Data in an HBase Read-Only Cluster

If the Replication function is enabled for HBase in an MRS 3.x and later cluster, a protection mechanism for data modification is added on the standby HBase cluster to ensure data consistency between the active and standby clusters. Upon receiving an RPC request for data modification, the standby HBase cluster checks the permission of the user who sends the request (only HBase manage users have the modification permission). Then it checks the validity of the source IP address of the request. Only modification requests from IP addresses in the white list are accepted. The IP address white list is configured by the **hbase.replication.allowedIPs** item.

Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HBase**. Click **Configurations** and search for the parameter name in **Table 9-100**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-100 Parameter description

Parameter	Description	Default Value
hbase.replication.allowedIPs	Only replication requests from specified IP addresses are allowed. Only regular expressions separated by commas (,) are supported. Each pattern can be any of the following: • Regex pattern Example: 10.18.40.*, 10.18.*, 10.18.40.11 • Range pattern (Range can be specified only in the last octet) Example: 10.18.40.[10-20] If this item is empty (default value), the white list contains only the IP address of the RegionServer of the cluster, indicating that only modification requests from the RegionServer of the standby HBase cluster are accepted.	N/A

9.9.2.7 Configuring LDAP Output Audit Logs

Users can set the audit log output level of the LDAP service and output audit logs in a specified directory, for example, **/var/log/messages**. The logs output can be used to check user activities and operation commands.

WARNING

Enabling LDAP audit log output can generate a large number of logs, impacting cluster performance. Use this feature with caution.

Notes and Constraints

This topic is available for MRS 3.x or later.

Configuring the LDAP Firewall Policy

In the cluster adopting the dual-plane networking, the LDAP is deployed on the service plane. To ensure the LDAP data security, you are advised to configure the firewall policy in the cluster to disable relevant LDAP ports.

Step 1 Log in to FusionInsight Manager.

Step 2 Choose **Cluster** > **Services** > **LdapServer** and click **Configurations**.

Step 3 Check the value of **LDAP_SERVER_PORT**, which is the service port of LdapServer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 To ensure data security, configure the firewall policy for the whole cluster to disable the LdapServer port based on the customer's firewall environment.

----End

Enabling the LDAP Audit Log Output

Step 1 Log in to any LdapServer node.

Step 2 Run the following command to edit the **slapd.conf.consumer** file, and set the value of **loglevel** to **256** (you can run the **man slapd.conf** command on the OS to view the log level definition).

cd ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-ldapserver-2.7.0/ldapserver/local/template

vi slapd.conf.consumer

```
...
pidfile         [PID_FILE_SLAPD_PID]
argsfile        [PID_FILE_SLAPD_ARGS]
loglevel   256
...
```

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **LdapServer**. Click **More** and select **Restart Service**. In the displayed dialog box, verify the current user identity, and restart the service.

----End

9.9.2.8 Updating Encryption Keys of an MRS Cluster

When you install a cluster, the system generates an encryption key automatically to protect the security information stored in the cluster, such as database user passwords and key file access passwords. If you need to change the encryption key for any reason, such as if the original key is compromised or you want to rotate the key periodically, you can update it manually.

Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt data encrypted using the old key. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.
- When the key is updated, the cluster is stopped and cannot be accessed.

Prerequisites

- You have obtained the IP addresses of the active and standby management nodes.
- You have stopped the upper-layer service applications that depend on the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Updating an MRS Cluster Key (MRS 3.*x* or Later)

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Cluster** > **Overview** > **More** > **Stop** (for MRS 3.3.0 or later, choose **More** > **Stop** in the upper right corner on the **Homepage**). In the displayed dialog box, enter the password for the current login user.

Click **OK**. Wait until the system displays a message indicating that the cluster is successfully stopped.

Step 3 Log in to the active management node as user **omm**.

Step 4 Run the following command to disable logout upon timeout:

TMOUT=0

After completing these operations, run the **TMOUT=***Timeout interval* command to promptly restore the timeout setting.

For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

Step 5 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-server/om/tools

Step 6 Run the following command to update the cluster key:

sh updateRootKey.sh

Enter **y** as prompted.

```
The root key update is a critical operation.
Do you want to continue?(y/n):
```

The key is updated successfully if the following information is displayed:

```
Step 4-1: The key save path is obtained successfully.
...
Step 4-4: The root key is sent successfully.
```

Step 7 On FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and click **Start**. (For MRS 3.3.0 or later, choose **More** > **Start** in the upper right corner of the homepage.)

In the displayed dialog box, click **OK**. Wait until a message is displayed indicating that the startup is successful.

----End

Updating an MRS Cluster Key (MRS 2.*x* or Earlier)

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Services** > **More** > **Stop Cluster**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In the displayed dialog box, select **I have read the information and understand the impact.** Click **OK**. Wait until the system displays a message indicating that the operation is successful. Click **Finish**. The cluster is stopped successfully.

Step 3 Log in to the active management node.

Step 4 Run the following commands to switch the user:

sudo su - omm

Step 5 Run the following command to disable logout upon timeout:

TMOUT=0

Step 6 Run the following command to switch the directory:

cd ${BIGDATA_HOME}/om-0.0.1/tools

Step 7 Run the following command to update the cluster key:

sh updateRootKey.sh

Enter **y** as prompted.

```
The root key update is a critical operation.
Do you want to continue?(y/n):
```

The key is updated successfully if the following information is displayed:

```
...
Step 4-1: The key save path is obtained successfully.
...
Step 4-4: The root key is sent successfully.
```

Step 8 On MRS Manager, choose **Services** > **More** > **Start Cluster**.

In the displayed dialog box, click **OK**. After **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

9.9.2.9 Updating the SSH Key of User omm on MRS Cluster Nodes

Scenario

During cluster installation, the system automatically generates the SSH public key and private key for user **omm** to establish the trust relationship between nodes. After the cluster is installed, if the original keys are accidentally disclosed or new keys are used, the system administrator can perform the following operations to manually change the keys.

Notes and Constraints

This topic is available for MRS 3.x or later.

Prerequisites

- The cluster has been stopped.
- No other management operations are being performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Updating SSH Keys for User omm

Step 1 Log in as user **omm** to the node whose SSH keys need to be replaced.

If the node is a Manager management node, run the following command on the active management node.

Step 2 Run the following command to disable logout upon timeout:

TMOUT=0

After the operations in this section are complete, run the **TMOUT=***Timeout interval* command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

Step 3 Run the following command to generate a key for the node:

- If the node is a Manager management node, run the following command:

  sh ${CONTROLLER_HOME}/sbin/update-ssh-key.sh

- If the node is a non-Manager management node, run the following command:

  sh ${NODE_AGENT_HOME}/bin/update-ssh-key.sh

If "Succeed to update ssh private key." is displayed when the preceding command is executed, the SSH key is generated successfully.

Step 4 Run the following command to copy the public key of the node to the active management node:

scp ${HOME}/.ssh/id_rsa.pub** *oms_ip*:**${HOME}/.ssh/id_rsa.pub_bak

oms_ip: indicates the IP address of the active management node.

Enter the password of user **omm** to copy the files.

Step 5 Log in to the active management node as user **omm**.

Step 6 Run the following command to disable logout on system timeout:

TMOUT=0

Step 7 Run the following command to go to the related directory:

cd ${HOME}/.ssh

Step 8 Run the following command to add new public keys:

cat id_rsa.pub_bak >> authorized_keys

Step 9 Run the following command to move the temporary public key file, for example, **/tmp**.

mv -f id_rsa.pub_bak /tmp

Step 10 Copy the **authorized_keys** file of the active management node to the other nodes in the cluster:

scp authorized_keys *node_ip*:**/${HOME}/.ssh/authorized_keys**

node_ip: indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 11 Run the following command to confirm private key replacement without entering the password:

ssh *node_ip*

node_ip: indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

Step 12 Log in to FusionInsight Manager. On the homepage, click > **Start** next to the name of the desired cluster to start the cluster. (For MRS 3.3.0 or later, choose **More** > **Start** in the upper right corner of the homepage.)

----End

9.9.2.10 Enabling and Disabling Permission Verification on MRS Cluster Components

Scenario

HDFS and ZooKeeper verify the permission of users who attempt to access the services in both security and normal clusters by default. Users without related permission cannot access resources in HDFS and ZooKeeper. When the cluster is deployed in normal mode, YARN does not verify the permission of users who attempt to access the services by default. All users can access YARN resources.

Based on actual service requirements, administrators can enable YARN permission verification or disable permission verification on HDFS and ZooKeeper in normal clusters.

Notes and Constraints

This topic is available for MRS 3.x or later.

Impact on the System

After the enabling and disabling operations, the service configuration will expire. You need to restart the corresponding service for the configuration to take effect.

Disabling Permission Verification on HDFS

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Cluster**, click the name of the desired cluster, choose **Services** > **HDFS**, and click **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for parameters **dfs.namenode.acls.enabled** and **dfs.permissions.enabled**.

- **dfs.namenode.acls.enabled** indicates whether to enable HDFS ACL. The default value is **true**, indicating that the ACL is enabled. Change the value to **false**.
- **dfs.permissions.enabled** indicates whether to enable permission check for HDFS. The default value is **true**, indicating that permission check is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Change the value to **false**. After the modification, the owner, owner group, and permission of the directories and files in HDFS remain unchanged.

Step 5 Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

Enabling Permission Verification on YARN

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Cluster**, click the name of the desired cluster, choose **Services** > **Yarn**, and click **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for parameter **yarn.acl.enable**.

yarn.acl.enable indicates whether to enable the permission check for YARN.

- In normal clusters, the value is set to **false** by default to disable permission check. To enable permission check, change the value to **true**.
- In security clusters, the value is set to **true** by default to enable authentication.

Step 5 Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

Disabling Permission Verification on ZooKeeper

Step 1 Log in to FusionInsight Manager.

Step 2 Click **Cluster**, click the name of the desired cluster, choose **Services** > **ZooKeeper**, and click **Configurations**.

Step 3 Click **All Configurations**.

Step 4 Search for parameter **skipACL**.

skipACL indicates whether to skip the ZooKeeper permission check. The default value is **no**, indicating that permission check is enabled. Change the value to **yes**.

Step 5 Click **Save**, click **OK**, and wait for message "Operation successful" to display.

----End

9.9.2.11 Allowing External Users to Access MRS Clusters in Normal Mode

Scenario

When the cluster is installed in normal mode, the component clients do not support security authentication and cannot use the **kinit** command. Therefore, nodes outside the cluster cannot use users in the cluster by default. This may result in a user authentication failure when one of these nodes access a component server.

The node administrator can configure a user who has the same name as that of a user for a node outside the cluster, allow the user to log in to the node using the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SSH protocol, and connect to the servers of components in the cluster by using the user who logs in to the OS.

Notes and Constraints

This topic is available for MRS 3.x or later.

Prerequisites

- Nodes outside the cluster can connect to the service plane of the cluster.
- The KrbServer service of the cluster is running properly.
- You have obtained the password of user **root** of the node outside the cluster.
- A human-machine user has been planned and added to the cluster, and you have obtained the authentication credential file. For details, see **Creating a User (MRS 3.x and Later)** and **Downloading MRS Cluster User Credentials**.

Allowing External Users to Access Clusters in Normal Mode

Step 1 Log in to the node where a user is to be added as user **root**.

Step 2 Run the following command:

rpm -qa | grep pam

rpm -qa| grep krb5-client

The following RPM packages are displayed:

```
pam_krb5-32bit-2.3.1-47.12.1
pam-modules-32bit-11-1.22.1
yast2-pam-2.17.3-0.5.211
pam-32bit-1.1.5-0.10.17
pam_mount-32bit-0.47-13.16.1
pam-config-0.79-2.5.58
pam_krb5-2.3.1-47.12.1
pam-doc-1.1.5-0.10.17
pam-modules-11-1.22.1
pam_mount-0.47-13.16.1
pam_ldap-184-147.20
pam-1.1.5-0.10.17
krb5-client-1.6.3
```

Step 3 Check whether the RPM packages in the list are installed in the OS.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Obtain the lacked RPM packages from the OS image, upload the files to the current directory, and run the following command to install the RPM package:

rpm -ivh *.rpm

WARNING

The RPM packages to be installed may bring security risks. The risks that may be brought by the installation of these RPM packages must be taken into consideration during OS hardening.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

After the RPM packages are installed, go to **Step 5**.

Step 5 Run the following command to configure Kerberos authentication on PAM:

pam-config --add --krb5

If you need to cancel Kerberos authentication and system user login on a non-cluster node, run the **pam-config --delete --krb5** command as user **root**.

Step 6 Decompress the authentication credential file to obtain **krb5.conf**, use WinSCP to upload this configuration file to the **/etc** directory on the node outside the cluster, and run the following command to configure related permission to enable other users to access the file, such as permission **604**:

chmod 604 /etc/krb5.conf

Step 7 Run the following command in the connection session as user **root** to add the corresponding OS user to the human-machine user, and specify **root** as the primary group.

The OS user password is the same as the initial password when the human-machine user is created on Manager.

useradd *User name* **-m -d /home/admin_test -g root -s /bin/bash**

For example, if the name of the human-machine user is **admin_test**, run the following command:

useradd admin_test -m -d /home/admin_test -g root -s /bin/bash

When you use the newly added OS user to log in to the node by using the SSH protocol for the first time, the system prompts that the password has expired after you enter the user password, and the system prompts that the password needs to be changed after you enter the user password again. You need to enter a new password that meets the password complexity requirements of both the node OS and the cluster.

----End

9.9.2.12 Modifying the Session Timeout Duration for MRS Cluster Management Pages

FusionInsight Manager allows you to configure the timeout duration of the Manager pages. You can adjust the timeout duration according to your service requirements.

You need to set a proper web session timeout duration to avoid potential information leakage resulting from long- term web page exposure.

Notes and Constraints

This function is supported only by MRS 3.3.0 or later.

Changing the Session Timeout Duration

Step 1 Log in to FusionInsight Manager of the MRS cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **System** > **OMS**.

Step 3 In the list, locate the row that contains **tomcat** and click **Modify Configuration**.

Step 4 On the displayed page, set **Session Timeout** as required and click **OK**. Enter the user password and wait until the configuration to complete. Once done, the timeout setting will take effect for MRS Manager.

CAUTION

Set the minimum session duration based on service requirements. Otherwise, there will be security risks.

----End

9.9.2.13 Configuring Secure Communication Authorization for an MRS Cluster

MRS clusters provision, manage, and use big data components through the management console. Big data components are deployed in a user's VPC. If the MRS management console needs to directly access big data components deployed in the user's VPC, you need to enable the corresponding security group rules after you have obtained user authorization. This authorization process is called secure communications.

If the secure communications function is not enabled, MRS clusters cannot be created. If you disable the communication after a cluster is created, the cluster status will be **Network channel is not authorized** and the following functions will be affected:

- Installation of cluster components, cluster scaling out or in, upgrading Master node specifications will not be available.
- The cluster running status, alarms, and events cannot be monitored.
- The node management, component management, alarm management, file management, job management, patch management, and tenant management functions on the cluster details page are unavailable.
- The Manager page and the website of each component cannot be accessed.

After the secure communications function is enabled again, the cluster status is restored to **Running**, and the preceding functions become available. For details, see **Enabling Secure Communications for Clusters with This Function Disabled**.

If the security group rules authorized in the cluster are insufficient for you to provision, manage, and use big data components, is displayed on the right of **Secure Communications**. In this case, click **Update** to update the security group rules. For details, see **Updating Secure Communications**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Enabling Secure Communications During Cluster Creation

Step 1 Log in to the MRS console.

Step 2 Click **Create Cluster**. The page for creating a cluster is displayed.

Step 3 On the displayed page, select **Quick Config**.

Step 4 Configure cluster information by referring to **Quickly Creating an MRS Cluster** or **Creating a Custom MRS Cluster**.

Step 5 Select the check box for **Secure Communications**.

Step 6 Click **Create Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

----End

Disabling Secure Communications After a Cluster Is Created

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to disable secure communications.

The cluster details page is displayed.

Step 3 Click the switch on the right of **Secure Communications** to disable authorization. In the dialog box that is displayed, click **OK**.

After the authorization is disabled, the cluster status changes to **Network channel unauthorized**, and some functions of the cluster are unavailable. Exercise caution when performing this operation.

----End

Enabling Secure Communications for Clusters with This Function Disabled

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to enable secure communications.

The cluster details page is displayed.

Step 3 Click the switch on the right of **Secure Communications** to enable the function.

After the function is enabled, the cluster status changes to **Running**.

----End

Updating Secure Communications

If the security group rules configured for the cluster are insufficient for provisioning, managing, or using big data components, appears to the right of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Secure Communications. In this case, click **Update** to update the security group rules.

Step 1 Log in to the MRS console.

Step 2 In the active cluster list, click the name of the cluster for which you want to update secure communications.

The cluster details page is displayed.

Step 3 Click **Update** on the right of **Secure Communications**.

Step 4 Click **OK**.

----End

9.9.3 Changing the Passwords for System Users of an MRS Cluster

9.9.3.1 Changing or Resetting the Password for User admin of an MRS Cluster

User **admin** is the system administrator account of Manager. You are advised to periodically change the password by referring to **Changing the Password of User admin** to improve system security. If you forget the password, you can reset it by referring to **Resetting the Password of User admin**.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Changing the Password of User admin

Changing the password of user admin on Manager:

You can change the password for the user **admin** on Manager for clusters with Kerberos authentication enabled or clusters with Kerberos authentication disabled but with the EIP function enabled.

Step 1 Log in to Manager as user **admin**.

- For MRS 2.*x* or earlier, click the username in the upper right corner of the page and choose **Change Password**.
- For MRS 3.*x* or later, hover over **Hello, admin** in the upper right corner of the page and choose **Change Password**.

Step 2 On the **Change Password** page, set **Old Password**, **New Password**, and **Confirm Password**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The default password complexity requirements are as follows:

- For MRS 2.*x* or earlier:
  - The password must contain at least eight characters.
  - The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?
  - The password cannot be the username or the username spelled backwards.
- MRS 3.*x* or later:
  - The password must contain at least eight characters.
  - The password must contain at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~`!?,.;-_'(){}[]/<>@#$%^&*+|\=).
  - The password cannot be the same as the username or the username spelled backwards.
  - The password cannot be a common or easily cracked password.
  - The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**.

Step 3 Click **OK**. Log in to Manager with the new password.

----End

Changing the password of user admin on the cluster node (versions later than MRS 2.*x*):

Step 1 Update the client of the active management node. For details, see **Updating the MRS Cluster Client After the Server Configuration Expires**.

Step 2 Log in to the active management node.

Step 3 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 4 Run the following command to switch to the client directory, for example, **/opt/client**.

cd /opt/client

Step 5 Run the following command to configure environment variables:

source bigdata_env

Step 6 Run the following command to change the password of user **admin**: This operation takes effect in the whole cluster.

kpasswd admin

Enter the old password and then enter a new password twice.

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?
- The password cannot be the username or the username spelled backwards.

----End

Resetting the Password of User admin

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Go to the client directory.

cd *Client installation directory*

Step 4 Run the following command to set environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

The default password of user **kadmin/admin** is **KAdmin@123** for MRS 2.*x* or earlier and **Admin@123** for MRS 3.*x* or later. The system displays a message indicating that the password has expired upon the first login. Change the password as prompted. Keep the password secure as it cannot be retrieved once lost.

Step 6 Run the following command to reset the password of user **admin**:

cpw admin

For the cluster, the default password complexity requirements are as follows:

- For MRS 2.*x* or earlier:
  - The password must contain at least eight characters.
  - The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?
  - The password cannot be the username or the username spelled backwards.
- MRS 3.*x* or later:
  - The password must contain at least eight characters.
  - The password must contain at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~`!?,.;-_'(){}[]/<>@#$%^&*+|\=).
  - The password cannot be the same as the username or the username spelled backwards.
  - The password cannot be a common or easily cracked password.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**.

----End

9.9.3.2 Changing the Passwords for OS Users of an MRS Cluster Node

This section describes how to periodically change the login passwords for the OS users **omm**, **ommdba**, and **root** on MRS cluster nodes to improve system O&M security. You do not need to set a unified password for the OS users on each node.

By default, the password validity period of an OS user is 90 days. **Changing the MRS OS User Password Validity Period** describes how to change the validity period.

You are advised to periodically change a user's login password of the cluster node operating system to improve system O&M security.

Prerequisites

- You have obtained the IP address of the node where the passwords of users **omm** and **ommdba** are to be changed.
- You have obtained the password of user **root** before changing the passwords of users **omm** and **ommdba**.

Changing the Password for OS Users of an MRS Cluster Node

Step 1 Log in to the node that requires password change as user **root**.

Step 2 Run the following command to switch the user:

sudo su - root

Step 3 Run the following command to change the passwords of users **omm**, **ommdba**, or **root**:

passwd omm

passwd ommdba

passwd root

For example, after you run the command to change the password of user **omm**, the following information is displayed:

```
Changing password for user omm.
New password:
Retype new password:
```

Enter the new password and confirm the password. The OS password change policies vary depending on the OS in use.

The default password complexity requirements of an MRS cluster are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The new password cannot be the same as any of the last five passwords.

----End

Changing the MRS OS User Password Validity Period

Step 1 Log in to the node where you want to change the password validity period of the OS user password as the **root** user.

Step 2 Change the OS user password validity period.

- **Legacy users**

  Run the following command to change the password validity period:

  chage -M *Validity period (days) user_name*

  - *Validity period (days)*: how many days the password is valid since its creation. If this parameter is set to **99999**, the password never expires. Set this parameter based on your service requirements.
  - *user_name*: OS user whose validity period you want to change, for example, **ommdba**.
  - You are advised to set this parameter based on service requirements and periodically change the user password.

- **New users**

  Run the following command to edit the file and change the value of **PASS_MAX_DAYS**, which indicates the password validity period, in days. If the value is changed to **99999**, the password never expires.

  vi /etc/login.defs

----End

9.9.3.3 Changing the Password for the Kerberos Administrator of an MRS Cluster

This section describes how to periodically change the password for the Kerberos or OMS Kerberos administrator **kadmin** of an MRS cluster (MRS 3.*x* or later) to improve system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

Prerequisites

- For MRS 2.*x* or earlier, the client has been installed on the **Master1** node.
- For MRS 3.*x* or later, the client has been installed on any node in the cluster and the IP address of the node has been obtained.

Changing the Password of the Kerberos Administrator

If the current MRS version is 3.*x* or later, changing the password of this user will change the password of the OMS Kerberos administrator.

Step 1 Log in to a cluster node.

- For MRS 3.*x* or later, log in to the node where the client is installed as user **root** using the node IP address.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For MRS 2.*x* or earlier: Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch to user **omm**:

sudo su - omm

Step 3 Run the following command to go to the client directory, for example, **/opt/hadoopclient**:

cd /opt/hadoopclient

Step 4 Run the following command to set environment variables:

source bigdata_env

Step 5 Run the following command to change the password of **kadmin/admin**. This operation takes effect for all servers. Keep the password secure as it cannot be retrieved once lost.

kpasswd kadmin/admin

Enter the password (default: **Admin@123**) and set a new password. The new password must meet the following complexity requirements:

- For MRS 2.*x* or earlier:
  - The password must contain at least eight characters.
  - The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?
  - The password cannot be the username or the username spelled backwards.
- MRS 3.*x* or later:
  - The password must contain at least eight characters.
  - The password must contain at least four of the following character types: uppercase letters, lowercase letters, numbers, spaces, and special characters. Supported special characters: ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=
  - The password cannot be the same as the username or the username spelled backwards.
  - The password cannot be a common or easily cracked password.
  - The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**.

----End

Changing the Password of the OMS Kerberos Administrator

This operation is supported only in MRS 3.*x* or later.

Changing this user's password will also update the Kerberos administrator password.

Step 1 Log in to any management node in the cluster as user **omm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Run the following command to go to the directory:

cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts

Step 3 Run the following command to set environment variables:

source component_env

Step 4 Run the following command to change the password of **kadmin/admin**. This operation takes effect for all servers. Keep the password secure as it cannot be retrieved once lost.

kpasswd kadmin/admin

Enter the user password and set a new password. The new password must meet the following complexity requirements:

- The password contains at least 8 characters.
- The password contains at least four types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!?,.;-_'(){}[]/<>@#$%^&*+|\=).
- The password cannot be the same as the username or the username spelled backwards.
- The password cannot be a common easily-cracked password.
- The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**.

----End

9.9.3.4 Changing the Passwords for Manager Users of an MRS Cluster

Passwords of human-machine system users must be regularly changed to ensure MRS cluster security. This section describes how to change passwords on Manager.

If you have the permission to use Manager, you can change the passwords on Manager.

If you do not have the permission to use Manager, you can change the passwords on the cluster client.

Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after changing the password of the MRS cluster user.

Prerequisites

- You have obtained the current password policy. For details, see **Configuring Password Policies for MRS Cluster Users**.
- If you need to use a client to reset passwords, ensure that the cluster client has been installed on any node in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Changing Passwords on Manager

Step 1 Log in to Manager as a user who has the user management permission, for example, **admin**.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Hover over the username in the upper right corner of the page.

Choose **Change Password**.

Step 3 On the displayed page, set **Current Password**, **New Password**, and **Confirm Password**, and click **OK**.

The default password complexity requirements are as follows:

- For MRS 2.*x* or earlier:
  - The password must contain at least eight characters.
  - The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?
  - The password cannot be the username or the username spelled backwards.
- MRS 3.*x* or later:
  - The password must contain at least eight characters.
  - The password must contain at least four of the following character types: uppercase letters, lowercase letters, numbers, spaces, and special characters. Supported special characters: ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=
  - The password cannot be the same as the username or the username spelled backwards.
  - The password cannot be a common or easily cracked password.
  - The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**.

----End

Changing Passwords on the Client

This function is only available in MRS 3.*x* or later.

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 3 Run the following command to set environment variables:

source bigdata_env

Step 4 Change the user password.

kpasswd *System username*

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For example, change the password of the system user **test1**.

kpasswd test1

Enter the old password as prompted and set a new password. The default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least four of the following character types: uppercase letters, lowercase letters, numbers, spaces, and special characters. Supported special characters: ~`!?,.;-_'(){}[]/<>@#$%^&*+|\=
- The password cannot be the same as the username or the username spelled backwards.
- The password cannot be a common or easily cracked password.
- The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**.

If an error occurs during the **kpasswd** command execution, try the following operations:

- Close the SSH session and reopen it.
- Run **kdestroy** and then **kpasswd**.

----End

9.9.3.5 Changing the Password for a Regular LDAP User of an MRS Cluster

This section describes how to periodically change the passwords for LDAP administrators and users of an MRS cluster to improve system O&M security.

- Usernames in MRS 3.1.0:
  - LDAP administrators: cn=root, dc=hadoop, dc=com
  - LDAP users: cn=pg_search_dn, ou=Users, dc=hadoop, dc=com
- Usernames in MRS 2.*x* or earlier:
  - LDAP administrators: rootdn:cn=root, dc=hadoop, dc=com
  - LDAP users: pg_search_dn:cn=pg_search_dn, ou=Users, dc=hadoop, dc=com

Notes and Constraints

- This section applies only to MRS 2.*x* or earlier and MRS 3.1.0. For versions later than MRS 3.1.0, refer to **Modifying the OMS Service Configuration**.
- For MRS 3.1.0 clusters:
  - Changing these user passwords will also update the corresponding OMS LDAP administrator or user passwords.
  - If the cluster is upgraded from an earlier version, the LDAP administrator passwords will retain the password policy of the original cluster. To ensure system security, change the passwords after the upgrade.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- For MRS 2.*x* or earlier, all services need to be restarted after passwords are changed, during which the services are unavailable.
- For MRS 3.1.0 clusters:
  - Changing the user password of the LdapServer service is a high-risk operation and requires restarting the KrbServer and LdapServer services. If KrbServer is restarted, users may fail to be queried by running the **id** command on nodes in the cluster temporarily. Therefore, exercise caution when restarting KrbServer.
  - After the passwords for LDAP users **cn=pg_search_dn**, **ou=Users**, **dc=hadoop**, and **dc=com** are changed, the users may be locked in the LDAP component. You are advised to unlock them after password change. For details, see **Unlocking the LDAP Management Account of the MRS Cluster**.

Prerequisites (MRS 3.1.0)

Before changing the passwords for LDAP users **cn=pg_search_dn**, **ou=Users**, **dc=hadoop**, and **dc=com**, ensure that the users are not locked by running the following command on the active management node of the cluster:

ldapsearch -H ldaps://*Floating IP address of OMS:OLDAP port***-LLL -x -D cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -W -b cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -e ppolicy**

Enter the password for the LDAP user **pg_search_dn**. If the following information is displayed, the user is locked. In this case, unlock the user by referring to **Unlocking the LDAP Management Account of the MRS Cluster**.

```
ldap_bind: Invalid credentials (49); Account locked
```

- To obtain the OLDAP port, log in to FusionInsight Manager, choose **System** > **OMS** > **oldap** > **Modify Configuration**, and view the value of **LDAP Listening Port**.
- The password for the LDAP user **pg_search_dn** is randomly generated by the system, which can be obtained from the **/etc/sssd/sssd.conf** or **/etc/ldap.conf** file on the active node.

Changing the Password for a Regular LDAP User of an MRS Cluster

For MRS 3.1.0:

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Cluster** > **Services** > **LdapServer**.

Step 3 In the upper right corner of the **Overview** page, choose **More** > **Change Database Password**. In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 4 In the **Change Password** dialog box, select the user whose password needs to be changed in the **User Information** drop-down list.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The default password complexity requirements are as follows:

- The password must contain 16 to 32 characters.
- The password contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (`~!@#$%^&*()-_=+|[{}];,<.>/?).
- The password cannot be the same as the username or the username spelled backwards.
- The password cannot be the same as the current password.

Step 6 Select **I have read the information and understood the impact** and click **OK** to confirm the modification and restart the service.

----End

For MRS 2.*x* or earlier:

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Services** > **LdapServer** > **More**.

Step 3 Click **Change Password**. In the displayed dialog box, enter the old password and click **OK**.

Step 4 In the **Change Password** dialog box, select the user whose password needs to be modified in the **User Information** drop-down box.

Step 5 Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The default password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (`~!@#$%^&*()-_=+\|[{}];:",<.>/?).
- The password cannot be the username or the reverse username.
- The new password cannot be the same as the current password.

The default password of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** is **LdapChangeMe@123**, and that of the LDAP user **pg_search_dn:cn=pg_search_dn,ou=Users,dc=hadoop,dc=com** is **pg_search_dn@123**. Periodically change the passwords and keep them secure.

Step 6 Select **I have read the information and understand the impact**, and click **OK** to confirm the modification and restart the service.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

9.9.3.6 Changing the LDAP Administrator Password for an MRS Cluster

It is recommended that the administrator periodically changes the passwords of LDAP administrator accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbadmin,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

Notes and Constraints

This section applies only to MRS 3.1.0. For versions later than MRS 3.1.0, see **Modifying the OMS Service Configuration**.

Impact on the System

- You need to restart the KrbServer service after changing the password.
- After the password is changed, check whether the LDAP administrator accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbadmin,ou=Users,dc=hadoop,dc=com** are locked, run the following command on the active management node of the cluster to check whether **krbkdc** is locked (the method for user **krbadmin** is similar):

  ldapsearch -H ldaps://*OMS_FLOAT_ IP address:OLdap port* **-LLL -x -D cn=krbkdc,ou=Users,dc=hadoop,dc=com -W -b cn=krbkdc,ou=Users,dc=hadoop,dc=com -e ppolicy**

  Enter the password of the LDAP administrator account **krbkdc**. The default password is **LdapChangeMe@123**. If the following message is displayed, the account is locked. For details about how to unlock the account, see **Unlocking the LDAP Management Account of the MRS Cluster**.

  ```
  ldap_bind: Invalid credentials (49); Account locked
  ```

  OLdap port number obtaining method:

  a. Log in to FusionInsight Manager, choose **System** > **OMS** > **oldap** > **Modify Configuration**:

  b. The **LDAP Listening Port** parameter value is **oldap port**.

Prerequisites

You have obtained the management node IP address.

Changing the Password of the LDAP Administrator

Step 1 Log in to the active management node as user **omm** with the IP address of the active management node.

Step 2 Run the following command to go to the related directory:

cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts

Step 3 Run the following command to change the password of the LDAP administrator account:

./okerberos_modpwd.sh

Enter the old password and then enter a new password twice.

The password must meet the following complexity requirements:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Contains 16 to 32 characters.
- Contains at least three types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (`~!@#$%^&*()-_=+|[{}];,<.>/?).
- Cannot be the same as the current password.

If the following information is displayed, the password is changed.

```
Modify kerberos server password successfully.
```

Step 4 Log in to FusionInsight Manager, click **Cluster**, click the name of the desired cluster, and choose **Services** > **KrbServer**. On the displayed page, choose **More** > **Restart Service**.

Enter the password and do not select **Restart upper-layer services**. Click **OK** to restart the KrbServer service.

----End

9.9.3.7 Changing the Passwords for MRS Cluster Component Running Users

You are advised to regularly change the passwords for MRS cluster component running users to enhance system O&M security.

- For MRS 2.*x* or earlier:
  - If the initial password is randomly generated by the system, reset the password.
  - If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.
- In MRS 3.*x* or later, component running users are classified into the following types based on whether their initial passwords are randomly generated by the system:
  - If the initial password of a component running user is randomly generated by the system, the user is of the machine-machine type.
  - If the initial password of a component running user is not randomly generated by the system, the user is of the human-machine type.

Impact on the System

For MRS 3.*x* or later, the initial password for the component running user is randomly generated by the system. After changing the password, the MRS cluster needs to be restarted, which may cause temporary interruption of services during the restart.

Prerequisites

- For MRS 2.*x* or earlier, the client has been installed on the **Master1** node.
- For MRS 3.*x* or later, the client has been installed on any node in the cluster and the IP address of the node has been obtained.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Changing the Passwords for MRS Cluster Component Running Users (MRS 3.*x* or Later)

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Go to the client directory.

cd *Client installation directory*

Step 3 Run the following command to set environment variables:

source bigdata_env

Step 4 Run the following command and enter the password for user **kadmin/admin** to log in to the kadmin console:

kadmin -p kadmin/admin

The default password for the user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted. Keep the password secure as it cannot be retrieved once lost.

Step 5 Run the following command to change the password for an internal component running user:

cpw *Internal component username*

Example: **cpw hdfs**

The username **hdfs** is given as an example. Replace it with the actual one.

The default password complexity requirements are as follows:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: uppercase letters, lowercase letters, numbers, spaces, and special characters (~`!?,.;-_'(){}[]/<>@#$%^&*+|\=).
- The password cannot be the same as the username or the username spelled backwards.
- The password cannot be a common or easily cracked password, for example, **Admin@12345**.
- The new password cannot be the same as any of the last *N* passwords. The value of *N* is determined by **Repetition Rule** in **Configuring Password Policies for MRS Cluster Users**. This policy only applies to human-machine accounts.

Run the following command to view user information:

getprinc *Internal system username*

Example: **getprinc hdfs**

Step 6 Determine the type of the user whose password needs to be changed.

- If the user is a machine-machine user, go to **Step 7**.
- If the user is a human-machine user, the password is successfully changed and no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Log in to FusionInsight Manager.

Step 8 On the home page, click or **More** and click **Restart**.

Step 9 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 10 In the displayed restart confirmation dialog box, click **OK**.

Step 11 Wait until the system displays a message indicating that the restart is successful.

----End

Changing the Passwords for MRS Cluster Component Running Users (MRS 2.*x* or Earlier)

Step 1 Log in to the **Master1** node.

Step 2 (Optional) To change the password as user **omm**, run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch to the client directory, for example, **/opt/client**:

cd /opt/client

Step 4 Run the following command to configure environment variables:

source bigdata_env

Step 5 Run the following command to log in to the console as user **kadmin/admin**:

kadmin -p kadmin/admin

The default password for user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted. Keep the password secure as it cannot be retrieved once lost.

Step 6 Run the following command to reset the password of a component running user. This operation takes effect for all servers.

cpw*Component running user name*

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters '~!@#$%^&*()-_=+\|[{}];:'",<.>/?
- The password cannot be the username or the username spelled backwards.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

9.9.4 Changing the Passwords for Database Users of an MRS Cluster

9.9.4.1 Changing the Password for the OMS Database Administrator

You are advised to regularly change the password for the OMS database administrator to enhance system O&M security.

Step 1 Log in to the active management node as user **root**.

To ensure proper cluster running, you are not allowed to change the password for the user **ommdba** on the standby management node. Change the password on the active management node only.

Step 2 Run the following command to switch the user:

sudo su - omm

Step 3 Run the following command to switch the directory:

cd $OMS_RUN_PATH/tools

Step 4 Change the password for the user **ommdba**.

mod_db_passwd ommdba

Step 5 Enter the old password of user **ommdba** and enter a new password twice.

The password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

----End

9.9.4.2 Changing the Password for an OMS Database Access User

This section describes how to regularly change the password for an OMS database access user to enhance system O&M security.

Impact on the System

The OMS service needs to be restarted for the new password to take effect. The service is unavailable during the restart.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Changing the Password for an OMS Database Access User (MRS 3.*x* or Later)

Step 1 Log in to FusionInsight Manager and choose **System** > **OMS** > **gaussDB** > **Change Password**.

Step 2 Locate the row that contains the user **omm** and click **Change Password** in the **Operation** column.

Step 3 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#$%^&*()-+_=\| [{}];",<.>/?).
- The password cannot be the same as the username or the username spelled backwards.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Click **OK**. Wait until the system displays a message indicating that the operation is successful.

Step 6 Locate the row that contains the user **omm** and click **Restart OMS Service** in the **Operation** column.

Step 7 In the displayed dialog box, enter the password of the current login user and click **OK**.

Step 8 In the displayed confirmation dialog box, click **OK**.

----End

Changing the Password for an OMS Database Access User (MRS 2.*x* or Earlier)

Step 1 Log in to MRS Manager and click **System**.

Step 2 In the **Permission** area, click **Change OMS Database Password**.

Step 3 Locate the row that contains the user **omm** and click **Change Password** in the **Operation** column.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\| [{}];:'",<.>/?).
- The password cannot be the username or the username spelled backwards.
- The password cannot be the same as the last 20 historical passwords.

Step 4 Click **OK**. When **Operation successful** is displayed, click **Finish**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Locate the row that contains the user **omm** and click **Restart OMS Service** in the **Operation** column.

If the password is changed but the OMS database is not restarted, the user **omm** enters the **Waiting to restart** state, and the password cannot be changed again until the OMS database is restarted.

Step 6 In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**, and restart the OMS service.

----End

9.9.4.3 Changing the Passwords for Database Users of MRS Cluster Components

This section describes how to regularly change the passwords for database users of cluster components to enhance system O&M security.

Impact on the System

The services need to be restarted for the new password to take effect. The services are unavailable during the restart.

Changing the Passwords for Database Users of MRS Cluster Components (MRS 3.1.0)

This function is only available in MRS 3.1.0. For later versions, refer to **Resetting the MRS Component Database User Password**.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services**.

Step 2 Click the name of the service whose database user password is to be reset. On the displayed **Dashboard** page, click **Stop Service**.

In the displayed dialog box, enter the password for the current login user and click **OK**.

Once you have confirmed the impact of stopping the service, wait for it to come to a complete stop.

Step 3 Click the service whose database user password is to be changed, click **More**, and select **Change Database Password**. On the displayed page, enter the password for the current login user and click **OK**.

Step 4 Enter the old and new passwords as prompted.

The password must meet the following complexity requirements:

- The database user password contains 8 to 32 characters.
- The password contains at least three types of the following: uppercase letters, lowercase letters, numbers, and special characters (~`!@#$%^&*()-+_=\| [{}];",<.>/?).
- The password cannot be the same as the username or the username spelled backwards.
- The password cannot be the same as the last 20 historical passwords.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Select **I have read the information and understand the impact** and click **OK**.

Step 6 After the password is changed, choose **More** > **Restart Service**. In the displayed dialog box, enter the password for the current login user, click **OK**, select **Restart the upper-layer services**, and click **OK**.

----End

Changing the Passwords for Database Users of MRS Cluster Components (MRS 2.*x* or Earlier)

Step 1 On MRS Manager, click **Services** and click the name of the database user service to be modified.

Step 2 Determine the component database user whose password is to be changed.

- To change the password of the DBService database user, go to **Step 3**.
- To change the password for the Hive, Hue, or Loader database user, click **Stop Service** and go to **Step 3**.

Step 3 Choose **More** > **Change Password**.

Step 4 Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password of the DBService database user contains 16 to 32 characters. The password of the Loader, Hive, or Hue database user contains 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#$%^&*()-_=+\|[{}];:'",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

Step 5 Click **OK**. The system automatically restarts the corresponding service. When **Operation successful** is displayed, click **Finish**.

----End

9.9.4.4 Resetting the MRS Component Database User Password

MRS cluster components use random default passwords for connecting to the DBService database. For operations security, you need to periodically reset the passwords of component database users.

Notes and Constraints

This section applies only to MRS 3.1.2 or later. For versions earlier than MRS 3.1.2, see **Changing the Passwords for Database Users of MRS Cluster Components**.

Impact on the System

To reset passwords, you need to stop and then restart services, during which services are unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Resetting the Component Database User Password

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services**.

Step 2 Click the name of the service whose database user password is to be reset, for example, **Kafka**, and click **Stop Service** on the **Dashboard** page.

In the displayed dialog box, enter the password of the current login user and click **OK**.

After confirming the impact of stopping the service, wait until the service is stopped.

Step 3 On the **Dashboard** page, choose **More** > **Reset Database Password**.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select "I have read the information and understand the impact", and click **OK**.

Step 4 After the password is reset, click **Start Service** on the **Dashboard** page.

Step 5 In the displayed dialog box, click **OK** and wait until the service is started.

----End

9.9.4.5 Resetting the Password for User omm in DBService

Scenario

The default password of the DBService database user **omm** in the MRS cluster is randomly generated. You need to periodically reset the password to improve system O&M security.

Notes and Constraints

This topic is available for MRS 3.2.0-LTS.1 and later versions only. Versions earlier than MRS 3.2.0-LTS.1 do not support password resetting.

Resetting the Password

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **DBService**.

Step 2 On the **Dashboard** page, choose **More** > **Reset Database Password**.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select **I have read the information and understand the impact**, and click **OK**.

Step 3 After the password is reset, click **More** and select **Service Restart Rolling** on the **Dashboard** page.

In the displayed dialog box, enter the password of the current login user and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Confirm the impact of restarting the service, click **OK**, and wait until the service is started.

----End

9.9.4.6 Changing the Password for User compdbuser of the DBService Database

You need to regularly change the password of the OMS database to enhance system security and maintenance.

Notes and Constraints

This section applies only to MRS 3.x or later.

Changing the Password for the OMS Database Administrator

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **Cluster** > **Services** > **DBService**, click **Instances**, and view the IP address of the active DBService node.

Step 3 Log in to the active DBService node as user **root**.

The password of user **compuserdb** cannot be changed on the standby DBService node. Change the password on the active management node only.

Step 4 Switch to the **$DBSERVER_HOME** directory and configure environment variables.

su - omm

cd $DBSERVER_HOME

source .dbservice_profile

Step 5 Change the password of user **compdbuser** as user **omm** of the DBService database.

gsql -U omm -W omm*Password of user omm of the DBService database* **-d postgres -p 20051 -c "alter user compdbuser identified by '***New password***' valid until '***Expiration time***';"**

- To obtain the initial password of user **omm** in the DBService database, see **MRS Cluster User Accounts** or contact the O&M personnel.
- The new password must meet the following complexity requirements:
  - Contains 16 to 32 characters.
  - Contains at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (~`!@#$%^&*()-+_=\|[{}];:",<.>/?).
  - Cannot be the same as the username or the username spelled backwards.
  - Cannot be the same as the last 20 historical passwords.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The expiration time format is *xxxx-xx-xx*, for example, **2020-10-31**.

If the following information is displayed, the modification is successful:

```
ALTER ROLE
```

----End

9.10 Viewing and Configuring MRS Alarm Events

9.10.1 Viewing MRS Cluster Events

Alarms and events are important mechanisms for ensuring the stability, reliability, and performance of MRS clusters.

Events capture status changes and system operations that occur during system running. They are used to audit or trace system behavior, including component instance startup, shutdown, and active/standby switchover in an MRS cluster, and node-level changes such as slow disk isolation.

For details about common events in an MRS cluster, see **Table 9-102**.

Generally, you do not need to manually handle events. However, **for events of the major or higher severity, you need to check whether the related components are running properly and whether related alarms exist**. For details, see **Viewing Alarms of an MRS Cluster**.

Viewing Cluster Events on the Management Console

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 On the **Dashboard** page, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.

Step 4 Choose **Alarms** > **Events**. On the displayed page, view event information about the cluster.

In the event list, you can check events generated in the current cluster, including the event name, severity, and generation time.

You can click the arrow before an event name to expand the event details.

Step 5 To export event information, click **Export**, select the file format, and export the event file to a local directory.

----End

Viewing Cluster Events on Manager

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Choose **O&M** > **Alarm** > **Events**. On the displayed **Events** page, you can view information about all events in the cluster, including the event name, ID, severity, generation time, source, object, and location. By default, the latest 10 events are displayed on each page.

- For clusters of MRS 2.x or earlier, choose **Alarms** > **Events**.
- Click **Export All** to export all event details.
- You can click to manually refresh the current page and click to select the columns that will display.
- You can filter events by object or cluster.
- You can click **Advanced Search** to search for events by event ID, name, severity, start time, or end time.

You can click on the left of an event to view detailed event parameters. **Table 9-101** describes the parameters.

Table 9-101 Event parameters

Parameter	Description
Event ID	Event ID.
Event Name	Event name.
Event Severity	Event severity. The options are **Critical**, **Major**, **Minor**, and **Suggestion**.
Generated	Time when an event is generated.
Object	Possible cause of an event.
Serial Number	Number of events generated by the system.
Location	Detailed information for locating the event, which includes the following: • **Source**: cluster for which the event is generated. • **ServiceName**: service for which the event is generated. • **RoleName**: role for which the event is generated. • **HostName**: host for which the event is generated.
Additional Info	Error information.
Event Cause	Possible cause of an event.
Source	Cluster name.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Common Events of an MRS Cluster

Table 9-102 MRS Cluster Event List

Event ID	Component	Event Name	Event Severity
12019	Manager	Stop Service	Warning
12021	Manager	Stop RoleInstance	Warning

Helpful Links

- You can configure event notifications to receive notification messages through different subscription endpoints (such as SMS messages and emails). For details, see **Configuring Notifications for MRS Cluster Alarms and Events**.
- You can view MRS operation logs on the management console. For details, see **Viewing MRS Operation Logs**.

9.10.2 Viewing Alarms of an MRS Cluster

Alarms and events are important mechanisms for ensuring the stability, reliability, and performance of MRS clusters.

An alarm is a system-generated notification that signals an abnormal condition or fault requiring attention. It is triggered by analyzing system events and requires manual intervention from a user or automatic handling by the system. You can view alarms reported by components on the management console or MRS Manager. You can also define alarm thresholds for threshold-related monitoring metrics in the cluster.

For alarms that can be automatically cleared, the system clears them as soon as the predefined conditions are met. If faults have been rectified and the alarms cannot be automatically cleared, you can manually clear the alarms.

You can view up to 100,000 latest alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS Manager. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to the dump path.

The alarm dump directory is as follows. The system automatically generates the directory when alarms are dumped for the first time.

- Clusters of versions earlier than MRS 3.*x*: **${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data** directory on the active management node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For MRS 3.*x* clusters: **${BIGDATA_HOME}/om-server/OMS/workspace/data** directory on the active management node

Viewing and Clearing Alarms on the Management Console

Step 1 Log in to the MRS console.

Step 2 On the **Active Clusters** page, select a running cluster and click its name to switch to the cluster details page.

Step 3 Click **Alarms** and view the alarm information in the alarm list.

- The alarm list page displays the latest 10 alarms by default.
- You can filter all alarms of the same severity. The results include cleared and uncleared alarms.
- Click **Export All**. In the displayed **Export** dialog box, set **Save As** and click **OK**.

Table 9-103 Alarm descriptions

Parameter	Description
Alarm ID	ID of an alarm.
Alarm Name	Name of an alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Severity	Alarm severity. In versions earlier than MRS 3.x, the cluster alarm severity is as follows: • Critical Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. You need to check the cluster status based on the alarms and rectify the faults in a timely manner. • Major Indicates alarms reporting errors that affect some cluster functions, including process faults, periodic backup task failures, and abnormal key file permissions. Check the objects for which the alarms are generated based on the alarms and clear the alarms in a timely manner. • Minor Indicates alarms reporting errors that do not affect major functions of the current cluster, including alarms indicating that the certificate file is about to expire, audit logs fail to be dumped, and the license file is about to expire. • Warning Indicates an alarm of the lowest severity. It is used for information display or prompt and indicates that an event occurs in the scenarios when you stop a service, delete a service, stop an instance, delete an instance, delete a node, restart a service, restart an instance, perform an active/standby switchover for MRS Manager, scale in a host, or restore an instance. Additionally, this type of alarms also occurs when an instance is faulty, a job executed successfully, or a job failed to be executed. In MRS 3.x or later, the alarm severity of a cluster is as follows: • Critical Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. You need to check the cluster status based on the alarms and rectify the faults in a timely manner. • Major Indicates alarms reporting errors that affect some cluster functions, including process faults, periodic backup task failures, and abnormal key file permissions. Check the objects for which the alarms are generated based on the alarms and clear the alarms in a timely manner. • Minor Indicates alarms reporting errors that do not affect major functions of the current cluster, including alarms indicating

Parameter	Description
	that the certificate file is about to expire, audit logs fail to be dumped, and the license file is about to expire. • Warning Indicates an alarm of the lowest severity. It is used for information display or prompt and indicates that an event occurs in the scenarios when you stop a service, delete a service, stop an instance, delete an instance, delete a node, restart a service, restart an instance, perform an active/standby switchover for MRS Manager, scale in a host, or restore an instance. Additionally, this type of alarms also occurs when an instance is faulty, a job executed successfully, or a job failed to be executed.
Generated	Time when the alarm is generated.
Location	Details about the alarm.
Operation	If the alarm can be manually cleared, click **Clear Alarm**. To view details about an alarm, click **View Help**. (This function is available in MRS 3.*x* or later).

Step 4 Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view information about specified alarms. Click **Reset** to clear the search criteria.

The start time and end time are specified in **Time Range**. You can search for alarms generated within the time range.

Handle the alarm by referring to the **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

Step 5 Click **Clear Alarm** if you need to.

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

Viewing and Clearing Alarms on MRS Manager

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **O&M** > **Alarm** > **Alarms**.

Step 3 View the alarm information reported by each cluster on FusionInsight Manager, including the alarm name, ID, severity, and generation time. By default, the latest 10 alarms are displayed on each page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 You can click ⌄ on the left of an alarm to view detailed alarm parameters. **Table 9-104** describes the parameters.

Table 9-104 Alarm parameters

Parameter	Description
Alarm ID	Alarm ID.
Alarm Name	Alarm name.
Alarm Severity	Alarm severity. The options are **Critical**, **Major**, **Minor**, and **Suggestion**.
Generated	Time when the alarm is generated.
Cleared	Time when an alarm is cleared. If the alarm is not cleared, **--** is displayed.
Source	Cluster name.
Object	Service, process, or module that triggers the alarm.
Auto Clear	Whether the alarm can be automatically cleared after the fault is rectified.
Alarm Status	Current status of the alarm. The options are **Auto**, **Manual**, and **Uncleared**.
Alarm Cause	Possible cause of an alarm.
Serial Number	Number of alarms generated by the system.
Additional Information	Error information. MRS 3.3.0 or later: You can view the monitoring metric values in **Additional Information** if thresholds are set for the metrics to generate alarms.
Location	Detailed information for locating the alarm, which includes the following: • **Source**: cluster for which the alarm is generated. • **ServiceName**: service for which the alarm is generated. • **RoleName**: role for which the alarm is generated. • **HostName**: host for which the alarm is generated.

Step 5 Manage alarms.

- Click **Export All** to export all alarm details.
- After handling multiple alarms, you can select and clear one or more of them in batches by clicking **Clear Alarm**. Each batch can only clear a maximum of 300 alarms.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

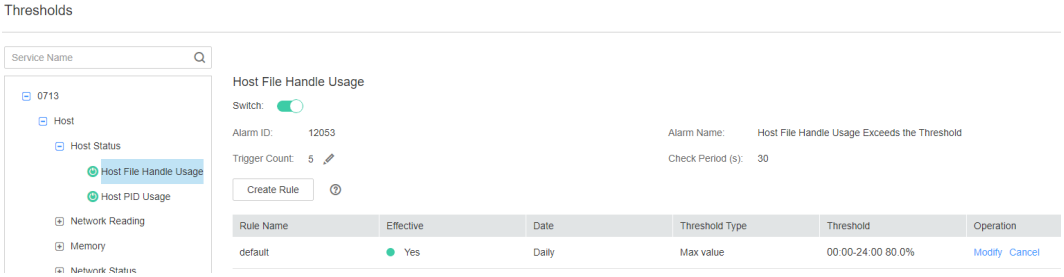
- You can filter alarms by object or severity.
- You can click **Advanced Search** to search for alarms by alarm ID, name, type, start time, or end time. Click **Search** to filter alarms that meet the search criteria. Click **Advanced Search** again to view the number of search criteria that you have configured.
- You can click **Clear**, **Mask**, or **View Help** to perform corresponding operations on an alarm.
- If there are a large number of alarms, you can click **View by Category** to sort uncleared alarms by alarm ID. After alarms are classified, click the number of uncleared alarms to view alarm details.

----End

9.10.3 Configuring Alarm Thresholds for an MRS Cluster

Manager allows you to configure monitoring metric thresholds to monitor the health of various metrics. If abnormal data occurs and meets the preset conditions, the system will trigger an alarm, which will appear on the alarm page.

Configuring Alarm Thresholds for a Cluster (MRS 3.*x*)



Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds**.

Step 3 Select a monitoring metric for a host or service in the cluster.

Figure 9-2 Configuring the threshold for a metric

For example, after selecting **Host Memory Usage**, the information about this indicator threshold is displayed.

- If the alarm sending switch is turned on, an alarm will be triggered if the threshold is reached.
- When **Alarm Severity** is on, hierarchical alarms are enabled. The system dynamically reports alarms at each severity based on the real-time metric values and hierarchical thresholds set for the severity. MRS 3.3.0 or later supports this function.
- **Alarm ID** and **Alarm Name**: alarm information triggered against the threshold
- **Trigger Count**: FusionInsight Manager checks whether the value of a monitoring metric reaches the threshold. If the number of consecutive checks

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

reaches the value of **Trigger Count**, an alarm is generated. **Trigger Count** is configurable.

- **Check Period (s)**: interval for the system to check the monitoring metric.
- The rules in the rule list are used to trigger alarms.

Step 4 Click **Create Rule** to add rules used for monitoring indicators.

Table 9-105 Monitoring indicator rule parameters

Parameter	Description	Example Value
Rule Name	Specifies the alarm rule name.	CPU_MAX

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Alarm Severity	Select an alarm severity. After **Alarm Severity** is on, you need to configure the alarm severity in **Thresholds**. The alarm severity can be one of the following: ● Critical: Indicates a severe fault or issue within the system that could impact cluster running or lead to data loss. This severity level applies to extreme conditions, such as disk or memory usage exceeding 95%. ● Major: Indicates a significant impact on system performance or availability that requires prompt attention to prevent further degradation. ● Minor: Indicates small issues within the system that have no impact on overall system running. Alarms of this severity level should be monitored and addressed, but they have a low handling priority. ● Warning: Indicates the occurrence of a system event and serves purely as an informational notice or prompt.	Major

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Threshold Type	You can use the maximum or minimum value of an indicator as the alarm triggering threshold. If **Threshold Type** is set to **Max value**, the system generates an alarm when the value of the specified indicator is greater than the threshold. If **Threshold Type** is set to **Min value**, the system generates an alarm when the value of the specified indicator is less than the threshold.	Max value
Date	This parameter is used to set the date when the rule takes effect. Possible values are as follows: • Daily • Weekly • Others If **Alarm Severity** is on, only **Daily** is supported.	Daily
Add Date	This parameter is available only when **Date** is set to **Others**. You can set the date when the rule takes effect. Multiple options are available.	09-30
Thresholds	This parameter is used to set the time range when the rule takes effect. If **Alarm Severity** is on, you cannot set the start time and end time. The default start time and end time are 00:00-23:59.	Start and End Time: 00:00–08:30

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
	Thresholds of the rule monitoring metric After **Alarm Severity** is on, different alarm severities can be set for a cluster based on different thresholds. **You can click to set multiple time ranges for the threshold or click to delete one.**	Threshold: 10

Step 5 Click **OK** to save the rules.

Step 6 Locate the row that contains an added rule, and click **Apply** in the **Operation** column. The value of **Effective** for this rule changes to **Yes**.

A new rule can be applied only after you click **Cancel** for an existing rule.

----End

Configuring Alarm Thresholds for a Cluster (Versions Earlier Than MRS 3.*x*)

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Click **System**.

Step 3 In **Configuration**, click **Configure Alarm Threshold** under **Monitoring and Alarm**, select monitoring metrics as planned, and set their baselines.

Step 4 Click a metric, for example, **CPU Usage**, and click **Create Rule**.

Step 5 In the displayed dialog box, set monitoring metric rule parameters.

Table 9-106 Monitoring indicator rule parameters

Parameter	Description	Example Value
Rule Name	Specifies the alarm rule name.	CPU_MAX
Reference Date	Specifies the date on which the reference indicator history is generated.	2014/11/06

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Threshold Type	You can use the maximum or minimum value of an indicator as the alarm triggering threshold. If **Threshold Type** is set to **Max value**, the system generates an alarm when the value of the specified indicator is greater than the threshold. If **Threshold Type** is set to **Min value**, the system generates an alarm when the value of the specified indicator is less than the threshold.	Max value
Alarm Severity	Alarm severity. The value can be: • Critical: Indicates a severe fault or issue within the system that could impact cluster running or lead to data loss. • Major: Indicates a significant impact on system performance or availability that requires prompt attention to prevent further degradation. • Minor: Indicates small issues within the system that have no impact on overall system running. Alarms of this severity level should be monitored and addressed, but they have a low handling priority. • Warning: Indicates the occurrence of a system event and serves purely as an informational notice or prompt.	Major
Time Range	Specifies the period in which the rule takes effect.	From 00:00 to 23:59
Threshold	Specifies the threshold of the rule monitoring metrics.	80
Date	Date when the rule takes effect. • **Workday** • **Weekend** • **Other**	Workday
Add Date	This parameter is valid only when **Date** is set to **Other**. You can select multiple dates.	11/30

Step 6 Click **OK**. A message is displayed in the upper right corner of the page, indicating that the template is saved successfully.

Send alarm is selected by default. **Trigger Count**: FusionInsight Manager checks whether the value of a monitoring metric reaches the threshold. If the number of consecutive checks reaches the value of **Trigger Count**, an alarm is generated. **Trigger Count** is configurable. **Check Period (s)** indicates the interval at which MRS Manager checks monitoring metrics.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Locate the row that contains the newly added rule, and click **Apply** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully applied. Click **Cancel** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule *xx* is successfully canceled.

----End

Threshold Alarm Metric Reference

FusionInsight Manager alarm monitoring metrics are classified as node information metrics and cluster service metrics. **Table 9-107** lists the metrics whose thresholds can be configured for a node, and **Table 9-108** lists the metrics whose thresholds can be configured for a component.

On FusionInsight Manager of MRS 3.3.0 or later, alarms of some components can be reported by severity. Each alarm severity has a threshold. You can view them on the FusionInsight Manager configuration page.

Table 9-107 Node monitoring metrics

Metric Group	Metric	Description	Default Threshold
CPU	Host CPU Usage	This indicator reflects the computing and control capabilities of the current cluster in a measurement period. By observing the indicator value, you can better understand the overall resource usage of the cluster.	90.0%
Disk	Disk Usage	Indicates the disk usage of a host.	90.0%
	Disk Inode Usage	Indicates the disk inode usage in a measurement period.	80.0%
Memory	Host Memory Usage	Indicates the average memory usage at the current time.	90.0%

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Metric Group	Metric	Description	Default Threshold
Host Status	Host File Handle Usage	Indicates the usage of file handles of the host in a measurement period.	80.0%
	Host PID Usage	Indicates the PID usage of a host.	90%
Network Status	TCP Ephemeral Port Usage	Indicates the usage of temporary TCP ports of the host in a measurement period.	80.0%
Network Reading	Read Packet Error Rate	Indicates the read packet error rate of the network interface on the host in a measurement period.	0.5%
	Read Packet Dropped Rate	Indicates the read packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Read Throughput Rate	Indicates the average read throughput (at MAC layer) of the network interface in a measurement period.	80%
Network Writing	Write Packet Error Rate	Indicates the write packet error rate of the network interface on the host in a measurement period.	0.5%

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Metric Group	Metric	Description	Default Threshold
	Write Packet Dropped Rate	Indicates the write packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Write Throughput Rate	Indicates the average write throughput (at MAC layer) of the network interface in a measurement period.	80%
Process	Uninterruptible Sleep Process	Number of D state processes on the host in a measurement period	0
	omm Process Usage	omm process usage in a measurement period	90

		IoTDBServer Direct Memory Usage	IoTDBServer direct memory usage	90%

9.10.4 Configuring Alarm Masking for an MRS Cluster

MRS clusters support manual alarm masking, allowing administrators to filter out redundant notifications and focus on critical alarms more effectively.

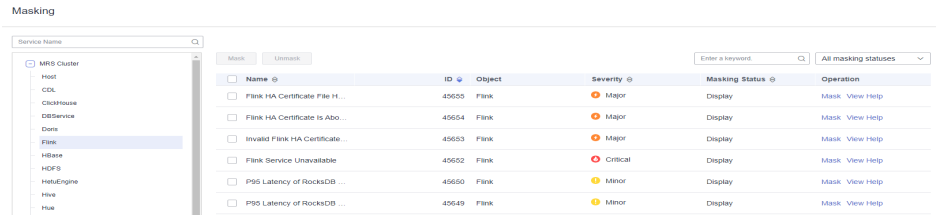
- Some unimportant alarms and minor alarms need to be masked during MRS cluster running.
- When a third-party product is interconnected with MRS, some alarms of the product are duplicated with the alarms of MRS and need to be masked.
- When the deployment environment is special, certain alarms may be falsely reported and need to be masked.

Once an alarm is masked, any new alarms with the same ID will no longer appear on the **Alarm Management** page or be counted. However, previously reported alarms will still be displayed.

Configuring the Alarm Masking Status

Step 1 Log in to FusionInsight Manager of the MRS cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **O&M** > **Alarm** > **Masking Setting**.

Step 3 In the **Masking Setting** area, select the specified service or module.

Step 4 Select an alarm from the alarm list.

Figure 9-3 Masking an alarm

The information about the alarm is displayed, including the alarm name, ID, severity, masking status, and operations can be performed on the alarm.

- The masking status includes **Display** and **Masking**.
- Operations include **Masking** and **Help**.

Step 5 Set the masking status for an alarm:

- Click **Masking**. In the displayed dialog box, click **OK** to change the alarm masking status to **Masking**.
- Click **Cancel Masking**. In the dialog box that is displayed, click **OK** to change the masking status of the alarm to **Display**.

----End

Configuring Alarm Masking and Alarm Trigger Count

MRS allows you to mask alarms and number of trigger times on the background. If the number of alarm report times is less than or equal to the number of alarm trigger times, no alarm will be reported.

The following steps apply only to MRS 3.5.0 or later clusters.

Step 1 Log in to the active management node as user **root**.

For details about how to log in to an MRS cluster node, see **Logging In to an MRS Cluster Node**.

Step 2 Run the following command to switch to user **omm**:

```
su - omm
```

Step 3 Run the following command to modify the **alarm_filter_config.json** configuration file. If the file does not exist, create it.

```
vi $BIGDATA_HOME/om-server/OMS/workspace/conf/fms/alarm_filter_config.json
```

Step 4 Configure or add parameters based on service demands.

- **Alarm ID**: ID of the alarm to be masked, for example, **12016**.
- **is_filtered:** Whether to mask the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

true indicates that the alarm is masked and not reported. **false** indicates that the alarm is reported after certain times of trigger.

- **smoothing_times**: trigger count. If the number of alarm trigger times is less than or equal to the value of this parameter, no alarm will be reported. The value is an integer greater than 0.

The **is_filtered** parameter takes priority over the **smoothing_times** parameter.

For example, if the configuration is as follows, alarm 12016 is masked and alarm 12017 is reported after it is triggered for more than three times:

```
{
  "12016": {
    "is_filtered": true,
    "smoothing_times": 1
  },
  "12017": {
    "is_filtered": false,
    "smoothing_times": 3
  }
}
```

Step 5 Restart the FMS service on the active OMS node to apply the changes.

```
sh $BIGDATA_HOME/om-server/OMS/workspace/bin/omm_s_fm_ctl.sh restart
```

Step 6 Log in to the standby management node as user **root** and perform **Step 3** and **Step 4**.

----End

9.10.5 Connecting an MRS Cluster to SNMP to Report Alarms

If users need to view alarms and monitoring data of a cluster on the O&M platform, you can use Simple Network Management Protocol (SNMP) on FusionInsight Manager to report related data to the network management system (NMS).

Prerequisites

The ECS corresponding to the server must be in the same VPC as the MRS cluster's Master node, and the Master node must be able to access the server's IP address and specified port.

Connecting an MRS Cluster to SNMP to Report Alarms

Step 1 Log in to MRS Manager and access the SNMP configuration page.

- MRS 3.*x* or later:
  a. Log in to FusionInsight Manager.
  b. Choose **System** > **Interconnection** > **SNMP**.
  c. Enable the SNMP service.
- Versions earlier than MRS 3.*x*:
  a. Log in to MRS Manager and click **System**.
  b. In **Configuration**, enable **Configure SNMP** under **Monitoring and Alarm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Set interconnection parameters based on **Table 9-109**.

Table 9-109 Interconnection parameters

Parameter	Example Value	Description
Version	V3	Specifies the version of SNMP, which can be: • **V2C**: This is an earlier version with low security. • **V3**: This is a later version with higher security than SNMPv2c SNMPv3 is recommended.
Local Port	20000	Specifies the local port. The default value is **20000**. The value ranges from **1025** to **65535**.
Read Community Name	-	Specifies the read-only community name. This parameter is available only when **Version** is set to **V2C**.
Write Community Name	-	Specifies the write community name. This parameter is available only when **Version** is set to **V2C**.
Security Username	test	Specifies the SNMP security username. This parameter is available only when **Version** is set to **V3**.
Authentication Protocol	SHA	Specifies the authentication protocol. This parameter is available only when **Version** is set to **V3**. SHA is recommended.
Authentication Password	-	Specifies the authentication password. This parameter is available only when **Version** is set to **V3**.
Confirm Password	-	Used to confirm the authentication password. This parameter is available only when **Version** is set to **V3**.
Encryption Protocol	AES256	Specifies the encryption protocol. This parameter is available only when **Version** is set to **V3**. AES256 is recommended.
Encryption Password	-	Specifies the encryption password. This parameter is available only when **Version** is set to **V3**.
Confirm Password	-	Used to confirm the encryption password. This parameter is available only when **Version** is set to **V3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The value of **Security Username** cannot contain repeated strings with the unit length as a common factor of 64 (such as 1, 2, 4, and 8), for example, **abab** and **abcdabcd**.
- The **Authentication Password** and **Encryption Password** must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or username spelled backwards.
- For security purposes, periodically change the authentication password and encryption password when the SNMP protocol is used.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

Step 3 Click **Create Trap Target** in the **Trap Target** area. In the displayed dialog box, set the following parameters:

- **Target Symbol**: specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address Mode** (only for MRS 3.*x* or later): mode of the target IP address. The options are **IPv4** and **IPv6**.
- **Target IP Address**: specifies the target IP address, which can communicate with the management plane IP address of the management node.
- **Target Port**: specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name**: This parameter is available only when **Version** is set to **V2C** and is used to report the community name.

Click **OK**.

The **Create Trap Target** dialog box is closed.

Step 4 Click **OK**.

----End

9.10.6 Connecting an MRS Cluster to the Syslog Server to Report Alarms

If users need to view alarms and events of a cluster on the unified alarm reporting platform, you can use the Syslog protocol to report related data to the alarm platform.

WARNING

The Syslog protocol is not inherently encrypted, making data transmitted via Syslog vulnerable to theft and security breaches. In high-security environments, it is crucial to use encryption and authentication mechanisms to protect sensitive information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Prerequisites

The ECS corresponding to the server must be in the same VPC as the MRS cluster's Master node, and the Master node must be able to access the server's IP address and specified port.

Connecting an MRS Cluster to the Syslog Server to Report Alarms

Step 1 Log in to MRS Manager by referring to **Accessing MRS Manager** and access the SNMP configuration page.

- MRS 3.*x* or later:
  a. Log in to FusionInsight Manager.
  b. Choose **System** > **Interconnection** > **Syslog**.
  c. Enable the Syslog service.
- Versions earlier than MRS 3.*x*:
  a. Log in to MRS Manager and click **System**.
  b. In **Configuration**, enable **Configure Syslog** under **Monitoring and Alarm**.

Step 2 Set northbound parameters based on **Table 9-110**.

Table 9-110 Syslog interconnection parameters

Parameter Area	Parameter	Example Value	Description
Syslog Protocol	Server IP Address Mode	IPV4	Specifies the IP address mode of the interconnected server. The value can be **IPV4** or **IPV6**. (only for MRS 3.*x* or later)
	Server IP Address	192.168.*xx*.*xxx*	Specifies the IP address of the interconnected server.
	Server Port	514	Specifies the port number for interconnection.
	Protocol	UDP	Specifies the protocol type, including: • **TCP** • **UDP**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Area	Parameter	Example Value	Description
	Severity Level	Informational	Specifies the severity of the reported message. The options are as follows: • **Emergency** • **Alert** • **Critical** • **Error** • **Warning** • **Notice** • **Informational** (default value) • **Debug** **NOTE** **Severity Level** and **Facility** determine the priority of the sent message. **Priority** = **Facility** × 8 + **Severity Level** For the values of **Severity Level** and **Facility**, see **Table 9-111**.
	Facility	local use 0 (local0)	Specifies the module where the log is generated. For the available values of this parameter, see **Table 9-111**. Default value **local use 0 (local0)** is recommended.
	Identifier	FusionInsight Manager	Product ID. The identifier can contain a maximum of 256 characters, including letters, digits, underscores (_), periods (.), hyphens (-), spaces, and the following special characters: | $ { } • MRS 3.*x* or later: The default value is **FusionInsight Manager**. • Versions earlier than MRS 3.*x*: The default value is **MRS Manager**.
Report Message	Report Format	${alarm.id}	Specifies the message format of the alarm report. For details, see the help information on the page. The report format can contain a maximum of 1024 characters, including letters, digits, underscores (_), periods (.), hyphens (-), spaces, and the following special characters: | $ { } **NOTE** For details about each field in the report format, see **Table 9-112**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Area	Parameter	Example Value	Description
	Alarm Type	Fault	Specifies the type of the alarm to be reported. • For MRS 3.*x* or later, see **Table 9-112**. • Versions earlier than MRS 3.*x*: – **Fault**: indicates that the Syslog alarm message is reported when MRS Manager generates an alarm. – **Clear**: indicates that a Syslog alarm message is reported when an alarm on MRS Manager is cleared. – **Event**: indicates that the Syslog alarm message is reported when MRS Manager generates an event.
	Alarm Severities	Major	Specifies the level of the alarm to be reported. • For MRS 3.*x* or later, see **Table 9-112**. • Versions earlier than MRS 3.*x*: **Suggestion**, **Minor**, **Major**, and **Critical**.
Uncleared Alarm Reporting	Periodic Uncleared Alarm Reporting	Enable	Specifies whether to report uncleared alarms in a specified period. You can toggle on or off the function. The function is toggled off by default.
	Report Interval (min)	30	Specifies the interval for periodically reporting uncleared alarms. This parameter is valid only when **Periodic Uncleared Alarm Reporting** is enabled. The default value is **15**, in minutes. The value ranges from **5** to **1440** (one day).
Heartbeat Settings	Heartbeat Reporting	Enable	Specifies whether to periodically report Syslog heartbeat messages. You can toggle on or off the function. The function is toggled off by default.
	Heartbeat Interval (minutes)	15	Specifies the interval for periodically reporting heartbeat messages. This parameter is valid only when **Heartbeat Reporting** is enabled. The default value is **15**, in minutes. The value ranges from **1** to **60**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Area	Parameter	Example Value	Description
	Heartbeat Packet	FusionInsight Syslog Heartbeat	Specifies the heartbeat message to be reported. This parameter is valid when **Heartbeat Reporting** is toggled on and cannot be left blank. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars (|), colons (:), spaces, commas (,), and periods (.).

After periodic heartbeat packet reporting is enabled, packet sending may be interrupted during some automatic cluster fault recovery scenarios (for example, active/standby OMS switchover). The sending process resumes automatically after the recovery.

Step 3 Click **OK**.

----End

cause	Alarm cause
additionalInfo	Additional information
object	Alarm object

9.10.7 Periodically Backing Up Alarm and Audit Information

You can modify the configuration file to periodically back up FusionInsight Manager alarm information, FusionInsight Manager audit information, and audit information of all services to the specified storage location.

The backup can be performed using FTP or SFTP. FTP does not encrypt data, which may cause security risks. Therefore, SFTP is recommended.

Notes and Constraints

This section applies only to MRS 3.*x* or later.

Periodically Backing Up Alarm and Audit Information

Step 1 Log in to the active management node of an MRS cluster as user **root**.

For details about how to log in to an MRS cluster node, see **Logging In to an MRS Cluster**.

Perform this operation only on the active management node. Scheduled backup is not supported on the standby management node.

Step 2 Run the following command to switch to user **omm**:

```
su - omm
```

Step 3 Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

Step 4 Run the following command to configure scheduled backup of FusionInsight Manager's alarm and audit information or service audit information:

./setNorthBound.sh -t *Information type* **-i** *Remote server IP address* **-p** *SFTP or FTP port used by the server*-**u** *Username* **-d** *Save path* **-c** *Interval (minutes)* **-m** *Number of records in each file* **-s** *Whether to enable backup* **-e** *Protocol*

Example:

```
./setNorthBound.sh -t alarm -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This script modifies the alarm backup configuration file **alarm_collect_upload.properties**.

The file save path is **${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

```
./setNorthBound.sh -t audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100  -s true -e sftp
```

This script modifies the audit backup configuration file **audit_collect_upload.properties**.

The file save path is **${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

```
./setNorthBound.sh -t service_audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100  -s true -e sftp
```

This script modifies the service audit backup configuration file **service_audit_collect_upload.properties**.

The file save path is **${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

Step 5 Enter the password as prompted.

The password is encrypted and saved in the configuration file.

```
Please input sftp/ftp server password:
```

Step 6 Check the configuration result. If the following information is displayed, the configuration is successful. The configuration file will be automatically synchronized to the standby management node.

```
execute command syncfile successfully.
Config Succeed.
```

----End

9.10.8 Enabling the MRS Cluster Maintenance Mode to Disable Alarm Reporting

FusionInsight Manager allows you to set clusters, services, hosts, or OMSs to the maintenance mode. Objects in maintenance mode do not report alarms. This prevents the system from generating a large number of unnecessary alarms during maintenance changes, such as upgrade, because these alarms may influence O&M personnel's judgment on the cluster status.

- Cluster maintenance mode

  If a cluster is not brought online or has been brought offline due to O&M operations (for example, non-rolling upgrade), you can set the entire cluster to the maintenance mode.

- Service maintenance mode

  When performing maintenance operations on a specific service (for example, performing service-affecting commissioning operations like batch restart of service instances, directly powering on or off nodes of the service, or repairing the service), you can set only this service to the maintenance mode.

- Host maintenance mode

  When performing maintenance operations on a host (such as powering on or off, isolating, or reinstalling the host, upgrading its OS, or replacing the host), you can set only this host to the maintenance mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- OMS maintenance mode

  When restarting, replacing, or repairing an OMS node, you can set the OMS node to the maintenance mode.

Notes and Constraints

Only MRS 3.*x* and later clusters support the cluster maintenance mode.

Impact on the System

After the maintenance mode is set, alarms caused by non-maintenance operations are suppressed and cannot be reported. Alarms can be reported only when faults persist after the system exits the maintenance mode. Therefore, exercise caution when setting the maintenance mode.

Enabling the MRS Cluster Maintenance Mode

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Set the maintenance mode.

Determine the object to set the maintenance mode based on the service scenario. For details, see **Table 9-113**.

Table 9-113 Setting to the maintenance mode

Scenario	Operation
Configure a cluster to enter the maintenance mode.	1. On the management page, choose ··· or **More** > **Enter Maintenance**. 2. In the displayed dialog box, click **OK**. After the cluster enters the maintenance state, the status of the cluster becomes . After maintenance is complete, click **Exit Maintenance Mode**. The cluster then exits the maintenance mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

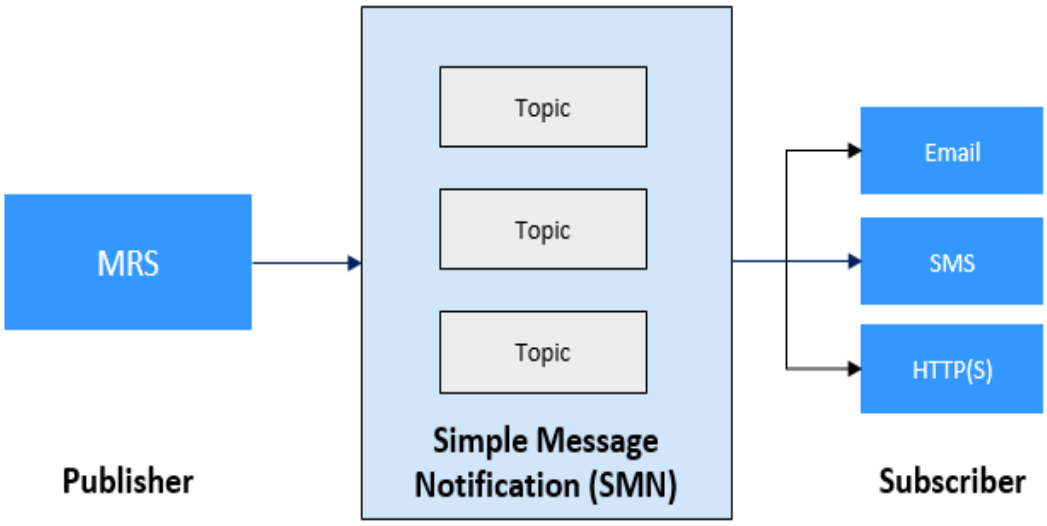
Scenario	Operation
Configure a service to enter the maintenance mode.	1. On FusionInsight Manager, choose **Cluster** > **Services** > *Service name*. 2. On the service details page, click **More** and select **Enter Maintenance Mode**. 3. In the displayed dialog box, click **OK**. After a service enters the maintenance mode, the status of the service becomes in the service list. After maintenance is complete, click **Exit Maintenance Mode**. The service then exits the maintenance mode. **When configuring a service to enter the maintenance mode, you are advised to set the upper-layer services that depend on this service to the maintenance mode as well.**
Configure a host to the maintenance mode.	1. On FusionInsight Manager, choose **Hosts**. 2. On the **Hosts** page, select the target host, click **More**, and select **Enter Maintenance Mode**. 3. In the displayed dialog box, click **OK**. After the host enters the maintenance mode, the status of the host becomes in the host list. After maintenance is complete, click **Exit Maintenance Mode**. The host then exits the maintenance mode.
Configure the OMS to enter the maintenance mode.	1. On FusionInsight Manager, choose **System** > **OMS** > **Enter Maintenance Mode**. 2. In the displayed dialog box, click **OK**. After the OMS enters the maintenance state, the OMS status becomes . After maintenance is complete, click **Exit Maintenance Mode**. The OMS then exits the maintenance mode.

Step 3 Check the cluster maintenance view.

On FusionInsight Manager, click or **More** next to the cluster name and select **Maintenance Mode View**. In the displayed window, you can view the services and hosts in maintenance mode in the cluster.

After maintenance is complete, you can select services and hosts in batches in the maintenance mode view and click **Exit Maintenance Mode** to make them exit the maintenance mode.

----End



9.10.9 Configuring Notifications for MRS Cluster Alarms and Events

Simple Message Notification (SMN) is a reliable and flexible large-scale message notification service. It enables you to efficiently send messages to various

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

endpoints, such as email addresses and phone numbers. MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications through different subscription endpoints (SMSs and emails).

Figure 9-4 MRS cluster message notification

In an MRS cluster, you can choose whether to enable message notification in cluster alarm management to proactively notify users of specified messages.

- After a user subscribes to the notification service, the MRS management plane notifies the user of success or failure of manual cluster scale-out and scale-in, cluster deletion, and auto scaling by emails or SMS messages.
- The management plane checks the alarms about the MRS cluster and sends a notification to the tenant if the alarms are critical.
- If either of the operations such as deletion, shutdown, specifications modification, restart, and OS update is performed on an ECS in a cluster, the MRS cluster works abnormally. The management plane notifies a user when detecting that the VM of the user is in either of the preceding operations.

Step 1: Creating an SMN Topic and Adding a Subscription

A topic is used to publish messages and subscribe to notifications. It serves as a message sending channel, where publishers and subscribers can interact with each other.

Step 1 Log in to the management console.

Step 2 Click **Service List**. Under **Management & Governance**, click **Simple Message Notification**.

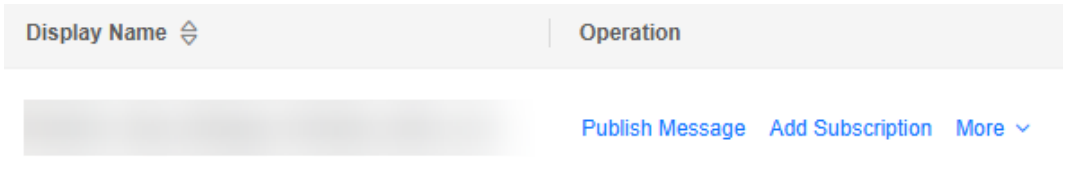
Step 3 In the navigation pane, choose **Topic Management** > **Topics**.

Step 4 Click **Create Topic**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-114 Parameters for creating an SMN topic

Parameter	Description	Example Value
Topic Name	Topic name, which: • Contains only letters, digits, hyphens (-), and underscores (_) and must start with a letter or digit. • Contains 1 to 255 characters. • Must be unique and cannot be modified after the topic is created.	mrs-job
Display name	Message sender name, which can contain up to 192 bytes. After you specify a display name, the sender in email messages will be presented as *Display name*<**username@example.com**>. Otherwise, the sender will be **username@example.com**.	mrs-job-failed
Enterprise Project	Name of an enterprise project. An enterprise project allows you to group cloud resources under specific projects, making it easier to manage cloud resources and users. The default name is **default**. This parameter is for enterprise users.	default



Step 5 Click **OK**.

After a topic is created, the system generates a topic URN, which uniquely identifies the topic and cannot be changed.

The created topic is displayed in the topic list. You can click the topic name to view its details.

Step 6 Locate the topic to which you want to add a subscription, click **More** in the **Operation** column, and select **Add Subscription**.

Figure 9-5 Adding a subscription to a topic

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Endpoint indicates the address of the subscription endpoint. You can add multiple SMS and email endpoints at a time, one in each line. You can enter a maximum of 10 endpoints.

Table 9-115 Parameters for adding a subscription

Parameter	Description	Example Value
Protocol	Protocol supported by the subscription endpoints. For example, you can receive messages through SMS messages or emails.	Email
Method	The following two options are available: • **Add subscriptions** • **Import subscriptions**: Select subscribers whose subscription has been confirmed and import the subscription data.	Add subscriptions
Endpoint	Subscription endpoint. You can enter up to 10 SMS, email, HTTP, or HTTPS endpoints, one in each line.	username@example.com

Step 7 Click **OK**. The new subscription is displayed in the subscription list.

Once you have added a subscription, SMN will send a confirmation message to the subscription endpoint, which includes a link for confirming the subscription. The subscription confirmation link is valid for 48 hours. Make sure to confirm your subscription on your mobile phone, mailbox, or other endpoints within this time frame.

The subscription endpoint can receive messages only after the subscription status changes to **Confirmed**.

----End

Configuring Notification Rules for MRS Clusters

Step 1 Log in to the MRS console.

Step 2 Choose **Active Clusters**, select a running cluster, and click its name to go to its details page.

Step 3 Click **Alarms**.

Step 4 Choose **Notification Rules** > **Add Notification Rule**.

Step 5 Set the notification rule parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-116 Parameters of a notification rule

Parameter	Example Value	Description
Rule Name	mrs_alarm	User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.
Message Notification	Enable	• If you enable this function, the system sends notifications to subscribers based on the notification rule. • If you disable this function, the rule does not take effect, that is, notifications are not sent to subscribers.
Topic Name	mrs_topic	Select an existing topic or click **Create Topic** to create a topic.
Notification Type	Alarm	Select the type of the notification to be subscribed to. • **Alarm** • **Event**
Subscription Items	Major	Select the items to be subscribed to. You can select all or some items as required. For example, choose **Major** > **Manager** and select **Node Fault**.

Step 6 Click **OK**. After the message notification is configured, the related endpoint can receive detailed notification messages when alarms or events in the subscription rule are generated in the MRS cluster.

----End

9.11 MRS Cluster Alarm Handling Reference

9.11.1 ALM-12001 Audit Log Dumping Failure

Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. The system starts to check the dump server at 3 a.m. every day. If the dump server meets the configuration conditions, audit logs can be successfully dumped. This alarm is generated when the audit log dump fails because the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12001	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

System can store a maximum of only 50 dump files locally. If the fault persists on the dump server, the local audit logs may be lost, and the first 50 audit logs that exceed the current time cannot be queried.

Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.
- The disk space of the dump directory is insufficient.

Procedure

Check whether the network connection is normal.

Step 1 On the FusionInsight Manager home page, choose **Audit > Configurations**.

Step 2 Check whether the SFTP IP on the dump configuration page is valid.

Log in to the node where Manager is located as user **root** and run the **ping** command to check whether the network connection between the SFTP server and the cluster is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Repair the network connection, reset the SFTP password, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the username, password, or dump directory are correct.

Step 5 On the dump configuration page, check whether the username, password, and dump directory of the third-party server are correct.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Change the username, password, and dump directory, and click **OK** to deliver the configuration again.

Step 7 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the disk space of the dump directory is sufficient.

Step 8 Log in to the third-party server as user **root** and run the **df** command to check whether the disk space of the dump directory of the third-party server exceeds 100 MB.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Expand disk space capacity for the third-party server, Reset the SFTP password and click **OK**

Step 10 Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Reset the dump rule.

Step 11 On the FusionInsight Manager home page, choose **Audit > Configurations**.

Step 12 Reset dump rules, set the parameters properly, and click **OK**.

Step 13 Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 15 Select **OmmServer** from the **Service** and click **OK**.

Step 16 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact the O&M personnel and send the collected log information.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.2 ALM-12004 OLdap Resource Abnormal

Description

The system checks LDAP resources every 60 seconds. This alarm is generated when the system detects that the LDAP resources in Manager are abnormal for six consecutive times.

This alarm is cleared when the Ldap resource in the Manager recovers and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Manager active/standby switchover may occur. The Manager and WebUI authentication service of components is unavailable. Security authentication and user management functions cannot be provided for upper-layer web services. As a result, you may fail to log in to the Manager and WebUI of components.

Possible Causes

The LdapServer process in the Manager is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check whether the LdapServer process in the Manager is normal.

Step 1 Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

Step 2 Run **ps -ef | grep slapd** command to check whether the LdapServer resource process in the **${BIGDATA_HOME}/om-server/om/** in the process configuration file is running properly.

NOTE

You can determine that the resource is normal by checking the following information:

1. After the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command runs, **ResHAStatus** of the OLdap is **Normal**.
2. After the **ps -ef | grep slapd** command runs, the slapd process of port 21750 can be viewed.
   - If yes, go to **Step 3**.
   - If no, go to **Step 4**.

Step 3 Run the **kill -2** *ldap pid* command and wait for 20 seconds. HA automatically starts the OLdap process. Check whether the current OLdap resource is in normal state.

- If yes, the operation is complete.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Log** > **Download**.

Step 5 Select **OmsLdapServer** and **OmmServer** from the **Service** and click **OK**.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.3 ALM-12005 OKerberos Resource Abnormal

Description

The alarm module checks the status of the Kerberos resource in Manager every 80 seconds. This alarm is generated when the alarm module detects that the Kerberos resources are abnormal for six consecutive times.

This alarm is cleared when the Kerberos resource recovers and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The component WebUI authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to FusionInsight Manager and the WebUIs of components.

Possible Causes

The OLdap resource on which the Okerberos depends is abnormal.

Procedure

Check whether the OLdap resource on which the Okerberos depends is abnormal in the Manager.

Step 1 Log in the Manager node in the cluster as user **omm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Log in to FusionInsight Manager using the floating IP address, and run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

Step 2 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the OLdap resource managed by HA is normal. In single-node system, the OLdap resource is in the **Active_normal** state. In dual-node system, the OLdap resource is in the **Active_normal** state on the active node and in the **Standby_normal** state on the standby node.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 See the procedure in **ALM-12004 OLdap Resource Abnormal** to resolve the problem. After the OLdap resource status recovers, check whether the OKerberos resource status is normal.

- If yes, the operation is complete.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Log** > **Download**.

Step 5 Select **OmsKerberos** and **OmmServer** from the **Service** and click **OK**.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.4 ALM-12006 Node Fault

Alarm Description

Controller checks the NodeAgent heartbeat every 30 seconds. If Controller does not receive heartbeat messages from a NodeAgent, it attempts to restart the NodeAgent process. This alarm is generated if the NodeAgent fails to be restarted for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

In MRS 3.3.0 and later versions, the alarm name is changed to **NodeAgent Process Is Abnormal**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12006	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The NodeAgent process is abnormal and cannot report heartbeat messages to the platform. If the fault is caused by network or hardware faults or SSH mutual trust, component services may be abnormal.

Possible Causes

- The network is disconnected, the hardware is faulty, or the operating system runs slowly.
- The memory of the NodeAgent process is insufficient.
- The NodeAgent process is faulty.

Handling Procedure

Check whether the network is disconnected, whether the hardware is faulty, or whether the operating system runs commands slowly.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, click the host name, and view address information about the host for which the alarm is generated.

Step 2 Log in to the active management node as user **root**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the faulty node is the active management node and fails login, the network of the active management node may be faulty. In this case, go to Step 4.

Step 3 Run the following command to check whether the faulty node is reachable:

```
ping IP address of the faulty host
```

- If yes, go to **Step 12**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Contact the hardware administrator to check whether the hardware (CPU or memory) of the node is faulty.

- If yes, go to **Step 7**.
- If no, go to **Step 12**.

Step 7 Repair or replace faulty components and restart the node. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 If a large number of node faults are reported in the cluster, the floating IP addresses may be abnormal. As a result, Controller cannot detect the NodeAgent heartbeat.

Log in to any management node in the cluster as user **root** and view the **/var/log/Bigdata/omm/oms/ha/scriptlog/floatip.log** file to check whether the logs generated one to two minutes before and after the faults occur are complete.

```
cat /var/log/Bigdata/omm/oms/ha/scriptlog/floatip.log
```

For example, a complete log is in the following format:

```
2017-12-09 04:10:51,000 INFO (floatip) Read from ${BIGDATA_HOME}/om-server_*/om/etc/om/
routeSetConf.ini,value is : yes
2017-12-09 04:10:51,000 INFO (floatip) check wsNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check omNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check wsInterface : eRth0:oms, wsFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check omInterface : eth0:oms, omFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check  wsFloatIp : XXX.XXX.XXX.XXX is reachable.
2017-12-09 04:10:52,000 INFO (floatip) check  omFloatIp : XXX.XXX.XXX.XXX is reachable.
```

- If yes, go to **Step 12**.
- If no, go to **Step 9**.

Step 9 Check whether the omNetExport log is printed after the wsNetExport is detected or whether the interval for printing two logs exceeds 10 seconds or longer.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Check the **/var/log/message** file of the OS to determine whether sssd frequently restarts or nscd exception information is displayed when the fault occurs.

```
cat /var/log/message
```

Example of sssd restart information:

```
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

Example of the nscd exception information:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780: Can't contact LDAP server
```

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Check whether the LdapServer node is faulty, for example, the service IP address is unreachable or the network latency is too long. If the fault occurs periodically, troubleshoot the fault when it occurs. Run the **top** command to check whether there is any software error.

To obtain information about the LdapServer node, log in to Manager (a cluster management tool), choose **Clusters** > **Services** > **LdapServer**, and click the **Instances** tab.

Check whether the memory of the NodeAgent process is insufficient.

Step 12 Log in to the faulty node as user **root** and run the following command to view the NodeAgent process logs:

```
vi /var/log/Bigdata/nodeagent/scriptlog/agent_gc.log.*.current
```

Step 13 Check whether the log file contains an error indicating that the metaspace size or heap memory size is insufficient.

Generally, the keyword for insufficient metaspace is **java.lang.OutOfMemoryError: Metaspace**, and the keyword for insufficient heap memory is **java.lang.OutOfMemoryError: Java heap space**.

The following is an example log containing an error:

```
java.lang.OutOfMemoryError:  Metaspace
        at java.lang.ClassLoader.defineClass1(Native Method)
        ...
```

- If yes, go to **Step 14**.
- If no, go to **Step 17**.

Step 14 Switch to user **omm**. Edit the corresponding file based on the cluster version, increase the values of **nodeagent.Xms** (NodeAgent initial heap memory) and **nodeagent.Xmx** (maximum heap memory), and save the modification.

```
su - omm
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The path of the file containing the parameters is as follows:

- For MRS clusters earlier than version 3.2.1:
  vi /opt/Bigdata/om-agent/nodeagent/bin/nodeagent_ctl.sh
- For MRS clusters of version 3.2.1 or later:
  vi $NODE_AGENT_HOME/etc/agent/nodeagent.properties

For example, change the value of **nodeagent.Xms** from **1024m** to **2048m**.

Step 15 Restart NodeAgent:

Command for stopping NodeAgent:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/stop-agent.sh
```

Command for starting NodeAgent:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/start-agent.sh
```

Step 16 Wait a moment and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check whether the NodeAgent process is faulty.

Step 17 Log in to the faulty node as user **root** and run the following command:

Command for switching to user **omm**:

```
su - omm
```

Command for viewing the NodeAgent process:

```
ps -ef | grep "Dprocess.name=nodeagent" | grep -v grep
```

Step 18 Check whether the NodeAgent process query command output is empty.

- If yes, go to **Step 19**.
- If no, go to **Step 21**.

Step 19 View the NodeAgent startup and run logs to locate the fault. After the fault is rectified, go to **Step 20**.

- NodeAgent run log:
  /var/log/Bigdata/nodeagent/agentlog/agent.log
- NodeAgent startup log:
  /var/log/Bigdata/nodeagent/scriptlog/nodeagent_ctl.log

Step 20 Restart the NodeAgent service:

Command for stopping NodeAgent:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/stop-agent.sh
```

Command for starting NodeAgent:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/start-agent.sh
```

Collect fault information.

Step 21 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 22 Select the following nodes from **Services** and click **OK**.

- NodeAgent
- Controller
- OS

Step 23 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 24 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.5 ALM-12007 Process Fault

Alarm Description

The process health check module checks the process status every 5 seconds. This alarm is generated when the process health check module detects that the process connection is faulty for three consecutive times.

This alarm is cleared when the process can be connected.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12007	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The impact varies depending on the instance that is faulty.

For example, if an HDFS instance is faulty, the impacts are as follows:

- If a DataNode instance is faulty, read and write operations cannot be performed on data blocks stored on the DataNode, which may cause data loss or unavailability. However, data in HDFS is redundant. Therefore, the client can access data from other DataNodes.
- If an HttpFS instance is faulty, the client cannot access files in HDFS over HTTP. However, the client can use other methods (such as shell commands) to access files in HDFS.
- If a JournalNode instance is faulty, namespaces and data logs cannot be stored to disks, which may cause data loss or unavailability. However, HDFS stores backups on other JournalNodes. Therefore, the faulty JournalNode can be recovered and data can be rebalanced.
- If a NameNode deployed in active/standby mode is faulty, an active/standby switchover occurs. If only one NameNode is deployed, the client cannot read or write any HDFS data. On MRS, NameNodes must be deployed in two-node mode.
- If a Router instance is faulty, the client cannot access data on the router. However, the client can use other Routers or directly access data on the backend NameNode.
- If a ZKFC instance is faulty, the NameNode does not continuously and automatically fail over. As a result, data cannot be read from or write to HDFS by the client. In this case, you need to enable automatic failover on other available ZKFC instances to restore the HDFS cluster.

Possible Causes

- The instance process is abnormal.
- The disk space is insufficient.

NOTE

If a large number of process fault alarms exist in a time segment, files in the installation directory may be deleted mistakenly or permission on the directory may be modified.

Handling Procedure

Check whether the instance process is abnormal.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located, and click the host name to view the service IP address and service name of the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 On the **Alarms** page, check whether the **ALM-12006 Node Fault** is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the alarm according to **ALM-12006 Node Fault**.

Step 4 Log in to the host for which the alarm is generated as user **root**. Check whether the installation directory user, user group, and permission of the alarm role are correct. The user, user group, and the permission must be **omm:ficommon 750**.

For example, the NameNode installation directory is ***${BIGDATA_HOME}*/FusionInsight_Current/*1_8_NameNode*/etc**.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Run the following command to set the permission to **750** and **User:Group** to **omm:ficommon**:

chmod 750 *<folder_name>*

chown omm:ficommon *<folder_name>*

Step 6 Wait for 5 minutes. In the alarm list, check whether **ALM-12007 Process Fault** is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Log in to the active OMS node as user **root** and run the following command to view the **configurations.xml** file. In the preceding command, "Service name" is the service name queried in **Step 1**.

vi $BIGDATA_HOME/components/current/*Service name***/configurations.xml**

Search for the keyword **healthMonitor.properties**, find the health check configuration item corresponding to the alarm reporting instance, and record the interface or script path specified by **monitor.info**, as shown in the following figure.

Check the logs recorded in the interface or script and rectify the fault.

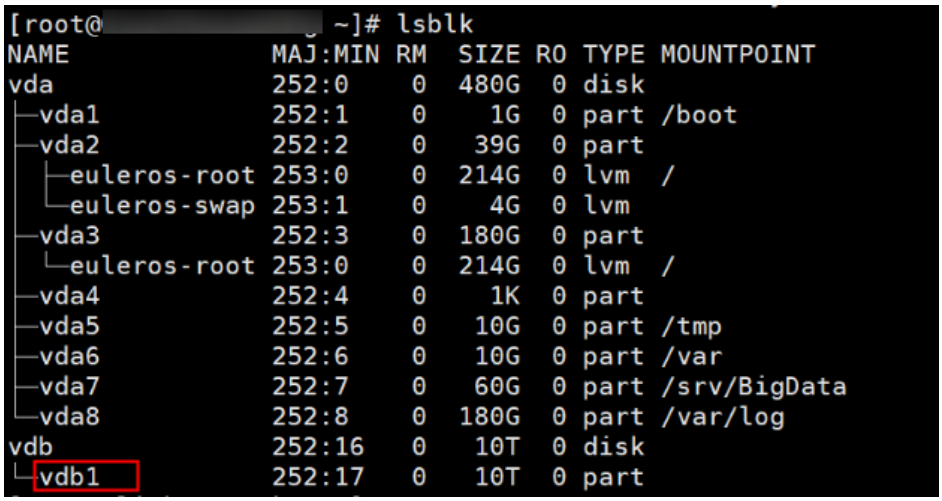
```
<config category="healthMonitor.properties" format="propertyfileconfigurer">
    <property type="hidden" scope="setup" classification="System">
        <name>monitor.type</name>
        <value>SCRIPT</value>
    </property>
    <property type="hidden" scope="setup" classification="System">
        <name>monitor.preInitDelay</name>
        <value>120000</value>
        <!-- 2min -->
    </property>
    <property type="hidden" scope="setup" classification="System">
        <name>monitor.recheckTimes</name>
        <value>90</value>
        </property>
    <property type="hidden" scope="setup" classification="System">
        <name>monitor.checkIntervals</name>
        <value>10000</value>
    </property>
    <property type="hidden" scope="setup" classification="System">
        <name>monitor.info</name>
        <value>#{install_home}/sbin/dbservice_mon.sh</value>
    </property>
    <property type="hidden" scope="setup" classification="System">
        <name>monitor.metric.connector</name>
        <value>#{install_home}/sbin/dbservice_ha.sh</value>
    </property>
</config>
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Check whether the required disk is mounted on the faulty node normally.



1. Log in to the node where the alarm was generated as the **root** user and run the following command to check whether there is a disk whose **TYPE** is **part** and **MOUNTPOINT** is empty.

   lsblk

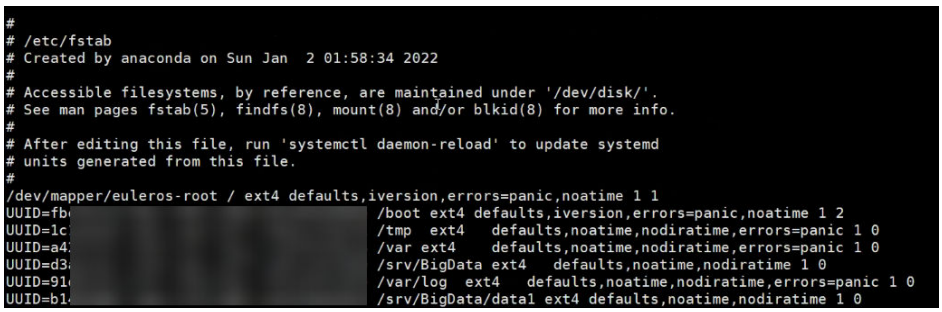
   – If yes, the disk is not mounted. Go to **Step 9.2**.

   – If no, the disk is mounted. Go to **Step 11**.

   If information similar to the following is displayed, disk **vdb1** is not mounted.

2. Initialize the disk that fails to be mounted and mount it again.
3. Log in to the node for which the alarm was generated as the **root** user and run the following command to check and record the UUID of the mounted disk:

   blkid



4. Run the following command to check whether there is the UUID of the mounted disk:

   vi /etc/fstab

   – If yes, go to **Step 9.6**.

   – If no, go to **Step 9.5**.

   The command output is shown in the following figure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

5. Add the mounted disk information to the **/etc/fstab** file. You can obtain the information in any of the following ways:
   - On the node where the alarm was generated, run the following command to view historical snapshot files and check the mounting information of the offline disk:

     cat /usr/local/diskmgt/ini/fstab.*xxx*
   - Obtain mounting information from the **/etc/fstab** file on a normal node in the current cluster.
   - Contact O&M personnel.
6. Restart the faulty instance on the node for which the alarm was generated.

   Log in to Manager, choose **Hosts**, and click the name of the host for which the alarm was generated. On the **Dashboard** tab page, at the **Instances** area, click a faulty instance. On the displayed instance page, choose **More** > **Restart Instance**. Repeat the preceding operations to restart all faulty instances on the host.

Step 10 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether disk space is sufficient.

Step 11 On the FusionInsight Manager, check whether the alarm list contains **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 12**.
- If no, go to **Step 15**.

Step 12 Rectify the fault by following the steps provided in **ALM-12017 Insufficient Disk Capacity**.

Step 13 Wait for 5 minutes. In the alarm list, check whether **ALM-12017 Insufficient Disk Capacity** is cleared.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 16 According to the service name obtained in **Step 1**, select the component and **NodeAgent** from the **Service** and click **OK**.

Step 17 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 18 Contact the O&M personnel and send the collected log information.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes

Alarm Description

This alarm is generated when the active Mager does not receive the heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12010	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When the active Manager process is abnormal, the active/standby switchover cannot be performed, affecting basic O&M functions.

Possible Causes

- The link between the active and standby Manager is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The node name configuration is incorrect.
- The port is disabled by the firewall.

Handling Procedure

Check whether the network between the active and standby Manager server is normal.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row containing the alarm and view the IP address of the standby Manager (Peer Manager) server in the alarm details.

Step 2 Log in to the active management node of the cluster as user **root**.

Step 3 Run the following command to check whether the standby FusionInsight Manager server is reachable:

```
ping heartbeat IP address of the standby FusionInsight Manager server
```

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the node name is correctly configured.

Step 6 Run the following command to go to the software installation directory of the active management node:

```
cd /opt
```

Step 7 Run the following command to find the configuration file directory of the active and standby nodes.

```
find -name hacom_local.xml
```

Step 8 Run the following command to go to the **workspace** directory:

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/local/hacom/conf/
```

Step 9 Open the **hacom_local.xml** file. Check whether the local and peer nodes are correctly configured. The local node is configured as the active node, and the peer node is configured as the standby node.

```
vim hacom_local.xml
```

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Modify the configuration of the active and standby nodes in the **hacom_local.xml** file and press **Esc** to return to the command mode. Run the **:wq** command to save the modification and exit.

Step 11 Check whether the alarm is cleared automatically.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether the port is disabled by the firewall.

Step 12 Run a command to check whether the heartbeat ports of the active and standby nodes are enabled. If the command output is displayed, the ports are enabled. Otherwise, the ports are disabled by the firewall.

```
lsof -i :20012
```

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Run the following command to prevent disconnections from the server:

```
iptables -P INPUT ACCEPT
```

Step 14 Run the following command to clear the firewall:

```
iptables -F
```

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 17 Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

Step 18 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes

Alarm Description

The system checks data synchronization between the active and standby Manager nodes every 60 seconds. This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12011	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The configuration file of the standby Manager is not updated. When an active/standby switchover occurs, the configuration file that fails to be synchronized may be lost. Manager and some components may not run properly.

Possible Causes

- The link between the active and standby Managers is interrupted or The storage space of the **/srv/BigData/LocalBackup** directory is full.
- The synchronization file does not exist or the file permission is incorrect.

Handling Procedure

Check whether the network between the active Manager server and the standby Manager server is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located and obtain the standby Manager server IP address (Peer Manager IP address) in the alarm details.

Step 2 Log in to the active OMS node of the cluster as user **root**.

You can view IP addresses of the active and standby OMS nodes on the MRS management console. The IP addresses are displayed on the **Nodes** tab page of the cluster details page.

Step 3 Check whether the standby Manager server is accessible:

```
ping IP address of the standby OMS node
```

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the storage space of the /srv/BigData/LocalBackup directory is full.

Step 6 Check whether the storage space of the **/srv/BigData/LocalBackup** directory is full:

```
df -hl /srv/BigData/LocalBackup
```

The command output is displayed as follows:

```
Filesystem      Size  Used Avail Use% Mounted on
/dev/vdb1        28G  1.6G   26G   6% /srv/BigData/LocalBackup
```

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Clear unnecessary backup files:

```
rm -rf Directory to be cleared
```

The following is an example command:

```
rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443
```

Step 8 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

In the **Operation** column of the backup task to be performed, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait about 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the synchronization file exists and whether the file permission is valid.

Step 10 Run the following command to check whether the synchronization file exists.

```
find /srv/BigData/ -name "sed*"
find /opt -name "sed*"
```

If no command output is displayed, there are no synchronization files.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Run the following command to view the synchronization file information and permission obtained in **Step 10**.

```
ll Path of the file you want to search for
```

- If the size of the file is 0 and the permission column is **-**, the file is a junk file. Run the following command to delete it.

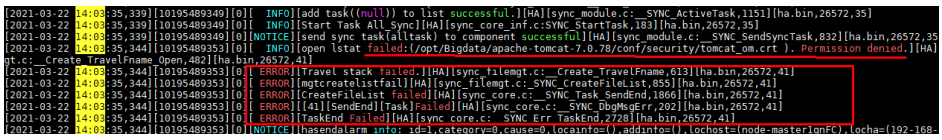
  ```
  rm -rf File to be deleted
  ```

  Wait several minutes and check whether the alarm is cleared. If the alarm persists, go to **Step 12**.
- If the file size is not 0, go to **Step 12**.

Step 12 View the log files generated when the alarm is generated.

1. Run the following command to switch to the HA run log file path.

   ```
   cd /var/log/Bigdata/omm/oms/ha/runlog/
   ```



2. Decompress and view the log files generated when the alarm is generated.

   For example, if the name of the file to be viewed is **ha.log.2021-03-22_12-00-07.gz**, run the following command:

   ```
   gunzip ha.log.2021-03-22_12-00-07.gz
   vi ha.log.2021-03-22_12-00-07
   ```

   Check whether error information is reported before and after the alarm generation time.

   For example, if the following error information is displayed, the directory permission is insufficient. In this case, change the directory permission to be the same as that on the normal node.

   - If yes, rectify the fault based on the error information and go to **Step 13**.
   - If no, go to **Step 14**.

Step 13 Wait about 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 15 Select the following nodes from the **Service** and click **OK**:

- OmmServer

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Controller
- NodeAgent

Step 16 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.8 ALM-12012 NTP Service Is Abnormal

Alarm Description

The system checks whether the NTP service on a node synchronizes time with the NTP service on the active OMS node every 60 seconds. This alarm is generated when the NTP service fails to synchronize time for two consecutive times.

This alarm is generated when the time difference between the NTP service on a node and the NTP service on the active OMS node is greater than or equal to 20s for two consecutive times. This alarm is cleared when the time difference is less than 20s.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12012	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The time on the node is inconsistent with that on other nodes in the cluster. Therefore, some FusionInsight applications on the node may not run properly. If the time difference between the node and other Kerberos service instances keeps increasing, Kerberos authentication on the node may fail and service exceptions occur.

Possible Causes

- The NTP service on the current node cannot start properly.
- The current node fails to synchronize time with the NTP service on the active OMS node.
- The key authenticated by the NTP service on the current node is inconsistent with that on the active OMS node.
- The time offset between the node and the NTP service on the active OMS node is large.

Handling Procedure

Check the NTP service mode of the node.

Step 1 Log in to the active management node as the **root** user and check the resource status of the active and standby management nodes.

Switch to user **omm**:

```
su - omm
```

Check the resource status of the active and standby management nodes.

```
sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh
```

- If "chrony" is displayed in the **ResName** column of the command output, go to **Step 2**.
- If "ntp" is displayed in the **ResName** column, go to **Step 20**.

NOTE

If both "chrony" and "ntp" are displayed in the **ResName** column of the command output, the NTP service mode is being switched. Wait for 10 minutes and go to **Step 1** again. If both "chrony" and "ntp" persist, contact O&M personnel.

Check whether the chrony service on the node is started properly.

Step 2 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the chronyd process is running on the node where the alarm is generated. Log in to the node where the alarm is generated as user **root** and run the following command to check whether the chronyd process information is displayed:

```
ps -ef | grep chronyd | grep -v grep
```

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Start the NTP service.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the current node can synchronize time properly with the chrony service on the active OMS node.

Step 6 Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

- If yes, go to **Step 7**.
- If no, go to **Step 17**.

Step 7 Check whether the synchronization with the chrony service on the active OMS node is faulty.

Log in to the node for which the alarm is generated as user **root** and run the **chronyc sources** command.

```
chronyc sources
```

In the command output, if there is an asterisk (*) before the IP address of the chrony service on the active OMS node, the synchronization is normal. The command output is as follows:

```
MS Name/IP address         Stratum Poll Reach LastRx Last sample
===============================================================================
^* 10.10.10.162              10  10   377   626    +16us[  +15us] +/-  308us
```

In the command output, if there is no asterisk (*) before the IP address of the NTP service on the active OMS node, and the value of **Reach** is **0**, the synchronization is abnormal.

```
MS Name/IP address         Stratum Poll Reach LastRx Last sample
===============================================================================
^? 10.1.1.1                  0  10     0     -     +0ns[   +0ns] +/-    0ns
```

- If yes, go to **Step 8**.
- If no, go to **Step 38**.

Step 8 The chrony synchronization failure is typically caused by the system firewall. If the firewall can be disabled, disable it. If the firewall cannot be disabled, check the firewall configuration policy and ensure that UDP ports 123 and 323 are not disabled. (For details, see the firewall configuration policy of each system.)

Step 9 Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to **Step 10**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Log in to the active OMS node as user **root** and run the following command to view the authentication code whose key index is **1M**:

```
cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys
```

Step 11 Run the following command to check whether the key is the same as that queried in **Step 10**:

```
diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys /etc/chrony.keys
```

If the keys are the same, no result is returned after the command is executed. For example:

```
host01:~ # cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys
1 M sdYbq;o^CzEAWo<U=Tw5
host01:~ # diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys /etc/chrony.keys
host01:~ #
```

- If yes, go to **Step 12**.
- If no, go to **Step 38**.

Step 12 Run the following command to check whether the key is the same as that queried in **Step 10**: (Compare the key with that of the authentication key index **1M** queried in **Step 10**.)

```
cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile
```

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Log in to the faulty node as user **root** and run the **cat /etc/chrony.keys** command to check whether the key value is the same as that queried in **Step 12** (compare it with that of the authentication key index **1M**).

```
cat /etc/chrony.keys
```

- If yes, go to **Step 38**.
- If no, go to **Step 14**.

Step 14 Switch to user **omm**, change the key value of the authentication key index **1M** in **${NODE_AGENT_HOME}/chrony.keys** to the key value of **ntpKeyFile** in **Step 12**, and go to **Step 16**.

```
su - omm
vi ${NODE_AGENT_HOME}/chrony.keys
```

Step 15 Run the following commands as user **root** or **omm** to change the NTP key of the active OMS node (change **ntp.keys** to **ntpkeys** in Red Hat Enterprise Linux):

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace/conf
sed -i "`cat chrony.keys | grep -n '1 M'|awk -F ':' '{print $1}'`d" chrony.keys
echo "1 M `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile`" >> chrony.keys
```

Check whether the key value of the authentication key index **1M** in **chrony.keys** is the same as that of **ntpKeyFile**.

- If yes, go to **Step 16**.
- If no, change the key of the authentication key index **1M** in **chrony.keys** to the key of **ntpKeyFile** and go to **Step 16**.

Step 16 After 5 minutes, restart the chrony service on the active OMS node. After 15 minutes, check whether the alarm is cleared.

```
systemctl restart chronyd
```

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 38**.

Check whether the time deviation between the node and the chrony service on the active OMS node is large.

Step 17 Check whether the time deviation is large in additional information of the alarm.

- If yes, go to **Step 18**.
- If no, go to **Step 38**.

Step 18 On the **Hosts** tab page, select the host for which the alarm is generated, and choose **More** > **Stop All Instances** to stop all the services on the node.

If the time on the alarm node is later than that on the chrony service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More** > **Start All Instances** to start the services on the node.

If the time on the alarm node is earlier than that on the chrony service of the active OMS node, wait until the time deviation is due and adjust the time of the alarm node. After adjusting the time, choose **More** > **Start All Instances** to start the services on the node.

NOTE

If you do not wait, data loss may occur.

Step 19 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 38**.

Check whether the NTP service on the node is started properly.

Step 20 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**.

Step 21 Check whether the ntpd process is running on the node using the following method. Log in to the node where the alarm is generated as user **root**. Run the following command to check whether the ntpd process information is displayed:

```
ps -ef | grep ntpd | grep -v grep
```

- If yes, go to **Step 24**.
- If no, go to **Step 22**.

Step 22 Start the NTP service:

```
service ntp start
```

For Red Hat operating systems, run the **service ntpd start** command.

Step 23 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Check whether the node can synchronize time properly with the NTP service on the active OMS node.

Step 24 Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 25**.
- If no, go to **Step 35**.

Step 25 Check whether the synchronization with the NTP service on the active OMS node is faulty.

Log in to the alarm node as user **root** and run the **ntpq -np** command.

```
ntpq -np
```

If an asterisk (*) exists before the IP address of the NTP service on the active OMS node in the command output, the synchronization is in normal state. The command output is as follows:

```
remote refid st t when poll reach delay offset jitter
==============================================================================
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

If there is no asterisk (*) before the IP address of the NTP service on the active OMS node, as shown in the following command output, and the value of **refid** is **.INIT.**, the synchronization is abnormal.

```
remote refid st t when poll reach delay offset jitter
==============================================================================
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

- If yes, go to **Step 26**.
- If no, go to **Step 38**.

Step 26 The NTP synchronization failure is typically caused by the system firewall. If the firewall can be disabled, run the **iptables -F** command to disable it. If the firewall cannot be disabled, run the **iptables -L** command to check the firewall configuration policy and ensure that the UDP port 123 is not disabled. (For details, see the firewall configuration policy of each system.)

```
iptables -F
```

Step 27 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 28**.

Step 28 Log in to the active OMS node as user **root** and run the following command to view the authentication key index **1M**:

```
cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntpkeys
```

Step 29 Run the following command to check whether the key is the same as that queried in **Step 28**:

```
diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntpkeys /etc/ntp/ntpkeys
```

If the keys are the same, no result is returned after the command is executed. For example:

```
host01:~ # cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys
1 M sdYbq;o^CzEAWo<U=Tw5
host01:~ # diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys /etc/ntp.keys
host01:~ #
```

- If yes, go to **Step 30**.
- If no, go to **Step 38**.

Step 30 Check whether the key value is the same as that queried in **Step 28**: (Compare the key with that of the authentication key index **1M** queried in **Step 28**.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile
```

- If yes, go to **Step 31**.
- If no, go to **Step 33**.

Step 31 Log in to the faulty node as user **root**. Check whether the key value is the same as that queried in **Step 30** (compare it with that of the authentication key index **1M**).

```
cat /etc/ntp/ntpkeys
```

- If yes, go to **Step 38**.
- If no, go to **Step 32**.

Step 32 Switch to user **omm**, change the key value of the authentication key index **1M** in **${NODE_AGENT_HOME}/ntp.keys** (**${NODE_AGENT_HOME}/ntpkeys** in Red Hat Enterprise Linux) to the key value of **ntpKeyFile** in **Step 30**, and go to **Step 34**.

```
su - omm
```

Step 33 Run the following commands as user **root** or **omm** to change the NTP key of the active OMS node (change **ntp.keys** to **ntpkeys** in Red Hat Enterprise Linux):

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace/conf
sed -i "`cat ntp.keys | grep -n '1 M'|awk -F ':' '{print $1}'`d" ntp.keys
echo "1 M `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile`" >>ntp.keys
```

Check whether the key value of the authentication key index **1M** in **ntp.keys** is the same as that of **ntpKeyFile**.

- If yes, go to **Step 34**.
- If no, change the key of the authentication key index **1M** in **ntp.keys** to the key of **ntpKeyFile** and go to **Step 34**.

Step 34 After 5 minutes, restart the NTP service on the active OMS node. After 15 minutes, check whether the alarm is cleared.

```
service ntp restart
```

- If yes, no further action is required.
- If no, go to **Step 38**.

Check whether the time deviation between the node and the NTP service on the active OMS node is large.

Step 35 Check whether the time deviation is large in additional information of the alarm.

- If yes, go to **Step 36**.
- If no, go to **Step 38**.

Step 36 On the **Hosts** tab page, select the host for which the alarm is generated, and choose **More** > **Stop All Instances** to stop all the services on the node.

If the time on the alarm node is later than that on the NTP service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More** > **Start All Instances** to start the services on the node.

If the time on the alarm node is earlier than that on the NTP service of the active OMS node, wait until the time deviation is due and adjust the time of the alarm node. After adjusting the time, choose **More** > **Start All Instances** to start the services on the node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If you do not wait, data loss may occur.

Step 37 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 38**.

Collect fault information.

Step 38 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 39 Expand the **Service** drop-down list, select **NodeAgent** and **OmmServer** for the target cluster, and click **OK**. Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 40 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 41 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.9 ALM-12014 Partition Lost

Alarm Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Clear
12014	Major	• Yes: MRS 3.3.0 and later versions • No: Versions earlier than MRS 3.3.0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

- Data loss: The device partition is lost and the data stored in the partition is lost.
- System breakdown: If the system disk is lost, the system deployed on the node cannot run properly. In some cases, the system may break down and cannot be started.
- Service failure: Read and write jobs on the lost device partition fail to run or run slowly.
- Service interruption: Customers may need time to restore data and systems, and services cannot be provided.
- Security risk: Important data may be stolen or disclosed, which severely affects customer services.

Possible Causes

- The hard disk is removed.
- The hard disk is offline, or a bad sector exists on the hard disk.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and click ⌄ in the row where the alarm is located.

Step 2 Obtain **HostName**, **PartitionName** and **DirName** from **Location**.

Step 3 Check whether the disk of **PartitionName** on **HostName** is inserted to the correct server slot.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Contact hardware engineers to remove the faulty disk.

Step 5 Log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file as user **root**.

```
cat /etc/fstab
```

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Edit the file and delete the line containing **DirName**:

```
vi /etc/fstab
```

Step 7 Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.

Step 8 Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.

- If yes, go to **Step 9** for MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions. For clusters earlier than MRS 3.3.0, manually clear the alarm. No further action is required.
- If no, go to **Step 10**.

Step 9 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 11 Select the **OmmServer** from the Services drop-down list and click **OK**.

Step 12 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions: After the fault is rectified, the system automatically clears this alarm.

Versions earlier than MRS 3.3.0: After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

9.11.10 ALM-12015 Partition Filesystem Readonly

Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

Attribute

Alarm ID	Alarm Severity	Auto Clear
12015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

- Service failure: If a job needs to modify the data on the read-only device partition, the job may fail to run.
- Latency: If some components need to synchronize data to the read-only device partition, data synchronization may fail or time out, causing service delay.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The hard disk is faulty, for example, a bad sector exists.

Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and click ⌄ in the row that contains the alarm.

Step 2 Obtain **HostName** and **PartitionName** from **Location**. **HostName** is the node where the alarm is reported, and **PartitionName** is the partition of the faulty disk.

Step 3 Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.

Step 4 After the disk is removed, the system reports ALM-12014 Partition Lost. Handle the alarm by following the instructions in **ALM-12014 Partition Lost**. After the handling, the alarm is automatically cleared.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.11 ALM-12016 CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage every 30 seconds and compares the actual CPU usage with the threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is 1 and the CPU usage is smaller than or equal to the threshold; the value of **Trigger Count** is greater than 1 and the CPU usage is smaller than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12016	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- Latency: If the CPU usage of a host is too high, service processes may run slowly and services may be delayed.
- Service failure: If the host CPU usage is too high, service processing may slow down, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm smoothing times are incorrect.
- CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit. Or the service is in peak hours. As a result, the CPU usage reaches the upper limit in a short period of time.

Handling Procedure

Check whether the alarm threshold or alarm Trigger Count are correct.

Step 1 Change the alarm threshold and alarm **Trigger Count** based on CPU usage.

On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Host** > **CPU** > **Host CPU Usage** and change the alarm smoothing times based on CPU usage.

Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.

On **Host CPU Usage** page and click **Modify** in the **Operation** column to change the alarm threshold.

Step 2 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the CPU usage reaches the upper limit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 4 On the **Hosts** page, click the node on which the alarm is reported.

Step 5 Observe the real-time data of the host CPU usage for about 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the MRS cluster administrator to increase the CPU specifications.

Step 6 Check whether the current traffic is in peak hours. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the CPU specifications.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **OmmServer**, and click **OK**.

Step 10 Click ✎ in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.12 ALM-12017 Insufficient Disk Capacity

Alarm Description

The system checks the host disk usage of the system every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold, this alarm is generated when the host disk usage exceeds the specified threshold.

When the **Trigger Count** is 1, this alarm is cleared when the usage of a host disk partition is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the usage of a host disk partition is less than or equal to 90% of the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12017	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If you need to modify or use data on the disk when the disk capacity is insufficient, the job may fail.

Possible Causes

- The alarm threshold is incorrect.
- The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Handling Procedure

Check whether the threshold is set properly.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Host** > **Disk** > **Disk Usage** and check whether the threshold (configurable, 90% by default) is appropriate.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Locate the target threshold rule and click **Modify** in the **Operation** column to change the alarm threshold based on the current disk usage.

Step 3 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the disk usage reaches the upper limit.

Step 4 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host name and disk partition information in the alarm details.

Step 5 Log in to the node for which the alarm is generated as user **root**.

Step 6 Check the system disk partition usage. Check whether the disk is mounted to the following directories based on the disk partition name obtained in **Step 4**: **/**, **/opt**, **/tmp**, **/var**, **/var/log**, and **/srv/BigData** (can be customized).

```
df -lmPT |  awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1
```

- If yes, the disk is a system disk. Then go to **Step 10**.
- If no, the disk is not a system disk. Then go to **Step 7**.

Step 7 Check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in **Step 4**.

```
df -lmPT |  awk '$2 != "iso9660"' | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1
```

Step 8 Check whether the service that the disk belongs to is HDFS, Yarn, Kafka, Supervisor, or other services that require disk storage.

- If yes, expand the cluster capacity by referring to **Scaling Out an MRS Cluster** and go to **Step 9**.
- If no, go to **Step 12**.

Step 9 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 10 Check whether there is a file larger than 500 MB on the node: Check whether a large file that is written into the disk by mistake:

```
find / -xdev -size +500M -exec ls -l {} \;
```

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Handle the large file and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 Contact the system administrator to expand the disk capacity.

Step 13 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 15 Select **OMS** from the **Service** and click **OK**.

Step 16 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 17 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.13 ALM-12018 Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the system every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold. This alarm is generated when the memory usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the host memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12018	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- Latency: If the host memory usage is too high, service processes may run slowly and services may be delayed.
- Service failure: If the host memory usage is too high, memory overflow may occur in service processes and jobs may fail.

Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper limit.

Handling Procedure

Expand the system.

Step 1 Log in to FusionInsight Manager. In the alarm list, locate the alarm and click ⌄ to view the alarm host address.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 If the memory usage exceeds the preset threshold, increase the memory of the cluster.

Step 4 Check the system memory usage:

```
free -m | grep Mem\: | awk '{printf("%s,", $3 * 100 / $2)}'
```

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OmmServer** from the **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.14 ALM-12027 Host PID Usage Exceeds the Threshold

Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default PID usage threshold. This alarm is generated when the system detects that the PID usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the PID usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the PID usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12027	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Service failure: If the PID usage of the host is too high, PIDs cannot be allocated to new service processes. As a result, jobs may fail to be executed.

Possible Causes

Too many processes are running on the node. You need to increase the value of **pid_max**.

Procedure

Increase the value of pid_max.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located to view the alarm host address in the alarm details.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **cat /proc/sys/kernel/pid_max** command to check the value of **pid_max**.

Step 4 If the PID usage exceeds the threshold, edit the **/etc/sysctl.conf** file and increase the value of **kernel.pid_max** to twice of the value of **pid_max** queried in **Step 3**. If this parameter does not exist, add it to the end of the file.

For example, change the parameter to **kernel.pid_max=65536** and run the following command to make the parameter take effect immediately:

sysctl -p

NOTE

The maximum value of **kernel.pid_max** is as follows:

- On 32-bit systems: 32768
- On 64-bit systems: 4194304 (2^22)

Step 5 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select all services from the **Service** and click **OK**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.15 ALM-12028 Number of Processes in the D State and Z State on a Host Exceeds the Threshold

Alarm Description

The system checks the number of processes in the D state and Z state of user **omm** on the host every 30 seconds and compares the actual number with the threshold. The number of processes in the D state and Z state on the host has a default threshold range. This alarm is generated when the number of processes exceeds the threshold.

This alarm is cleared when **Trigger Count** is **1** and the total number of processes in the D state and Z state of user **omm** on the host does not exceed the threshold. This alarm is cleared when **Trigger Count** is greater than **1** and the total number of processes in the D state and Z state of user **omm** on the host is less than or equal to 90% of the threshold.

NOTE

The function of checking the number of processes in the Z state on the host applies to MRS 3.2.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12028	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

- Latency: New service processes cannot be created. Concurrent task processing may be slow and services may be delayed.
- Service failure: New service processes cannot be created, which may cause job failures.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state.

Handling Procedure

Check the processes in the D state and Z state.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Switch to user **omm**:

```
su - omm
```

Step 3 Run the following command as user **omm** to view the PID of the process that is in the D state and Z state:

```
ps -elf | grep -v "\[thread_checkio\]" | awk 'NR!=1 {print $2, $3, $4}' | grep omm | awk -F' ' '{print $1, $3}' | grep -E "Z|D" | awk '{print $2}'
```

Step 4 Check whether the command output is empty.

- If yes, the service process is running properly. Then go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Switch to user **root** and restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

```
reboot
```

Step 6 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Select **OMS** for **Service** and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.16 ALM-12033 Slow Disk Fault

Alarm Description

For MRS 3.3.0 and its later versions:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 20 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when neither of the preceding conditions is met for three consecutive detection periods (30 or 300 seconds).

For versions earlier than MRS 3.3.0:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - The system runs the **iostat** command every 3 seconds by default, and detects that the **svctm** value exceeds 1000 ms in at least seven consecutive periods within 30 seconds.
  - The system runs the **iostat** command every 3 seconds, and detects that more than 50% of I/Os take more than 150 ms within 300s.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - The system runs the **iostat** command every 3 seconds by default, and detects that the **svctm** value exceeds 1000 ms for at least 10 periods within 30 seconds.
  - The system runs the **iostat** command every 3 seconds by default, and detects that more than 60% of I/Os take more than 20 ms within 300s.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is automatically cleared when the preceding conditions have not been met for 15 minutes.

NOTE

For details about how to obtain the **svctm** value, see **Related Information**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12033	• Minor: MRS 3.3.0 and its later versions • Major: versions earlier than MRS 3.3.0	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
DiskName	Specifies the disk for which the alarm was generated.

Impact on the System

- The system I/O performance deteriorates, which means slow response and low throughput. For example, job submission is slow, page responds slowly, interface response times out, and the system is in error or even crash.
- System fault: Customer services may be interrupted. The system may break down and the key information stored on the faulty disk may be lost.

Possible Causes

The disk is aged or has bad sectors.

Handling Procedure

Check the disk status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

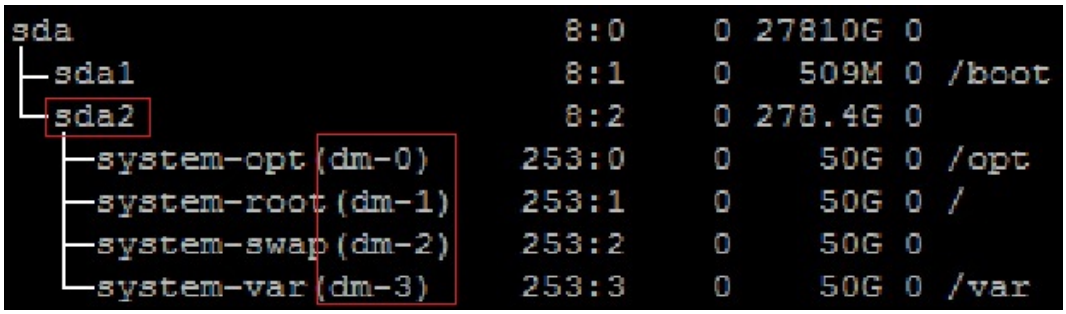
Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is generated.

Step 3 Check whether the node for which the alarm is generated is in a virtualization environment.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then, go to **Step 5**.



Step 5 Log in to the node where the alarm is generated as user **root**. Check whether the command output contains the value of the **DiskName** field.

```
df -h
```

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Check whether the mapping between the value of **DiskName** and the disk has been created.

```
lsblk
```

- If yes, go to **Step 7**.
- If no, go to **Step 22**.

Step 7 Log in to the node where the alarm is generated as user **root**. View the disk information and check whether RAID has been set up.

```
lsscsi | grep "/dev/sd[x]"
```

NOTE

In the command, **/dev/sd[x]** indicates the disk name obtained in **Step 2**.

Example:

```
lsscsi | grep "/dev/sda"
```

In the command output, if **ATA**, **SATA**, or **SAS** is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, RAID has been set up.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports the SMART tool.

Example:

```
smartctl -i /dev/sda
```

In the command output, if "SMART support is: Enabled" is displayed, the hardware supports SMART. If "Device does not support SMART" or other information is displayed, the hardware does not support SMART.

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Step 9 Run the **smartctl -H --all /dev/sd[x]** command to check basic SMART information and determine whether the disk is working properly.

Example:

```
smartctl -H --all /dev/sda
```

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 10**.
- If no, go to **Step 18**.

Step 10 Run the **smartctl -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is normal.

Example:

```
smartctl -l error -H /dev/sda
```

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to **Step 11**.
- If no, go to **Step 18**.

Step 11 Run the **smartctl -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 9** and **Step 10** to check whether the disk is working properly.

Example:

```
smartctl -t long /dev/sda
```

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command to check whether the hardware supports SMART.

NOTE

- In the command, **[sat|scsi]** indicates the disk type. Both types need to be used.
- **[DID]** indicates the slot information. Slots 0 to 15 need to be used.

For example, run the following commands in sequence:

```
smartctl -d sat+megaraid,0 -H --all /dev/sda
smartctl -d sat+megaraid,1 -H --all /dev/sda
smartctl -d sat+megaraid,2 -H --all /dev/sda
...
```

Try the command combinations of different disk types and slot information. If "SMART support is: Enabled" is displayed in the command output, the disk supports SMART. Record the parameters of the disk type and slot information when a command is successfully executed. If "SMART support is: Enabled" is not displayed in the command output, the disk does not support SMART.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command recorded in **Step 12** to check basic SMART information and determine whether the disk is normal.

Example:

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 14**.
- If no, go to **Step 18**.

Step 14 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the hard disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -l error -H /dev/sda
```

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 15 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 13** and **Step 14** to check whether the disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -t long /dev/sda
```

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 16 If the configured RAID controller card does not support SMART, the disk does not support SMART. In this case, use the check tool provided by the corresponding RAID controller card vendor to rectify the fault. Then go to **Step 17**.

For example, LSI is a MegaCLI tool.

Step 17 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click **Clear** in the **Operation** column of the alarm, and check whether the alarm is reported on the same disk again.

If the alarm is reported for three times, replace the disk.

- If yes, go to **Step 18**.
- If no, no further action is required.

Replace the disk.

Step 18 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 19 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 20 Replace the disk.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 22**.

Collect the fault information.

Step 22 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 23 Select **OMS** for **Service** and click **OK**.

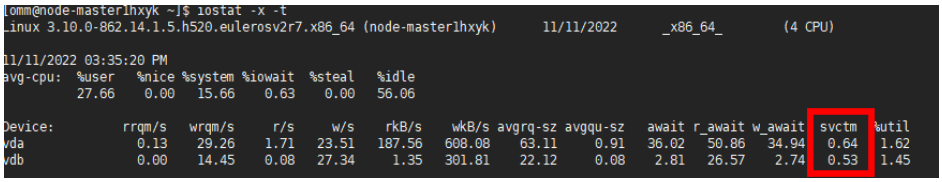
Step 24 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 25 Contact O&M personnel and provide the collected logs.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance



This alarm is automatically cleared after the fault is rectified.

Related Information

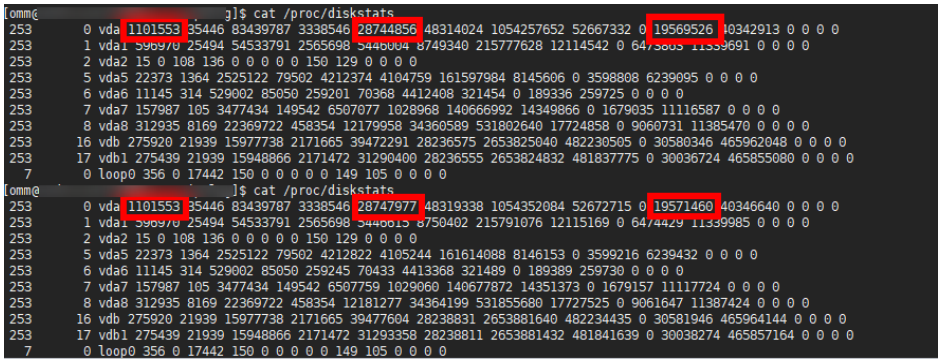
The **svctm** value can be obtained as follows:

- MRS 3.1.0:

  Run the **iostat -x -t** command in the OS.

- Versions later than MRS 3.1.0:

  svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)



- Versions earlier than MRS 3.3.0: If **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.
- MRS 3.3.0 and its later versions:

  When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

  When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters can be obtained as follows:

The system runs the **cat /proc/diskstats** command every 3 seconds to collect data. For example:

In the two commands:

In the data collected for the first time, the number in the fourth column is the **rd_ios_old** value, the number in the eighth column is the **wr_ios_old** value, and the number in the thirteenth column is the **tot_ticks_old** value.

In the data collected for the second time, the number in the fourth column is the **rd_ios_new** value, the number in the eighth column is the **wr_ios_new** value, and the number in the thirteenth column is the **tot_ticks_new** value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In this case, the value of **svctm** is as follows:

(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197

9.11.17 ALM-12034 Periodical Backup Failure

Description

The system executes the periodic backup task every 60 minutes. This alarm is generated when a periodical backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12034	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task.

Impact on the System

The periodic backup task failed, resulting in no available backup packages during the time period when the backup failed. When a system exception occurs and you need to use the backup package to restore data, no backup package is available during the failure period. As a result, data during the failure period cannot be restored.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check whether the disk space is sufficient.

Step 1 In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click ⌄ in the row where the alarm is located and obtain **TaskName** from **Location**.

Step 3 Log in to the active node of the cluster as the **root** user and check the backup and restoration logs in **/var/log/Bigdata/controller/backup/**.

```
cd /var/log/Bigdata/controller/backup/
```

Run the **ll** command to view the log name. The following is an example of the command output:

```
[root@xxx backup]#ll
total 4476
-rw------- 1 omm wheel    4205 Jun 10 14:14 backupplugin_ctl.log
-rw------- 1 omm wheel  158640 Jun 11 00:02 backupplugin.log
-rw------- 1 omm wheel 4405518 Jun 11 10:28 controller_backup.log
```

Run the following command to check the backup and restoration logs:

```
vi Log file name
```

Check whether the log file contains information similar to the following:

```
Upload backup files to *** file failed, error info: ***
```

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On FusionInsight Manager, choose **O&M** > **Backup and Restoration > Backup Management**. Locate the backup task based on **TaskName**, click **Configure** in the **Operation** column, and check whether all configuration items are correctly configured.

- If yes, go to **Step 7**.
- If no, modify the configuration, save the modification, and go to **Step 5**.

Step 5 Choose **More > Back Up Now** to start the backup task and check whether the backup task is successfully executed.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 Choose **More > View History** in the **Operation** column. In the displayed dialog box view the task details.

Step 8 In the displayed dialog box and click ⌄ to check whether the following message is displayed: **Failed to backup xx due to insufficient disk space, move the data in the /srv/BigData/LocalBackup directory to other directories**.

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Choose **Backup Path** > **View** and obtain the **Backup Path**.

Step 10 Log in to the node as user **root** and run the following command to view the node mounting details.

```
df -h
```

Step 11 Check whether the available space of the node to which the backup path is mounted is less than 20 GB.

- If yes, go to **Step 12**.
- If no, go to **Step 16**.

Step 12 Check whether there are many backup packages in the backup directory.

- If yes, go to **Step 13**.
- If no, go to **Step 16**.

Step 13 Remove the backup package from the backup directory or delete the backup package to ensure that the available space of the node to which the backup directory is mounted is greater than 20 GB.

Step 14 After the problem is resolved, perform the backup task again and check whether the backup task execution is successful.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 17 Select **Controller** from the **Service** and click **OK**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.18 ALM-12035 Unknown Data Status After Recovery Task Failure

Description

After the recovery task fails, the system automatically rolls back every 60 minutes. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the next recovery task execution is successful.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12035	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task.

Impact on the System

After the recovery task fails, the system automatically rolls back. If the rollback fails, data may be lost or the data status may be unknown, which may affect services.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Collect fault information.

Step 1 In the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the running status of the component meets the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

requirements. (The OMS and DBService must be in the normal state, and other components must be stopped.)

- If yes, go to **Step 9**.
- If no, go to **Step 2**.

Step 2 Restore the component status as required and start the recovery task again.

Step 3 Log in to the FusionInsight Manager portal and click **O&M > Alarm > Alarms**.

Step 4 In the alarm list, click ⌄ in the row where the alarm is located to obtain **TaskName** from **Location**.

Step 5 Choose **O&M** > **Backup and Restoration > Restoration Management**.

Step 6 Find the restoration task by **Task Name** and view the task details.

Step 7 Perform the recovery task again and check whether the recovery task execution is successful.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Controller** from the **Service** and click **OK**.

Step 11 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.19 ALM-12037 NTP Server Abnormal

Description

The system checks the NTP server status every 60 seconds. This alarm is generated when the system detects that the NTP server is abnormal for 10 consecutive times.

This alarm is cleared when the NTP server recovers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12037	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the IP address of the NTP server for which the alarm is generated.

Impact on the System

- The NTP server configured on the active OMS node is abnormal. In this case, the active OMS node cannot synchronize time with the NTP server and a time offset may be generated in the cluster.
- If the time difference exceeds 5 minutes, the client outside the cluster fails to authenticate the client inside the cluster. As a result, the job may fail to run.

Possible Causes

- The NTP server network is abnormal.
- The NTP server authentication fails.
- The NTP server time cannot be obtained.
- The time obtained from the NTP server is not continuously updated.

Procedure

Check the NTP server network.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and click ⌄ in the row where the alarm is located.

Step 2 View the alarm additional information to check whether the NTP server fails to be pinged.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Contact the network administrator to check the network configuration and ensure that the network between the NTP server and the active OMS node is normal. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the NTP server authentication fails.

Step 4 Log in to the active OMS node as user **root**.

Step 5 Run the following command to check the status of the resources on the active and standby nodes:

su - omm

sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh

- If "chrony" is displayed in the **ResName** column of the command output, go to **Step 6**.
- If "ntp" is displayed in the **ResName** column, go to **Step 7**.

NOTE

If both "chrony" and "ntp" are displayed in the **ResName** column of the command output, the NTP service mode is being switched. Wait for 10 minutes and perform **Step 5** again. If both "chrony" and "ntp" still exist in the **ResName** column, contact O&M personnel.

Step 6 Run the command **chronyc sources** to check whether the NTP server authentication fails.

If the value of **Reach** for chrony is **0**, the connection or authentication fails.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Step 7 Run the command **ntpq -np** to check whether the NTP server authentication fails.

If **refid** of the NTP server is **.AUTH.**, the authentication fails.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Check whether the time can be obtained from the NTP server.

Step 8 View the alarm additional information to check whether the time can be obtained from the NTP server.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is normal, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the time obtained from the NTP server is not continuously updated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 View the alarm additional information to check whether the time obtained from the NTP server is not continuously updated.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is normal, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 13 Select **NodeAgent** and **OmmServer** from the **Service** and click **OK**.

Step 14 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.20 ALM-12038 Monitoring Indicator Dumping Failure

Description

After monitoring indicator dumping is configured on FusionInsight Manager, the system checks the monitoring indicator dumping result at the dumping interval (60 seconds by default). This alarm is generated when the dumping fails.

This alarm is cleared when dumping is successful.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12038	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The upper-layer management system cannot obtain monitoring indicators from the FusionInsight Manager system.

Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

Procedure

Check whether the server connection is normal.

Step 1 Check whether the network between the FusionInsight Manager system and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to recover the network and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Choose **System** > **Interconnection** > **Upload Performance Data** and check whether the FTP username, password, port, dump mode, and public key configured on the upload performance data page are consistent with the configuration on the server.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Enter the correct configuration information, click **OK**, and check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Check the permission of the save path on the server is correct.

Step 5 Choose **System** > **Interconnection > Upload Performance Data** and check the configuration items **FTP Username**, **Save Path**, and **Dump Mode**.

- If the dump mode is FTP, go to **Step 6**.
- If the dump mode is SFTP, go to **Step 7**.

Step 6 Log in to the server in FTP mode. In the default path, check whether **FTP Username** has the read and write permission of the relative path **Save Path**.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 7 Log in to the server in SFTP mode and check whether **FTP Username** has the read and write permission of the absolute path **Save Path**.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Add the read and write permission and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the save path on the server has sufficient disk space.

Step 9 Log in to the server and check whether the save path has sufficient disk space.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Then, check whether the save path has sufficient disk space.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select **OMS** from the **Service** and click **OK**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Related Information

None

9.11.21 ALM-12039 Active/Standby OMS Databases Not Synchronized

Description

The system checks the data synchronization status between the active and standby OMS Databases every 10 seconds. This alarm is generated when the synchronization status cannot be queried for 30 consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12039	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Data on the active database cannot be synchronized to the standby database. If the active instance is abnormal during the alarm reporting period, service data may be lost or data on the FusionInsight Manager may be abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby OMS Database is abnormal.
- The standby node disk space is full.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 Log in to FusionInsight Manager, click **O&M > Alarm > Alarms**, click ⌄ in the row where the alarm is located, and query the standby OMS Database IP address.

Step 2 Log in to the active OMS Database node as user **root**.

Step 3 Run the **ping** *Standby OMS Database heartbeat IP address* command to check whether the standby OMS Database node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby OMS database is normal.

Step 6 Log in to the standby OMS Database node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory and run the **./status-oms.sh** command to check whether the standby OMS database resource status is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the standby node disk space is full.(Skip this check for versions later than MRS 3.1.2.)

Step 9 Log in to the standby OMS Database node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **echo ${BIGDATA_DATA_HOME}/dbdata_om** command to obtain the OMS Database data directory.

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the disk where the OMS Database data directory is mounted is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 Select **OMMServer** from the **Service** and click **OK**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.22 ALM-12040 Insufficient System Entropy

Alarm Description

MRS 3.2.0 or later:

The system checks whether the rng-tools or haveged tool has been enabled and correctly configured every 5 minutes. If neither tool is configured, this alarm is generated. If either is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is generated.

This alarm is cleared when rng-tools or haveged has been installed and enabled on the target node and the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

MRS 3.1.2 or earlier:

The system checks the entropy for five consecutive times at 00:00 every day. Specifically, the system checks whether rng-tools or haveged has been enabled and correctly configured. If neither is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is reported.

This alarm is cleared when the system detects that the true random number mode has been configured, the random number parameters have been configured in the pseudo-random number mode, or neither mode is configured but the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12040	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The execution of encryption and decryption commands on the node may be slow. As a result, the service processing performance of each instance deteriorates, and even service processes cannot run.

Possible Causes

- rng-tools or haveged has not been installed or started.
- The entropy of the OS is smaller than 100 for multiple consecutive times.

Handling Procedure

Check whether haveged or rng-tools has been installed or started.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 Check the value of **HostName** in the **Location** area to obtain the name of the host for which the alarm is generated.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 Run the following command to check the haveged installation status and check whether the command output is empty:

```
/bin/rpm -qa | grep -w "haveged"
```

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Check the command output:

```
/sbin/service haveged status |grep "running"
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the command is executed successfully, haveged has been installed and configured correctly and is running properly. Go to **Step 8**.
- If the command fails to execute, haveged is not running properly. Run the following command to manually restart haveged and go to **Step 9**:
  ```
  systemctl restart haveged.service
  ```

Step 6 Run the following command to check the rng-tools installation status and check whether the command output is empty:

```
/bin/rpm -qa | grep -w "rng-tools"
```

- If yes, contact the OS vendor to install and start haveged or rng-tools. Then go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Check the command output:

```
ps -ef | grep -v "grep" | grep rngd  | tr -d " " | grep "\-r/dev/urandom"
```

- If the command is executed successfully, rngd has been installed and configured correctly and is running properly. Go to **Step 8**.
- If the command fails to execute, rngd is not running properly. Run the following command to manually restart rngd and go to **Step 9**:
  ```
  systemctl restart rngd.service
  ```

Check the entropy of the OS.

Step 8 Manually check the entropy of the OS.

Log in to the target node as user **root** and check whether the entropy of the OS meets cluster installation requirements (no less than 100).

```
cat /proc/sys/kernel/random/entropy_avail
```

- If yes, the entropy of the OS is not less than 100. Go to **Step 9**.
- If no, the entropy of the OS is less than 100. Use either of the following methods and go to **Step 9**.
  - Method 1: Use haveged (true random number mode). Contact the OS vendor to install and start haveged.
  - Method 2: Use rng-tools (pseudo-random number mode). Contact the OS vendor to install and start rng-tools and configure it based on the OS type.

Step 9 Wait till the system checks the entropy again. Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **NodeAgent** for **Service** and click **OK**.

Step 12 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.23 ALM-12041 Incorrect Permission on Key Files

Alarm Description

The system checks whether the permission, user, and user group information about critical directories or files is normal every 5 minutes. This alarm is generated when the information is abnormal.

This alarm is cleared when the information becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12041	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
PathName	Specifies the path or name of the abnormal file.

Impact on the System

System functions are unavailable.

- If the permission of key files **okerberos** and **oldap** is abnormal, the authentication fails and the job may fail to run.
- If the permission of key files **controller** and **pms** is abnormal, the process becomes faulty, which may affect the elastic scaling performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the permission on key Tomcat files is abnormal, the login and viewing functions of FusionInsight Manager are affected.

Possible Causes

The file permission is abnormal or the file is lost due to a user manually modified information such as the file permission, user, and user group, or the system is powered off unexpectedly.

Handling Procedure

Check whether the abnormal file exists and whether the permission on the abnormal file is correct.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

Step 2 Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 Run the following command to check the current user, permissions, and user group information of the file or directory on the host:

```
ll Path name
```

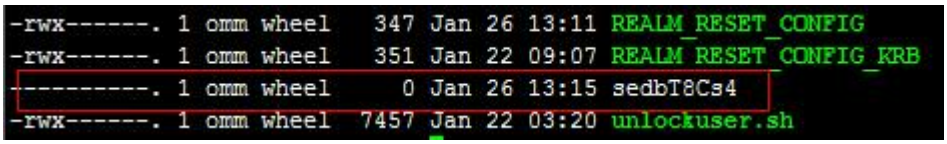
The path name is the abnormal file path obtained in **Step 2**.

Step 5 Go to **${BIGDATA_HOME}/om-agent/nodeagent/etc/agent/autocheck** directory. Then search for the name of the abnormal file and check the due permissions on the file.

```
cd ${BIGDATA_HOME}/om-agent/nodeagent/etc/agent/autocheck
vi keyfile
```

NOTE

To ensure proper configuration synchronization between the active and standby OMS servers, files, directories, and files and sub-directories in the directories configured in **$OMS_RUN_PATH/workspace/ha/module/hasync/plugin/conf/filesync.xml** will also be monitored except files and directories in **keyfile**. User **omm** must have read and write permissions of files and read and execute permissions of directories.



Step 6 Compare the real-world permission of the file with the due permission obtained in **Step 5** and correct the permission, user, and user group information for the file.

Step 7 Wait an hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

If the disk partition where the cluster installation directory resides is used up, some temporary files will be generated in the program installation directory when running the **sed** command fails. Users do not have the read, write, and execute permissions of these temporary files. The system reports an alarm indicating that permissions of temporary files are abnormal if these files are within the monitoring range of the alarm. Perform the preceding alarm handling processes to clear the alarm. Alternatively, you can directly delete the temporary files after confirming that the files with abnormal permissions are temporary. The following is an example temporary file generated after a **sed** command execution failure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Expand the **Service** drop-down list, select **NodeAgent**, and click **OK**.

Step 10 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.24 ALM-12042 Incorrect Configuration of Key Files

Description

The system checks whether critical configurations are correct every 5 minutes. This alarm is generated when the configurations are abnormal.

This alarm is cleared when the configurations become normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12042	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
PathName	Specifies the path or name of the abnormal file.

Impact on the System

Functions related to the file are abnormal.

- If the configuration of key files **okerberos** and **oldap** is abnormal, the authentication fails and the job may fail to run.
- If the permission on the controller and pms key files is abnormal, the process may be faulty, which may affect the elastic scaling performance.
- If the permission on key Tomcat files is abnormal, the login and viewing functions of FusionInsight Manager are affected.

Possible Causes

The file configuration is modified manually or the system is powered off unexpectedly.

Procedure

Check abnormal file configuration.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

Step 2 Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

Step 3 Log in to the node for which the alarm is generated as user **root**.

Step 4 View the $BIGDATA_LOG_HOME/nodeagent/scriptlog/checkfileconfig.log file and analyze the cause based on the error log. Locate the check standards of the file in the **Related Information** and manually check and modify the file based on the standards.

Run the **vi** *file name* command to enter the editing mode, and then press **Insert** to start editing.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq** to save the settings and exit.

For example:

vi /etc/ssh/sshd_config

Step 5 Wait an hour and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **NodeAgent** from the **Service** and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

- **Check standards of /etc/fstab**

  Check whether the partitions configured in the **/etc/fstab** file can be found in **/proc/mounts**.

  Check whether the swap partitions configured in fstab correspond to those in /proc/swaps.

- **Check the /etc/hosts configuration file.**

  Run **cat /ect/hosts**. If any of the following situations occurs, the **/etc/hosts** configuration file is abnormal:

  a. The **/etc/hosts** file does not exist.
  b. The host name is not configured in the file.
  c. The host name maps to multiple IP addresses in the file.
  d. The IP address corresponding to the host name does not exist in the command output of the **ifconfig** command.
  e. One IP address maps to multiple host names in the file.
  f. The file does not contain the Hadoop local domain name mapping, for example, xxx hadoop.example.com. (applicable only to MRS 3.2.0-LTS.1.10)

- **Check standards of /etc/ssh/sshd_config**

  Run the **vi /etc/ssh/sshd_config** command to check whether configuration items are configured as follows:

  a. The value of **UseDNS** must be set to **no**.
  b. The value of **MaxStartups** must be greater than or equal to 1000.
  c. At least one of the **PasswordAuthentication** and **ChallengeResponseAuthentication** parameters must be left blank or at least one of the parameters must be set to **yes**.

9.11.25 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold

Alarm Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**.

This alarm is cleared when **Trigger Count** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12045	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
PortName	Specifies the network port for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- Latency: Requests are responded slowly and services are delayed.
- Service failure: Requests cannot be responded or time out. Jobs may fail to run.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

Possible Causes

- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network quality is poor.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and view the name of the host for which the alarm is generated and the NIC name.

Check whether the NICs are bonded in active/standby mode.

Step 2 Log in to the alarm node as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, the bond mode is configured for the node. Go to **Step 3**.

```
# ls -l /proc/net/bonding/
total 0
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to **Step 5**.

```
# ls -l /proc/net/bonding/
ls: cannot access /proc/net/bonding/: No such file or directory
```

Step 3 Run the **cat /proc/net/bonding/***bond0* command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

NOTE

In the command, **bond0** indicates the name of the bond configuration file. Use the file name obtained in **Step 2**.

```
# cat /proc/net/bonding/bond0
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)

Bonding Mode: fault-tolerance (active-backup)
Primary Slave: eth1 (primary_reselect always)
Currently Active Slave: eth1
MII Status: up
MII Polling Interval (ms): 100
Up Delay (ms): 0
Down Delay (ms): 0

Slave Interface: eth0
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
Slave Interface: eth1
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0
```

- If yes, the NICs are configured in active/standby bond mode. Go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Check whether the NIC specified by **NetworkCardName** in the alarm is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to **Step 5**.

NOTE

To determine the standby NIC, check the **/proc/net/bonding/bond0** configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

Check whether the threshold is set properly.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network connection is normal.

Step 8 Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to **Step 9**.
- If no, go to **Step 10**.

Step 9 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect the fault information.

Step 10 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **OMS** for **Service** and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.26 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold

Alarm Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Packet Dropped Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12046	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.

9.11.29 ALM-12049 Network Read Throughput Rate Exceeds the Threshold

Description

The system checks the network read throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network read throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

When the **Trigger Count** is 1, this alarm is cleared when the network read throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network read throughput rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12049	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: When the host network read throughput exceeds the threshold, the request response slows down, causing service delay.
- Service failure: When the host network read throughput exceeds the threshold, requests cannot be properly responded or timed out, which may cause job execution failures.

Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

Procedure

Check whether the threshold is set properly.

Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate** and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate can meet the service requirements.

Step 4 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

Step 5 Log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool** *network port name* command to check the maximum speed of the current network port.

NOTE

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

Step 7 If the network read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 10 Select **OMS** from the **Service** and click **OK**.

Step 11 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 12 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.30 ALM-12050 Network Write Throughput Rate Exceeds the Threshold

Description

The system checks the network write throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network write throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network write throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network write throughput rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12050	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the alarm triggering condition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- Latency: When the host network write throughput exceeds the threshold, the request response is slowed down and services are delayed.
- Service failure: When the host network write throughput exceeds the threshold, requests cannot be responded or times out, which may cause job running failures.

Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

Procedure

Check whether the threshold is set properly.

Step 1 On the FusionInsight Manager, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Based on actual usage condition, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Writing** > **Write Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

Step 3 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate can meet the service requirements.

Step 4 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

Step 5 Log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool** *network port name* command to check the maximum speed of the current network port.

NOTE

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

Step 7 If the network write throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Collect fault information.

Step 9 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log > Download**.

Step 10 Select **OMS** from the **Service** and click **OK**.

Step 11 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.31 ALM-12051 Disk Inode Usage Exceeds the Threshold

Alarm Description

The system checks the disk Inode usage every 30 seconds and compares the actual Inode usage with the threshold (the default threshold is 80%). This alarm is generated when the Inode usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > **Host** > **Disk** > **Disk Inode Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the disk Inode usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the disk Inode usage is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12051	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition for which the alarm is generated.
Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Service failure: If you need to modify or use data on the disk when data cannot be written to the file system, the job may fail.

Possible Causes

Massive small files are stored in the disk.

Handling Procedure

Massive small files are stored in the disk.

Step 1 On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the disk partition for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the following command to check the disk Inode usage:

```
df -i | grep -iE Partition name|Filesystem
```

The command output is as follows:

```
# df -i | grep -iE "xvda2|Filesystem"
Filesystem            Inodes   IUsed   IFree IUse% Mounted on
/dev/xvda2            2359296  207420 2151876    9% /
```

Step 4 If the Inode usage exceeds the threshold, manually check small files stored in the disk partition and confirm whether these small files can be deleted.

Run the **for i in /*; do echo $i; find $i|wc -l; done** command to query the number of files in a partition. Replace **/*** with the specified partition.

```
# for i in /srv/*; do echo $i; find $i|wc -l; done
/srv/BigData
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
4284
/srv/ftp
1
/srv/www
13
```

- If yes, delete the files and go to **Step 5**:
  rm -rf *Path of the files or folder to be deleted*

  NOTICE

  Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If no, expand the disk capacity. Then, perform **Step 5**.

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager homepage of the active cluster, choose **O&M** > **Log** > **Download**.

Step 7 Select **OMS** from the **Service** and click **OK**.

Step 8 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.32 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold

Description

The system checks the TCP temporary port usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the TCP temporary port usage exceeds the threshold for several times (5 times by default) consecutively.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Status** > **TCP Ephemeral Port Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the TCP temporary port usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the TCP temporary port usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12052	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Services on the host may fail to establish connections, causing service interruption.

Possible Causes

- The temporary port cannot meet the current service requirements.
- The system is abnormal.

Procedure

Expand the temporary port number range.

Step 1 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1** command to obtain the value of the start port and run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2** command to obtain the value of the end port. The total number of temporary ports is the value of the end port minus the value of the start port. If the total number of temporary ports is smaller than 28,232, the random port range of the OS is narrow. Contact the system administrator to increase the port range.

Step 4 Run the **ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}'| awk -F':' '{print $NF}' | awk '$1 >"***Value of the start port***" {print $1}' | sort -u | wc -l** command to calculate the number of used temporary ports.

Step 5 The formula for calculating the usage of the temporary ports is: Usage of the temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100%. Check whether the temporary port usage exceeds the threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the system environment is abnormal.

Step 7 Run the following command to import the temporary file and view the frequently used ports in the **port_result.txt file**:

netstat -tnp|sort > $BIGDATA_HOME/tmp/port_result.txt

```
netstat -tnp|sort

Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp   0   0 10-120-85-154:45433
10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45434  10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45435  10-120-85-154:9866 CLOSE_WAIT 94237/java
...
```

Step 8 Run the following command to view the processes that occupy a large number of ports:

ps -ef |grep *PID*

NOTE

- PID is the processes ID queried in **Step 7**.
- Run the following command to collect information about all processes and check the processes that occupy a large number of ports:

  ps -ef > $BIGDATA_HOME/tmp/ps_result.txt

Step 9 After obtaining the administrator's approval, clear the processes that occupy a large number of ports. Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 11 Select **OMS** from the **Service** and click **OK**.

Step 12 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected log information and files **port_result.txt** and **ps_result.txt**. Then, delete the two residual temporary files from the environment.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.33 ALM-12053 Host File Handle Usage Exceeds the Threshold

Description

The system checks the file handle usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the host file handle usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Host Status** > **Host File Handle Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the host file handle usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host file handle usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12053	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Service failure: When the host file handle usage exceeds the threshold, system applications cannot perform I/O operations such as file opening and network operations. As a result, the program is abnormal, which may cause job running failure.

Possible Causes

- The application process is abnormal. For example, the opened file or socket is not closed.
- The number of file handles cannot meet the current service requirements.
- The system is abnormal.

Procedure

Check information about files opened in processes.

Step 1 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the following command to check the process that occupies excessive file handles.

for proc in /proc/[0-9]*; do if [-d "$proc/fd"]; then num_fds=$(ls -l "$proc/fd" | wc -l); pid=$(basename $proc); echo "$num_fds ${pid}" ; fi; done | sort -nr | more

Step 4 Check whether the processes in which a large number of files are opened are normal. For example, check whether there are files or sockets not closed.

- If yes, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 7**.

Step 5 Release the abnormal processes that occupy too many file handles.

Step 6 Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Increase the number of file handles.

Step 7 On FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

Step 8 Log in to the host for which the alarm is generated as user **root**.

Step 9 Contact the system administrator to increase the number of system file handles.

Step 10 Run the **cat /proc/sys/fs/file-nr** command to view the used handles and the maximum number of file handles. The first value is the number of used handles, the third value is the maximum number. Please check whether the usage exceeds the threshold.

```
# cat /proc/sys/fs/file-nr
12704    0    640000
```

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 11 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether the system environment is abnormal.

Step 12 Contact the system administrator to check whether the operating system is abnormal.

- If yes, rectify the operating system fault and go to **Step 13**.
- If no, go to **Step 14**.

Step 13 Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download**.

Step 15 Select **OMS** from the **Service** and click **OK**.

Step 16 Set **Host** to the node for which the alarm is generated and the active OMS node.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.34 ALM-12054 Invalid Certificate File

Alarm Description

The system checks whether the certificate file is invalid (has expired or is not valid yet) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when a valid certificate is imported and the alarm detection mechanism is triggered on the next hour.

NOTE

For MRS 3.2.0 or later, the certificate file is checked at the beginning of each hour.

For versions earlier than MRS 3.2.0, the certificate file is checked on 23:00 every day.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12054	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The functions of the related modules cannot be used.

Possible Causes

No certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

Handling Procedure

Check the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to **Step 2**.
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 3**.
- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.
- If **Certificate has expired** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and perform **Step 2** to **Step 4** in sequence to check whether the certificates have expired. If these certificates have not expired, check whether other certificates have been imported. If yes, import the certificate files again.

Check the validity period of the certificate files in the system.

Step 2 Check whether the current system time is in the validity period of the CA certificate.

Run the **bash ${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 3 Check whether the current system time is in the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Check whether the current system time is in the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT          // Effective time
            Not After : Dec 11 06:38:26 2026 GMT          // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.35 ALM-12055 Certificate File Is About to Expire

Alarm Description

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire within 30 days.

This alarm is cleared when a certificate that is not about to expire is imported and the alarm detection mechanism is triggered on the next hour.

NOTE

For MRS 3.2.0 or later, the certificate file is checked at the beginning of each hour.

For versions earlier than MRS 3.2.0, the certificate file is checked on 23:00 every day.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12055	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Some functions will be unavailable if the certificate expires.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The remaining validity period of a system certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is less than 30 days.

Handling Procedure

Check the alarm cause.

Step 1 On FusionInsight Manager, locate the target alarm in the real-time alarm list and click ⌄.

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to **Step 2**.
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 3**.
- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.

Check the validity period of the certificate files in the system.

Step 2 Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **bash ${CONTROLLER_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 3 Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 4 Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The following is an example of the effective time and due time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Due time
```

Import certificate files.

Step 5 Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Step 6 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.36 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server

Description

After the system is installed, it checks whether the task for periodically backing up metadata to the third-party server, and then performs the check hourly. If the task for periodically backing up metadata to a third-party server is not configured, a critical alarm is generated.

This alarm is cleared when a user creates such a backup task.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12057	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the metadata is not backed up to a third-party server, when the active/standby management nodes in the cluster are faulty and the local backup data is lost, if you want to use the backup package to restore the cluster metadata, no backup package is available.

Possible Causes

Metadata is not configured with the task to periodically back up data to a third-party server.

Procedure

Check whether periodic backup is configured for the metadata..

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On the FusionInsight Manager portal choose **O&M > Alarm > Alarms**.

Step 2 In the alarm list, click ⌄ in the row where the alarm is located and identify the data module from which the alarm is generated based on **Additional Information**.

Step 3 Choose **O&M** > **Backup and Restoration > Backup Management** > **Create**.

Step 4 Configure a backup task. The backup data to be configured is consistent with the data in Additional Information of the alarm.

Step 5 After the backup task is created successfully, wait for two minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information

Step 6 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 7 In the **Service** area, select **Controller** and click **OK**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.37 ALM-12061 Process Usage Exceeds the Threshold

Description

The system checks the usage of the omm process every 30 seconds. Users can run the **ps -o nlwp, pid, args, -u omm | awk '{sum+=$1} END {print "", sum}'** command to obtain the number of concurrent processes of user **omm**. Run the **ulimit -u** command to obtain the maximum number of processes that can be simultaneously opened by user **omm**.

Divide the number of concurrent processes by the maximum number to obtain the process usage of user **omm**. The process usage has a default threshold. This alarm is generated when the process usage exceeds the threshold.

If **Trigger Count** is **3** and the process usage is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the process usage is less than or equal to 90% of the threshold, this alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12061	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service failure: When the process usage exceeds the threshold, you cannot switch to user **omm**. A new **omm** thread cannot be created. As a result, the job may fail to run.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of processes (including threads) that can be concurrently opened by user **omm** is inappropriate.
- An excessive number of threads are opened at the same time.

Procedure

Check whether the alarm threshold or alarm hit number is properly configured.

Step 1 On the FusionInsight Manager, change the alarm threshold and **Trigger Count** based on the actual CPU usage.

Specifically, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Process** > **omm Process Usage** to change Trigger Count.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The alarm is generated when the process usage exceeds the threshold for the times specified by **Trigger Count**.

Set the alarm threshold based on the actual process usage. To check the process usage, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Process** > **omm Process Usage**.

Step 2 2 minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 3**.

Check whether the maximum number of processes (including threads) opened by user omm is appropriate.

Step 3 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 4 Log in to the host for which the alarm is generated as user **root**.

Step 5 Run the following command to check whether the maximum number of threads that can be concurrently opened by user **omm** is greater than or equal to 60000:

su - omm -c "ulimit -u"

- If it is, go to **Step 7**.
- If it is not, go to **Step 6**.

Step 6 Run the following command to change the maximum number of threads that can be concurrently opened by user **omm** to 60000:

vi /etc/security/limits.d/omm-nproc.conf

Run the following commands to switch to user **omm**, and restart the NodeAgent process. After two minutes, check whether the alarm is cleared.

su - omm

sh $BIGDATA_HOME/om-agent/nodeagent/bin/restart-agent.sh

- If it is, no further action is required.
- If it is not, go to **Step 11**.

Check whether an excessive number of processes are opened at the same time.

Step 7 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

Step 8 Log in to the host where the alarm is generated as user **root**.

Step 9 Run the **ps -o nlwp, pid, lwp, args, -u omm|sort -n** command to check the numbers of threads used by the system.

The result is sorted based on the thread number. Analyze the top 5 thread numbers and check whether the threads are incorrectly used. (The PID column indicates the process ID.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, perform the following operations to stop the parent processes of the top 5 abnormally used processes without affecting services. Then, go to **Step 10**.

  a. Run the following command to query the parent process of the corresponding process:

  ps -ef | grep "*Process ID***"**

  The third column in the command output is the parent process ID.

  b. Run the following command to stop the parent process:

  kill -9 *parent process ID*

- If it is not, run the **ulimit -u** command to change the maximum number to be greater than 60000.

Step 10 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager home page of the active clusters, choose **O&M** > **Log** > **Download**.

Step 12 Select **OmmServer** and **NodeAgent** from the **Service** and click **OK**.

Step 13 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

9.11.38 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale

Alarm Description

The system checks whether the OMS parameter configurations match with the cluster scale at each top hour. If the OMS parameter configurations do not meet the cluster scale requirements, the system generates this alarm. This alarm is automatically cleared when the OMS parameter configurations are modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12062	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the parameters configured for the current cluster are smaller than the configuration standard required by the cluster scale, problems such as job running delay and slow service page response may occur. In severe cases, the Agent or OMS process on the cluster node is abnormal. As a result, component jobs fail to be submitted and OMS data fails to be synchronized.

Possible Causes

The OMS parameter configurations mismatch with the cluster scale.

Handling Procedure

Check whether the OMS parameter configurations match with the cluster scale.

Step 1 Log in to the active management node of the MRS cluster as user **root**.

Run the following command to switch to user **omm**:

```
su - omm
```

Step 2 Run the following command to open the Manager log:

```
vi $BIGDATA_LOG_HOME/controller/scriptlog/modify_manager_param.log
```

Search for log "Current oms configurations can not support *xx* nodes", where *xx* indicates the number of nodes in the current cluster.

Step 3 Optimize the current cluster configuration by referring to **Optimizing Manager Configurations Based on the Number of Cluster Nodes**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 One hour later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Select **Controller** from the **Service** and click **OK**.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

Optimizing Manager Configurations Based on the Number of Cluster Nodes

Step 1 Log in to the active management node of the MRS cluster as user **root**.

Run the following command to switch to user **omm**:

```
su - omm
```

Step 2 Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

Step 3 Run the following command to view the current Manager configurations.

```
sh oms_config_info.sh -q
```

Step 4 Run the following command to specify the number of nodes in the current cluster:

Command format:

```
sh oms_config_info.sh -s Number of nodes
```

Example:

```
sh oms_config_info.sh -s 1000
```

Enter **y** as prompted.

```
The following configurations will be modified:
    Module      Parameter        Current             Target
    Controller  controller.Xmx   4096m          =>  16384m
    Controller  controller.Xms   1024m          =>  8192m       Controller
controller.node.heartbeat.error.threshold    30000                =>   60000
    Pms         pms.mem          8192m          =>  10240m
Do you really want to do this operation? (y/n):
```

The configurations are updated successfully if the following information is displayed:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
...
Operation has been completed. Now restarting OMS server.                [done]
Restarted oms server successfully.
```

NOTE

- OMS is automatically restarted during the configuration update process.
- Clusters with similar quantities of nodes have same Manager configurations. For example, when the number of nodes is changed from 100 to 101, no configuration item needs to be updated.

----End

9.11.39 ALM-12063 Unavailable Disk

Description

The system checks whether the data disk of the current host is available at the top of each hour. The system creates files, writes files, and deletes files in the mount directory of the disk. If the operations fail, the alarm is generated. If the operations succeed, the disk is available, and the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12063	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

Service failure: If you need to modify or use data on a disk that is unwritable or unreadable, the job may fail.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The permission of the disk mount directory is abnormal.
- There are disk bad sectors.

Procedure

Check whether the permission of the disk mount directory is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host and **DiskName** for the disk.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **df -h |grep DiskName** command to obtain the mount point and check whether the permission of the mount directory is unwritable or unreadable.

- If it is, go to **Step 4**.
- If it is not, go to **Step 8**.

NOTE

If the permission of the mount directory is 000 or the owner is **root**, the mount directory is unreadable and unwritable.

Step 4 Modify the directory permission.

Step 5 One hour later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Step 6 Contact hardware engineers to rectify the disk.

Step 7 One hour later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **NodeAgent** from the **Service** and click **OK**.

Step 10 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.40 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port

Alarm Description

The system checks whether the random port range of the host conflicts with the range of ports used by the Cluster system every hour. The alarm is generated if they conflict. The alarm is automatically cleared when the random port range of the host is changed to the normal range.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12064	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- Authentication fails and jobs may fail to run.
- The process becomes faulty, which may affect the elastic scaling performance.
- If the Tomcat port is occupied, the login and query functions of FusionInsight Manager are affected.

Possible Causes

The random port range configuration is modified.

Procedure

Check the random port range of the system.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **cat /proc/sys/net/ipv4/ip_local_port_range** command to obtain the random port range of the host and check whether the minimum value is smaller than 32768.

- If it is, go to **Step 4**.
- If it is not, go to **Step 7**.

Step 4 Run the **vim /etc/sysctl.conf** command to change the value of **net.ipv4.ip_local_port_range** to **32768 61000**. If this parameter does not exist, add the following configuration: **net.ipv4.ip_local_port_range = 32768 61000**.

Step 5 Run the **sysctl -p /etc/sysctl.conf** command for the modification to take effect.

Step 6 One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **NodeAgent** for **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.41 ALM-12066 Trust Relationships Between Nodes Become Invalid

Alarm Description

The system checks whether the trust relationship between the active OMS node and other Agent nodes is normal every hour. The alarm is generated if the mutual trust fails. This alarm is automatically cleared after the fault is rectified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12066	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Some operations (such as restart, configuration synchronization, and instance status query) that need to connect to the node may fail. If the trust relationships between nodes are invalid, services may be affected.

Possible Causes

- The **/etc/ssh/sshd_config** configuration file on the cluster node is damaged.
- The password of user **omm** for logging in to the cluster node expired.

Handling Procedure

Check the status of the /etc/ssh/sshd_config configuration file.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm and click ⌄ to view the host list in the alarm details.

Step 2 Log in to the active OMS management node as user **root**.

Run the following command to switch to user **omm**:

```
su - omm
```

Step 3 Then run **ssh** to check whether the connection fails:

```
ssh host2
```

host2 indicates any other nodes except the OMS management node in the alarm details.

- If yes, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 6**.

Step 4 Open the **/etc/ssh/sshd_config** configuration file on the host specified by *host2* and check whether **AllowUsers** or **DenyUsers** includes the nodes specified by *host2*.

- If yes, go to **Step 5**.
- If no, contact OS experts.

Step 5 Modify the whitelist or blacklist to ensure that user **omm** is in the whitelist or not in the blacklist. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the status of the password of user omm.

Step 6 Check the interaction information of the **ssh** command.

- If the password of user **omm** is required, go to **Step 7**.
- If message "Enter passphrase for key '/home/omm/.ssh/id_rsa':" is displayed, go to **Step 9**.
- If the connection is set up successfully, run the following command to restart **ssh-agent** and then go to **Step 3**:

```
ps -ef|grep ssh-agent |grep -v grep |awk '{print $2}' | xargs kill -9
```

Step 7 Check the trust list (**/home/omm/.ssh/authorized_keys**) of user **omm** on the OMS node and host2 node. Check whether the trust list contains the public key file (**/home/omm/.ssh/id_rsa.pub**) of user **omm** on the peer host.

- If yes, contact OS experts.
- If no, add the public key of user **omm** of the peer host to the trust list of the local host.

Step 8 Add the public key of user **omm** of the peer host to the trust list of the local host. Run the **ssh** command, for example, **ssh host2**, on each node in the alarm details to check whether the connection fails. (***host2*** is a node other than the OMS node in the alarm details.)

- If yes, go to **Step 9**.
- If no, check whether the alarm is cleared. If the alarm is cleared, no further action is required; otherwise, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **Controller** for **Service** and click **OK**.

Step 11 Click  in the upper right corner to set the log collection time range. Generally, the time range is 10 minutes before and after the alarm generation time. Click **Download**.

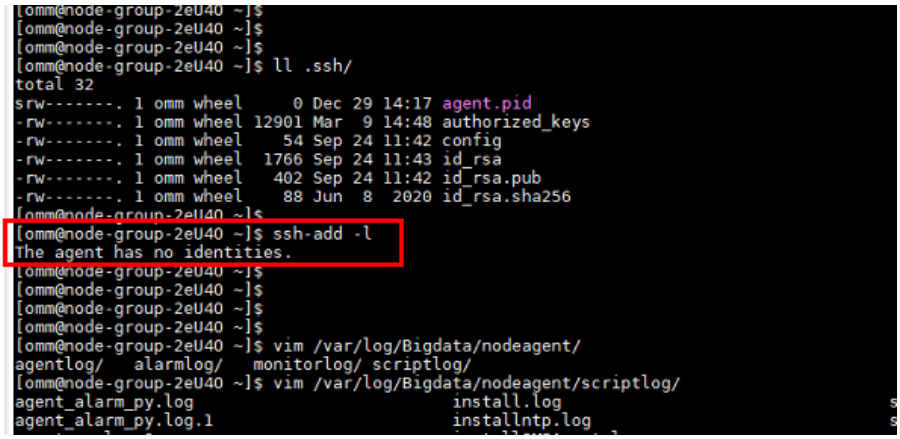
Step 12 Contact O&M personnel and provide the collected logs.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

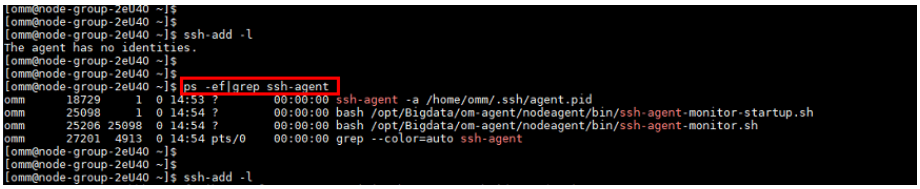
This alarm is automatically cleared after the fault is rectified.



Related Information

Perform the following steps to handle abnormal trust relationships between nodes:

NOTICE



- Perform this operation as user **omm**.
- If the network between nodes is disconnected, rectify the network fault first. Check whether the two nodes are connected to the same security group and whether **hosts.deny** and **hosts.allow** are set.

1. Run the **ssh-add -l** command on both nodes to check whether any identities exist.

   - If yes, go to 4.
   - If no, go to 2.

2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the **ssh-agent** process, stop the process, and wait for the process to automatically restart.

3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. If identities exist, check whether the **/home/omm/.ssh/authorized_keys** file contains the information in the **/home/omm/.ssh/id_rsa.pub** file of the peer node. If it does not, manually add the information.
5. Check whether the permissions on the files in the **/home/omm/.ssh** directory are modified.
6. Check the **/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log** file.
7. If the **/home** directory of user **omm** is deleted, contact MRS support personnel for assistance.

9.11.42 ALM-12067 Tomcat Resource Is Abnormal

Alarm Description

HA checks the Tomcat resources of Manager every 85 seconds. This alarm is generated when HA detects that the Tomcat resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the Tomcat resources become normal.

Resource Type of Tomcat is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Tomcat resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12067	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

An active/standby Manager switchover may occur. The Manager and component web UIs are unavailable. The cluster management function cannot be provided for upper-layer web applications, and users may fail to log in to the Manager and component web UIs.

Possible Causes

- The Tomcat directory permission is abnormal, and the Tomcat process is abnormal.

Handling Procedure

Check whether the permission on the Tomcat directory is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/tomcat.log** command to check whether the Tomcat resource log contains keyword **Cannot find *XXX*** and rectify the file permission based on the keyword.

Step 5 After 5 minutes, check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **OmmServer** and **Tomcat**, and click **OK**.

Step 8 Click ✎ in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

9.11.43 ALM-12068 ACS Resource Exception

Alarm Description

HA checks the ACS resources of Manager every 80 seconds. This alarm is generated when HA detects that the ACS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the ACS resources are normal.

Resource Type of ACS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new ACS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12068	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

An active/standby Manager switchover may occur. The security authentication and user management functions cannot be provided for ACS upper-layer applications. As a result, you may fail to log in to Manager and component web UIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The ACS process is abnormal.

Handling Procedure

Check whether the ACS process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command and then **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** to check whether the status of the ACS resources managed by the HA is normal. In the single-node system, the ACS resource is in the normal state. In the dual-node system, the ACS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/acs.log** command to check whether the ACS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.44 ALM-12069 AOS Resource Exception

Alarm Description

HA checks the AOS resources of Manager every 81 seconds. This alarm is generated when HA detects that the AOS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the AOS resources become normal.

Resource Type of AOS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new AOS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12069	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

An active/standby Manager switchover may occur. Tenant and role management cannot be provided for AOS upper-layer applications. As a result, you may fail to log in to Manager and component web UIs.

Possible Causes

The AOS process is abnormal.

Handling Procedure

Check whether the AOS process is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the alarm host as user **root**.

Step 3 Run the **su - omm** command and then **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** to check whether the status of the AOS resources managed by the HA is normal. In the single-node system, the AOS resource is in the normal state. In the dual-node system, the AOS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/aos.log** command to check whether the AOS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 5 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.45 ALM-12070 Controller Resource Is Abnormal

Alarm Description

HA checks the controller resources of Manager every 80 seconds. This alarm is generated when HA detects that the controller resources are abnormal for 2 consecutive times.

This alarm is cleared when the Controller resource is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Resource Type of Controller is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Controller resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12070	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the name of the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The Controller process repeatedly restarts, which may cause the native UI of the service login failure.

Possible Causes

The Controller process is abnormal.

Procedure

Check whether the controller process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the Controller resources

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

managed by the HA is normal. In the single-node system, the Controller resource is in the normal state. In the dual-node system, the Controller resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/controller.log** command to view the Controller resource logs, and run the **vi $BIGDATA_LOG_HOME/controller/controller.log** command to view the Controller running logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 5 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour before and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.46 ALM-12071 Httpd Resource Is Abnormal

Description

HA checks the httpd resources of Manager every 120 seconds. This alarm is generated when HA detects that the httpd resources are abnormal for 10 consecutive times.

This alarm is cleared when the httpd resource is normal.

Resource Type of httpd is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new httpd resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12071	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The httpd process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

The httpd process is abnormal.

Procedure

Check whether the httpd process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the httpd resources managed by the HA is normal. In the single-node system, the httpd resource is in the normal state. In the dual-node system, the httpd resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 7**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If it is not, go to **Step 5**.

Step 5 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/httpd.log** command to view the httpd resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

Step 6 Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.11.47 ALM-12072 FloatIP Resource Is Abnormal

Description

HA checks the floatip resources of Manager every 9 seconds. This alarm is generated when HA detects that the floatip resources are abnormal for 3 consecutive times.

This alarm is cleared when the FloatIP resource is normal.

Resource Type of FloatIP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FloatIP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12072	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The FloatIP process is repeatedly restarts, which may lead to the failure to visit the native service UI.

Possible Causes

The floating IP address is abnormal.

Procedure

Check the floating IP address status of the active management node.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm and click ⌄ to view the host address and resource name for which the alarm is generated.

Step 2 Log in to the active management node as user **root**.

Step 3 Run the following command, go to the **${BIGDATA_HOME}/om-server/om/sbin/** directory.

su - omm

cd ${BIGDATA_HOME}/om-server/om/sbin/

Step 4 Run the **sh status-oms.sh** command, and execute the **status-oms.sh** script to check whether the floating IP address of the active FusionInsight Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

For example:

```
10-10-10-160   floatip  Normal  Normal   Single_active
```

- If it is, go to **Step 8**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If it is not, go to **Step 5**.

Step 5 Run the **ifconfig** command to check whether the NIC with the floating IP address exists.

- If it does, go to **Step 8**.
- If it does not, go to **Step 6**.

Step 6 Run the **ifconfig** *NIC name Floating IP address* netmask *Subnet mask* command to reconfigure the NIC with the floating IP address. (For example, **ifconfig eth0 10.10.10.102 netmask 255.255.255.0**).

Step 7 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Select **Controller** and **OmmServer** for **Service** and click **OK**.

Step 10 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.11.48 ALM-12073 CEP Resource Is Abnormal

Description

HA checks the cep resources of Manager every 60 seconds. This alarm is generated when HA detects that the cep resources are abnormal for 2 consecutive times.

This alarm is cleared when the CEP resource is normal.

Resource Type of CEP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new CEP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12073	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The CEP process repeatedly restarts. As a result, monitoring data collection fails during the alarm reporting period. In severe cases, monitoring data during the alarm reporting period may be lost.

Possible Causes

The CEP process is abnormal.

Procedure

Check whether the CEP process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the CEP resources managed by the HA is normal. In the single-node system, the CEP resource is in the normal state. In the dual-node system, the CEP resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.

9.11.49 ALM-12074 FMS Resource Is Abnormal

Description

HA checks the fms resources of Manager every 60 seconds. This alarm is generated when HA detects that the fms resources are abnormal for 2 consecutive times.

This alarm is cleared when the FMS resource is normal.

Resource Type of FMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12074	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The FMS process repeatedly restarts. As a result, the alarm data reported during the alarm reporting period is abnormal. In severe cases, the alarm data reported during the alarm reporting period may fail to be reported and cleared.

Possible Causes

The FMS process is abnormal.

Procedure

Check whether the FMS process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command and then the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the FMS resources managed by the HA is normal. In the single-node system, the FMS resource is in the normal state. In the dual-node system, the FMS resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to **Step 6**.
- If it is not, go to **Step 4**.

Step 4 Run the **vi $BIGDATA_LOG_HOME/omm/oms/fms/fms.log** and **vi $BIGDATA_LOG_HOME/omm/oms/fms/scriptlog/fms_ha.log** commands to view the FMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

9.11.51 ALM-12076 GaussDB Resource Is Abnormal

Description

HA checks the Manager database every 10 seconds. This alarm is generated when HA detects that the database is abnormal for 3 consecutive times.

This alarm is cleared when the database is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12076	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the database is abnormal, all core services and related service processes of Manager, such as the alarm, monitoring, and query functions, are affected.

Possible Causes

An exception occurs in the database.

Procedure

Check the database status of the active and standby management nodes.

Step 1 Log in to the active and standby management nodes as user **root**. . Run the **su - ommdba** command to switch to user **ommdba**, and run the **gs_ctl query** command. Check whether the following information is displayed.

Command output of the active management node:

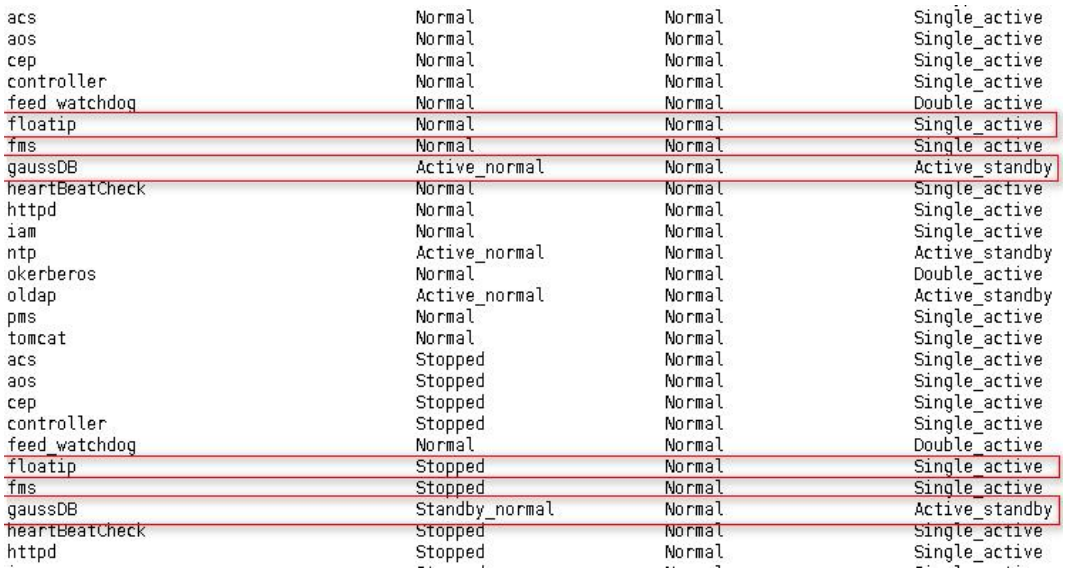
```
Ha state:
        LOCAL_ROLE                  : Primary
        STATIC_CONNECTIONS          : 1
        DB_STATE                    : Normal
        DETAIL_INFORMATION          : user/password invalid
Senders info:
        No information
Receiver info:
        No information
```

Command output of the standby management node:

```
Ha state:
        LOCAL_ROLE                  : Standby
        STATIC_CONNECTIONS          : 1
        DB_STATE                    : Normal
        DETAIL_INFORMATION          : user/password invalid
Senders info:
        No information
Receiver info:
        No information
```

- If it is, go to **Step 3**.
- If it is not, go to **Step 2**.

Step 2 Contact the network administrator to check whether the network is faulty.



- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Log in to the active and standby management nodes, run the **su - omm** command to switch to user **omm**, go to the **${BIGDATA_HOME} /om-server/om/sbin/** directory, and run the **status-oms.sh** script to check whether the floating IP addresses and GaussDB resources of the active and standby FusionInsight Managers are in the status shown in the following figure.

acs	Normal	Normal	Single_active
aos	Normal	Normal	Single_active
cep	Normal	Normal	Single_active
controller	Normal	Normal	Single_active
feed_watchdog	Normal	Normal	Double_active
floatip	Normal	Normal	Single_active
fms	Normal	Normal	Single_active

9.11.52 ALM-12077 User omm Expired

Description

The system starts at 00:00 every day to check whether user **omm** has expired every eight hours. This alarm is generated if the user account has expired.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12077	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

Possible Causes

User **omm** has expired.

Procedure

Check whether user omm in the system has expired.

Step 1 Log in to the faulty node in the cluster as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Run the **chage -E 'yyyy-MM-dd' omm** command to set the expiration time of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.11.53 ALM-12078 Password of User omm Expired

Description

The system starts at 00:00 every day to check whether the password of user **omm** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **omm** password is changed and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12078	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services. The **crontab** scheduled task cannot be executed, affecting the ClickHouse service.

Possible Causes

The password of user **omm** has expired.

Procedure

Check whether the password of user omm in the system has expired.

Step 1 Log in to the faulty node in the cluster as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Password expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -M** '*days*' **omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

9.11.54 ALM-12079 User omm Is About to Expire

Description

The system starts at 00:00 every day to check whether user **omm** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12079	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The account of user **omm** is about to expire.

Procedure

Check whether user omm is about to expire.

Step 1 Log in to the faulty node in the cluster as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

Step 2 View the value of **Account expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **omm** command to set the validity period of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

9.11.55 ALM-12080 Password of User omm Is About to Expire

Description

The system starts at 00:00 every day to check whether the password of user **omm** is about to expire every 8 hours. This alarm is generated if the password will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** password is reset and the user password status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12080	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services. The **crontab** scheduled task cannot be executed, affecting the ClickHouse service.

Possible Causes

The password of user **omm** is about to expire.

Procedure

Check whether the password of user omm in the system is about to expire.

Step 1 Log in to the faulty node in the cluster as user **root**.

Run the **chage -l omm**command to view the information about the password of user **omm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 View the value of **Password expires** to check whether the user configurations are about to expire.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

Step 3 Run the **chage -M '***days***' omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Select **NodeAgent** for **Service** and click **OK**.

Step 6 Click in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

9.11.56 ALM-12081 User ommdba Expired

Description

The system starts at 00:00 every day to check whether user **ommdba** has expired every 8 hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **ommdba** is reset and the user account status becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12081	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

The account of user **ommdba** for the host has expired.

Procedure

Check whether user ommdba has expired.

Step 1 Log in to the faulty node in the cluster as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

Step 2 View the value of **Account expires** to check whether the user configurations have expired.

NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to **Step 3**.
- If they do not, go to **Step 4**.

Step 3 Run the **chage -E** *'yyyy-MM-dd'* **omm** command to set the validity period of user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

9.11.60 ALM-12085 Service Audit Log Dump Failure

Description

The system dumps service audit logs at 03:00 every day and stores them on the OMS node. This alarm is generated when the dump fails. This alarm is cleared when the next dump succeeds.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12085	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the audit logs of a component fail to be dumped, the audit logs cannot be retrieved if they are aged locally. This affects service analysis and troubleshooting of the component.

Possible Causes

- The service audit logs are oversized.
- The OMS backup storage space is insufficient.
- The storage space of a host where the service is located is insufficient.

Procedure

Check whether the service audit logs are oversized.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the IP address of the host for which the alarm is generated and additional information.

Step 2 Log in to the host where the alarm is generated as user **root**.

Step 3 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to search for the keyword "LOG SIZE is more than 5000MB", which indicates whether the keyword can be found.

- If it can, go to **Step 4**.
- If it cannot, go to **Step 5**.

Step 4 Check whether the oversized service audit logs are caused by exceptions.

The OMS backup storage space is insufficient.

Step 5 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to search for the keyword "Collect log failed, too many logs on", which indicates whether the keyword can be found.

- If it can, obtain the host IP address following the keyword "Collect log failed, too many logs on", and go to **Step 6**.
- If it cannot, go to **Step 11**.

Step 6 Log in to the host with the IP address obtained in **Step 5** as user **root**.

Step 7 Run the **vi ${BIGDATA_LOG_HOME}/nodeagent/scriptlog/collectLog.log** command to check whether the keyword "log size exceeds" can be searched.

- If it can, go to **Step 9**.
- If it cannot, go to **Step 8**.

Step 8 Check whether the alarm additional information contains the keyword "no enough space".

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Perform the following operations to expand the disk capacity (only for MRS 3.1.2 and earlier versions) or reduce the maximum number of audit log backups:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Expand the capacity of the OMS node.
- Run the following command to edit the file and decrease the value of **MAX_NUM_BK_AUDITLOG**.

  vi ${CONTROLLER_HOME}/etc/om/componentsauditlog.properties

Step 10 In the next execution period, 03:00, check whether the alarm is cleared.

- If yes, no further action is required.
- If it is not, go to **Step 11**.

Check whether the space of the host where the service is located is insufficient.

Step 11 Run the **vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log** command to search for the keyword "Collect log failed, no enough space on *hostIp* ", which indicates whether the keyword can be found.

- If it can, obtain the IP address of the abnormal host and go to **Step 12**.
- If it cannot, go to **Step 15**.

Step 12 Log in to the host with the IP address obtained as user **root**, and run the **df "$BIGDATA_HOME/tmp" -lP | tail -1 | awk '{print ($4/1024)}'** command to obtain the remaining space of the host log directory. Check whether the value is less than 1000 MB.

- If it is, go to **Step 13**.
- If it is not, go to **Step 15**.

Step 13 Expand the capacity of the node

Step 14 In the next execution period, 03:00, check whether the alarm is cleared.

- If yes, no further action is required.
- If it is not, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 16 Select **Controller** for **Service** and click **OK**.

Step 17 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.11.61 ALM-12087 System Is in the Upgrade Observation Period

Description

The system checks whether it is in the upgrade observation period at 00:00 every day and checks whether the duration that it has been in the upgrade observation state exceeds the preset upgrade observation period, 10 days by default. This alarm is generated when the system is in the upgrade observation period and the duration that the system has been in the upgrade observation state exceeds the preset period (10 days by default). This alarm is automatically cleared if the system exits the upgrade observation period after the user performs a rollback or submission.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12087	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Upgrade Observation Period (Days)	Specifies the days that the system is in the upgrade observation period.

Impact on the System

During the upgrade observation period, do not add or delete users, instances, roles, services, hosts, or resource pools that affect the management topology.

Possible Causes

The upgrade task is not submitted a specified period of time (10 days by default) after the system upgrade.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check whether the system is in the upgrade observation period.

Step 1 Log in to the active management node as user **root**.

Step 2 Run the following commands to switch to user **omm** and log in to the **omm** database:

su - omm

gsql -U omm -W *omm database password* **-p 20015**

Step 3 Run the **select * from OM_CLUSTERS** command to view cluster information.

Step 4 Check whether the value of **upgradObservationPeriod isON** is **true**, as shown in **Figure 9-6**.

- If it is, the system is in the upgrade observation period. Use the UpdateTool to submit the upgrade task. For details, see the upgrade guide of the corresponding version.
- If it is not, go to **Step 6**.

Figure 9-6 Cluster information

Step 5 In the early morning of the next day, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Controller** from the **Service** and click **OK**.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

Related Information

None

9.11.62 ALM-12089 Inter-Node Network Is Abnormal

Alarm Description

The alarm module checks the network health status of nodes in the cluster every 10 seconds. This alarm is generated when the network between two nodes is unreachable or the network status is unstable.

This alarm is cleared when the network recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12089	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- Data transmission becomes slow or interrupted. Data may be lost or incomplete.
- Task scheduling is affected. For example, Yarn tasks cannot be executed properly or fail to be executed due to timeout.
- Data processing is affected. For example, HDFS data synchronization fails or the data is inaccurate.
- System performance deteriorates. The efficiency and quality of data processing is low.

Possible Causes

- The node breaks down.
- The network is faulty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the network health status.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, click ⌄ to view the description in additional information. Record the source IP address and destination IP address of the node for which the alarm is reported.

Step 2 Log in to the node that the alarm is generated for. On the node, run **ping** the destination node to check whether the network between the two nodes is normal.

```
ping IP address of the destination node
```

- If yes, go to **6**.
- If no, go to **3**.

Check the node status.

Step 3 On FusionInsight Manager, click **Host** and check whether the host list contains the faulty node to determine whether the faulty node has been removed from the cluster.

- If yes, go to **5**.
- If no, go to **4**.

Step 4 Check whether the faulty node is powered off.

- If yes, start the faulty node and go to **Step 2**.
- If no, contact related personnel to find root cause. If you need to remove the faulty nodes from the cluster, go to **Step 5**. Otherwise, go to **Step 6**.

Step 5 Remove the faulty node from the **$NODE_AGENT_HOME/etc/agent/hosts.ini** file on all nodes in the cluster, clear the **/var/log/Bigdata/unreachable/unreachable_ip_info.log** file, and clear the alarm.

Step 6 Wait 30 seconds and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **OmmAgent** from the **Service** and click **OK**.

Step 9 Click ✎ in the upper right corner to set the log collection time range. Generally, the time range is 10 seconds before and after the alarm generation time. Click **Download**.

Step 10 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.63 ALM-12091 Abnormal disaster Resources

Alarm Description

HA checks the disaster resources of Manager every 86 seconds. This alarm is generated when HA detects that the disaster resources have been abnormal for 10 consecutive times.

This alarm is cleared when HA detects that the disaster resources become normal.

Resource Type of disaster is **Single-active**. Active/Standby switchover will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new disaster resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12091	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The active/standby Manager switchover occurs.
- The disaster process restarts repeatedly, which may cause active/standby DR to be unavailable.

Possible Causes

The disaster process is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check whether the disaster process is normal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the disaster resources managed by the HA is normal. In the single-node system, the disaster resource is in the normal state. In the dual-node system, the disaster resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the **vi ${BIGDATA_LOG_HOME}/disaster/disaster.log** command to check whether the disaster resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

Step 6 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **Disaster** for the target cluster, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.64 ALM-12101 AZ Unhealthy

Description

After the AZ DR function is enabled, the system checks the AZ health status every 5 minutes. This alarm is generated when the system detects that the AZ is subhealthy or unhealthy. This alarm is cleared when the AZ becomes healthy.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12101	Critical	Yes

Parameters

Parameter	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
AZName	Specifies the AZ for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The health status of an AZ is determined by whether the health status of storage resources (HDFS), computing resources (Yarn), and key roles in the AZ exceeds the configured threshold.

An AZ is subhealthy when:

- The computing resources (Yarn) are unhealthy, but the storage resources (HDFS) are healthy. Tasks cannot be submitted to the local AZ, but data can still be read and written in the local AZ.
- The computing resources (Yarn) are healthy, but some storage resources (HDFS) are unhealthy. Tasks can be submitted to the local AZ, and some data can be read and written in the local AZ. This depends on the locality of data detected by Spark/Hive scheduling.

An AZ is unhealthy when:

- The computing resources (Yarn) are healthy, but the storage resources (HDFS) are unhealthy. Although tasks can be submitted to the local AZ, data cannot be read or written in the local AZ. As a result, the tasks submitted to the local AZ are invalid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The computing resources (Yarn) and storage resources (HDFS) are unhealthy. Tasks cannot be submitted to the local AZ, and data cannot be read or written in the local AZ.
- The health status of key roles except Yarn and HDFS is lower than the configured threshold.

Possible Causes

- The computing resources (Yarn) are unhealthy.
- The storage resources (HDFS) are unhealthy.
- Some storage resources (HDFS) are unhealthy.
- Key roles except Yarn and HDFS are unhealthy.

Procedure

Disable the DR drill.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Cross-AZ HA**. The Cross-AZ HA page is displayed.

Step 2 In the AZ DR list, check whether **Perform DR Drill** in the **Operation** column of the AZ whose health status is **Unhealthy** is gray.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Click **Restore** in the **Operation** column of the target AZ. Wait 2 minutes and refresh the page to view the health status of the AZ. Check whether the health status is normal.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 Log in to the active management node as user **root**.

Step 5 View logs of unhealthy services.

- HDFS log files are stored in **/var/log/Bigdata/hdfs/nn/hdfs-az-state.log**.
- Yarn log files are stored in **/var/log/Bigdata/yarn/rm/yarn-az-state.log**.
- For other services, view the service health check logs in the corresponding service log directory.

Step 6 Contact O&M personnel and provide detailed log file information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.65 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements

Alarm Description

The alarm module checks the deployment status of AZ HA components every 5 minutes. This alarm is generated when the components that support DR are not deployed based on DR requirements after AZ is enabled. This alarm is cleared when the components are deployed based on DR requirements.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12102	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

Impact on the System

The cross-AZ HA capability of a single cluster is affected.

Possible Causes

The roles of the components that support DR are not deployed based on DR requirements.

Handling Procedure

Obtain alarm information.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, click ⌄ in the row that contains the alarm and view the roles that are not deployed based on DR requirements in **Additional Information**.

Redeploy the role instance.

Step 3 Choose **Cluster** > **Services** > *Name of the desired service* > **Instance**. On the instance page, redeploy or adjust the role instance.

Step 4 Check whether the alarm is cleared 10 minutes later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.66 ALM-12103 Executor Resource Exception

Alarm Description

HA checks the Executor resources of Manager every 30 seconds. This alarm is generated when HA detects that the Executor resources are abnormal for two consecutive times.

This alarm is cleared when the Executor resources are normal.

Resource Type of Executor is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Executor resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12103	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- The active/standby Manager switchover occurs.
- The Executor process keeps restarting. As a result, the cluster page may fail to be accessed.

Possible Causes

The Executor process is abnormal.

Handling Procedure

Check whether the Executor process is abnormal.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status_ha.sh** command to check whether the status of the Executor resources managed by the HA is normal. In the single-node system, the Executor resource is in the normal state. In the dual-node system, the Executor resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/executor.log** command to check whether the Executor resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.

Step 6 After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

9.11.67 ALM-12104 Abnormal Knox Resources

Alarm Description

HA checks the Knox resources of Manager every 70 seconds. This alarm is generated when HA detects that the Knox resources are abnormal for three consecutive times.

This alarm is cleared when HA detects that the Knox resources are normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12104	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Requests sent by upper-layer services by using Knox cannot be properly processed.

Possible Causes

The Knox process is abnormal.

Handling Procedure

Check whether the Knox process is normal.

Step 1 Log in to FusionInsight Manager. In the alarm list, locate the row that contains the alarm and view the name of the host for which the alarm is generated.

Step 2 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 3 Run the **su - omm** command to switch to user **omm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Run the **sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh** command to check whether the status of the Knox resources managed by HA is normal. If the status is normal, the Knox resources are normal. Otherwise, the Knox resources are abnormal.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the **vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/knox.log** command to check whether the Knox resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.

Step 6 After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

9.11.68 ALM-12110 Failed to get ECS temporary AK/SK

Alarm Description

The meta component calls the ECS API to obtain AK/SK information every 5 minutes and caches the information. Before the AK/SK expires, the component calls the API again to update it. This alarm is generated when the component fails to call the API for three consecutive times.

This alarm is cleared when Meta successfully calls the ECS API.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12110	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The cluster cannot obtain the latest temporary AK/SK. For a storage-compute decoupled system, OBS files may fail to be accessed. As a result, upper-layer component services cannot process data.

Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS, but later it was unbound from the agency.

Handling Procedure

Check the status of the meta role.

Step 1 On FusionInsight Manager of the cluster, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and determine the IP address of the host for which the alarm is generated.

Step 2 Choose **Cluster** > **Services** > **meta**. On the page that is displayed, click the **Instances** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Select the abnormal role, click **More**, and select **Restart Instance** to restart the abnormal meta role.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

Step 4 After the role is restarted, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Log in to the required host as user **root** using the IP address obtained in **Step 1** and check whether the **/var/log/Bigdata/meta/mrs-meta.log** file contains error information. If yes, rectify the fault based on the log information.

```
cat /var/log/Bigdata/meta/mrs-meta.log
```

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Rebind an IAM agency to the cluster.

Step 7 Log in to the MRS management console.

Step 8 In the navigation pane on the left, choose **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an IAM agency in the O&M management area.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Click **Select Agency**. On the page that is displayed, rebind an IAM agency that the permissions to access OBS cluster to the cluster. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **meta** for the target cluster, and click **OK**.

Step 12 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 13 Contact O&M personnel and provide the collected logs.

----End

9.11.69 ALM-12172 Failed to Report Metrics to Cloud Eye

Alarm Description

After metric sharing is enabled for a cluster, the Controller periodically collects cluster metrics and reports them to Cloud Eye.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12172	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

MRS monitoring metrics are unavailable on Cloud Eye.

Possible Causes

- Failed to call Cloud Eye APIs due to insufficient permissions.
- Failed to report data to Cloud Eye due to network problems.
- Failed to report data to Cloud Eye due to internal errors.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the additional information in the alarm details.

Step 2 Rectify the fault based on the following scenarios:

- If "Call CES to send metrics fail. Permission exception" is displayed in the additional information, the token of the resource tenant is invalid. Restart the Controller and obtain the token again. The detailed procedure is as follows:
  a. Log in to FusionInsight Manager, click the task center icon in the upper right corner, and verify that no task is being executed in the task center.
  b. Use PuTTY to log in to the active management node as user **omm**.
  c. Restart the controller.
     sh ${BIGDATA_HOME}/om-server/om/sbin/restart-controller.sh
  d. Wait for 5 minutes and check whether the alarm is cleared.
     - If yes, no further action is required.
     - If no, go to **Step 3**.
- If "Call CES to send metrics fail. Request CES error code xxx" or "CES internal error code xxx" is displayed, the function service is abnormal. Go to **Step 3**.
- If "Call CES to send metrics fail. Too many request" is displayed in additional alarm information, the service request triggers triffic control. Go to **Step 3**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 4 On the displayed page, select **Controller** of **OMS** for **Service**, and click **OK**. Select the active node for **Host** and click **OK**.

Step 5 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.70 ALM-12180 Suspended Disk I/O

Alarm Description

For MRS 3.3.0 and its later versions:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 6 seconds within 30 seconds in at least seven collection periods.
  - The system collects data every 3 seconds by default, and within 30 seconds, at least 10 collection cycles have a disk queue depth (**avgqu-sz**) > 0, IOPS = 0, or bandwidth = 0, and **ioutil** > 99%.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 1000 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 3 seconds within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 500 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when neither of the preceding conditions is met for three consecutive detection periods (30 or 300 seconds).

For versions earlier than MRS 3.3.0:

- For HDDs, the alarm is triggered when any of the following conditions is met:

  - By default, the system collects data every 3 seconds. The svctm latency exceeds 6 seconds within 30 seconds in at least 10 collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency exceeds 2 seconds within 30 seconds in at least 10 collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.

This alarm is automatically cleared when the preceding conditions have not been met for 90s.

NOTE

For details about how to obtain and calculate related parameters, see **Related Information**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12180	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
DiskName	Specifies the disk for which the alarm was generated.

Impact on the System

If the I/O usage keeps increasing, operations will be affected and services will be interrupted. The possible impacts are as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The system I/O performance deteriorates, which means slow response and low throughput. For example, job submission is slow, page responds slowly, interface response times out, and the system is in error or even crash.
- Customer services may be interrupted. The system may break down and the key information stored on the faulty disk may be lost.

Possible Causes

The disk is aged.

Handling Procedure

Replace the disk.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 3 Replace the hard disk.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

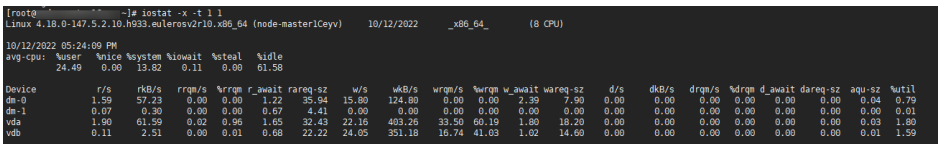
Step 6 Select **OMS** for **Service** and click **OK**.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance



This alarm is automatically cleared after the fault is rectified.

Related Information

Obtain and calculate related parameters as follows:

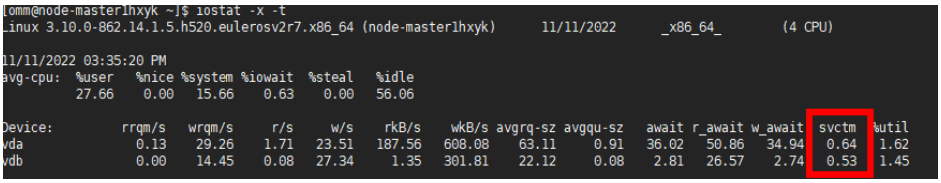
- Run the following command in the OS to collect data:

  iostat -x -t 1 1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters are as follows:

avgqu-sz indicates the disk queue depth.



The sum of **r/s** and **w/s** is the IOPS.

The sum of **rkB/s** and **wkB/s** is the bandwidth.

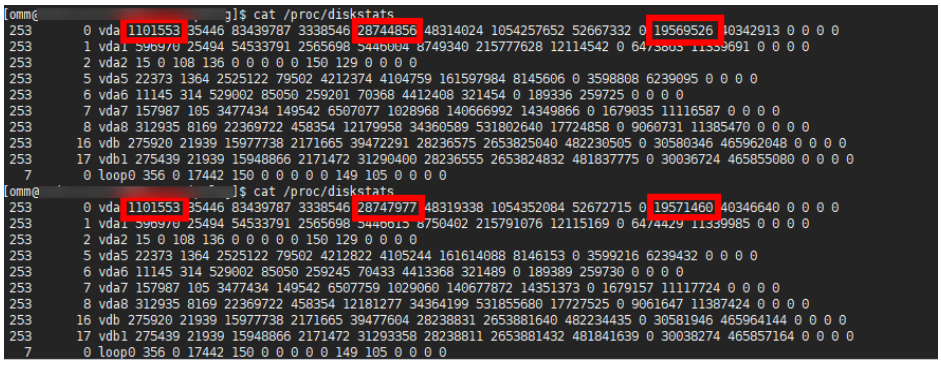
%util is the **ioutil** value.

- MRS 3.1.0:

  Run the **iostat -x -t** command in the OS.

- Calculate **svctm** as follows in versions later than MRS 3.1.0:

  svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)



- Versions earlier than MRS 3.3.0: If **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.
- MRS 3.3.0 and its later versions:

  When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

  When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters can be obtained as follows:

The system runs the **cat /proc/diskstats** command every 3 seconds to collect data. For example:

In the two commands:

In the data collected for the first time, the number in the fourth column is the **rd_ios_old** value, the number in the eighth column is the **wr_ios_old** value, and the number in the thirteenth column is the **tot_ticks_old** value.

In the data collected for the second time, the number in the fourth column is the **rd_ios_new** value, the number in the eighth column is the **wr_ios_new** value, and the number in the thirteenth column is the **tot_ticks_new** value.

In this case, the value of **svctm** is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197

9.11.71 ALM-12186 CGroup Task Usage Exceeds the Threshold

Alarm Description

The system checks the CGroup task usage of user **omm** every 5 minutes. This alarm is generated when the CGroup task usage exceeds 90%. This alarm is cleared when the CGroup task usage is less than or equal to 90%.

CGroup task usage = Number of used CGroup tasks/Maximum number of CGroup tasks

You can run the **systemctl status user-$(id -u).slice | grep limit | awk -F ' ' '{print $2}'** command as user **omm** to obtain the number of used CGroup tasks of this user and run the **echo $(systemctl status user-$(id -u).slice | grep limit | awk -F ' ' '{print $4}') | sed -e 's/)//g'** command to obtain the maximum number of CGroup tasks allowed for this user.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12186	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- Failed to switch to user **omm**.
- Failed to create new **omm** processes.
- A faulty service or process cannot be restarted.

Possible Causes

The CGroup task usage exceeds 90%.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the maximum number of threads that can be concurrently opened by user omm is properly set.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click ⌄ in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**. Click the host name to view its IP address.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the following command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether this number is greater than or equal to **60000**:

systemctl status user-$(id -u).slice | grep limit

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Switch to user **root** and run the following command to change the value for user **omm** to **60000**:

systemctl set-property user-2000.slice TasksMax=60000

Step 5 Change the value of **UserTasksMax** in the **/etc/systemd/logind.conf** file to **60000**. (If the parameter is commented out, uncomment it.) Save the file, wait 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager of the cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **OmmServer** and **NodeAgent** for the target cluster, and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.72 ALM-12187 Failed to Expand Disk Partition Capacity

Alarm Description

The system checks the disk space every 60 seconds. When detecting that the disk space is expanded, the system expands disk partition. This alarm is generated when the disk partition fails to be expanded.

This alarm is cleared when the system detects that the disk partition is successfully expanded.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12187	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
MountDirectoryName	Specifies the directory for which the alarm is generated.

Impact on the System

A disk partition scale-out failure may have the following impacts on the system:

- Data may be lost. (It is important to back up key information before scale-out.)
- The system may be unstable or cannot be started because the system files may be damaged.
- The disk may be unavailable. In this case, you need to format the disk and partition it again.
- The system performance may deteriorate because the disk partition space is not enough. The performance remains low until the disk partition is scaled out successfully.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The growpart scale-out tool is not installed.
- The system fails to execute the command for expanding disk partition.

Handling Procedure

Check whether growpart is installed.

Step 1 Log in to FusionInsight Manager, click **O&M**, and choose **Alarm** > **Alarms** to view the alarm details. In the **Location** column, check the name of the host and mount directory for which the alarm is generated. Click the host name to view its IP address.

Step 2 Log in to the node for which the alarm is generated as user **root**.

Step 3 Run the following command to check whether growpart is installed:

which growpart

If information similar to the following is displayed, the growpart tool is installed. Otherwise, contact O&M personnel to install the growpart tool.

```
[root@xxx ~]#which growpart
/usr/bin/growpart
```

Step 4 Wait for 5 minutes, then choose **O&M**, and choose **Alarm** > **Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Run the disk partition expansion command.

Step 5 Run the following command to view the disk and partition information:

lsblk

Search for the partition and the disk based on the mount directory name in the alarm location information, and check the disk and partition sizes.

In the following example, the mount directory is **/srv/BigData/data1**, the used disk is **/dev/vdb**, and the disk partition is **/dev/vdb1**.

```
[root@                    ~]# lsblk
NAME   MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
loop0    7:0    0  1.5G  0 loop /media
vda    253:0    0  500G  0 disk
├─vda1 253:1    0  220G  0 part /
├─vda2 253:2    0    1K  0 part
├─vda5 253:5    0   10G  0 part /tmp
├─vda6 253:6    0   10G  0 part /var
├─vda7 253:7    0   60G  0 part /srv/BigData
└─vda8 253:8    0  180G  0 part /var/log
vdb    253:16   0  650G  0 disk
└─vdb1 253:17   0  600G  0 part /srv/BigData/data1
```

Step 6 Run the following command to expand the partition using growpart:

growpart *Data disk Partition number*

Run the following command:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

growpart /dev/vdb 1

If information similar to the following is displayed, the execution is successful. If the execution fails, contact O&M personnel.

```
[root@host-                    ~]# growpart /dev/vdb 1
CHANGED: partition=1 start=2048 old: size=1258287104 end=1258289152 new: size=1363146719 end=1363148767
```

Step 7 Run the following command to expand the file system size of the disk partition:

resize2fs *Disk partition*

Run the following command:

resize2fs /dev/vdb1

If information similar to the following is displayed, the execution is successful:

```
[root@host-                    ~]# resize2fs /dev/vdb1
resize2fs 1.46.4 (18-Aug-2021)
Filesystem at /dev/vdb1 is mounted on /srv/BigData/data1; on-line resizing required
old_desc_blocks = 75, new_desc_blocks = 82
The filesystem on /dev/vdb1 is now 170393339 (4k) blocks long.
```

Step 8 Wait for 5 minutes, click **O&M**, and choose **Alarm** > **Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.73 ALM-12188 diskmgt Disk Monitoring Unavailable

Alarm Description

NodeAgent checks the status of the diskmgt disk monitoring service every 5 minutes. This alarm is generated when diskmgt disk monitoring is unavailable.

This alarm is cleared when the diskmgt disk monitoring service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12188	Minor	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When diskmgt disk monitoring is unavailable, the read-only detection of the device partition file system, device partition loss detection, and disk partition scale-out detection cannot be performed.

Possible Causes

- The diskmgt disk monitoring service does not exist.
- The diskmgt disk monitoring service is not started.

Handling Procedure

Check whether the diskmgt disk monitoring service exists.

Step 1 Log in to FusionInsight Manager, click **O&M**, and choose **Alarm** > **Alarms** to view the alarm details. In the **Location** column, check the name of the host for which the alarm is generated. Click the host name to view its IP address.

Step 2 Log in to the node for which the alarm is generated as user **root**.

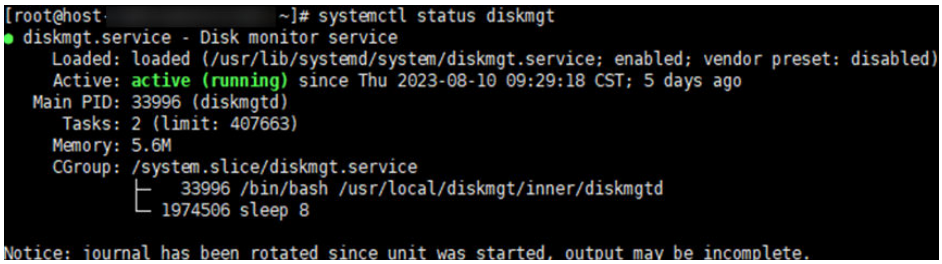
Step 3 Run the following command to check whether the core service file exists:

stat /usr/local/diskmgt/inner/diskmgtd

If the file does not exist, contact O&M personnel.

Start the diskmgt disk monitoring service.

Step 4 Run the following command to start the diskmgt disk monitoring service:



systemctl restart diskmgt

Step 5 Run the following command to check whether the diskmgt disk monitoring service is started:

systemctl status diskmgt

- If information similar to the following is displayed, the service is started successfully. Go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, contact O&M personnel.

Step 6 Wait for 5 minutes, click **O&M**, and choose **Alarm** > **Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.74 ALM-12190 Number of Knox Connections Exceeds the Threshold

Alarm Description

The system periodically checks the number of connections to all Knox topologies. This alarm is generated when the number of connections to a topology exceeds the threshold (90% by default). This alarm is automatically cleared when the number of connections to a topology falls below the threshold.

NOTE

This alarm applies to clusters of MRS 3.1.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12190	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Topology	Specifies the Knox topology for which the alarm was generated.

Impact on the System

The topology may reach the upper limit of connections and fail to forward requests, adversely affecting the MRS functions.

Possible Causes

Hue or Manager is too frequently used, but the default maximum number of Knox connections is small.

Handling Procedure

Step 1 Log in to active and standby OMS nodes as user **root**, respectively.

Step 2 Add the following configuration to the **gateway-site.xml** file on the active and standby OMS nodes to increase the number of thread pools:

vi /opt/knox/conf/gateway-site.xml

```
<property>
<name>gateway.httpclient.maxConnections</name>
<value>64</value>
</property>
```

Step 3 Log in to the active OMS node as user **omm** and run the following command to restart the Knox process:

sh /opt/knox/bin/restart-knox.sh

Step 4 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Contact O&M personnel to rectify the fault.

----End

9.11.75 ALM-12191 Disk I/O Usage Exceeds the Threshold

Alarm Description

The system checks the disk I/O usage every 30 seconds and compares the actual disk I/O usage with the threshold. This alarm is generated when the disk I/O usage exceeds the threshold for multiple consecutive times (**10** by default).

If the **hit number** is **1**, this alarm is cleared when the disk I/O usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the disk I/O usage is less than or equal to 90% of the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12191	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The disk configuration cannot meet service requirements. The disk I/O usage reaches the upper limit. Alternatively, services are in peak hours. The disk I/O usage reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual disk I/O usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Host** > **Disk** > **Disk IO Utilization**.
2. Click the edit button next to **Trigger Count** to change it to a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the disk I/O usage reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of the disk I/O usage for about 5 minutes. If the disk I/O usage exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the disk specification.

If **Disk IO Utilization** chart is not displayed, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the disk specification.

Step 6 Check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.76 ALM-12192 Host Load Exceeds the Threshold

Alarm Description

The system checks the average load every 30 seconds and compares the actual average load with the threshold. This alarm is generated when the average load exceeds the threshold for multiple consecutive times (10 by default).

This alarm is cleared when **Trigger Count** is **1** and the average load is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the average load is less than or equal to 90% of the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12192	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

The host cannot meet service requirements. The average load reaches the upper limit. Alternatively, requirements surged during peak hours, and the average load reaches the upper limit in a short period.

Handling Procedure

Check the host CPU load.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 2 On the **Hosts** page, select the host for which the alarm is generated. Click the **Chart** tab, select **Host Status**, and check whether the **Average Host Load per CPU Core** is greater than 3.

- If yes, the system is overloaded. Go to **Step 3**.
- If no, go to **Step 8**.

Step 3 Log in to the host for which the alarm is reported as user **omm**.

Step 4 Run the **top** command to check whether the **us** value of **%Cpu(s)** is greater than 80.

9.11.77 ALM-12200 Password Is About to Expire

Alarm Description

The system checks whether a user password is about to expire at 1:00 a.m. every day. This alarm is generated when a user password is about to expire in less than 5 days by default.

This alarm is cleared when the password is about to expire in at least five days by default.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12200	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
Additional Information	Details	Specifies that the username of password that is about to expire.

Impact on the System

The account cannot be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The password is about to expire.

Handling Procedure

Change the user password.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, and view and record the name of the user whose password is about to expire in additional information.

Step 2 Change the password.

Step 3 If DataArts Studio is interconnected, check whether DataArts Studio jobs are using a password that is about to expire. If yes, go to the DataArts Studio management center to change the password. Otherwise, a large number of jobs may fail.

Step 4 Check whether the alarm is automatically cleared after 1:00 a.m. the next day.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Select **Controller** for **Service** and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.78 ALM-12201 Process CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage every 30 seconds and compares the check result with the default threshold. This alarm is generated when the CPU usage exceeds the threshold for multiple consecutive times (**10** by default).

This alarm is cleared when **Trigger Count** is **1** and the CPU usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the CPU usage is less than or equal to 90% of the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12201	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit. Alternatively, services are in peak hours. The CPU usage reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual CPU usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds** > **OMS** > **OMSServices** > **CPU** > **Process Used CPU (OMS)**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.

3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the CPU usage reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of the host CPU usage for about 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the MRS cluster administrator to increase the CPU.

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the CPU specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **OmmServer** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

9.11.79 ALM-12202 Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of main OMS processes every 30 seconds. This alarm is generated when the memory usage of main OMS processes is greater than 90% (default value) of the maximum memory.

This alarm is cleared when the memory usage of main OMS processes is less than or equal to 90% of the maximum memory.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12202	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

If the memory usage of main OMS processes is too high, the performance of these processes deteriorates, and even memory overflow occurs. As a result, main OMS processes are unavailable, and OMS tasks are slow or fail to run.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The memory usage of main OMS processes is too high or the memory is inappropriately allocated.

Handling Procedure

Check the memory usage of main OMS processes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, record the process name in **Location**, click the reported host name, and record the service IP address of the host.

Step 2 Choose **System** > **OMS** to view the **OMS Process Memory Usage Ratio** chart. Check whether the memory usage of the processes reaches the threshold (90% by default) at the time when the alarm is generated.

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

- If yes, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 Contact O&M personnel to modify the memory configurations of the processes.

Step 4 Restart the processes for which the alarm is generated.

Step 5 Check whether the alarm is cleared in 10 minutes.

- If yes, no further action is required.
- If the threshold is not reached, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **OmmServer** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.80 ALM-12203 Process Full GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of main OMS processes every 30 seconds. If the GC duration of an OMS process exceeds the threshold for three consecutive times, this alarm is generated. You can choose **O&M** > **Alarm** > **Thresholds** > **OMS** > **OMSServices** to change the threshold.

This alarm is cleared when the GC duration of the OMS process is shorter than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12203	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger condition	Specifies the alarm triggering condition.

Impact on the System

Read and write performance deteriorates. As a result, the task execution may slow down and even the service may restart unexpectedly.

Possible Causes

The memory of main OMS processes is too high or inappropriately allocated, causing frequent occurrence of the full GC.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, record the process name in **Location**, click the reported host name, and record the service IP address of the host.

Step 2 Choose **System** > **OMS**, view the **Full GC Duration of an OMS Process** - *Process Name* chart, and check whether the GC duration is longer than 12 seconds (default value).

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Contact O&M personnel to modify the memory configurations of the processes.

Step 4 Restart the process.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **OmmServer** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.81 ALM-12204 Wait Duration of a Disk Read Exceeds the Threshold

Alarm Description

The system checks the wait duration of a disk read every 30 seconds and compares the actual wait duration with the threshold. This alarm is generated

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

when the wait duration exceeds the threshold (10s by default) for multiple consecutive times.

This alarm is cleared when the wait duration is less than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12204	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The disk configuration cannot meet service requirements. The disk I/O performance reaches the upper limit. Alternatively, services are in peak hours. The wait duration of a disk read reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual disk I/O usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Average Time Required for Each Read operation**.
2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the average time required for each read operation reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of average time required for each read operation for about 5 minutes. If the wait duration exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the disk specification.

If the **Average Time Required for Each Read Operation** chart is unavailable, click the drop-down arrow on the right, select **Customize**, select the corresponding item, and click **OK**.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the disk specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.82 ALM-12205 Wait Duration of a Disk Write Exceeds the Threshold

Alarm Description

The system checks the wait duration of a disk write every 30 seconds and compares the actual wait duration with the threshold. This alarm is generated when the wait duration exceeds the threshold (10s by default) for multiple consecutive times.

This alarm is cleared when the wait duration is less than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12205	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- Latency: Service processes may run slowly and there is a latency.
- Service failure: Service processing may be slow, time out, or fail. As a result, jobs may fail to run.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The disk configuration cannot meet service requirements. The disk I/O performance reaches the upper limit. Alternatively, services are in peak hours. The wait duration of a disk write reaches the upper limit in a short period.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Modify the alarm threshold and alarm trigger count based on the actual disk I/O usage.

1. Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Disk** > **Average Time Required for Each Write Operation**.
2. Click the edit button next to **Trigger Count** to set it a proper value based on the actual service usage.

   NOTE

   Trigger Count indicates how many consecutive times the threshold is reached when the alarm is triggered.
3. Click **Modify** in the **Operation** column of the row that contains the rule and change the alarm threshold.

Step 2 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check whether the average time required for each write operation reaches the upper limit.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details and click the name of the host for which the alarm is generated in **Location** area.

Step 4 On the overview page of the host, observe the real-time data of average time required for each write operation for about 5 minutes. If the wait duration exceeds the threshold for multiple times, contact the MRS cluster administrator to improve the disk specification.

If the **Average Time Required for Each Write Operation** chart is not displayed, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Check whether it was the peak hour. If this alarm was generated during peak hours, expand the node capacity or contact the MRS cluster administrator to improve the disk specification.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **NodeAgent** for the target cluster, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.83 ALM-12206 Password Has Expired

Alarm Description

The system checks whether a user password has expired at 1:00 a.m. every day. This alarm is generated when a user password has expired.

This alarm is cleared when the user password in the system is within the validity period.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12206	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
Additional Information	Details	Specifies that the username of password that has expired.

Impact on the System

The account cannot be used.

Possible Causes

The user password has expired.

Handling Procedure

Change the user password.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, and view and record the name of the user whose password has expired in additional information.

Step 2 Change the user password that has expired.

Step 3 If DataArts Studio is interconnected, check whether DataArts Studio jobs are using an expired user password. If yes, go to the DataArts Studio management center to change the password and execute the affected jobs again.

Step 4 Check whether the alarm is automatically cleared after 1:00 a.m. the next day.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Select **Controller** for **Service** and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.84 ALM-12207 Slow Disk Processing Timeout

Alarm Description

When slow disk detection is enabled, the system checks the slow disk processing status every 10 minutes by default. This alarm is generated when the following disk or node status does not change within 10 hours.

Disk: Automatic isolation aborted, isolated, isolation failed, and de-isolation failed.

Node: Isolated, Isolation failed, Isolation cancellation failed, Node startup failed, and De-isolated.

This alarm is automatically cleared when the status of the node or disk that is in the processing timeout state changes.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12207	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	DiskName	Specifies the disk for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Description
Additional Information	HostName	Specifies the host for which the alarm was generated.
	DiskName	Specifies the disk for which the alarm was generated.
	Details	Specifies that the description of slow disk isolation.

Impact on the System

If an isolated disk or node cannot be restored in a timely manner, the running of components may be affected, which further affects user services.

Possible Causes

The isolation status of the disk or node exceeds the configured timeout period for processing slow disks.

Handling Procedure

Check the cause of the slow disk processing timeout.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, expand the alarm details, and view and record the host or disk for which the alarm is generated.

Step 2 Log in to the active OMS node as user **root** and run the following command to check the cause of slow disk processing timeout in the controller log and check whether there is obvious error information:

vi /var/log/Bigdata/controller/controller.log

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Log in to the node for which the alarm is generated as user **root** and run the following command to check the cause of slow disk processing timeout in the agent log and check whether any error information is displayed:

vi /var/log/Bigdata/nodeagent/agentlog/agent.log

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Contact O&M personnel to rectify the fault and manually run the command for the slow disk or node. After the command is executed, observe for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Select **Controller** and **NodeAgent** for **Service**, select the active/standby OMS node and the node for which the alarm is generated in the **Host** area, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.85 ALM-13000 ZooKeeper Service Unavailable

Description

The system checks the ZooKeeper service status every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

ZooKeeper cannot provide coordination services for upper layer components and the components (such as Yarn and Flink) that depend on ZooKeeper may not run properly.

Possible Causes

- The DNS is installed on the ZooKeeper node.
- The network is faulty.
- The KrbServer service is abnormal.
- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.

Procedure

Check the DNS.

Step 1 Check whether the DNS is installed on the node where the ZooKeeper instance is located. On the Linux node where the ZooKeeper instance is located, run the **cat /etc/resolv.conf** command to check whether the file is empty.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Run the **service named status** command to check whether the DNS is started.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.

Step 4 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the network status.

Step 5 On the Linux node where the ZooKeeper instance is located, run the **ping** command to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Modify the IP addresses in **/etc/hosts** and add the host name and IP address mapping.

Step 7 Run the **ping** command again to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 8**.
- If no, go to **Step 23**.

Step 8 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the KrbServer service status (Skip this step if the normal mode is used).

Step 9 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services**.

Step 10 Check whether the KrbServer service is normal.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Rectify the fault by referring to **ALM-25500 KrbServer Service Unavailable** and check whether the KrbServer service is restored.

- If yes, go to **Step 12**.
- If no, go to **Step 23**.

Step 12 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the ZooKeeper service instance status.

Step 13 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **quorumpeer**.

Step 14 Check whether the ZooKeeper instances are normal.

- If yes, go to **Step 18**.
- If no, go to **Step 15**.

Step 15 Select instances whose status is not good, and choose **More** > **Restart Instance**.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

Step 16 Check whether the instance status is good after restart.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check disk status.

Step 18 On FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Service** > **ZooKeeper** > **quorumpeer**, and check the node host information of the ZooKeeper instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 19 On FusionInsight Manager, click **Host**.

Step 20 In the **Disk** column, check whether the disk space of each node where ZooKeeper instances are located is insufficient (disk usage exceeds 80%).

- If yes, go to **Step 21**.
- If no, go to **Step 23**.

Step 21 Expand disk capacity. For details, see **ALM-12017 Insufficient Disk Capacity**.

Step 22 On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 24 Select the following nodes in the required cluster from the **Service**: (KrbServer logs do not need to be downloaded in normal mode.)

- ZooKeeper
- KrbServer

Step 25 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.86 ALM-13001 Available ZooKeeper Connections Are Insufficient

Description

The system checks ZooKeeper connections every 60 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

When the **Trigger Count** is 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to 90% of the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, the ZooKeeper cannot process external connections. As a result, upstream components (such as Yarn and Flink) cannot run properly.

Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not comply with the actual scenario.

Procedure

Check connection status.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Connections Are Insufficient** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Obtain the PID of the ZooKeeper process. Log in to the node involved in this alarm as user **root** and run the **pgrep -f proc_zookeeper** command.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the PID can be correctly obtained.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the following command based on the obtained PID: **lsof -i|grep** *$pid* **| awk '{print $9}' | cut -d : -f 2 | cut -d \>-f 2 | awk '{a[$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10**. (The PID obtained in the preceding step is used.)

Step 5 Check whether node IP addresses and number of connections are successfully obtained.

- If yes, go to **Step 6**.
- If no, go to **Step 15**.

Step 6 Obtain the ID of the port connected to the process. Run the following command based on the obtained PID and IP address: **lsof -i|grep** *$pid* **| awk '{print $9}'|cut -d \> -f 2 |grep** *$IP*| **cut -d : -f 2**. (The PID and IP address obtained in the preceding step are used.)

Step 7 Check whether the port ID is successfully obtained.

- If yes, go to **Step 8**.
- If no, go to **Step 15**.

Step 8 Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep** *$port*. (The port ID obtained in the preceding step is used.)

Step 9 Check whether the process ID is successfully obtained.

- If yes, go to **Step 10**.
- If no, go to **Step 15**.

Step 10 Check whether connection leakage occurs on the process based on the obtained process ID.

- If yes, go to **Step 11**.
- If no, go to **Step 12**.

Step 11 Close the process where connection leakage occurs and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Step 12 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **Performance** and increase the value of **maxCnxns** as required.

Step 13 Save the configuration and restart the ZooKeeper service.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 14 Check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 16 Select **ZooKeeper** in the required cluster from the **Service**:

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected log information.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.87 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the ZooKeeper service every 30 seconds. The alarm is generated when the direct memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

When the **Trigger Count** is 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than 80% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available memory of ZooKeeper is insufficient, memory overflow may occur and services may break down. As a result, upstream services (such as HDFS and Yarn) fail to run.

Possible Causes

The direct memory of the ZooKeeper instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ZooKeeper Direct Memory Usage Exceeds the Threshold**. Check the IP address of the instance that reports the alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance** > **quorumpeer(the IP address checked)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**.

Step 3 Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, delete **-XX:MaxDirectMemorySize** from **GC_OPTS**. Then go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 6**.

Step 5 Save the configuration and restart the ZooKeeper service.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 6 Check whether the **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **ZooKeeper** in the required cluster from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.88 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) duration of the ZooKeeper process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13003	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The ZooKeeper process may respond slowly. Services of upper-layer components (such as YARN, Flink, and Spark) may fail.

Possible Causes

The heap memory of the ZooKeeper process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, click the drop-down list of **GC Duration of the ZooKeeper Process Exceeds the Threshold**. View the IP address of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Instance** > **quorumpeer**. Click the drop-down list in the upper right corner of **Chart**, choose **Customize** > **GC**, select **ZooKeeper GC Duration per Minute**, and click **OK** to check the GC duration statistics of the ZooKeeper process collected every minute.

Step 3 Check whether the GC duration of the ZooKeeper process collected every minute exceeds the threshold (12 seconds by default).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 Check whether memory leakage occurs in the application.

Step 5 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Increase the value of the **GC_OPTS** parameter as required.

NOTE

Generally, **-Xmx** is twice of ZooKeeper data capacity. If the capacity of ZooKeeper reaches 2 GB, set **GC_OPTS** as follows:

-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 6 Save the configuration and restart the ZooKeeper service.

NOTE

The service is unavailable during the restart. Upper-layer services that depend on the service are also affected.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.89 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the ZooKeeper service every 60 seconds. The alarm is generated when the heap memory usage of a ZooKeeper instance exceeds the threshold (95% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available ZooKeeper heap memory is insufficient, memory overflow may cause service breakdown, and upstream components (such as Yarn, Flink, and Spark) may fail to run.

Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, On the displayed interface, click the drop-down button of **ZooKeeper Heap Memory Usage Exceeds the Threshold** and confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Instance**, click **quorumpeer** in the **Role** column of the corresponding IP address. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ZooKeeper reaches 95% of the maximum heap memory specified for ZooKeeper.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** as required. The details are as follows:

1. On the **Instance** tab, click **quorumpeer** in the **Role** column of the corresponding IP address. Choose **Customize** > **CPU and Memory** in the upper right corner, and select **ZooKeeper Heap And Direct Buffer Resource**, click **OK** to check the heap memory used by ZooKeeper.
2. Change the value of **-Xmx** in the **GC_OPTS** parameter based on the actual heap memory usage. Generally, the value is twice the size of the ZooKeeper data volume. For example, if 2 GB ZooKeeper heap memory is used, the following configurations are recommended: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1

Step 5 Save the configuration and restart the ZooKeeper service.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.90 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components

Description

The system sets quotas for each ZooKeeper top-level directory in the **customized.quota** configuration item and components every 5 hours. This alarm is generated when the system fails to set the quota for a directory.

This alarm is cleared when the setting succeeds after a failure.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13005	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

Components can write a large amount of data to the top-level directory of ZooKeeper. As a result, services or services of upstream components (such as Yarn, Flink, and Spark) that depend on the top-level directory are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The quota for the alarm directory is inappropriate.

Procedure

Check whether the quota for the alarm directory is appropriate.

Step 1 Log in to FusionInsight Manager, and choose **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper**. On the displayed page, choose **Configurations** > **All Configurations** > **Quota**. Check whether the directory for which the alarm is reported and its quota exist in the **customized.quota** configuration item.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 Check whether the alarm directory for which the alarm is reported is in the following alarm list.

Table 9-117 Component alarm directory

Component	Alarm Directory
Hbase	/hbase
Hive	/beelinesql
Yarn	/rmstore
Storm	/stormroot
Streaming	/storm
Kafka	/kafka

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 View the component of the alarm directory in the table, open the corresponding service page, and choose **Configurations** > **All Configurations**. On the displayed page, search for **zk.quota** in the upper right corner. The search result is the quota of the alarm directory.

Step 4 Check whether the quota of the alarm directory for which the alarm is reported is appropriate. The quota must be greater than or equal to the actual value, which can be obtained in **Trigger Condition**.

Step 5 Modify the **services.quota** value as prompted and save the configuration.

Step 6 After the time specified by **service.quotas.auto.check.cron.expression**, check whether the alarm is cleared.

The **service.quotas.auto.check.cron.expression** parameter indicates the scheduled expression used by ZooKeeper to set the directory quota. You can choose **Cluster > Services > ZooKeeper > Configurations > All Configurations**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

on FusionInsight Manager and set this parameter. The default value is */5 * * * *, indicating 5 minutes.

- If it is, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.91 ALM-13006 Znode Number or Capacity Exceeds the Threshold

Description

The system periodically detects the status of secondary Znode in the ZooKeeper service data directory every four hours. This alarm is generated when the number or capacity of secondary Znodes exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13006	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large amount of data is written to the ZooKeeper data directory space. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on this directory are abnormal. For details, see the alarm location information.

Possible Causes

A large amount of data is written to the ZooKeeper data directory. The threshold is not appropriate.

Procedure

Check whether a large amount of data is written to the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Znode Number or Capacity Exceeds the Threshold**. Confirm the Znode for which the alarm is generated in Location Information.

Step 2 Log in to FusionInsight Manager, open the ZooKeeper service interface, and select **Resource**. In the table **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written to the top-level Znode for which the alarm is reported.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Log in to the ZooKeeper client and delete the data in the top-level Znode.

Step 4 Log in to FusionInsight Manager and open the ZooKeeper service interface. On the **Resource** page, choose > **By Znode quantity** in **Used Resources (By Second-Level Znode)**. **Threshold Configuration of By Znode quantity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.Znode.count** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations > Quota**.

Step 5 In the **Used Resources (By Second-Level Znode)**, choose > **By capacity**. The **Threshold Settings** page of **By Capacity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.data.size** by choosing **Cluster >** *Name of the desired cluster* **> Services** > **ZooKeeper** > **Configurations > All Configurations** > **Quota**.

Step 6 Check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.92 ALM-13007 Available ZooKeeper Client Connections Are Insufficient

Description

The system periodically detects the number of active processes between the ZooKeeper client and the ZooKeeper server every 60 seconds. This alarm is generated when the number of connections exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13007	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
HostName	Specifies the host name for which the alarm is generated.
ClientIP	Specifies the client IP address.
ServerIP	Specifies the server IP address.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

A large number of processes are connected to ZooKeeper, and the number of ZooKeeper connections is used up. As a result, services of upstream components (such as Yarn, Flink, and Spark) are abnormal.

Possible Causes

A large number of client processes are connected to ZooKeeper. The thresholds are not appropriate.

Procedure

Check whether there are a large number of client processes connected to ZooKeeper.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Client Connections Are Insufficient**. Confirm the node IP address of the host for which the alarm is generated in the Location Information.

Step 2 Open the ZooKeeper service interface, click **Resource** to enter the **Resource** page, and check whether the number of connections of the client with the IP address specified by **Number of Connections (By Client IP Address)** is large.

- If it is, go to **Step 3**.
- If it is not, go to **Step 4**.

Step 3 Check whether connection leakage occurs on the client process.

Step 4 Click in the **Number of Connections (by Client IP Address)** to enter the **Thresholds** page, and click **Modify** under **Operation**. Increase the threshold by referring to the value of **maxClientCnxns** by choosing **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer**.

Step 5 Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.93 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold

Alarm Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13008	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

When a large amount of data is written to the ZooKeeper data directory space, ZooKeeper cannot provide services for external systems. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Handling Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper**, and click **Resource**. Click **By Znode quantity** in **Used Resources (By Second-Level Znode)**, and check whether a large amount of data is written to the top Znode.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select **Location** from the drop-down list box next to **ALM-13008 ZooKeeper Znode Quantity Usage Exceeds Threshold**, and obtain the Znode path in **ServiceDirectory**.

Step 3 Log in to the ZooKeeper client as a cluster user and delete unnecessary data from the Znode corresponding to the alarm.

Step 4 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.znode.count**, which is the maximum number of ZooKeeper directories. The alarm threshold is 80% of this parameter. Increase the value of this parameter, click **Save**, and restart the service for the configuration to take effect.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select **ZooKeeper** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.94 ALM-13009 ZooKeeper ZNode Capacity Usage Exceeds the Threshold

Alarm Description

The system checks the level-2 znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the total capacity usage exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13009	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
ServiceDirectory	Specifies the directory for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

ZooKeeper cannot provide services for external systems, and the services of upstream components (such as YARN, Flink, and Spark) that depend on the alarm directory are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- A large volume of data has been written to the ZooKeeper data directory.
- The threshold is improperly defined.

Handling Procedure

Check whether a large volume of data is written to the alarm directory.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. Click the drop-down list in the row containing **ALM-13009 ZooKeeper ZNode Capacity Usage Exceeds the Threshold**, and find the ZNode for which the alarm is generated in the **Location** area.

Step 2 Choose **Cluster** > **Services** > **ZooKeeper**. On the page that is displayed, click the **Resource** tab. In the **Used Resources (By Second-Level ZNode)** area, click **By capacity** and check whether a large amount of data is written to the top-level ZNode directory.

- If yes, record the directory to which a large amount of data is written and go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Check whether data in the directory can be deleted.

NOTICE

Deleting data from ZooKeeper is a high-risk operation. Exercise caution when performing this operation.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Log in to the ZooKeeper client and delete unnecessary data from the directory to which a large amount of data is written.

1. Log in to the ZooKeeper client installation directory, for example, **/opt/client**, and configure environment variables.

   cd /opt/client

   source bigdata_env

2. Run the following command to authenticate the user (skip this step for a cluster in normal mode):

   kinit *Component service user*

3. Run the following command to log in to the client tool:

   zkCli.sh -server <*Service IP address of the node where any ZooKeeper instance resides*>:<*Client port*>

4. Run the following command to delete unnecessary data:

   delete *Path of the file to be deleted*

Step 5 Log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.data.size**. The value of **max.data.size** is the maximum

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

capacity quota of the ZooKeeper directory. The unit is byte. Search for the **GC_OPTS** configuration item and check the value of **Xmx**.

Step 6 Compare the values of **max.data.size** and **Xmx*0.65**. The threshold is the smaller value multiplied by 80%. You can change the values of **max.data.size** and **Xmx*0.65** to increase the threshold.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.95 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold

Alarm Description

The system checks the Znode usage of all service directories with quota configured every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13010	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

Impact on the System

When a large amount of data is written to the ZooKeeper data directory space, ZooKeeper cannot provide services for external systems. As a result, services of upper-layer components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

Handling Procedure

Check whether a large amount of data is written into the directory for which the alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.

Step 2 Choose **Cluster** > **Services** > **ZooKeeper** and click **Resource**. In **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written into the top Znode.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, click the arrow next to **ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold**, and obtain the Znode path from **ServiceDirectory** in **Location**.

Step 4 Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Log in to FusionInsight Manager, and choose **Cluster** > **Services** > *Component of the top Znode for which the alarm is generated*. Choose **Configurations** > **All Configurations**, search for **zk.quota.number**, increase its value, click **Save**.

NOTICE

If the Component of the top Znode for which the alarm is generated is ClickHouse, change the value of **clickhouse.zookeeper.quota.node.count**.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **ZooKeeper** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.96 ALM-14000 HDFS Service Unavailable

Description

The system checks the NameService service status every 60 seconds. This alarm is generated when all the NameService services are abnormal and the system considers that the HDFS service is unavailable.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14000	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The ZooKeeper service is abnormal.
- All NameService services are abnormal.
- The number of service requests is too large, and the HDFS health check fails to read and write files.
- The health check fails due to HDFS FullGC.

Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarm page, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the ZooKeeper service fault by following the instructions in **ALM-13000 ZooKeeper Service Unavailable**. Then check whether the running status of the ZooKeeper service is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 13**.

Step 3 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Handle the NameService service exception alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14010 NameService Service Unavailable** is reported.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Handle the abnormal NameService services by referring to the handling method provided in **ALM-14010 NameService Service Is Abnormal**. Then, check whether the alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 13**.

Step 6 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the HDFS health check fails to read or write files due to a large number of service requests.

Step 7 On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** or **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold** is generated.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the abnormal NameService services by following the instructions provided in **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** and **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold**, and check whether the alarm is cleared for each NameService.

- If yes, go to **Step 9**.
- If no, go to **Step 13**.

Step 9 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the health check fails due to HDFS FullGC.

Step 10 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14014 NameNode GC Time Exceeds the Threshold** is reported.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Handle the abnormal NameService services by referring to the handling method provided in **ALM-14014 NameNode GC Time Exceeds the Threshold**. Then check whether the alarm is cleared for each NameService service.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 14 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.97 ALM-14001 HDFS Disk Usage Exceeds the Threshold

Alarm Description

The system checks the HDFS disk usage every 30 seconds and compares the actual HDFS disk usage with the threshold. The HDFS disk usage metric has a default threshold. This alarm is generated when the HDFS disk usage exceeds the threshold.

You can choose **O&M** > **Alarm** > **Thresholds** > **HDFS** and change the threshold.

When **Trigger Count** is **1**, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to the threshold. When **Trigger Count** is greater than **1**, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14001	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

Possible Causes

The disk space configured for the HDFS cluster is insufficient.

Handling Procedure

Check the disk capacity and delete unnecessary files.

Step 1 On the homepage of FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**.

Step 2 In the **Chart** area, click **Real-time**, and view the value of the monitoring item **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (**80%** by default). If the monitoring item is not displayed, click the drop-down list in the upper right corner of the **Chart** area, choose **Customize** > **Disk**, and select **Percentage of HDFS Capacity**.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 In the **Basic Information** area, click the **NameNode(Active)** of the failure NameService and the HDFS WebUI page is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 On the HDFS web user interface (WebUI), click **Datanodes** tab. In the **Block pool used** column, view the disk usage of all DataNodes to check whether the disk usage of any DataNode exceeds the threshold.

- If yes, go to **Step 6**.
- If no, go to **Step 11**.

Step 5 Log in to the node as user **root** where the cluster client is installed.

Step 6 Run the following command to go to the client installation directory and complete authentication:

```
cd /opt/client
```

Load environment variables:

```
source bigdata_env
```

If Kerberos authentication is enabled for the cluster, run the following command to complete authentication as the cluster user that has the operation permissions for HDFS.

You need to create related users on Manager in advance or contact the cluster administrator to obtain the users. For details, see **Creating an MRS Cluster User**.

```
kinit hdfsuser
```

Step 7 Run the following command to delete unnecessary HDFS files:

1. Run the following command to check files or sub-directories in the corresponding folder:
   hdfs dfs -ls *Folder name*
2. Run the following command to query the HDFS file directory size:
   hdfs dfs -du *HDFS file directory*

   For example, if you run the above command to query the size of files or sub-directories in the **/tmp** folder, the following command output is returned, indicating that the **/tmp/hadoop-yarn** directory occupies 622,222,017 bytes:

   ```
   0          0          /tmp/.testHDFS
   207407339  622222017  /tmp/hadoop-yarn
   0          0          /tmp/hive
   0          0          /tmp/hive-scratch
   0          0          /tmp/logs
   ...
   ```

3. Run the following command to delete confirmed unnecessary HDFS files:
   hdfs dfs -rm -r *HDFS file or directory path*

WARNING

Deleting files is a high-risk operation. Ensure that the files to be deleted are unnecessary files to prevent data loss.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Expand the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Expand the capacity of the cluster node where HDFS is deployed. For details, see **Scaling Out an MRS Cluster**.

Step 10 Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

Step 13 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

None

9.11.98 ALM-14002 DataNode Disk Usage Exceeds the Threshold

Alarm Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. A default threshold range is provided for the DataNode disk usage. This alarm is generated when the DataNode disk usage exceeds the threshold.

You can choose **O&M** > **Alarm** > **Thresholds** > **HDFS** and change the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the DataNode disk usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the DataNode disk usage is less than or equal to 80% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14002	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Insufficient disk space will impact data write to HDFS.

Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

Handling Procedure

Check whether the cluster disk capacity is insufficient.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the **ALM-14001 HDFS Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Handle the alarm by following the instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Step 3 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the balance status of DataNodes.

Step 4 On FusionInsight Manager, choose **Hosts**. Check whether the number of DataNodes on each rack is almost the same. If the difference is large, adjust the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

racks to which DataNodes belong to ensure that the number of DataNodes on each rack is almost the same. Restart the HDFS service for the settings to take effect.

NOTE

The service is unavailable during the restart, and upper-layer services that depend on the service will also be affected.

Step 5 Choose **Cluster** > **Services** > **HDFS**.

Step 6 In the **Basic Information** area, click **NameNode(Active)**. The HDFS web UI is displayed.

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 7 In the **Summary** area of the HDFS web UI, check whether the value of **Max** is 10% greater than that of **Median** in **DataNodes usages**.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Balance skewed data in the cluster.

Log in to the node where the MRS cluster client is installed, as user **root**.

1. If Kerberos authentication is not enabled for the MRS cluster, run the following command to switch to user **omm**:
   ```
   su - omm
   ```
2. Run the following command to go to the client installation directory and load environment variables:
   ```
   cd Client installation directory
   source bigdata_env
   ```
3. If Kerberos authentication is enabled for the cluster, complete security authentication:
   ```
   kinit Username of the service user who has the HDFS operation permissions
   ```
   Enter the required password.

Step 9 Run the following command to balance data distribution:

```
hdfs balancer -threshold 10
```

-threshold < Percentage >: specifies the balancing threshold (10% by default).

When the difference between the node storage usage and the average cluster storage usage exceeds the threshold, data migration is triggered.

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 13 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.99 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

Alarm Description

The system checks the lost HDFS blocks every 30 seconds and compares the actual lost blocks with the threshold. This alarm is generated when the number of lost HDFS blocks usage exceeds the threshold.

You can choose **O&M** > **Alarm** > **Thresholds** > **HDFS** > **Lost Blocks** and change the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14003	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- HDFS data is deleted.

Handling Procedure

Check the DataNode instance.

Step 1 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS** > **Instances**.

Step 2 Check whether the **Running Status** of all DataNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Step 3 Restart the DataNode instance and check whether the DataNode instance restarts successfully.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Delete the damaged file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS** > **NameNode(Active)**. On the WebUI page of the HDFS, view the information about lost blocks.

- If a block is lost, an error message is displayed on the HDFS web UI.
- For clusters with Kerberos authentication enabled, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 The user checks whether the file containing the lost data block is useful.

NOTE

Files generated in directories **/mr-history**, **/tmp/hadoop-yarn**, and **/tmp/logs** during MapReduce task execution are unnecessary.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 The user checks whether the file containing the lost data block is backed up.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

Step 8 Log in to the node where the HDFS cluster client is installed, as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password.

- For clusters with Kerberos authentication enabled:
  ```
  cd Client installation directory
  source bigdata_env
  kinit hdfs
  ```
- For clusters with Kerberos authentication disabled:
  ```
  su - omm
  cd Client installation directory
  source bigdata_env
  ```

Step 9 Run the following command to delete a lost file. If the file where the lost block is located is a useful file, you need to write the file again to restore file data.

```
hdfs fsck / -delete
```

WARNING

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 12 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.100 ALM-14006 Number of HDFS Files Exceeds the Threshold

Alarm Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the number of HDFS files is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of HDFS files is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14006	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If there are too many HDFS files, the HDFS system may respond slowly or the disk space may be used up.

Possible Causes

The number of HDFS files exceeds the threshold.

Handling Procedure

Check the number of files in the system.

Step 1 On FusionInsight Manager, check the number of HDFS files. Specifically, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **File and Block**, and select **HDFS File** and **Total Blocks**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **GC_OPTS** parameter under **NameNode**.

Step 3 Configure the threshold of the number of configuration file objects. Specifically, change the value of **Xmx** (GB) in the **GC_OPTS** parameter. The threshold (specified by y) is calculated as follows: y = 0.2007 x Xmx - 0.6312, where x indicates the memory capacity Xmx (GB) and y indicates the number of files (unit: kW). Adjust the memory size as required.

Step 4 Check that the value of **GC_PROFILE** is **custom** so that the **GC_OPTS** configuration can take effect. Click **Save**, click **More**, and select **Restart Service** to restart the service.

NOTE

The service is unavailable during the restart. Upper-layer services that depend on the service are also affected.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether needless files exist in the system.

Step 6 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env** to configure the environment variables.

If the cluster uses the security mode, perform security authentication.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the MRS cluster administrator.

Step 7 Run **hdfs dfs -ls** *file or directory* to check whether the files in the directory can be deleted.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Run the **hdfs dfs -rm -r** *file or directory path* command. After deleting unnecessary files, wait until the files are retained in the recycle bin for a period longer than the value of **fs.trash.interval** on the NameNode. Then check whether the alarm is cleared.

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Configuration rules of the NameNode JVM parameter

Default value of the NameNode JVM parameter **GC_OPTS**:

-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=3072 -Djdk.tls.rejectClientInitiatedRenegotiation=true -Djava.io.tmpdir=${Bigdata_tmp_dir}

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The number of NameNode files is proportional to the used memory size of the NameNode. When file objects change, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 9-118 NameNode JVM configuration

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

9.11.101 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS NameNode Heap Memory usage every 30 seconds and compares the actual Heap memory usage with the threshold. The HDFS NameNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS NameNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14007	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS NameNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS NameNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in the HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of **HDFS->NameNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of files in **Step 6** and the NameNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the heap memory parameters of the NameNode based on the mapping between the number of file objects and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 12 Select the following nodes in the required cluster from the **Service**:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- ZooKeeper
- HDFS

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.102 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold

Description

The system checks the HDFS DataNode Heap Memory usage every 30 seconds and compares the actual Heap Memory usage with the threshold. The HDFS DataNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS DataNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The HDFS DataNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS DataNode Heap Memory is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **DataNodes** tab, and check the number of blocks of all DataNodes related to the alarm.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the GC_OPTS memory parameter of **HDFS->DataNode**.

Adjust the configuration in the system.

Step 8 Check whether the memory is configured properly based on the number of blocks in **Step 6** and the DataNode Heap Memory parameters in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the heap memory parameters of the DataNode based on the mapping between the number of blocks and the memory. Click **Save** and choose **Dashboard** > **More** > **Restart Service**.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 12 Select **HDFS** in the required cluster from the **Service**.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

9.11.103 ALM-14009 Number of Dead DataNodes Exceeds the Threshold

Description

The system periodically detects the number of dead DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of DataNodes in the Dead state has a default threshold. This alarm is generated when the number exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

DataNodes that are in the Dead state cannot provide HDFS services. As a result, users cannot read or write files.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.
- The NameNodes are not restarted after the DataNode is deleted.

Procedure

Check whether DataNodes are faulty.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. The **HDFS Status** page is displayed.

Step 2 In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 On the HDFS WebUI, click the **Datanodes** tab. In the **In operation** area, click **Filter** to check whether **down** is in the drop-down list.

- If yes, select **down**, record the information about the filtered DataNodes, and go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** to check whether recorded DataNodes exist in the instance list.

- If all recorded DataNodes exist, go to **Step 5**.
- If no recorded DataNodes exists, go to **Step 6**.
- If some of the recorded DataNodes exist, go to **Step 7**.

Step 5 Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 6 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 7 Select all NameNode instances, choose **More** > **Instance Rolling Restart** to restart them. Locate the DataNode instance, click **More** > **Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the network between the NameNode and the DataNode.

Step 8 Log in to the faulty DataNode on the management page as user **root**, and run the **ping** *IP address of the NameNode* command to check whether the network between the DataNode and the NameNode is abnormal.

On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**. In the instance list, view the service plane IP address of the faulty DataNode.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the network fault, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the DataNode is overloaded.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Rectify the fault by following the handling procedure of **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**. Then, check whether the alarm is cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 13**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the NameNode is overloaded.

Step 13 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and check whether the alarm **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Handle the alarm by referring to the handling procedure in **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 15**.
- If no, go to **Step 16**.

Step 15 Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 17 Select **HDFS** in the required cluster from the **Service**.

Step 18 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.104 ALM-14010 NameService Service Is Abnormal

Alarm Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14010	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The KrbServer service is abnormal.
- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

Handling Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the KrbServer service exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Click **KrbServer**.

Step 4 Click **Instances**. On the KrbServer management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the instance successfully restarts.

- If yes, go to **Step 5**.
- If no, go to **Step 24**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the JournalNode instance status.

Step 6 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 7 Choose **HDFS** > **Instances**.

Step 8 Check whether the **Running Status** of the JournalNode is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

NOTE

If the number of restarted JournalNode instances exceeds one third of the total number of JournalNode instances, the HDFS service may be faulty.

- If yes, go to **Step 10**.
- If no, go to **Step 24**.

Step 10 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the DataNode instance status.

Step 11 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

Step 12 Click **Instances** and check whether **Running Status** of all DataNodes is **Normal**.

- If yes, go to **Step 15**.
- If no, go to **Step 13**.

Step 13 Click **Instances**. On the DataNode management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the DataNode successfully restarts.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

- If yes, go to **Step 14**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 15**.

Step 14 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check disk status.

Step 15 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Host**.

Step 16 In the **Disk** column, check whether the disk space is insufficient.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Expand the disk capacity.

Step 18 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check whether NameNode is in the safe mode.

Step 19 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click **NameNode(Active)** of the abnormal NameService. The NameNode web UI is displayed.

NOTE

By default, the admin user does not have the management rights of other components. If the page cannot be opened or the content is not completely displayed due to insufficient permission when you access the native page of a component, you can manually create a user with the management rights of the corresponding component to log in to the component.

Step 20 On the NameNode web UI, check whether "Safe mode is ON." is displayed.

Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.

- If yes, go to **Step 21**.
- If no, go to **Step 24**.

Step 21 Log in to the client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata_env** command. If the cluster uses the security mode, perform security authentication. Run the **kinit hdfs** command and enter the password as prompted. The password can be obtained from the MRS cluster administrator. If the cluster uses the non-security mode, log in as user **omm** and run the command. Ensure that user **omm** has the client execution permission.

Step 22 Run **hdfs dfsadmin -safemode leave**.

Step 23 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Collect the fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 24 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 25 In the **Service** area, select the following nodes of the desired cluster.

- ZooKeeper
- HDFS

Step 26 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 27 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.105 ALM-14011 DataNode Data Directory Is Not Configured Properly

Description

The DataNode parameter **dfs.datanode.data.dir** specifies DataNode data directories. This alarm is generated when a configured data directory cannot be created, a data directory uses the same disk as other critical directories in the system, or multiple directories use the same disk immediately.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode for which the alarm is generated is restarted.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the DataNode data directory is mounted to the root directory or a critical directory, the disk space of the root directory or critical directory will be used up after long time running and the system will be faulty.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk with critical directories, such as **/** or **/boot**.
- Multiple directories in the DataNode data directory use the same disk.

Procedure

Check the alarm cause and information about the DataNode for which the alarm is generated.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

Delete directories that do not comply with the disk plan from the DataNode data directory.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, click the DataNode instance on the node for which the alarm is generated.

Step 4 Click **Instance Configurations** and view the value of the DataNode parameter **dfs.datanode.data.dir**.

Step 5 Check whether all DataNode data directories are consistent with the disk plan.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.

Step 7 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** and restart the DataNode instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Log in to the DataNode for which the alarm is generated as user **root**.

- If the alarm cause is "The DataNode data directory fails to be created", go to **Step 10**.
- If the alarm cause is "The DataNode data directory uses the same disk with critical directories, such **/** or **/boot**", go to **Step 17**.
- If the alarm cause is "Multiple directories in the DataNode data directory uses the same disk", go to **Step 21**.

Check whether the DataNode data directory fails to be created.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Run the **ls** command to check whether the directories exist in the DataNode data directory.

- If yes, go to **Step 26**.
- If no, go to **Step 12**.

Step 12 Run the **mkdir** *data directory* command to create the directory and check whether the directory can be successfully created.

- If yes, go to **Step 24**.
- If no, go to **Step 13**.

Step 13 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to check whether alarm **ALM-12017 Insufficient Disk Capacity** exists.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Adjust the disk capacity and check whether alarm **ALM-12017 Insufficient Disk Capacity** is cleared. For details, see **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 12**.
- If no, go to **Step 15**.

Step 15 Check whether user **omm** has the **rwx** or **x** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **x** permission for directory **tmp** and the **rwx** permission for directory **abc**.)

- If yes, go to **Step 24**.
- If no, go to **Step 16**.

Step 16 Run the **chmod u+rwx** *path* or **chmod u+x** *path* command as user **root** to assign the **rwx** or **x** permission of these directories to user **omm**. Then go to **Step 12**.

Check whether the DataNode data directory uses the same disk as other critical directories in the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 17 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.

Step 18 Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.

- If yes, go to **Step 19**.
- If no, go to **Step 24**.

Step 19 Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.

Step 20 Go to **Step 24**.

Check whether multiple directories in the DataNode data directory use the same disk.

Step 21 Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.

Step 22 Modify the DataNode node parameters **dfs.datanode.data.dir** to reserve only one directory among the directories that mounted to the same disk directory.

Step 23 Go to **Step 24**.

Restart the DataNode and check whether the alarm is cleared.

Step 24 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** and restart the DataNode instance.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

Step 25 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 26**.

Collect fault information.

Step 26 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 27 Select **HDFS** in the required cluster from the **Service**.

Step 28 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.106 ALM-14012 JournalNode Is Out of Synchronization

Description

On the active NameNode, the system checks the data consistency of all JournalNodes in the cluster every 5 minutes. This alarm is generated when the data on a JournalNode is inconsistent with the data on the other JournalNodes.

This alarm is cleared in 5 minutes after the data on JournalNodes is consistent.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

When a JournalNode is working incorrectly, the data on the node becomes inconsistent with that on the other JournalNodes. If data on more than half of JournalNodes is inconsistent, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance does not exist (deleted or migrated).
- The JournalNode instance has not been started or has been stopped.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Procedure

Check whether the JournalNode instance has been started up.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.

Step 3 Choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance**. In the instance list, check whether the JournalNode instance exists on the node for which the alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Choose **O&M** > **Alarm** > **Alarms**. In the alarm list, click **Clear** in the **Operation** column of the alarm. In the dialog box that is displayed, click **OK**. No further action is needed.

Step 5 Click the JournalNode instance and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Select the JournalNode instance and choose **Start Instance** to start the instance.

Step 7 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the JournalNode instance is working correctly.

Step 8 Check whether **Running Status** of the JournalNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Select the JournalNode instance and choose **More** > **Restart Instance** to start the instance.

NOTE

If the number of JournalNode instances restarted exceeds one third of the total number of JournalNodes, the HDFS service may be faulty.

Step 10 After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the network of the JournalNode is reachable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 11 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Instance** to check the service IP address of the active NameNode.

Step 12 Log in to the active NameNode as user **root**.

Step 13 Run the **ping** command to check whether a timeout occurs or the network is unreachable between the active NameNode and the JournalNode.

ping *service IP address of the JournalNode*

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Contact the network administrator to rectify the network fault and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 16 Select **HDFS** in the required cluster from the **Service**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.107 ALM-14013 Failed to Update the NameNode FsImage File

Alarm Description

HDFS metadata is stored in the FsImage file of the NameNode data directory, which is specified by the **dfs.namenode.name.dir** configuration item. The standby NameNode periodically combines existing FsImage files and Editlog files stored in the JournalNode to generate a new FsImage file, and then pushes the new FsImage file to the data directory of the active NameNode. This period is specified by the **dfs.namenode.checkpoint.period** configuration item of HDFS. The default value is 3600s, namely, one hour. If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

On the active NameNode, the system checks the FsImage file information every five minutes. This alarm is generated when no FsImage file is generated within three combination periods.

This alarm is cleared when a new FsImage file is generated and pushed to the active NameNode, which indicates that the HDFS metadata combination function can be properly used.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14013	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

Impact on the System

If the FsImage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification. If it is not rectified, the Editlog files increase continuously after HDFS runs for a period. In this case, HDFS restart is time-consuming because a large number of Editlog files need to be loaded. In addition, this alarm also indicates that the standby NameNode is abnormal and the NameNode high availability (HA) mechanism becomes invalid. When the active NameNode is faulty, the HDFS service becomes unavailable.

Possible Causes

- The standby NameNode is stopped.
- The standby NameNode instance is working incorrectly.
- The standby NameNode fails to generate a new FsImage file.
- Space of the data directory on the standby NameNode is insufficient.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The standby NameNode fails to push the FsImage file to the active NameNode.
- Space of the data directory on the active NameNode is insufficient.

Handling Procedure

Check whether the standby NameNode is stopped.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 View **Location** and obtain the host name of the active NameNode for which the alarm is generated and name of the NameService where the active NameNode resides.

Step 3 Choose **Cluster** > **Services** > **HDFS** > **Instances**, find the standby NameNode instance of the NameService in the instance list, and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Select the standby NameNode instance, choose **Start Instance**, and wait until the startup is complete.

Step 5 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the NameNode instance is working correctly.

Step 6 Check whether **Running Status** of the standby NameNode instance is **Normal**.

- If yes, go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Select the standby NameNode instance, choose **More** > **Restart Instance**, and wait until the startup is complete.

NOTE

Services are not affected after the standby NameNode is restarted.

Step 8 Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Check whether the standby NameNode fails to generate a new FsImage file.

Step 9 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search and obtain the value of **dfs.namenode.checkpoint.period**. This value is the period of NameNode metadata.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Choose **Cluster** > **Services** > **HDFS** > **Instance** and obtain the service IP addresses of the active and standby NameNodes of the NameService for which the alarm is generated.

Step 11 Click the **NameNode(*xx*,Standby)** and **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the standby NameNode.

Step 12 Log in to the standby NameNode node as user **root**.

Run the following command to switch to user **omm**:

```
su - omm
```

Step 13 Go to the FsImage storage directory and check the generation time of the newest FsImage file.

```
cd Storage directory of the standby NameNode/current
stat -c %y $(ls -t | grep "fsimage_[0-9]*$" | head -1)
```

Step 14 Run the following command to obtain the current system time:

```
date
```

Step 15 Calculate the time difference between the generation time of the newest FsImage file and the current system time and check whether the time difference is greater than three times of the metadata combination period (**dfs.namenode.checkpoint.period**).

- If yes, go to **Step 16**.
- If no, go to **Step 20**.

Step 16 The metadata combination function of the standby NameNode is faulty. Run the following command to check whether the fault is caused by insufficient storage space.

Go to the FsImage storage directory.

```
cd Storage directory of the standby NameNode/current
```

Check the size of the newest FsImage file (in MB).

```
du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'
```

Step 17 Run the following command to check the available disk space of the standby NameNode (in MB).

```
df -m ./ | awk 'END{print $4}'
```

Step 18 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 7**.
- If no, go to **Step 19**.

Step 19 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the standby NameNode fails to push the FsImage file to the active NameNode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 20 Log in to the standby NameNode node as user **root**.

Step 21 Run the following command to switch to user **omm**:

```
su - omm
```

Step 22 Run the following command to check whether the standby NameNode can push the file to the active NameNode.

```
tmpFile=/tmp/tmp_test_$(date +%s)
echo "test" > $tmpFile
scp $tmpFile IP address of the active NameNode node:/tmp
```

- If yes, go to **Step 24**.
- If no, go to **Step 23**.

Step 23 When the standby NameNode fails to push data to the active NameNode as user **omm**, contact the MRS system administrator to handle the fault. Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 24**.

Check whether space on the data directory of the active NameNode is insufficient.

Step 24 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instances**, click the active NameNode of the NameService for which the alarm is generated, and then click **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the active NameNode.

Step 25 Log in to the active NameNode node as user **root** or **omm**:

Step 26 Go to the FsImage storage directory and check the size of the newest FsImage file (in MB).

```
cd Storage directory of the active NameNode node/current
du -m $(ls -t | grep "fsimage_[0-9]*$" | head -1) | awk '{print $1}'
```

Step 27 Run the following command to check the available disk space of the active NameNode (in MB).

```
df -m ./ | awk 'END{print $4}'
```

Step 28 Compare the FsImage file size and the available disk space and determine whether another FsImage file can be stored on the disk.

- If yes, go to **Step 30**.
- If no, go to **Step 29**.

Step 29 Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 31 Select **NameNode** in the required cluster from the **Service**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 32 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 33 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.108 ALM-14014 NameNode GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NameNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NameNode process may interrupt the services and users cannot read or write files.

Possible Causes

The heap memory of the NameNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14014 NameNode GC Time Exceeds the Threshold.** Then check the role name in **Location** and confirm the IP address of the instance.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **NameNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Garbage Collection**, and select **NameNode Garbage Collection (GC)**. Check the GC duration statistics of the NameNode process every minute.

Step 3 Check whether the GC duration of the NameNode process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **HDFS** > **Configurations** > **All Configurations** > **NameNode** > **System**. Increase the value of the **GC_OPTS** parameter as required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 5 Save the configuration and restart the NameNode instance.

NOTE

- During the restart of the active NameNode, a NameNode active/standby switchover occurs. As a result, no active node is available in the system for a short period of time (in the transition period of the active/standby switchover), and an alarm indicating that the HDFS service is unavailable may be generated. In addition, an error is reported during the running read and write tasks, but services are not interrupted.
- Services are not affected after the standby NameNode is restarted.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **NameNode** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.109 ALM-14015 DataNode GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the DataNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the DataNode process may interrupt the services and users cannot read or write files.

Possible Causes

The heap memory of the DataNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms**. On the displayed interface, click the drop-down button of **ALM-14015 DataNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **DataNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Garbage Collection**, and select **DataNode Garbage Collection (GC)**. Check the GC duration statistics of the DataNode process every minute.

Step 3 Check whether the GC duration of the DataNode process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **HDFS** > **Configurations** > **All Configurations** > **DataNode** > **System**. Increase the value of the **GC_OPTS** parameter as required.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 5 Save the configuration and restart the DataNode instance.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **DataNode** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.110 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of HDFS every 30 seconds. This alarm is generated when the direct memory usage of DataNode instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14016	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the available direct memory of DataNode instances is insufficient, a memory overflow may occur and the service breaks down.

Possible Causes

The direct memory of DataNode instances is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On the **Home** page of FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, click the drop-down list in the row containing **ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold**, and view the role name and IP address of the instance for which the alarm is generated in the **Location** area.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **DataNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Resource**, and select **DataNode Memory** to check the direct memory usage.

Step 3 Check whether the used direct memory of a DataNode instance reaches 90% (default threshold) of the maximum direct memory allocated to it.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **HDFS** > **Configurations** > **All Configurations** > **DataNode** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Adjust the value of **-XX:MaxDirectMemorySize**.

1. In **GC_OPTS**, check the value of **-Xmx** and check whether the node memory is sufficient.

   NOTE

   You can determine whether the node memory is sufficient based on the actual environment. For example, you can use the following method:

   Use the IP address to log in to the instance for which the alarm is generated as user **root** and run the **free -g** command to check the value of **Mem** in the **free** column. The value indicates the available memory of the node. In the following example, the available memory of the node is 4 GB.

   ```
                total        used        free      shared  buff/cache   available
   Mem:            112          48           4          10          58          46
   ......
   ```

   If the value of **Mem** is at least that of **-Xmx**, the node memory is sufficient. If the value of **Mem** is less than that of **-Xmx**, the node memory is insufficient.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, change the value of **-XX:MaxDirectMemorySize** to that of **-Xmx**.
- If no, increase **-XX:MaxDirectMemorySize** to a value no larger than that of **Mem**.

2. Save the configuration and restart the DataNode instances.

   NOTE

   Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

Step 6 Check whether **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DataNode** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.111 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a NameNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the NameNode instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms.** On the displayed interface, click the drop-down button of **ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **HDFS** and click the **Instance** tab. On the displayed page, select **NameNode** (the IP address of the instance for which the alarm is generated). Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource**, select **NameNode Memory**. Check the direct memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the used direct memory of NameNode reaches 90% of the maximum direct memory specified for NameNode by default.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **NameNode** > **All Configurations**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the NameNode instance.

NOTE

- During the restart of the active NameNode, a NameNode active/standby switchover occurs. As a result, no active node is available in the system for a short period of time (in the transition period of the active/standby switchover), and an alarm indicating that the HDFS service is unavailable may be generated. In addition, an error is reported during the running read and write tasks, but services are not interrupted.
- Services are not affected after the standby NameNode is restarted.

Step 6 Check whether the **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** alarm exists.

- If yes, handle the alarm by referring to **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 7**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 9 Select **NameNode** in the required cluster from the **Service**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.112 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the HDFS NameNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS NameNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS NameNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS NameNode is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

Non-heap memory of the HDFS NameNode is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the NameNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**. The HDFS status page is displayed.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in HDFS.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->NameNode**.

Adjust system configurations.

Step 8 Check whether the non-heap memory is properly configured based on the number of file objects in **Step 6** and the non-heap parameters configured for NameNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

Step 9 Modify the **GC_OPTS** parameter of the NameNode based on the mapping between the number of file objects and non-heap memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.113 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the HDFS DataNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS DataNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS DataNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds>** *Name of the desired cluster* **> HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS DataNode is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the memory usage of the HDFS DataNode is too high, data read/write performance of HDFS will be affected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

Non-heap memory of the HDFS DataNode is insufficient.

Procedure

Delete unnecessary files.

Step 1 Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

Step 2 Run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the DataNode JVM non-heap memory usage and configuration.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS**.

Step 5 In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 6 On the HDFS WebUI, click the **Datanodes** tab to view the number of blocks of all DataNodes that report alarms.

Step 7 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the **GC_OPTS** non-heap memory parameter of **HDFS->DataNode**.

Adjust system configurations.

Step 8 Check whether the memory is properly configured based on the number of blocks in **Step 6** and the memory parameters configured for DataNode in **Step 7**.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Step 9 Modify the **GC_OPTS** parameter of the DataNode based on the mapping between the number of blocks and memory.

Step 10 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 13 Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

Step 14 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.114 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold

Description

The system obtains the number of subfiles and subdirectories in a specified directory every hour and checks whether it reaches the percentage of the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

threshold (the maximum number of subfiles and subdirectories in an HDFS directory, the threshold for triggering an alarm is **90%** by default). If it exceeds the percentage of the threshold, an alarm is triggered.

When the number of subfiles and subdirectories in the directory the alarm is lower than the percentage of the threshold, the alarm is automatically cleared. When the monitoring switch is disabled, alarms corresponding to all directories are cleared. If a directory is removed from the monitoring list, alarms corresponding to the directory are cleared.

NOTE

- The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of subfiles and subdirectories in the HDFS directory. Its default value is **1048576**. If the number of subfiles and subdirectories in a directory exceeds the parameter value, subfiles and subdirectories cannot be created in the directory.
- The **dfs.namenode.directory-items.monitor** parameter specifies the list of directories to be monitored. Its default value is **/tmp,/SparkJobHistory,/mr-history**.
- The **dfs.namenode.directory-items.monitor.enabled** parameter is used to enable or disable the monitoring switch. Its default value is **true**, which means the monitoring switch is enabled by default.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14020	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Directory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the number of entries in the monitored directory exceeds 90% of the threshold, an alarm is triggered, but entries can be added to the directory. Once the maximum threshold is exceeded, entries will fail to be added to the directory.

Possible Causes

The number of entries in the monitored directory exceeds 90% of the threshold.

Procedure

Check whether unnecessary files exist in the system.

Step 1 Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata_env** to configure the environment variables.

If the cluster is in security mode, security authentication is required.

Run the **kinit hdfs** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 2 Run the following command to check whether files and directories in the directory with the alarm can be deleted:

hdfs dfs -ls *Directory with the alarm*

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to delete unnecessary files.

hdfs dfs -rm -r -f *File or directory path*

NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

Step 4 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the threshold is correctly configured.

Step 5 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **HDFS** > **Configurations** > **All Configurations**. Search for the **dfs.namenode.fs-limits.max-directory-items** parameter and check whether the parameter value is appropriate.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Increase the parameter value.

Step 7 Save the configuration and click **Dashboard** > **More** > **Restart Service**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 8 Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.115 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold

Alarm Description

The system checks the average RPC processing time of NameNode every 30 seconds, and compares the actual average RPC processing time with the threshold (default value: 100 ms). This alarm is generated when the system detects that the average RPC processing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M** > **Alarm** > **Thresholds** > **HDFS** and change the threshold.

When **Trigger Count** is **1**, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to the threshold. When **Trigger Count** is greater than **1**, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14021	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.

Handling Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of the **Chart** area, choose **Customize** > **RPC**, select **Average Time of Active NameNode RPC Processing**, and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Processing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Thresholds** > **HDFS**. Locate **Average Time of Active NameNode RPC Processing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the peak value within one day before and after the alarm is generated. Click **OK** to save the new threshold.

Step 7 Wait for 5 minutes and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated for the NameNode node whose ID is 12016.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the handling procedure of **ALM-12016 CPU Usage Exceeds the Threshold**.

Step 10 Wait for 10 minutes and check whether alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm >Alarms** and check whether **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** is generated for the NameNode node whose ID is 14007.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Rectify the fault by following the handling procedure of **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.

Step 13 Wait for 10 minutes and check whether alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 14 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

Step 16 Click **Save** and click **OK**.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

NOTE

Services are not affected after the standby NameNode is restarted.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 21 Select the following node in the required cluster from the **Service**.

- HDFS

Step 22 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 23 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.116 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold

Alarm Description

The system checks the average RPC queuing time of NameNode every 30 seconds, and compares the actual average RPC queuing time with the threshold (default

value: 200 ms). This alarm is generated when the system detects that the average RPC queuing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M** > **Alarm** > **Thresholds** > **HDFS** and change the threshold.

When **Trigger Count** is **1**, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to the threshold. When **Trigger Count** is greater than **1**, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14022	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.
- The volume of services that access HDFS is too large and therefore NameNode is overloaded.

Handling Procedure

Obtain alarm information.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.

Step 2 Check the alarm. Obtain the alarm generation time from **Generated**. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

Check whether the threshold is too small.

Step 3 Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize**, select **Average Time of Active NameNode RPC Queuing**, and click **OK**.

Step 5 On the **Average Time of Active NameNode RPC Queuing** monitoring page, obtain the value of the NameService node involved in this alarm.

Step 6 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Thresholds** > **HDFS**. Locate **Average Time of Active NameNode RPC Queuing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the monitored value. Click **OK** to save the new threshold.

Step 7 Wait for 1 minute and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the CPU performance of the NameNode node is sufficient.

Step 8 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the handling procedure of **ALM-12016 CPU Usage Exceeds the Threshold**.

Step 10 Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check whether the memory of the NameNode node is too small.

Step 11 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Rectify the fault by following the handling procedure of **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.

Step 13 Wait for 10 minutes and check whether alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check whether NameNode parameters are configured properly.

Step 14 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS** > **Configurations** > **All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value.

If the value is lower than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

Step 15 Search for parameter **ipc.server.read.threadpool.size** and view its value.

If the value is less than 5, change it to **5**.

Step 16 Click **Save** and then **OK** to save the settings.

Step 17 On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the required password and click **OK** . Wait until the standby NameNode is started up.

NOTE

Services are not affected after the standby NameNode is restarted.

Step 18 On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More** > **Restart Instance**. Enter the required password and click **OK**. Wait until the active NameNode is started up.

Step 19 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Check whether the HDFS workload changes and reduce the workload properly.

Step 20 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of the **Chart** area, choose **Customize** > **RPC**, select **Average Time of Active NameNode RPC Queuing**, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 21 Click . The **Details** page is displayed.

Step 22 Set the monitoring data display period, from 5 days before the alarm generation time to the alarm generation time. Click **OK**.

Step 23 On the **Average RPC Queuing Time** monitoring page, check whether the point in time when the queuing time increases abruptly exists.

- If yes, go to **Step 24**.
- If no, go to **Step 27**.

Step 24 Confirm and check the point in time. Check whether a new task frequently accesses HDFS and whether the access frequency can be reduced.

Step 25 If a Balancer task starts at the point in time, stop the task or specify a node for the task to reduce the HDFS workload.

Step 26 Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 27**.

Collect fault information.

Step 27 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 28 Select **HDFS** in the required cluster from the **Service**.

Step 29 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 30 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.117 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold

Description

The system checks the percentage of total reserved disk space for replicas (Total reserved disk space for replicas/(Total reserved disk space for replicas + Total remaining disk space)) every 30 seconds and compares the actual percentage with the threshold (**90%** by default). This alarm is generated when the percentage of total reserved disk space for replicas exceeds the threshold for multiple consecutive times (**Trigger Count**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is **1** and the percentage of total reserved disk space for replicas is less than or equal to the threshold; the value of **Trigger Count** is greater than **1** and the percentage of total reserved disk space for replicas is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14023	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The performance of writing data to HDFS is affected. If all remaining DataNode space is reserved for replicas, writing HDFS data fails.

Possible Causes

- The alarm threshold is improperly configured.
- The disk space configured for the HDFS cluster is insufficient.
- The volume of services that access HDFS is too large and therefore DataNode is overloaded.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Replicas of Unused Space to check whether the alarm threshold is appropriate. (The default threshold is **90%**. Users can change it as required.)

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **HDFS** > **Disk** > **Percentage of Reserved Space for Replicas of Unused Space** and Click **Modify,** change the threshold based on the actual usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether an alarm indicating insufficient disk space is generated.

Step 4 On the FusionInsight Manager portal, check whether **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** exists on the **O&M > Alarm > Alarms** page.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Rectify the fault by referring to **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold**. Check whether the alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Expand the DataNode capacity.

Step 7 Expand the DataNode capacity .

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **HDFS** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.118 ALM-14024 Tenant Space Usage Exceeds the Threshold

Description

The system checks the space usage (used space of each directory/space allocated to each directory) of each directory associated with a tenant every hour and compares the space usage of each directory with the threshold set for the directory. This alarm is generated when the space usage exceeds the threshold.

This alarm is cleared when the space usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14024	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

This alarm is generated if the space usage of the tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the used space exceeds the maximum storage space allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The space allocated to the tenant is improper.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the storage space threshold.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the space allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space quota of the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify the storage space quota.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.119 ALM-14025 Tenant File Object Usage Exceeds the Threshold

Description

The system checks the file object usage (used file objects of each directory/number of file objects allocated to each directory) of each directory associated with a tenant every hour and compares the file object usage of each directory with the threshold set for the directory. This alarm is generated when the file object usage exceeds the threshold.

This alarm is cleared when the file object usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14025	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

This alarm is generated if the usage of file objects in a tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the number of used file objects exceeds the maximum number of file objects allocated to the directory, the HDFS fails to write data to the directory.

Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of file objects allocated to the tenant directory is inappropriate.

Procedure

Check whether the alarm threshold is appropriate.

Step 1 View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the file object threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 On the **Resources** page, click **Modify** to modify or delete the file object threshold of the tenant directory for which the alarm is generated.

Step 4 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the maximum number of file objects allocated to the tenant is appropriate.

Step 5 On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the maximum number of file objects configured for the tenant directory for which

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the alarm is generated is proper based on the actual service status of the tenant directory.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 On the **Resources** page, click **Modify** to modify or delete the maximum number of file objects configured for the tenant directory.

Step 7 About one minute later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

9.11.120 ALM-14026 Blocks on DataNode Exceed the Threshold

Alarm Description

The system checks the number of blocks on each DataNode every 30 seconds. This alarm is generated when the number of blocks on the DataNode exceeds the threshold.

If **Trigger Count** is **1** and the number of blocks on the DataNode is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks on the DataNode is less than or equal to 90% of the threshold, this alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14026	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If this alarm is reported, there are too many blocks on the DataNode. In this case, data writing into the HDFS may fail due to insufficient disk space.

Possible Causes

- The alarm threshold is improperly configured.
- Data skew occurs among DataNodes.
- The disk space configured for the HDFS cluster is insufficient.

Handling Procedure

Change the threshold.

Step 1 On the FusionInsight Manager homepage, choose **Cluster** > **HDFS**. Then choose **Configurations** > **All Configurations**. On the displayed page, find the **GC_OPTS** parameter under **HDFS->DataNode**.

Step 2 Configure the threshold of the number of DataNodes.

Specifically, change the value of **Xmx** of the **GC_OPTS** parameter. **Xmx** specifies the memory, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required. Confirm that **GC_PROFILE** is set to **custom** and save the configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Choose **Cluster** > **HDFS** > **Instance**. Select the DataNode instance whose status is **Expired**, click **More**, and select **Restart Instance** to make the **GC_OPTS** configuration take effect.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

Step 4 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether associated alarms are reported.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the **ALM-14002 DataNode Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Handle the alarm by following the instructions in **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Expand the DataNode capacity.

Step 8 Expand the DataNode capacity.

Step 9 On FusionInsight Manager, wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

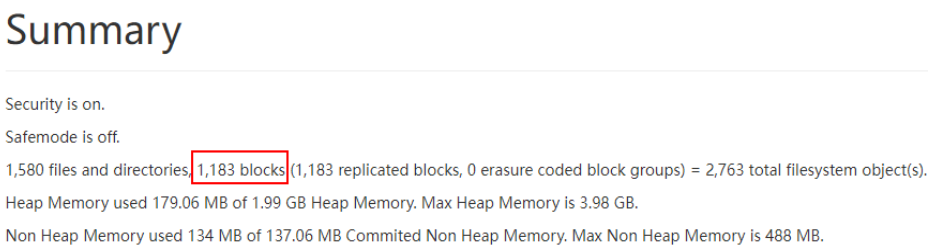
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

Configuration rules of the DataNode JVM parameter.



Default value of the DataNode JVM parameter **GC_OPTS**:

```
-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -XX:MetaspaceSize=128M -
XX:MaxMetaspaceSize=128M -XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -
XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -
Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFFFFFFFE -Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFFFFFFFE -XX:-
OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation -
XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -Djdk.tls.ephemeralDHKeySize=2048
```

Average number of saved blocks = Number of HDFS blocks x 3/Number of DataNodes

To obtain the number of HDFS blocks, log in to FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**, click **NameNode(*xxx*,Active)** to the right of **NameNode Web UI** to go to the native HDFS web UI, and then view the information in the **Summary** area.

Figure 9-7 Run the following command to view the number of HDFS blocks:

If the average number of blocks on a single DataNode has changed, modify **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

Table 9-119 DataNode JVM configuration

Average Number of Blocks in a DataNode Instance	Reference Value
2,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
5,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

Xmx specifies memory which corresponds to the threshold of the number of DataNode blocks, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required.

9.11.121 ALM-14027 DataNode Disk Fault

Alarm Description

The system checks the disk status on DataNodes every 60 seconds. This alarm is generated when a disk is faulty.

After all faulty disks on the DataNode are recovered, you need to manually clear the alarm and restart the DataNode.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14027	Major	No

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Failed Volumes	Specifies the list of faulty disks.

Impact on the System

If this alarm is reported, there are abnormal disk partitions on the DataNode. This may cause the loss of written files.

Possible Causes

- The hard disk is faulty.
- The disk permissions are configured improperly.

Handling Procedure

Check whether a disk alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Modify disk permissions.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

Step 5 Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission of the faulty disk is **711** and whether the user is **omm**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

chown omm:wheel data1

chmod 711 data1

Step 7 In the alarm list on Manager, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. Choose **Cluster** > **Services** > **HDFS** > **Instance**, select the DataNode, choose **More** > **Restart Instance**, wait for 5 minutes, and check whether a new alarm is reported.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

- If no, no further action is required.
- If yes, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **HDFS** and **OMS** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

Related Information

None

9.11.122 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold

Alarm Description

The system checks the number of blocks to be supplemented every 30 seconds and compares the number with the threshold. The number of blocks to be supplemented has a default threshold. This alarm is generated when the number of blocks to be supplemented exceeds the threshold.

To change the threshold, you can choose **O&M** > **Alarm** > **Thresholds** > **HDFS** > **File and Block** and click **Blocks Under Replicated (NameNode)**.

If **Trigger Count** is **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks to be supplemented is less than or equal to 90% of the threshold, this alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14028	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.
- The number of replicas written into the file is greater than the number of DataNodes.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure in **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Log in to the node where the MRS cluster client is installed, as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password.

1. If Kerberos authentication is not enabled for the MRS cluster, run the following command to switch to user **omm**:
   ```
   su - omm
   ```
2. Run the following command to go to the client installation directory and load environment variables:
   ```
   cd Client installation directory
   source bigdata_env
   ```
3. If Kerberos authentication is enabled for the cluster, complete security authentication:
   ```
   kinit Username of the service user who has the HDFS operation permissions
   ```
   Enter the required password.

Step 4 Run the following command to check integrity of the file system and obtain the status of the current cluster:

```
hdfs fsck / >> fsck.log
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Run the following command to count the number (*M*) of the blocks to be replicated:

```
cat fsck.log | grep "Under-replicated"
```

Step 6 Run the following command to count the number (*N*) of blocks to be replicated in the **/tmp/hadoop-yarn/staging/** directory:

```
cat fsck.log | grep "Under replicated" | grep "/tmp/hadoop-yarn/staging/" | wc -l
```

NOTE

/tmp/hadoop-yarn/staging/ is the default directory. If the directory is modified, obtain it from the configuration item **yarn.app.mapreduce.am.staging-dir** in the **mapred-site.xml** file.

Step 7 Check whether the percentage of *N* is greater than 50% (N/M > 50%).

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Run the following command to reconfigure the number of file replicas in the directory (set the number of file replicas to the number of DataNodes or the default number of file replicas):

```
hdfs dfs -setrep -w Number of file replicas/tmp/hadoop-yarn/staging/
```

Log in to FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the displayed page, click **Configurations** > **All Configurations**, and search for **dfs.replication**.

Step 9 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 12 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.123 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold

Alarm Description

The system checks the number of blocks in a single replica every four hours and compares the number with the threshold. There is a threshold for the number of blocks in a single replica. This alarm is generated when the actual number of blocks in a single replica exceeds the threshold.

This alarm is cleared when the number of blocks to be supplemented is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14029	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Replica data is prone to be lost when a node is faulty. Too many files of a single replica affect the security of the HDFS file system.

Possible Causes

- The DataNode is faulty.
- The disk is faulty.
- Files are written to a single replica.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault according to the handling procedure in **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Check whether files of a single replica have been written into the service.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:

  cd *Client installation directory*

  source bigdata_env

  kinit hdfs

- Normal mode:

  su - omm

  cd *Client installation directory*

  source bigdata_env

Step 5 Run the following command on the client node to increase the number of replicas for a single replica file:

hdfs dfs -setrep -w *file replica number file name or file path*

Step 6 In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.124 ALM-14030 HDFS Allows Write of Single-Replica Data

Alarm Description

This alarm is generated when **dfs.single.replication.enable** is set to **true**, indicating that HDFS is configured to allow write of single-replica data.

This alarm is cleared when this function is disabled on HDFS.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14030	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

Impact on the System

If this configuration is enabled on the server and the number of HDFS replicas configured on the client is 1, single-replica data can be written to HDFS. Data of a single replica may be lost. Therefore, the system does not allow write of single-replica data by default. If a service requires single-replica data write to a directory, modify the HDFS configuration item **dfs.single.replication.exclude.pattern**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The HDFS configuration item **dfs.single.replication.enable** is set to **true**.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HDFS**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.

Step 2 Search for **dfs.single.replication.enable** in the search box, change the value of the configuration item to **false**, and click **Save**.

Step 3 Wait for about 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.125 ALM-14031 DataNode Process Is Abnormal

Alarm Description

The DataNode process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14031	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Then go to **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check the process state:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.server.datanode.DataNode | grep -v grep | awk '{print $1}'

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.126 ALM-14032 JournalNode Process Is Abnormal

Alarm Description

The JournalNode process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14032	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check the process state:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.qjournal.server.JournalNode | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

9.11.127 ALM-14033 ZKFC Process Is Abnormal

Alarm Description

The ZKFC process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14033	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Go to **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check whether the process state is abnormal:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.tools.DFSZKFailoverController | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

9.11.128 ALM-14034 Router Process Is Abnormal

Alarm Description

The Router process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14034	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Go to **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check whether the process state is abnormal:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.hdfs.server.federation.router.DFSRouter | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.129 ALM-14035 HttpFS Process Is Abnormal

Alarm Description

The HttpFS process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14035	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Go to **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check whether the process state is abnormal:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.fs.http.server.HttpFSServerWebServer | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

9.11.130 ALM-14036 NameNode Is In Safe Mode

Alarm Description

The system checks the NameNode process status every 30 seconds. This alarm is generated when the NameNode is in the safe mode.

This alarm is cleared when the process status recovers.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14036	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

After a NameNode enters the safe mode, data cannot be written to the NameNode.

Possible Causes

Block loss occurs when a user manually enters the safe mode or restarts the NameNode.

Handling Procedure

Check whether NameNode is in the security mode.

Step 1 Log in to FusionInsight Manager, click **O&M**, and choose **Alarm** > **Alarms** to view the alarm details. In the **Location** column, check the name of the host for which the alarm is generated.

Step 2 Choose **Cluster** > **Services** > **HDFS**, and click **NameNode(***host name recorded in **Step 1**,x***)** next to **NameNode Web UI**.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 In the **Basic Information** area on the **Dashboard** page of HDFS (or in the **NameService Summary** area on the **Dashboard** page of HDFS), check whether the value of **Safe Mode** is **ON**.

ON indicates that the safe mode is enabled.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Log in to the HDFS client.

1. Log in to the node where the HDFS client is installed.
   - If Kerberos authentication is enabled for the cluster (the cluster is in security mode), log in as the **root** user.
   - If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), log in as user **omm** and ensure that user **omm** has the execute permission on the client.

   (Note that you need to decide with cluster security/normal mode, not the HDFS safe/common mode.)
2. Run the following commands to go to the client installation directory and configure environment variables:

   cd *HDFS client installation directory*

   source bigdata_env
3. If Kerberos authentication is enabled for the cluster (the cluster is in security mode), run the following command to authenticate the user. If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

kinit hdfs

Enter the password as prompted. You can obtain the password from the MRS cluster administrator. Change the password upon the first authentication.

4. Run the following command to exit from the safe mode:

   hdfs dfsadmin -safemode leave

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 In the **Basic Information** area on the **Dashboard** page of HDFS (or in the **NameService Summary** area on the **Dashboard** page of HDFS), check whether the value of **Missing Blocks** is **0**.

- If yes, no further action is required.
- If no, check whether "ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold" is reported and rectify the fault according to the alarm help.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.131 ALM-14037 DataNodes Outside the Cluster

Alarm Description

The NameNode checks whether there are DataNodes that are not managed in the cluster every 8 hours. This alarm is generated when there is a DataNode outside the cluster. This alarm is cleared when no DataNode is outside the cluster.

NOTE

This alarm applies only to MRS 3.5.0 or later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14037	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	NameService Name	Specifies the NameService for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition, that is, the IP address and port of a DataNode outside the cluster is detected.

Impact on the System

Data may be lost.

Possible Causes

After a host is forcibly deleted, the host is powered on again, and the process is restarted.

Handling Procedure

Step 1 Log in to FusionInsight Manager, click **O&M**, and choose **Alarm** > **Alarms** to view the alarm details. In the additional information area, check the IP address of the host for which the alarm is generated.

Step 2 Stop the DataNode process on the host for which the alarm is reported.

NOTICE

If there are multiple IP addresses of the host, you can **stop only one DataNode process at a time** and stop the next DataNode process only after **Number of Blocks to Be Replicated** changes to **0**.

1. Log in to the host for which the alarm is generated as the **root** user and change the permission on the **hadoop** directory in the installation directory **${BIGDATA_HOME}/FusionInsight_HD_*/install**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

chmod 000 ${BIGDATA_HOME}/FusionInsight_HD_*xxx*/install/FusionInsight-Hadoop-3.3.1

2. Run the following commands to obtain the PID of the DataNode process and stop it on the host:

   ps -ef | grep Dproc_datanode

   kill -15 *PID*

3. Choose **Cluster** > **Services** > **HDFS**. Check the **Basic Information** area in the **Dashboard** tab (or the **NameService Summary** area in the **Dashboard** tab of HDFS), and wait until the value of **Blocks to be Replicated** changes to **0**.

Step 3 Wait for 8 hours and check whether the alarm is cleared and whether the number of blocks to be replicated is 0.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

9.11.132 ALM-14038 Router Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the size of the used HDFS Router heap memory and the maximum size of the heap memory that can be allocated every 30 seconds, calculates the ratio of the used heap memory to the maximum size of the heap memory that can be allocated to obtain the heap memory usage, and compares the actual heap memory usage of the HDFS Router with the threshold. The HDFS Router Heap Memory usage has a default threshold. This alarm is generated when the HDFS Router Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M** > **Alarm > Thresholds** > *Name of the desired cluster* **> HDFS**.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14038	Critical (default threshold: 95%) Major (default threshold: 90%)	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The HDFS Router Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

Possible Causes

The HDFS Router Heap Memory is insufficient.

Handling Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC_OPTS** to check the GC_OPTS memory parameter of **HDFS->Router**.

Step 3 Increase the values of **-Xms** and **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If this alarm is generated, the heap memory configured for Router cannot meet the requirements of the current process. You are advised to change the values of **-Xms** and **-Xmx** in the **GC_OPTS** parameter to twice the size of the used heap memory or change the values based on the site requirements.

Step 4 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **HDFS** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.133 ALM-14039 Slow DataNodes Exist in the Cluster

Alarm Description

The system checks the number of slow operations per second on HDFS DataNode instances every 60 seconds and compares the number with the threshold. This alarm is generated when the number of slow operations per second of an HDFS DataNode instance has exceeded the threshold for three minutes.

This alarm is cleared when the number of slow operations per second of the HDFS DataNode instance is less than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14039	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Slow DataNodes on HDFS affect the data read and write performance of HDFS.

Possible Causes

- The disk I/O rate of the HDFS DataNode instance is low, and the HDFS DataNode processing capability reaches the bottleneck.
- The network transmission rate between HDFS DataNode instances is low.

Handling Procedure

Check whether the disk I/O rate of the DataNode instance is low.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the **Location** field of the alarm details, view the host name of the DataNode instance for which this alarm is generated.

Step 2 Choose **Cluster** > **Services** > **HDFS**, click the **Instances** tab, and click the DataNode role based on the host name obtained in **Step 1**.

Step 3 Click the **Chart** tab and select **Performance** from the **Chart Category** area. Check whether any data in **Slow Flush or Sync Occurrences Per Second**, **Slow SyncWriterOsCache Occurrences Per Second**, and **Slow WriteDataToDisk Occurrences Per Second** charts is high.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12033 Slow Disk Fault** exists.

- If yes, record the disk information in the alarm details and go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Obtain information about the disk where slow operations occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Log in to the DataNode using the IP address obtained in **Step 1** as user **omm** and run the following commands to view the run log:

   cd /var/log/Bigdata/hdfs/dn/

   vim hadoop-omm-datanode-*Hostname*.log

2. Search for keyword **slow** in the log to identify the disk where slow operations occur.

Step 6 Rectify the fault based on the obtained disk information by following the handling procedure of **ALM-12033 Slow Disk Fault**.

Step 7 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network transmission rate between HDFS DataNode instances is low.

Step 8 On FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**, click the **Chart** tab, select **Performance** in the **Chart Category** area, and check whether any data in the **Slow Write Packet To DownStream Count Per Second** and **Slow Ack To Upstream Count Per Second** charts is high.

- If yes, go to **Step 9**.
- If no, go to **Step 13**.

Step 9 Log in to the DataNode using the IP address obtained in **Step 1** as user **omm** and run the following commands to view the run log:

cd /var/log/Bigdata/hdfs/dn/

vim hadoop-omm-datanode-*Hostname*.log

Step 10 Search for keyword **slow** in the log to identify the upstream and downstream nodes where slow operations occur.

Step 11 Check whether the network communication between the current node and the nodes obtained in **Step 10** is normal.

- If yes, go to **Step 13**.
- If no, contact the network administrator to repair the network.

Step 12 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **HDFS** for the target cluster.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.134 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold

Description

The system detects the percentage of sessions connected to the HiveServer to the maximum number of allowed sessions every 30 seconds. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive > Instance** > *HiveServer instance***.** This alarm is generated when the the percentage of sessions connected to the HiveServer to the maximum number allowed exceeds the specified threshold (90% by default).

To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive > Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer**.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16000	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If a connection number alarm is generated, the number of sessions connected to HiveServer is too large. As a result, new connections cannot be established, new tasks fail, or even services restart unexpectedly.

Possible Causes

Too many clients are connected to HiveServer.

Procedure

Increase the maximum number of connections to Hive.

Step 1 On the FusionInsight Manager portal, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**.

Step 2 Search for **hive.server.session.control.maxconnections** and increase the value of this parameter. If the value of this parameter is **A**, the threshold is **B**, and the number of sessions connected to the HiveServer is **C**, adjust the value of this parameter according to **A x B > C**. To view the number of sessions connected to the HiveServer, check the value of **Statistics for Sessions of the HiveServer** on the Hive monitoring page.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.135 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

Description

The system checks the Hive warehouse space usage every 30 seconds. The metric **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page. This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default).

To change the threshold, choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> Hive > Percentage of HDFS Space Used by Hive to the Available Space**.

When the **Trigger Count** is 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to 90% of the threshold.

NOTE

The MRS cluster administrator can reduce the repository space usage by increasing the repository capacity or releasing some used space.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16001	Minor	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The system cannot write data properly. Some data may be lost.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The HDFS space is insufficient.
- Some data nodes break down.

Procedure

Expand the system configuration.

Step 1 Analyze the cluster HDFS space usage and increase the HDFS capacity for Hive.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configuration**, select **All Configurations**, search for **hive.metastore.warehouse.size.percent**, and increase the value. Assume that the value of the configuration item is A, the total HDFS storage space is B, the threshold is C, and the HDFS space used by Hive is D. Adjust the value by complying with A x B x C > D. You can view the total HDFS storage space on the HDFS NameNode page, and the HDFS space used by Hive on the Hive monitoring page.

Step 2 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Expand the system.

Step 3 Expand the system.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the data node is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

Step 6 Check whether "ALM-12006 Node Fault", "ALM-12007 Process Fault", or "ALM-14002 DataNode Disk Usage Exceeds the Threshold" exist.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarms by following the handling procedures in **ALM-12006 Node Fault**, **ALM-12007 Process Fault**, and **ALM-14002 DataNode Disk Usage Exceeds the Threshold**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.136 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

Description

The system checks the percentage of the HQL statements that are executed successfully in every 30 seconds. The formula is: Percentage of HQL statements that are executed successfully = Number of HQL statements that are executed successfully by Hive in a specified period/Total number of HQL statements that are executed by Hive. This indicator can be viewed on the **Cluster >** *Name of the desired cluster* **> Services** > **Hive > Instance** > *HiveServer instance*. The default threshold of the percentage of HQL statements that are executed successfully is **90%**. An alarm is reported when the percentage is lower than the **90%**. Users can view the name of the host where an alarm is generated in the location information about the alarm. The IP address of the host is the IP address of the HiveServer node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Users can modify the threshold by choosing **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive** > **Percentage of HQL Statements That Are Executed Successfully by Hive**.

This alarm is cleared when the execution success rate is higher than 110% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The service execution capability of the system is too low and cannot properly respond to customer requests. The Hive service is not affected. You need to check HiveServer logs to locate the SQL failure cause.

Possible Causes

- A syntax error occurs in HQL statements.
- The HBase service is abnormal when a Hive on HBase task is performed.
- The Spark service is abnormal when a Hive on Spark task is performed.
- The dependent basic services, such as HDFS, Yarn, and ZooKeeper, are abnormal.

Procedure

Check whether the HQL statements comply with syntax.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On the FusionInsight Manager page, choose **O&M** > **Alarm** to view the alarm details and obtain the node where the alarm is generated.

Step 2 Use the Hive client to log in to the HiveServer node where an alarm is reported. Query the HQL syntax provided by Apache, and check whether the HQL commands are correct.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

NOTE

To view the user who runs an incorrect statement, you can download the HiveServerAudit log file of the HiveServer node where this alarm is generated. **Start Data** and **End Data** are 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

Step 3 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 4**.

Check whether the HBase service is abnormal.

Step 4 Check whether a Hive on HBase task is performed with the user who runs the HQL command.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 On the FusionInsight Manager page, click **Cluster** > *Name of the desired cluster* > **Services**, check whether the HBase service is normal in the service list.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Choose **O&M** > **Alarm**, check the related alarms displayed on the alarm page and clear them according to related alarm help.

Step 7 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 8**.

Check whether the HDFS, Yarn, and ZooKeeper are normal.

Step 8 On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services**.

Step 9 In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Check the related alarms displayed on the alarm page and clear them according to related alarm help.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 11 Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 After 1 minute, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager home page, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service**:

- MapReduce
- Hive

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.137 ALM-16003 Background Thread Usage Exceeds the Threshold

Description

The system checks the usage of the background thread every 30 seconds. The default threshold is **90%**. This alarm is generated when the usage of the background thread pool of Hive exceeds the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16003	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

There are too many background threads, so the newly submitted task cannot run in time.

Possible Causes

The usage of the background thread pool of Hive is excessively high when:

- There are many tasks executed in the background thread pool of HiveServer.
- The capacity of the background thread pool of HiveServer is too small.

Procedure

Check the number of tasks executed in the background thread pool of HiveServer.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.

Step 2 Check whether the number of background threads in the latest half an hour is excessively high. (By default, the queue number is 100, and the thread number is considered as high if it is 90 or larger.)

- If it is, go to **Step 3**.
- If it is not, go to **Step 5**.

Step 3 Adjust the number of tasks submitted to the background thread pool. (For example, cancel some time-consuming tasks with low performance.)

Step 4 Check whether the values of Background Thread Count and Background Thread Usage decrease.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If it is, go to **Step 7**.
- If it is not, go to **Step 5**.

Check the capacity of the HiveServer background thread pool.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.

Step 6 Increase the value of **hive.server2.async.exec.threads** in the **${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_23_HiveServer/etc/hive-site.xml** file. For example, increase the value by 20%.

Step 7 Save the modification.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **Hive** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.138 ALM-16004 Hive Service Unavailable

Description

The system checks the Hive service status every 60 seconds. This alarm is generated when the Hive service is unavailable.

This alarm is cleared when the Hive service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16004	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Hive service unavailability may be related to the faults of the Hive process as well as basic services, such as ZooKeeper, Hadoop distributed file system (HDFS), YARN, and DBService.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The YARN service is abnormal.
  - The DBService service is abnormal.
  - The Hive service process is abnormal. If the alarm is caused by Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive and basic services is interrupted.
- The permission on the HDFS temporary directory of Hive is abnormal.
- The local disk space of the Hive node is insufficient.

Procedure

Check the HiveServer/MetaStore process status.

Step 1 On the FusionInsight Manager portal, click **Cluster >** *Name of the desired cluster* **> Services** > **Hive** > **Instance**. In the Hive instance list, check whether the HiveServer or MetaStore instances are in the Unknown state.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 In the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

During HiveServer or MetaStore instance restart, the instance cannot provide services for external systems. SQL tasks that are being executed on the instance may fail.

Step 3 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the ZooKeeper service status.

Step 4 On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.

- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 In the **Process Fault**, check whether **ServiceName** is **ZooKeeper**.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the steps provided in **ALM-12007 Process Fault**.

Step 7 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the HDFS service status.

Step 8 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

Step 10 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the Yarn service status.

Step 11 In FusionInsight Manager alarm list, check whether **Yarn Service Unavailable** is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Rectify the fault by performing the operations provided for **ALM-18000 Yarn Service Unavailable**.

Step 13 In the alarm list, check whether **Hive Service Unavailable** is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the DBService service status.

Step 14 In FusionInsight Manager alarm list, check whether **DBService Service Unavailable** is generated.

- If yes, go to **Step 15**.
- If no, go to **Step 17**.

Step 15 Rectify the fault. For details, see **ALM-27001 DBService Service Unavailable**.

Step 16 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check the network connection between the Hive and ZooKeeper, HDFS, Yarn, and DBService.

Step 17 On the FusionInsight Manager, choose **Cluster >** *Name of the desired cluster* **> Services** > **Hive**.

Step 18 Click **Instance**.

The HiveServer instance list is displayed.

Step 19 Click **Host Name** in the row of **HiveServer**.

The active HiveServer host status page is displayed.

Step 20 Record the IP address under **Basic Information**.

Step 21 Use the IP address obtained in **Step 20** to log in to the host where the active HiveServer runs as user **omm**.

Step 22 Run the **ping** command to check whether communication between the host that runs the active HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services are normal. (Obtain the IP addresses of the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services in the same way as that for obtaining the IP address of the active HiveServer.)

- If yes, go to **Step 25**.
- If no, go to **Step 23**.

Step 23 Contact the administrator to restore the network.

Step 24 In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Check the permission on the HDFS temporary directory.

Step 25 Log in to the node where the HDFS client is located and run the following command to go to the HDFS client installation directory:

cd *Client installation directory*

source bigdata_env

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

kinit *user with the supergroup permission* (Skip this step for common clusters.)

Step 26 Run the following command to check whether the permission on the data warehouse directory is 770:

hdfs dfs -ls /tmp | grep hive-scratch

- If yes, go to **Step 29**.
- If no, go to **Step 27**.

Step 27 Run the following command to restore the default data warehouse permission:

hdfs dfs -chmod 770 /tmp/hive-scratch

Step 28 Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 29**.

Check whether the local disk space is normal.

Step 29 Run the **df -h** command to check the root directory and check whether the disk usage of the **/srv**, **/var**, and **/opt** directories exceeds 95%.

- If yes, go to **Step 30**.
- If no, go to **Step 31**.

Step 30 Clear unnecessary information in the corresponding directory to ensure that the available disk space is greater than 80%. Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 31**.

Collect fault information.

Step 31 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 32 Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS
- Yarn
- DBService
- Hive

Step 33 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 34 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.139 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold

Alarm Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the heap memory usage of a Hive service exceeds the threshold (95% of the maximum memory).

You can choose **O&M** > **Alarm** > **Thresholds** > **Hive** and change the threshold.

The alarm is cleared when the Hive heap memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
16005	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When the heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The heap memory of the Hive instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Handling Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose **Alarm ID** is **16005**. Then check the role name in **Location** and confirm the IP address of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Hive** > **Instances** and click the HiveServer for which the alarm was generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area, choose **Customize** > **CPU and Memory**, select **HiveServer Memory Usage Statistics**, and click **OK**. Check whether the used heap memory of the HiveServer service reaches the threshold (default value: 95%) of the maximum heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Hive** > **Instances** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**. Check whether the used heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Hive** > **Configurations** > **All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** according to the following rules. Click **Save**.

1. Suggestions for GC parameter settings for the HiveServer:

   When the heap memory used by the HiveServer process reaches the heap memory threshold set for the HiveServer process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.

   On the FusionInsight Manager homepage, you can choose **O&M** > **Alarm** > **Thresholds** > **Hive** > **CPU and Memory** > **HiveServer Heap Memory Usage Statistics (HiveServer)** to view the threshold.

   Change the value of -Xms so that the ratio of -Xms to -Xmx is 1:2, which prevents performance from being affected when JVM dynamically adjusts the heap memory size.

2. Suggestions for GC parameter settings for the MetaServer:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

When the heap memory used by the MetaStore process reaches the heap memory threshold set for the MetaStore process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.

On the FusionInsight Manager homepage, you can choose **O&M** > **Alarm** > **Thresholds** > **Hive** > **CPU and Memory** > **MetaStore Heap Memory Usage Statistics (MetaStore)** to view the threshold.

Change the value of -Xms so that the ratio of -Xms to -Xmx is 1:2, which prevents performance from being affected when JVM dynamically adjusts the heap memory size.

Step 5 Click **More > Restart Service** to restart the Hive service.

WARNING

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.140 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the direct memory usage of a Hive service exceeds the threshold (95% of the maximum memory).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* **> Hive** to change the threshold.

The alarm is cleared when the direct memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the direct memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The direct memory of the Hive instance on the node is overused or the direct memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16006**. Then check the role name in **Location** and confirm the IP address of the instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used direct memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum direct memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used direct memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum direct memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxDirectMemorySize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

1. Suggestions for GC parameter settings for the HiveServer:
   - It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.
2. Suggestions for GC parameter settings for the MetaServer:
   - It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Click **More > Restart Service** to restart the service.

WARNING

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.141 ALM-16007 Hive GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) time of the Hive service every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold or exceeds 12 seconds for three consecutive checks. You can choose **O&M** > **Alarm** > **Thresholds** > **Hive** and change the threshold. This alarm is cleared when the Hive GC time is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
16007	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, Hive data read and write are affected, task execution may slow down, or services may restart unexpectedly.

Possible Causes

The memory of Hive instances is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose **Alarm ID** is **16007**. Then check the role name in **Location** and confirm the IP address of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Hive** > **Instances** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of HiveServer** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Hive** > **Instances** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC**, and select **Garbage Collection (GC) Time of MetaStore** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the current JVM configuration.

Step 4 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Hive** > **Configurations** > **All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-Xmx** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** according to the following rules. Click **Save**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Suggestions for GC parameter settings for the HiveServer:
  - When the Hive GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
  - You are advised to change the value of **-Xms** so that the ratio of **-Xms** to **-Xmx** is 1:2, which prevents performance from being affected when the JVM dynamically adjusts the heap memory size.
- Suggestions for GC parameter settings for the MetaServer:
  - When the Meta GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
  - You are advised to change the value of **-Xms** so that the ratio of **-Xms** to **-Xmx** is 1:2, which prevents performance from being affected when the JVM dynamically adjusts the heap memory size.

Step 5 Click **More** > **Restart Service** to restart the service.

WARNING

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service**, select **Hive** in the required cluster.

Step 9 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.142 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold

Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the non-heap memory usage of a Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds >** *Name of the desired cluster* > **Hive** to change the threshold.

The alarm is cleared when the non-heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
16008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When the non-heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

Possible Causes

The non-heap memory of the Hive instance on the node is overused or the non-heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16008**. Then check the role name in **Location** and confirm the IP address of the instance.

- If the role for which the alarm is generated is HiveServer, go to **Step 2**.
- If the role for which the alarm is generated is MetaStore, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for HiveServer.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for MetaStore.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Hive** > **Configurations > All Configurations**. Choose **HiveServer/MetaStore** > **JVM**. Adjust the value of **-XX:MaxMetaspaceSize** in **HIVE_GC_OPTS/METASTORE_GC_OPTS** as the following rules. Click **Save**.

NOTE

1. Suggestions for GC parameter settings for the HiveServer:
   - It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.
2. Suggestions for GC parameter settings for the MetaServer:
   - It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB

Step 5 Click **More > Restart Service** to restart the service.

WARNING

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Hive** in the required cluster from the **Service**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.143 ALM-16009 Map Number Exceeds the Threshold

Description

The system checks the number of HQL maps in every 30 seconds. This alarm is generated if the number exceeds the threshold. By default, **Trigger Count** is set to **3**, and the threshold is 5000.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the number of HQL maps executed by Hive is too large, a large number of Yarn queue resources are occupied, which may take a long time and affect other tasks running using this queue.

Possible Causes

The HQL statements are not the optimal.

Procedure

Check the number of HQL maps.

Step 1 On FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Resource**. Check the HQL statements with the excessively large number (5000 or more) of maps in **HQL Map Count**.

Step 2 Locate the corresponding HQL statements, optimize them and execute them again.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If it is not, go to **Step 4**.

Collect fault information.

Step 4 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 5 Select **Hive** in the required cluster from the **Service**.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.144 ALM-16045 Hive Data Warehouse Is Deleted

Description

The system checks the Hive data warehouse in every 60 seconds. This alarm is generated when the Hive data warehouse is deleted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16045	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The default Hive data warehouse is deleted. As a result, creating databases or tables in the default data warehouse fails, and services are affected.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that the default data warehouse is deleted.

Procedure

Check the default Hive data warehouse.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to check whether the **warehouse** directory exists in **hdfs://hacluster/user/***<username>***/.Trash/Current/**.

hdfs dfs -ls hdfs://hacluster/user/*<username>*/.Trash/Current/

For example, if **user/hive/warehouse** exists:

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 By default, there is an automatic recovery mechanism for the data warehouse. You can wait for 5 ~10s to check whether the default data warehouse is restored. If the data warehouse is not recovered, manually run the following command to restore the data warehouse.

hdfs dfs -mv hdfs://hacluster/user/*<username>*/.Trash/Current/user/hive/warehouse /user/hive/warehouse

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.145 ALM-16046 Hive Data Warehouse Permission Is Modified

Description

The system checks the Hive data warehouse permission in every 60 seconds. This alarm is generated if the permission is modified.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16046	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the permission on the Hive default data warehouse is modified, the permission for users or user groups to create databases or tables in the default data warehouse is changed.

Possible Causes

Hive periodically checks the status of the default data warehouse and finds that default data warehouse permission is changed.

Procedure

Check the Hive default data warehouse permission.

Step 1 Log in to the node where the client is located as user **root**.

Step 2 Run the following command to go to the HDFS client installation directory:

cd *Client installation directory*

source bigdata_env

kinit *User who has the supergroup permission* (Skip this step for a common cluster.)

Step 3 Run the following command to restore the default data warehouse permission:

- Security mode: **hdfs dfs -chmod 770 hdfs://hacluster/user/hive/warehouse**
- Non-security mode: **hdfs dfs -chmod 777 hdfs://hacluster/user/hive/warehouse**

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If it is not, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **hdfs://hacluster/user/hive/warehouse** directory on the client background.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.146 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper

Alarm Description

The system checks the Hive service every 60 seconds. This alarm is generated when Hive registration information on ZooKeeper is lost or Hive cannot connect to ZooKeeper.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
16047	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

When a Hive client sets up a new connection, it cannot select the HiveServer node that has been deregistered from ZooKeeper. If all HiveServer nodes have been deregistered from ZooKeeper, the HiveServer service will be unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The ZooKeeper instance is abnormal.
- Some Hive configurations are incorrect.

Handling Procedure

Check the ZooKeeper service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12007 Process Fault** exists in the alarm list.

- If yes, go to **Step 2**.
- If no, go to **Step 5**.

Step 2 In **Location** of **ALM-12007 Process Fault**, check whether the service name is **ZooKeeper**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the steps provided in **ALM-12007 Process Fault**.

Step 4 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the Hive configurations are correctly modified.

Step 5 On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click ··· on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

Step 6 In the search result, check the historical configurations of Hive- and ZooKeeper-related services in the **Service** column. **Table 9-120** lists some configurations that may affect the connection between Hive and ZooKeeper.

Table 9-120 Configurations related to connection between Hive and ZooKeeper

Service	Parameter	Description
Hive	HIVE_GC_OPTS	HiveServer memory configuration. If the configuration is abnormal, HiveServer may restart repeatedly. In this case, you need to check the health status of the instance processes.
	hive.zookeeper.quorum	IP address of the node accommodating ZooKeeper that is connected to Hive.
	hive.zookeeper.client.port	Port of the ZooKeeper client connected to Hive.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Service	Parameter	Description
	hive.zookeeper.session.timeout	Timeout interval of the session set up between Hive and ZooKeeper.
	hive.zookeeper.connection.timeout	Timeout interval for Hive to connect to ZooKeeper.
	hive.zookeeper.connection.max.retries	Maximum number of retries for Hive to connect to ZooKeeper.
ZooKeeper	clientPort	Port number of the ZooKeeper client.
	ssl.enabled	Whether to enable SSL connections of ZooKeeper.

Restart related instances.

Step 7 Log in to FusionInsight Manager. Choose **O&M** > **Alarm** > **Alarms**, click the drop-down list in the row that contains the alarm, and view the role and the IP address of the node for which the alarm is generated in **Location**.

Step 8 Choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Hive** > **Instance**. On the page that is displayed, select the instance at the IP address for which the alarm is generated, click **More**, and select **Restart Instance**.

NOTICE

During Hive instance restart, the instance cannot provide services for external systems. SQL tasks that are being executed on the instance may fail.

Step 9 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Hive** for the target cluster.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.147 ALM-16048 Tez or Spark Library Path Does Not Exist

Description

The system checks the Tez and Spark library paths every 180 seconds. This alarm is generated when the Tez or Spark library path does not exist.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16048	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Hive on Tez and Hive on Spark functions are affected.

Possible Causes

The Tez or Spark library path is deleted from the HDFS.

Procedure

Check the Tez and Spark library paths.

Step 1 Log in to the node where the client is deployed as user **root**.

Step 2 Run the following command to check whether the **tezlib** or **sparklib** directory exists in the **hdfs://hacluster/user/{User name}/.Trash/Current/** director:

hdfs dfs -ls hdfs://hacluster/user/*<username>***/.Trash/Current/**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For example, the following information shows that **/user/hive/tezlib/8.1.0.1/** and **/user/hive/sparklib/8.1.0.1/** exist.

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/
Found 1 items
drwx------   - test hadoop          0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Run the following command to restore **tezlib** and **sparklib**.

hdfs dfs -mv hdfs://hacluster/user/*<username>*/.Trash/Current/user/hive/tezlib/8.1.0.1/tez.tar.gz /user/hive/tezlib/8.1.0.1/tez.tar.gz

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 Collect related information in the **.Trash/Current/** directory on the client background.

Step 6 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.148 ALM-17003 Oozie Service Unavailable

Description

The system checks the Oozie service status in every 5 seconds. This alarm is generated when Oozie or a component on which Oozie depends cannot provide services properly.

This alarm is automatically cleared when the Oozie service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17003	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Details	Additional alarm information

Impact on the System

Oozie cannot be used to schedule jobs.

Possible Causes

- The DBService service is abnormal or the data of Oozie stored in DBService is damaged.
- The HDFS service is abnormal or the data of Oozie stored in HDFS is damaged.
- The YARN service is abnormal.
- The NodeAgent process is abnormal.

Procedure

Query the Oozie service health status code.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie**. Click **oozie** (any one is OK) on the **oozie WebUI** to go to the Oozie WebUI.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 2 Add **/servicehealth** to the URL in the address box of the browser and access again. The value of **statusCode** is the current Oozie service health status code.

For example, visit **https://10.10.0.117:20026/Oozie/oozie/130/oozie/servicehealth**. The result is as follows:

```
{"beans":[{"name":"serviceStatus","statusCode":0}]}
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the health status code cannot be displayed or the browser does not respond, the service may be unavailable due to Oozie process fault. See **Step 13** to rectify the fault.

Step 3 Perform the operations based on the error code. For details, see **Table 9-121**.

Table 9-121 Oozie service health status code

Status Code	Description	Error Cause	Solution
0	The service is running properly.	None	None
18002	The DBService service is abnormal.	Oozie fails to connect to DBService or the data stored in DBService is damaged.	See **Step 4**.
18003	The HDFS service is abnormal.	Oozie fails to connect to HDFS or the data stored in HDFS is damaged.	See **Step 7**.
18005	The MapReduce service is abnormal.	The Yarn service is abnormal.	See **Step 11**.

Check the DBService service.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the DBService service is running properly.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Resolve the problem of DBService based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 6 Log in to the Oozie database to check whether the data is complete.

1. Log in to the active DBService node as user **root**.

   On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService > Instance** to view the IP address of the active DBservice node.

2. Run the following command to log in to the Oozie database:

   su - omm

   source ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/FusionInsight-dbservice-2.7.0/.dbservice_profile

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gsql -U *Username* **-W** *Oozie database password* **-p 20051 -d** *Database name*

3. After the login is successful, enter **\d** to check whether there are 15 data tables.

   The Oozie service has 15 data tables by default. If these data tables are deleted or the table structure is modified, the Oozie service may be unavailable. Contact the O&M personnel to back up the data and perform restoration.

Check the HDFS service.

Step 7 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the HDFS service is running properly.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Resolve the problem of HDFS based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 9 Log in to HDFS to check whether the Oozie file directory structure is complete.

1. Download and install an HDFS client..
2. Log in to the client node as user **root** and run the following commands to check whether **/user/oozie/share** exists.

   If the cluster uses the security mode, perform security authentication.

   kinit admin

   hdfs dfs -ls /user/oozie/share

- If yes, go to **Step 18**.
- If no, go to **Step 10**.

Step 10 In the Oozie client installation directory, manually upload the share directory to **/user/oozie** in HDFS, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Yarn and MapReduce service.

Step 11 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services**, and check whether the Yarn and MapReduce services are running properly.

- If yes, go to **Step 18**.
- If no, go to **Step 12**.

Step 12 Resolve the problem of Yarn and MapReduce based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Check the Oozie process.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Log in to each node of Oozie as user **root**.

On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, click **Oozie**, and click the **Instances** tab. Record the IP address of the service nodes.

Step 14 Run the **ps -ef | grep oozie** command to check whether the Oozie process exists.

- If yes, go to **Step 15**.
- If no, go to **Step 18**.

Step 15 Collect fault information in **prestartDetail.log**, **oozie.log**, and **catalina.out** in the Oozie log directory **/var/log/Bigdata/oozie**. If the alarm is not caused by manual misoperation, go to **Step 16**.

Check the NodeAgent process.

Step 16 Log in to each node of Oozie as user **root**. Run the **ps -ef | grep nodeagent** command to check whether the NodeAgent process exists.

- If yes, go to **Step 17**.
- If no, go to **Step 18**.

Step 17 Run the **kill -9** *The process ID of nodeagent* command, wait 10 minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 18 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.149 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the Oozie service every 60 seconds. The alarm is generated when the heap memory usage of a Metadata instance exceeds the threshold (95% of the maximum memory). The alarm is cleared when the heap memory usage is less than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The heap memory overflow may cause a service breakdown. After the service breaks down, the Oozie service cannot be used to schedule tasks.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Oozie Heap Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Oozie Heap Memory Resource Percentage**. Click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the used heap memory of Oozie reaches the threshold (the default value is 95% of the maximum heap memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie** > **Configurations** > **All Configurations**. Set Search **GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save** > **OK**.

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.150 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non heap memory usage of Oozie every 30 seconds. This alarm is reported if the non heap memory usage of Oozie exceeds the threshold

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

(80%). This alarm is cleared if the non heap memory usage is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
17005	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The service may break down and the Oozie service cannot be used to schedule tasks.

Possible Causes

The non-heap memory of the Oozie instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **Oozie Non Heap Memory Usage Exceeds the Threshold**. On the displayed page, check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Choose **Memory** and select **Oozie Non Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the non-heap memory used by Oozie reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Configurations** and then **All Configurations**. On the displayed page, search for the **GC_OPTS** parameter in the search box and check whether it contains **-XX: MaxMetaspaceSize**. If yes, increase the value of **-XX: MaxMetaspaceSize** based on the site requirements. If no, manually add **-XX: MaxMetaspaceSize** and set its value to 1/8 of the value of **-Xmx**. Click **Save**, and then click **OK**

NOTE

JDK1.8 does not support the **MaxPermSize** parameter.

Suggestions on GC parameter settings for Oozie:

Set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Oozie** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.151 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Oozie service every 30 seconds. The alarm is generated when the direct memory usage of an Oozie instance exceeds the threshold (80% of the maximum memory). The alarm is cleared when the direct memory usage of Oozie is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The direct memory overflow may cause a service breakdown. After the service breaks down, the Oozie service cannot be used to schedule tasks.

Possible Causes

The direct memory of the Oozie instance is overused or the direct memory is inappropriately allocated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Oozie Direct Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Oozie Direct Buffer Resource Percentage**. Click **OK**.

Step 3 Check whether the used direct memory of Oozie reaches the threshold (the default value is 80% of the maximum direct memory) specified for Oozie.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 **On the FusionInsight Manager portal, choose Cluster > *Name of the desired cluster* > Services > Oozie > Configurations. Click All Configurations. Search GC_OPTS in the search box. Increase the value of -XX:MaxDirectMemorySize as required, and click Save. Click OK.**

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set the value of **-XX:MaxDirectMemorySize** to 1/4 of the value of **-Xmx**. For example, if **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 2 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

9.11.152 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold

Description

The system checks GC time of the Oozie process every 60 seconds. The alarm is generated when GC time of the Oozie process exceeds the threshold (default value: **12 seconds**). The alarm is cleared when GC time is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
17007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Oozie scheduling task responds slowly until the service is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

Procedure

Check GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold** > **Location**. Check the IP address of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of Oozie**. Click **OK**.

Step 3 Check whether GC time of the Oozie process every second exceeds the threshold (default value: **12 seconds**).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie** > **Configurations. Click All Configurations. Search GC_OPTS in the search box. Increase the value of -Xmx as required, and click Save. Click OK.**

NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Oozie** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.153 ALM-17008 Abnormal Connection Between Oozie and ZooKeeper

Alarm Description

In HA mode, Oozie depends on ZooKeeper. This alarm is generated when the connection between Oozie and ZooKeeper is abnormal for three consecutive times.

This alarm is cleared when the connection between Oozie and ZooKeeper becomes normal.

This section applies to MRS 3.3.0 and later versions.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
17008	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted. In HA mode, the Oozie service will restart if this alarm is reported.

Possible Causes

- The ZooKeeper service is abnormal.
- Oozie fails to connect to ZooKeeper.

Handling Procedure

Check the ZooKeeper service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and ZooKeeper.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement] [ZooKeeper]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.154 ALM-17009 Abnormal Connection Between Oozie and DBService

Alarm Description

Oozie depends on DBService. After a task is submitted, the system checks DBService connectivity. This alarm is generated when the service fails the check for 10 consecutive times.

This alarm is cleared when the connection between Oozie and DBService becomes normal.

This section applies to MRS 3.3.0 and later versions.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
17009	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

Possible Causes

- The DBService service is abnormal.
- Oozie fails to connect to DBService.

Handling Procedure

Check the DBService status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of DBService is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-27001 DBService Service Unavailable** is reported.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-27001 DBService Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and DBService.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][DB Service]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.155 ALM-17010 Abnormal Connection Between Oozie and HDFS

Alarm Description

Oozie depends on HDFS. After a task is submitted, the system checks HDFS connectivity. This alarm is generated when the service fails the check for 3 consecutive times.

This alarm is cleared when the connection between Oozie and HDFS becomes normal.

This section applies to MRS 3.3.0 and later versions.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
17010	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

Possible Causes

The HDFS service restarts, there is a fault, or the network connectivity is abnormal.

Handling Procedure

Check the HDFS service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of HDFS is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and HDFS.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][HDFS]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.11.156 ALM-17011 Abnormal Connection Between Oozie and YARN

Alarm Description

Oozie depends on YARN. After a task is submitted, the system checks YARN connectivity. This alarm is generated when the service fails the check for 5 consecutive times.

This alarm is cleared when the connection between Oozie and YARN becomes normal.

This section applies to MRS 3.3.0 and later versions.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
17011	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The Yarn service is abnormal.
- The connection between Oozie and Yarn is abnormal.

Handling Procedure

Check the YARN service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of Yarn is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-18000 YARN Service Unavailable** is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-18000 YARN Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the connectivity between Oozie and Yarn.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Log** > **Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][Yarn]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Select **Oozie** for **Service** and click **OK**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Related Information

None.

9.11.157 ALM-18000 Yarn Service Unavailable

Alarm Description

The alarm module checks the Yarn service status every 60 seconds. This alarm is generated when the Yarn service is unavailable.

The alarm is cleared when the Yarn service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18000	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The cluster cannot provide the Yarn service.
- Users cannot run new applications.
- Submitted applications cannot be run.

Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- There is no active ResourceManager instance in the Yarn cluster.
- All the NodeManager nodes in the Yarn cluster are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check ZooKeeper service status.

Step 1 On the FusionInsight Manager, check whether the alarm list contains **ALM-13000 ZooKeeper Service Unavailable**.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the fault by performing the operations provided in **ALM-13000 ZooKeeper Service Unavailable**. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check the HDFS service status.

Step 3 On the FusionInsight Manager, check whether the alarm list contains the HDFS alarms.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M > Alarm > Alarms**, handle HDFS alarms based on the alarm help, and check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ResourceManager status in the Yarn cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**.

Step 6 On the **Dashboard** page, check whether there is any active ResourceManager instance in the Yarn cluster.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Check the NodeManager node status in the Yarn cluster.

Step 7 On FusionInsight Manager, choose **Cluster** > **Services** > **Yarn** > **Instances**.

Step 8 Query the status of NodeManager and check whether there are unhealthy nodes.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Rectify the fault by following the steps provided in **ALM-18002 NodeManager Heartbeat Lost** or **ALM-18003 NodeManager Unhealthy**. After the fault is rectified, check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager portal of the active cluster, choose **O&M** > **Log > Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 11 Select **Yarn** in the required cluster from the **Service**.

Step 12 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.158 ALM-18002 NodeManager Heartbeat Lost

Alarm Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number with the threshold. The **Lost Nodes** indicator has a default threshold. The alarm is generated when the value of Number of Lost Nodes exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.lost.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of lost nodes exceeds the threshold, and is cleared when the number of lost nodes is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18002	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Lost Host	Specifies the list of hosts with lost nodes.

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All the NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Handling Procedure

Check the NodeManager status.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click before the alarm and obtain lost nodes in **Additional Information**.

Step 2 Check whether the lost nodes are hosts that have been manually deleted without decommission.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 After the setting, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**. Search for **yarn.nodemanager.lost.alarm.threshold** and change its value to the number of hosts that are not out of service and proactively deleted. After the setting, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Manually clear the alarm. Note that decommission must be performed before deleting hosts.

Step 5 On the FusionInsight Manager portal, choose **Cluster > Hosts**, and check whether the nodes obtained in **Step 1** are healthy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Rectify the node fault based on **ALM-12006 Node Fault** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the process status.

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Instance**, and check whether there are NodeManager instances whose status is not **Good**.

- If yes, go to **Step 10**.
- If no, go to **Step 8**.

Step 8 Check whether the NodeManager instance is deleted.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Restart the active and standby ResourceManager instances, and check whether the alarm is cleared.

NOTE

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate temporary service unavailability alarms.
- Restart the standby ResourceManager instance. Services are not affected.

- If yes, no further action is required.
- If no, go to **Step 13**.

Check the instance status.

Step 10 Select NodeManager instances which running state is not **Normal** and restart them. Check whether the alarm is cleared.

NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check the network status.

Step 11 Log in to the management node, **ping** the IP address of the lost NodeManager node to check whether the network is disconnected or busy.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Rectify the network, and check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 14 Select **Yarn** in the required cluster from the **Service**.

Step 15 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.159 ALM-18003 NodeManager Unhealthy

Description

The system checks the number of unhealthy NodeManager nodes every 30 seconds, and compares the number with the threshold. The Unhealthy Nodes indicator has a default threshold. This alarm is generated when the value of the Unhealthy Nodes indicator exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value

of **yarn.nodemanager.unhealthy.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of unhealthy nodes exceeds the threshold, and is cleared when the number of unhealthy nodes is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18003	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Unhealthy Host	Specifies the list of hosts with unhealthy nodes.

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The hard disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Check the hard disk space of the host.

Step 1 On the FusionInsight Manager, and choose **O&M** > **Alarm > Alarms**. Click before the alarm and obtain unhealthy nodes in **Additional Information**.

Step 2 Choose **Cluster** > *Name of the desired cluster* **> Services > Yarn** > **Instance**, select the NodeManager instance corresponding to the host, choose **Instance Configurations > All Configurations** and view disks corresponding to **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**.

Step 3 Choose **O&M > Alarm > Alarms**. In the alarm list, check whether the related disk has the alarm **ALM-12017 Insufficient Disk Capacity**.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the instructions provided in **ALM-12017 Insufficient Disk Capacity**. After the fault is rectified, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Choose **Hosts** > *Name of the desired host* . On the **Dashboard** page, check the disk usage of the corresponding partition. Check whether the percentage of the used space of the mounted disk exceeds the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Reduce the disk usage to less than the configured value, wait for 10 to 20 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the access permission of the local directory on each NodeManager node.

Step 7 Obtain the NodeManager directory viewed in **Step 2**, log in to each NodeManager node as user **root**, and go to the obtained directory.

Step 8 Run the **ll** command to check whether the permission of the **localdir** and **containerlogs** folders is **755** and whether **User:Group** is **omm:ficommon**.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Run the following command to set the permission to **755** and **User:Group** to **omm:ficommon**:

chmod 755 *<folder_name>*

chown omm:ficommon *<folder_name>*

Step 10 Wait for 10 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager in the active cluster, choose **O&M** > **Log** > **Download**.

Step 12 Select **Yarn** in the required cluster from the **Service**.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.160 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to 95% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager** (Indicates the host name of the instance for which the alarm is generated)**.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **ResourceManager > Percentage of Used Memory of the ResourceManager**. Check the heap memory usage.

Step 3 Check whether the used heap memory of ResourceManager reaches 95% of the maximum heap memory specified for ResourceManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Restart the role instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate temporary service unavailability alarms.

  Restart the standby ResourceManager instance. Services are not affected.
- The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

9.11.161 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of MapReduce JobHistoryServer exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **MapReduce** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to 95% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce log archiving is affected. What is more, a memory overflow occurs so that the YARN service is unavailable.

Possible Causes

The heap memory of the MapReduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **MapReduce** and click the **Instance** tab. On the displayed page, select **JobHistoryServer** (the host name for which the alarm is generated) and select **Customize** > **Resource** from the drop-down list in the upper right corner of the chart area. On the displayed page, select **JobHistoryServer Heap Memory Usage Statistics**. Check the heap memory usage.

Step 3 Check whether the used heap memory of JobHistoryServer reaches 95% of the maximum heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Increase the value of **GC_OPTS** parameter as required, click **Save**. Click **OK** and restart the role instance.

NOTE

- The mapping between the number of historical tasks (10000) and the memory of JobHistoryServer is as follows:

  -Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

- During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- MapReduce

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.162 ALM-18010 ResourceManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the ResourceManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the ResourceManager process may interrupt the services.

Possible Causes

The heap memory of the ResourceManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-18010 ResourceManager GC Time Exceeds the Threshold** > **Location**. View the IP address of the alarmed instance.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Yarn**. On the page that is displayed, click the **Instance** tab. In the instance list, select **ResourceManager** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Garbage Collection**, and select **Garbage Collection (GC) Time of ResourceManager**. Check the GC duration statistics of the ResourceManager process every minute.

Step 3 Check whether the GC duration of the ResourceManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of the **GC_OPTS** parameter as required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Save the configuration and restart the ResourceManager instance.

NOTE

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate service unavailable alarms for a short period of time.
- Restart the standby ResourceManager instance. Services are not affected.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **ResourceManager** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

9.11.163 ALM-18011 NodeManager GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the NodeManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the NodeManager process may interrupt the services.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The heap memory of the NodeManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-18011 NodeManager GC Time Exceeds the Threshold** > **Location**. View the IP address of the alarmed instance.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Yarn**. On the page that is displayed, click the **Instance** tab. In the instance list, select **NodeManager** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Garbage Collection**, and select **Garbage Collection (GC) Time of NodeManager**. Check the GC duration statistics of the NodeManager process every minute.

Step 3 Check whether the GC duration of the NodeManager process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Increase the value of the **GC_OPTS** parameter as required.

NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the NodeManager instance.

NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **NodeManager** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.164 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the JobHistoryServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the JobHistoryServer process may interrupt the services.

Possible Causes

The heap memory of the JobHistoryServer instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-18012 JobHistoryServer GC Time Exceeds the Threshold** > **Location**. View the IP address of the alarmed instance.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **MapReduce**. On the page that is displayed, click the **Instance** tab. In the instance list, select **JobHistoryServer** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Garbage Collection**, and select **Garbage Collection (GC) Time of the JobHistoryServer**. Check the GC duration statistics of the JobHistoryServer process every minute.

Step 3 Check whether the GC duration of the JobHistoryServer process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Increase the value of the **GC_OPTS** parameter as required.

NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Save the configuration and restart the JobHistoryServer instance.

NOTE

During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.

9.11.165 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of ResourceManager every 30 seconds. This alarm is generated when the direct memory usage of ResourceManager instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18013	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the available direct memory of ResourceManager is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of ResourceManager instances is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold** > **Location**. View the IP address of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Yarn**. On the page that is displayed, click the **Instances** tab and click the ResourceManager instance for which this alarm is generated. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Resource**, and select **Memory Usage Status of ResourceManager** to check the direct memory usage.

Step 3 Check whether the used direct memory of a ResourceManager instance reaches 90% (default threshold) of the maximum direct memory allocated to it.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Delete the **-XX:MaxDirectMemorySize** parameter from **GC_OPTS** and save the configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

MaxDirectMemorySize indicates the maximum off-heap memory size. If the **MaxDirectMemorySize** parameter of ResourceManager is not specified, the memory of ResourceManager is not limited. By default, **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter is not set.

Step 6 Perform the following steps to restart the ResourceManager instance:

NOTICE

- Restarting the standby ResourceManager instance does not affect services.
- During the ResourceManager switchover, new jobs cannot be submitted to Yarn, but submitted jobs are not affected.

1. On the Yarn service page, click the **Instances** tab, select the **ResourceManager (Standby)** instance, choose **More**, select **Restart Instance**, and verify the password to restart the instance.
2. After the standby instance is restarted, click the **Dashboard** tab of Yarn, choose **More**, select **Perform ResourceManager Switchover**, and verify the password to perform an active/standby switchover.
3. After the active/standby switchover is complete, click the **Instances** tab on the Yarn service page, select the **ResourceManager (Standby)** instance, choose **More**, select **Restart Instance**, and verify the password to restart the instance. Wait until the instance is restarted.

Step 7 Check whether **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **ResourceManager** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

9.11.166 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a NodeManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18014	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The direct memory of the NodeManager instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold** > **Location**. View the IP address of the alarmed instance.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the page that is displayed, click the **Instance** tab. In the instance list, select **NodeManager** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Resource**, and select **Percentage of Used Memory of the NodeManager**. Check the direct memory usage.

Step 3 Check whether the used direct memory of NodeManager reaches 90% of the maximum direct memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the NodeManager instance.

NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

Step 7 Check whether the **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Select **NodeManager** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.167 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the MapReduce service every 30 seconds. This alarm is generated when the direct memory usage of a JobHistoryServer instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18015	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the MapReduce service is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistoryServer instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-18015 JobHistory Direct Memory Usage Exceeds the Threshold** > **Location**. View the IP address of the alarmed instance.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **MapReduce** and click the **Instance** tab. On the displayed page, select **JobHistoryServer** (the IP address of the instance for which the alarm is generated). Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource**, select **Memory Usage Status of JobHistoryServer**. Check the direct memory usage.

Step 3 Check whether the used direct memory of MapReduce reaches 90% of the maximum direct memory specified for the MapReduce service.

- If yes, go to **Step 4**.
- If no, go to **Step 9**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC_OPTS** parameter.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 In the **GC_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

Step 6 Save the configuration and restart the JobHistoryServer instance.

NOTE

During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Check whether the **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 10 Select **JobHistoryServer** in the required cluster from the **Service**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.168 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn ResourceManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18016	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn ResourceManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18016 Non Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **ResourceManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Percentage of Used Memory of the ResourceManager**. ResourceManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of ResourceManager reaches 90% of the maximum Non Heap memory specified for ResourceManager by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Adjust the **GC_OPTS** memory parameter of ResourceManager. Save the configuration and restart the ResourceManager instance.

NOTE

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate service unavailable alarms for a short period of time.

  Restart the standby ResourceManager instance. Services are not affected.
- The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.169 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold

Description

The system checks the Non Heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn NodeManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18017	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The Non Heap memory of the Yarn NodeManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18017 Non Heap Memory Usage of Yarn NodeManager Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Instance** > **NodeManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager**. NodeManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of NodeManager reaches 90% of the maximum Non Heap memory specified for NodeManager by default.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Adjust the **GC_OPTS** memory parameter of NodeManager, click **Save**, and click **OK,** and restart the role instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- During NodeManager restart, containers submitted to this node may be retried to other nodes.
- The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

9.11.170 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn NodeManager exceeds the threshold (95% of the maximum memory by default).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18018	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn NodeManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the **Home** page of FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**. On the page that is displayed, click the **Instance** tab. In the instance list, select

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NodeManager (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize** > **Resource**, and select **Percentage of Used Memory of the NodeManager**. Check the heap memory usage.

Step 3 Check whether the used heap memory of NodeManager reaches 95% of the maximum heap memory specified for NodeManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Increase the value of the **GC_OPTS** parameter as required. Save the configurations and restart the NodeManager instance.

NOTE

- During NodeManager restart, containers submitted to this node may be retried to other nodes.
- The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

9.11.171 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold

Description

The system checks the Non Heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of MapReduce JobHistoryServer exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **MapReduce** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18019	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the Non Heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce task submission and operation is affected. In

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

addition, a memory overflow may occur so that the MapReduce service is unavailable.

Possible Causes

The Non Heap memory of the MapReduce JobHistoryServer instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the Non Heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** > **ALM-18019 Non Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold** > **Location**. Check the HostName of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Instance** > **JobHistoryServer.** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **JobHistoryServer Non Heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.

Step 3 Check whether the used Non Heap memory of JobHistoryServer reaches 90% of the maximum Non Heap memory specified for JobHistoryServer.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster >** *Name of the desired cluster* **> Services** > **MapReduce** > **Configurations** > **All Configurations** > **JobHistoryServer** > **System**. Adjust the **GC_OPTS** memory parameter of the NodeManager, click **Save**, and click **OK,** and restart the role instance.

NOTE

- During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.
- The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

  -Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following node in the required cluster from the **Service**.

- NodeAgent
- MapReduce

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.172 ALM-18020 Yarn Task Execution Timeout

Alarm Description

The system checks MapReduce and Spark tasks (except for permanent JDBC tasks) submitted to Yarn every 15 minutes. This alarm is generated when the task execution time exceeds the timeout duration specified by the user. However, the task can be properly executed. The client timeout parameter of MapReduce is mapreduce.application.timeout.alarm and that of Spark is spark.application.timeout.alarm. The unit is ms.

This alarm is cleared when the task is finished or terminated.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18020	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
ApplicationName	Specifies the object (application ID) for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The alarm persists after task execution times out. However, the task can still be properly executed, so this alarm does not exert any impact on the system.

Possible Causes

- The specified timeout duration is shorter than the required execution time.
- The queue resources for task running are insufficient.
- Task data skew occurs. As a result, some tasks process a large amount of data and take a long time to execute.

Handling Procedure

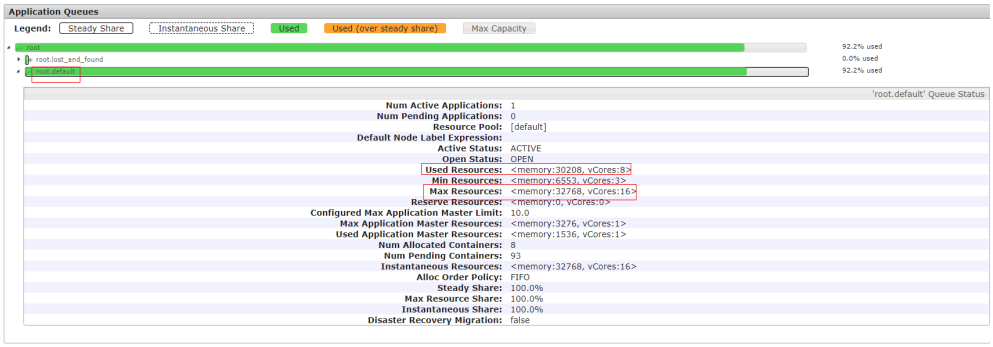
Check whether the timeout interval is correctly set.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. The **Alarms** page is displayed.

Step 2 Select the alarm whose ID is **18020**. In the alarm details, view **Location** to obtain the timeout task name and timeout duration.

Step 3 Based on the task name and timeout interval, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to log in to the native Yarn page. Then find the task on the native page, check its **StartTime** and calculate the task execution time based on the current system time. Check whether the task execution time exceeds the timeout duration.

- If yes, go to **Step 4**.
- If no, go to **Step 10**.



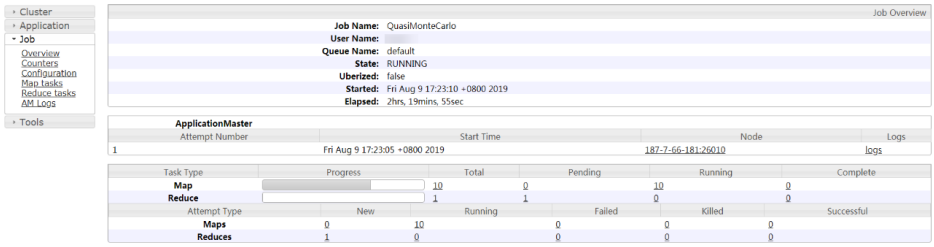
Step 4 Evaluate the expected task execution time based on the service and compare it with the task timeout interval. If the timeout interval is too short, set the timeout interval (**mapreduce.application.timeout.alarm** or **spark.application.timeout.alarm**) of the client to the task expected execution time. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the queue resources are sufficient.

Step 5 Find the task on the native page and view the queue name of the task. Click **Scheduler** on the left of the native page. On the **Applications Queues** page, find the corresponding queue name and expand the queue details, as shown in the following figure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Step 6 Check whether the value of **Used Resources** in the queue details is approximately equal to the value of **Max Resources**, which indicates that the resources in the queue submitted by the task have been used up. If the queue resources are insufficient, choose **Tenant Resources** > **Dynamic Resource Plan** > **Resource Distribution Policy** on FusionInsight Manager and increase the value of **Max Resources** for the queue. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether data skew occurs.

Step 7 On the native Yarn page, click *task ID* (for example, **application_1565337919723_0002**) > **Tracking URL:ApplicationMaster** > **job_1565337919723_0002**. The following page is displayed.

Step 8 Choose **Job** > **Map tasks** or **Job** > **Reduce tasks** on the left and check whether the execution time of each Map or Reduce task differs greatly. If yes, task data skew occurs. In this case, you need to balance the task data.

Step 9 Rectify the fault based on the preceding causes and perform the tasks again. Then, check whether the alarm persists.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.173 ALM-18021 MapReduce Service Unavailable

Description

The alarm module checks the MapReduce service status every 60 seconds. This alarm is generated when the system detects that the MapReduce service is unavailable.

The alarm is cleared when the MapReduce service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18021	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the MapReduce service. For example, MapReduce cannot be used to view task logs or the log archive function is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The JobHistoryServer instance is abnormal.
- The KrbServer service is abnormal.
- The ZooKeeper service abnormal.
- The HDFS service abnormal.
- The Yarn service is abnormal.

Procedure

Check MapReduce service JobHistoryServer instance status.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Instance**.

Step 2 Check whether the running status of JobHistoryServer is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

Check the KrbServer service status.

Step 3 In the alarm list on FusionInsight Manager, check whether **ALM-25500 KrbServer Service Unavailable** exists.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service.

Step 5 In the alarm list on FusionInsight Manager, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the HDFS service status.

Step 7 In the alarm list on FusionInsight Manager, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**, and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the Yarn service status.

Step 9 In the alarm list on FusionInsight Manager, check whether **ALM-18000 Yarn Service Unavailable** exists.

- If yes, go to **Step 10**
- If no, go to **Step 11**.

Step 10 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On the FusionInsight Manager home page of the active cluster, choose **O&M** > **Log** > **Download.**

Step 12 Select **MapReduce** in the required cluster from the **Service.**

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.174 ALM-18022 Insufficient Yarn Queue Resources

Description

- The alarm module checks Yarn queue resources every 60 seconds. This alarm is generated when available resources or ApplicationMaster (AM) resources of a queue are insufficient.

  This alarm is cleared when available resources are sufficient.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18022	Minor	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter Name	Description
Source	Specifies the cluster for which the alarm is generated.
QueueName	Specifies the queue for which the alarm is generated.
QueueMetric	Specifies the metric of the queue for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- An application being executed takes longer time.
- An application fails to be executed for a long time after being submitted.

Possible Causes

- NodeManager node resources are insufficient.
- The configured maximum resource capacity of the queue is excessively small.
- The configured maximum AM resource percentage is excessively small.

Procedure

Check NodeManager resources.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm > Alarms**.

Step 2 View location information of this alarm and check whether **QueueName** is **root** and **QueueMetric** is **Memory** or **QueueName** is **root** and **QueueMetric** is **vCores**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 The memory or CPU of the Yarn cluster is insufficient. In this case, log in to the node where NodeManager resides and run the **free -g** and **cat /proc/cpuinfo** commands to query the available memory and available CPU of the node, respectively. On FusionInsight Manager, increase the values of **yarn.nodemanager.resource.memory-mb** and **yarn.nodemanager.resource.cpu-vcores** for the Yarn NodeManager based on the query results. Then, restart the NodeManager instance. Check whether the alarm is cleared.

NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 4**.

Checking the maximum resource capacity of a queue.

Step 4 View location information of this alarm and check whether **QueueName** is **<*Tenant Queue*>** and **QueueMetric** is **Memory**, or **QueueName** is **<*Tenant Queue*>** and **QueueMetric** is **vCores** in **Location**, check whether **available Memory =** or **available vCores =** are included in **Additional Information**.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 The memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan > Resource Distribution Policy** and increase the value of **Maximum Capacity**. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available Memory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available Memory =** in **Additional Information**.

If **Additional Information** contains **available vCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available vCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Checking the maximum AM resource percentage.

Step 7 If **available AmMemory =** or **available AmvCores =** is included in **Additional Information**, ApplicationMaster memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources** > **Dynamic Resource Plan** > **Queue Configuration** and increase the value of **Maximum Am Resource Percent**. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available AmMemory =**, change the value of **yarn.am.memory.alarm.threshold** to a value smaller than that of **available AmMemory =** in **Additional Information**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If **Additional Information** contains **available AmvCores =**, change the value of **yarn.am.vcore.alarm.threshold** to a value smaller than that of **available AmvCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 Log in to FusionInsight Manager of the active cluster, and choose **O&M** > **Log** > **Download**.

Step 10 Select **Yarn** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.175 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold

Alarm Description

The alarm module checks the number of pending applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 60.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18023	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
QueueName	Specifies the queue for which the alarm was generated.
QueueMetric	Specifies the queue metric for which the alarm was generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Handling Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Applications** > **Pending Applications**, and increase the thresholds as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.176 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold

Alarm Description

The alarm module checks the pending memory of Yarn every 60 seconds. The alarm is generated when the pending memory exceeds the threshold. Pending memory indicates the total memory that is not allocated to submitted Yarn applications.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18024	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
QueueName	Specifies the queue for which the alarm was generated.
QueueMetric	Specifies the queue metric for which the alarm was generated.

Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

Handling Procedure

Check NodeManager resources.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

Step 2 Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check the maximum queue resource capacity and the maximum AM resource percentage.

Step 4 Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Adjust the monitoring thresholds.

Step 6 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **CPU and Memory** > **Pending Memory**, and increase the threshold as required.

Step 7 Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.177 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of terminated applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18025	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
Service Name	Specifies the service for which the alarm is generated.
Role Name	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A large number of application tasks are forcibly terminated.

Possible Causes

- The user forcibly terminates a large number of tasks.
- The system terminates tasks due to some error.

Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Terminated Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **KILLED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task termination details (for example, the task is terminated by a user).

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose **O&M > Log > Download**.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.178 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold

Description

The alarm module checks the number of failed applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18026	Major	Yes

Parameters

Name	Meaning
Cluster Name	Specifies the cluster for which the alarm is generated.
Service Name	Specifies the service for which the alarm is generated.
Role Name	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- A large number of application tasks fail to be executed.
- Failed tasks need to be submitted again.

Possible Causes

The task fails to be executed due to some error.

Procedure

Check the alarm details.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.

Step 2 View **Additional Information** in the alarm details to check whether the alarm threshold is too small.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Other** > **Failed Applications of root queue** to modify the threshold. Go to **Step 6**.

Step 4 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager(Active)** to access the ResourceManager web UI.

Step 5 Click **FAILED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task failure causes.

Step 6 Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On the FusionInsight Manager, choose O&M > Log > Download.

Step 8 Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

9.11.179 ALM-18027 JobHistoryServer Process Is Abnormal

Alarm Description

The JobHistoryServer process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18027	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check the process state:

ps ww -eo stat,cmd| grep -w org.apache.hadoop.mapreduce.v2.hs.JobHistoryServer | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **Mapreduce** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.180 ALM-18028 TimeLineServer Process Is Abnormal

Alarm Description

The TimeLineServer process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
18028	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

9.11.181 ALM-19000 HBase Service Unavailable

Alarm Description

The alarm module checks the HBase service status every 120 seconds. This alarm is generated when the HBase service is unavailable.

This alarm is cleared when the HBase service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19000	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Operations such as data read/write and table creation cannot be performed.

Possible Causes

- ZooKeeper is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- HDFS is abnormal.
- HBase is abnormal.
- The network connection is abnormal.
- The service configuration value is incorrect.

Handling Procedure

Check the ZooKeeper service status.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the HDFS service status.

Step 5 In the alarm list, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **HDFS**. On the **Dashboard**, check whether the **Safe Mode** is **ON** for HDFS.

- If yes, go to **Step 9**.
- If no, go to **Step 12**.

Step 9 Log in to the node where the HDFS client is deployed as the **root** user.

Run the following command to go to the client installation directory and load environment variables:

```
cd Client installation directory
source bigdata_env
```

If Kerberos authentication is enabled for the cluster, complete security authentication:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
kinit Username of the service user who has the HDFS operation permissions
```

Enter the required password.

Step 10 Run the following command to manually exit the safe mode:

```
hdfs dfsadmin -safemode leave
```

Step 11 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service status.

Step 12 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase**.

Step 13 Check whether there is one active HMaster and one standby HMaster.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

Step 14 Click **Instances** and select the HMaster instance whose status is not **Active**. Click **More** and select **Restart Instance** to restart HMaster. Then check whether there is one active HMaster and one standby HMaster.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

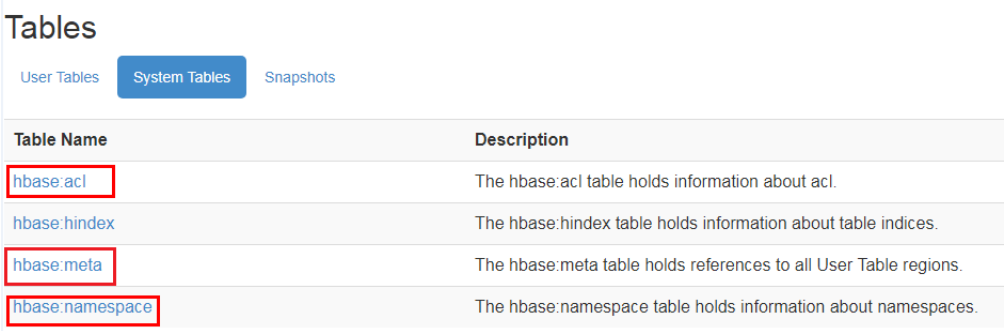
NOTICE

During the HMaster restart, table operations cannot be performed, and the HBase web UI is inaccessible. Data read and write operations are not affected.

Step 15 Choose **Cluster** > **Services** > **HBase** and click **HMaster(Active)** to access the HMaster WebUI.

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 16 Check whether at least one RegionServer exists under **Region Servers**.



- If yes, go to **Step 17**.
- If no, go to **Step 21**.

Step 17 Choose **Tables** > **System Tables** and check whether **hbase:meta**, **hbase:namespace**, and **hbase:acl** exist in the **Table Name** column, as shown in **Figure 9-8**.

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 9-8 HBase system tables

Step 18 Click **hbase:meta**, **hbase:namespace**, and **hbase:acl** to check whether all pages can be opened. If all of them can be opened, the tables are normal.

- If yes, go to **Step 19**.
- If no, go to **Step 25**.

NOTE

In a normal cluster, ACL permission control is disabled for HBase by default. The **hbase:acl** table is generated only after ACL permission control is manually enabled. In this case, you need to check this table.

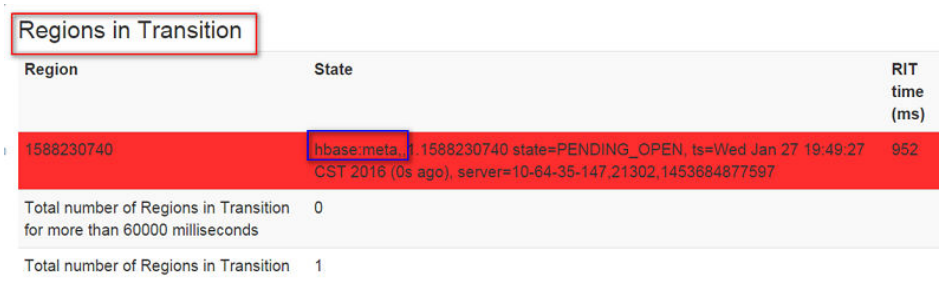
Step 19 View the HMaster startup status.

On the **Tasks** page shown in **Figure 9-9**, the **RUNNING** value in the **State** column indicates that HMaster is being started and provides how much time HMaster keeps in that state. As shown in **Figure 9-10**, if the state is **COMPLETE**, HMaster has been started.

Check whether HMaster has been in the **RUNNING** state for a long time.

Figure 9-9 HMaster being started

Figure 9-10 HMaster startup completed



- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 On the HMaster web UI, check whether any **hbase:meta** is in the **Regions in Transition** state for a long time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 9-11 Regions in Transition

- If yes, go to **Step 21**.
- If no, go to **Step 22**.

Step 21 After ensuring that services are not affected, log in to FusionInsight Manager, choose **Cluster**. Click the name of the required cluster, choose **Services** > **HBase**, click **More**, and select **Restart Service**. In the dialog box that is displayed, enter the password, and click **OK**.

- If yes, go to **Step 22**.
- If no, go to **Step 25**.

NOTICE

During HBase service restart, the service is unavailable. For example, data cannot be read or written, table operations cannot be performed, and the HBase web UI is inaccessible.

Step 22 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 25**.

Check whether the HBase configurations are correctly modified.

Step 23 On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click ··· on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

Step 24 In the search result, check whether the historical configurations of HBase-related services in the **Service** column, such as ZooKeeper, HDFS, and HBase, may affect the HBase service status. **Table 9-122** lists some configurations that may affect the HBase service status.

Table 9-122 Configurations affecting the HBase service status

Parameter	Possible Impact
GC_OPTS	The memory configuration may be improper. You need to check the health status of instance processes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Possible Impact
hbase.rpc.protection	If the HBase service is not restarted offline after the value of this parameter is changed, the connection authentication fails and the HBase service becomes abnormal.
hbase.regionserver.metahandler.count	If there are too many regions in the cluster but this parameter is set to a small value, RIT may occur and regions cannot be brought online for a long time.
hbase.regionserver.thread.compaction.large	If this parameter is set to a large value, the node CPU usage may be too high.
hbase.regionserver.thread.compaction.small	If this parameter is set to a large value, the node CPU usage may be too high.
hbase.coprocessor.master.classes	If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.
hbase.coprocessor.region.classes	If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.
hbase.coprocessor.regionserver.classes	If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.
zookeeper.session.timeout	If this parameter is set to a small value, the connection between HBase and ZooKeeper times out too quickly. As a result, the HMaster instance and RegionServer may restart repeatedly.

Check the network connection between HMaster and dependent components.

Step 25 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase**.

Step 26 Click **Instances**. In the HMaster instance list, record the management IP address of the active HMaster instance.

Step 27 Log in to the active HMaster node as user **omm** using the IP address obtained in **Step 26**.

Step 28 Run the **ping** command to check whether the network connection between the active HMaster node and the host where the dependent components reside is normal. (The dependent components include ZooKeeper, HDFS, and Yarn. The method of obtaining the IP address of the host where the dependent components reside is the same as that of obtaining the IP address of the active HMaster node.)

- If yes, go to **Step 31**.
- If no, go to **Step 29**.

Step 29 Contact the network administrator to restore the network.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 30 In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 31**.

Collect fault information.

Step 31 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 32 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select the following services for the target cluster:

- ZooKeeper
- HDFS
- HBase

Step 33 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 34 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.182 ALM-19006 HBase Replication Sync Failed

Description

The alarm module checks the HBase DR data synchronization status every 30 seconds. When disaster recovery (DR) data fails to be synchronized to a standby cluster, the alarm is triggered.

When DR data synchronization succeeds, the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19006	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

HBase data in the cluster cannot be synchronized to the standby cluster. Synchronization data is stacked, causing a large amount of active/standby data inconsistency. As a result, the latest data cannot be read from the standby cluster after an active/standby DR switchover or dual-read. If the alarm persists, the storage space of the primary cluster and ZooKeeper nodes will be stacked, leading to service faults in the primary cluster.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- A network exception occurs.

Procedure

Observe whether the system automatically clears the alarm.

Step 1 On the FusionInsight Manager portal of the active cluster, click **O&M** > **Alarm** > **Alarms.**

Step 2 In the alarm list, click the alarm to obtain alarm generation time from **Generated** of the alarm. Check whether the alarm has existed for five minutes.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Wait five minutes and check whether the system automatically clears the alarm.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the HBase service status of the standby cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 5 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 6 Access the node where the HBase client of the active cluster resides as user **omm**.

If the cluster uses a security mode, perform security authentication first and then access the **hbase shell** interface as user **hbase**.

cd /opt/client

source ./bigdata_env

kinit *hbaseuser*

Step 7 Run the **status 'replication', 'source'** command to check the DR synchronization status of the faulty node.

The DR synchronization status of a node is as follows.

```
10-10-10-153:
SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0,
TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
FailedReplicationAttempts=0
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
FailedReplicationAttempts=5
```

Step 8 Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node 10-10-10-153 fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

Step 9 Run the **list_peers** command to find the cluster and the HBase instance corresponding to the **PeerID** value.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

Step 10 In the service list of FusionInsight Manager of the standby cluster, check whether the running status of the HBase instance obtained by using **Step 9** is **Normal**.

- If yes, go to **Step 14**.
- If no, go to **Step 11**.

Step 11 In the alarm list, check whether the **ALM-19000 HBase Service Unavailable** alarm is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

Step 12 Follow troubleshooting procedures in **ALM-19000 HBase Service Unavailable** to rectify the fault.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Wait for a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check network connections between RegionServers on active and standby clusters.

Step 14 Log in to the FusionInsight Manager portal of the active cluster, and click **O&M** > **Alarm** > **Alarms.**

Step 15 In the alarm list, click the alarm to obtain **HostName** from **Location**.

Step 16 Use the IP address obtained in **Step 15** to log in to a faulty RegionServer node as user **omm**.

Step 17 Run the **ping** command to check whether network connections between the faulty RegionServer node and the host where RegionServer of the standby cluster resides are in the normal state.

- If yes, go to **Step 20**.
- If no, go to **Step 18**.

Step 18 Contact the network administrator to restore the network.

Step 19 After the network is running properly, check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 20**.

Collect fault information.

Step 20 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 21 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 22 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 23 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.183 ALM-19007 HBase GC Time Exceeds the Threshold

Alarm Description

The system checks the old generation garbage collection (GC) time of the HBase service every 60 seconds. This alarm is generated when the detected old generation GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks by default). To change the threshold, on the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Thresholds** > **HBase** > **GC** > **GC time for old generation**. This alarm is cleared when the old generation GC time of the HBase service is shorter than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19007	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

If the GC time of the old generation exceeds the threshold, the read and write of HBase data will slow down. In severe cases, the request times out.

Possible Causes

The memory of HBase instances is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in HBase. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19007**. Then check the role name in **Location** and confirm the IP address of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HBase** > **Instances** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of HMaster** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HBase** > **Instances** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of RegionServer** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the current JVM configuration.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Configurations** > **All Configurations**. In Search, enter **GC_OPTS** to check the **GC_OPTS** memory parameter of role HMaster(HBase->HMaster), RegionServer(HBase->RegionServer). Adjust the values of **-Xmx** and **-XX:CMSInitiatingOccupancyFraction** of the GC_OPTS parameter by referring to the Note.

1. Suggestions on GC parameter configurations for HMaster
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
   - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set **-Xmx** to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
   - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
   - Set **-XX:NewSize** to one eighth of **-Xmx**.
   - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.
  - **XX:CMSInitiatingOccupancyFraction** to be less than and equal to **85**, and it is calculated as follows: 100 x (hfile.block.cache.size + hbase.regionserver.global.memstore.size)

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 7 In the **Service** drop-down list box, select **HBase** in the required cluster.

Step 8 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.184 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the heap memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19008	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The available HBase memory is insufficient, which may cause node restart. During the node restart, the read/write request delay on the node increases or fails.

Possible Causes

The heap memory of the HBase service is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19008**. Then check the role name in **Location** and confirm the IP address of the instance.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Instances** and click the HMaster for which the alarm is generated. On the displayed **Dashboard** page, click the drop-down arrow in the upper right corner of the **Chart** area, choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics**, and click **OK**.

Check whether the HBase service process has consumed 90% of its allocated maximum heap memory.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Instances** and click the RegionServer for which the alarm is generated. On the displayed **Dashboard** page, click the drop-down arrow in the upper right corner of the **Chart** area, choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics**, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the HBase service process has consumed 90% of its allocated maximum heap memory.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager, choose **Cluster** > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** by referring to the Note.

NOTE

- Recommended GC parameter settings for HMaster
  - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
  - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
  - For large-scale HBase clusters with a large number of regions, increase values of **GC_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set -Xmx to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
- Recommended GC parameter settings for RegionServer
  - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
  - Set **-XX:NewSize** to one eighth of **-Xmx**.
  - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
  - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **HBase** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.185 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold

Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the direct memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The available HBase direct memory is insufficient, which may cause node restart. During the node restart, the read/write request delay on the node increases or fails.

Possible Causes

The direct memory of the HBase service is overused or the direct memory is inappropriately allocated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms** and select the alarm whose **ID** is **19009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

- If the role for which the alarm is generated is HMaster, go to **Step 2**.
- If the role for which the alarm is generated is RegionServer, go to **Step 3**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **CPU and Memory** > **RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and check whether **XX:MaxDirectMemorySize** exists in **GC_OPTS**.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer** > **System** and delete **XX:MaxDirectMemorySize** from **GC_OPTS**.

Step 6 Check whether the **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold** alarm is generated.

- If yes, handle the alarm by referring to **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold**.
- If no, go to **Step 8**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** in the required cluster drop-down list box, select **HBase**.

Step 10 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.186 ALM-19011 RegionServer Region Number Exceeds the Threshold

Alarm Description

The system checks the number of regions on each RegionServer in each HBase service instance every 30 seconds. The region number is displayed on the HBase service monitoring page and RegionServer role monitoring page. This alarm is generated when the number of regions on a RegionServer exceeds the threshold (default value: 2000) for 20 consecutive times. The threshold can be changed by choosing **O&M** > **Alarm** > **Thresholds** > **HBase**. This alarm is cleared when the number of regions is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19011	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the number of RegionServer regions exceeds the threshold, too many Regions increase the load of RegionServer, causing resource bottlenecks such as memory, disk I/O, and CPU. As a result, request response becomes slow or even times out.

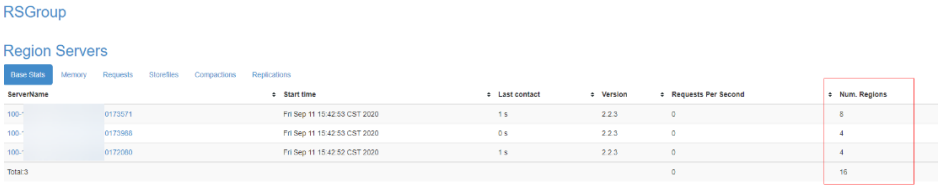
Possible Causes

- The RegionServer region distribution is unbalanced.
- The HBase cluster scale is too small.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19011**, and view the service instance and host name in **Location**.



Step 2 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HBase**. Click **HMaster(Active)** to go to the WebUI of the HBase instance and check whether regions are evenly distributed on the RegionServer.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- If yes, go to **Step 9**.
- If no, go to **Step 3**.

Figure 9-12 WebUI of HBase instance

Enable load balancing.

Step 3 Log in to the node where the HBase client is deployed as the **root** user.

Run the following command to open the client installation directory:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
cd Client installation directory
```

Configure environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, perform security authentication.

```
kinit Service user who has the HBase operation permissions
```

Enter the required password.

Step 4 Run the following command to go to the HBase shell CLI:

```
hbase shell
```

Check whether the load balancing function is enabled:

```
balancer_enabled
```

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 In the HBase shell CLI, run the following command to enable the load balancing function:

```
balance_switch true
```

Verify that the function is enabled:

```
balancer_enabled
```

Step 6 Run the following command to manually trigger load balancing:

```
balancer
```

Enable and manually trigger load balancing during off-peak hours.

Step 7 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether regions are evenly distributed.

- If yes, go to **Step 8**.
- If no, go to **Step 21**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Delete unnecessary HBase tables.

Step 9 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HBase** and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, view tables stored in the HBase service instance and record unnecessary tables that can be deleted.

Step 10 In the HBase shell CLI, run **disable** and **drop** to delete the unnecessary tables to reduce regions.

```
disable 'Name of the table to be deleted'
drop 'Name of the table to be deleted'
```

WARNING

Exercise caution to ensure data is deleted correctly.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 11 In the HBase shell CLI, run the following command to check whether the load balancing function is enabled:

```
balancer_enabled
```

- If yes, go to **Step 13**.
- If no, go to **Step 12**.

Step 12 In the HBase shell CLI, run the following command to enable the load balancing function:

```
balance_switch true
```

Verify that the function is enabled:

```
balancer_enabled
```

Step 13 In the HBase shell CLI, run the following command to manually trigger the load balancing function:

```
balancer
```

Step 14 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **HBase** and click **HMaster(Active)**. Click the HBase service instance that the alarm was generated for. On the displayed WebUI, refresh the page and check whether regions are evenly distributed.

- If yes, go to **Step 15**.
- If no, go to **Step 21**.

Step 15 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Adjust the threshold.

Step 16 On the FusionInsight Manager homepage, choose **O&M** > **Alarm** > **Thresholds** > **HBase** > **Regions(RegionServer)**, select the applied rule, and click **Modify** to check whether the threshold is proper.

- If it is excessively small, increase the threshold as required and go to **Step 17**.
- If it is proper, go to **Step 18**.

Step 17 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Perform system capacity expansion.

Step 18 Add nodes to the HBase cluster and add RegionServer instances to the nodes. Then enable and manually trigger the load balancing function.

Step 19 On the FusionInsight Manager homepage, choose **Cluster** > **Services** and click **HMaster(Active)**. Click the HBase service instance that the alarm was generated for. On the displayed WebUI, refresh the page and check whether regions are evenly distributed.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 21**.

Collect fault information.

Step 21 On the FusionInsight Manager home page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 22 Select **HBase** in the required cluster from the **Service**.

Step 23 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 24 Contact O&M personnel and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.187 ALM-19012 HBase System Table Directory or File Lost

Description

The system checks whether HBase directories and files exist on the HDFS every 120 seconds. This alarm is generated when the system detects that the files or directories do not exist. This alarm is cleared when the files or directories are restored.

Check the following items:

- Directory of the namespace **hbase** on the HDFS
- **hbase.version** file
- Directory of the table **hbase:meta** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:namespace** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the table **hbase:hindex** on the HDFS, .tableinfo file, and .regioninfo file
- Directory of the **hbase:acl** table on the HDFS, .tableinfo, and .regioninfo file (This table does not exist in the common mode cluster by default.)

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19012	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HBase service fails to be restarted or started. As a result, all HBase service requests fail.

Possible Causes

Files or directories on the HDFS are missing.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Click this alarm whose ID is **19012** and check whether **Alarm Cause** indicates unknown errors.

- If yes, go to **Step 4**.
- If no, go to **Step 2**

Step 2 On the FusionInsight Manager home page, choose **O&M** > **Backup and Restoration** > **Backup Management**. Check whether there are success records of the backup task named **default** or other HBase metadata backup tasks that have been successfully executed.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Use the latest backup metadata to restore the metadata of the HBase service.

Collect fault information.

Step 4 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 5 In the **Service** area, select faulty HBase services in the required cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.188 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold

Description

The system checks the number of regions in transaction state on HBase every 300 seconds. This alarm is generated when the system detects that the duration of regions in transaction state exceeds the threshold for two consecutive times. This alarm is cleared when all timeout regions are restored.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
19013	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Some data in the table gets lost or becomes unavailable.

Possible Causes

- Compaction is permanently blocked.
- The HDFS files are abnormal.

Procedure

Locate the alarm cause.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select this alarm, and view the **HostName** and **RoleName** in **Location**.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, Click the drop-down menu in the chart area and choose **Customize** > **Service** > **Region in transaction count**. Click **OK** and view **Region in transaction count over threshold**. (The default threshold is 60 seconds.)

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **HMaster (Active)** > **Tables** to check whether the regions of only one table transaction status time out.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Log in to the client as user **root**. Run the following commands:

cd *client installation directory*

source bigdata_env

If the cluster is in security mode, run the **kinit hbase** command

Log in to the HMaster WebUI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state in **Procedures**. If yes, run the following command to release the procedure lock:

hbase hbck -j *client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar bypass -o** *pid*

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigns** command to bring the region online again.

hbase hbck -j *client installation directory*/**HBase/hbase/tools/hbase-hbck2-*.jar assigns -o** *regionName*

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to **Step 7**.
- If no, no further action is required.

Collect fault information.

Step 7 On the FusionInsight Manager page of the active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select faulty HBase services in the required cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.189 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the ZNode capacity usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the ZNode capacity usage is less than the critical alarm threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19014	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Threshold	Specifies the threshold for generating the alarm.

Impact on the System

This alarm indicates that the capacity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19014**, and view the threshold in **Additional Information**.

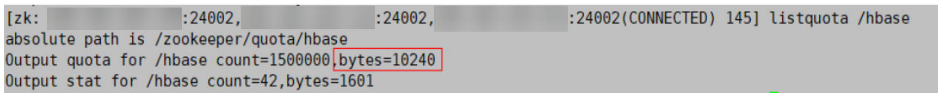
Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:



kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

zookeeper.znode.parent parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.

Step 4 Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared five minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HBase** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

9.11.190 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold

Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNode quantity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the ZNode quantity usage is less than the alarm threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19015	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Threshold	Specifies the threshold for generating the alarm.

Impact on the System

This alarm indicates that the Znode quantity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical** and data fails to be written.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

Check the quantity quota and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19015**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:

source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity quota configuration of the root ZNode of the HBase service.

```
[zk:                :24002,                :24002,                :24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

Step 4 Run the **getusage /hbase/splitWAL** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 6 Run the **getusage /hbase/replication** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

Impact on the System

This alarm indicates that the ZNodes capacity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical**, affecting data writing.

Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

Handling Procedure

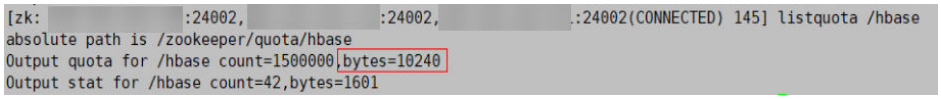
Check the capacity configuration and usage of ZNodes.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select the alarm whose ID is **19017**, and view the threshold in **Additional Information**.

Step 2 Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

cd *Client installation directory*

Run the following command to set environment variables:



source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted.

Step 3 Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. 9.11.193 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold

Alarm Description

The system checks the HBase compaction queue size every 30 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default) for three consecutive times. This alarm is cleared when the compaction queue size is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19018	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Write pressure on the HBase node continues going up, and the disk I/O and CPU may be overloaded. Read and write requests are responded slowly or even time out.

Possible Causes

- The number of HBase RegionServers is too small.
- There are excessive regions on a single RegionServer of HBase.
- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

Handling Procedure

Check whether related parameters are properly configured.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether the alarm whose **Alarm ID** is **19008** or **19011** exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **HBase**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab, search for

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hbase.hstore.compaction.min, **hbase.hstore.compaction.max**, **hbase.regionserver.thread.compaction.small**, and **hbase.regionserver.thread.compaction.throttle**, and set them to larger values.

Step 3 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.194 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold

Alarm Description

The system checks the number of HFiles to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of HFiles to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of HFiles to be synchronized is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19019	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A large number of HFile files are stacked. Data is inconsistent between the active and standby nodes, and the latest data cannot be read from the standby cluster during an active/standby switchover or during HBase dual-read. If the fault persists, the storage space of the active cluster and ZooKeeper nodes will be used up. As a result, the active cluster service will be interrupted.

Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19019**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

Step 2 Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to restore the network.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Step 4 After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the RegionServer region distribution in the active cluster.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

Step 6 Log in to the faulty RegionServer node as user **omm**.

Step 7 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 8 Run the following commands to check whether the load balancing function is enabled.

hbase shell

balancer_enabled

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

Step 10 Run the **balancer** command to manually trigger the load balancing function.

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the HBase service scale of the standby cluster.

Step 12 Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform **Step 6** to **Step 10** to enable the load balancing function and manually trigger it.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect the fault information.

Step 15 On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

9.11.196 ALM-19021 Handler Usage of RegionServer Exceeds the Threshold

Alarm Description

The system checks the RegionServer handler usage of each HBase service instance every 30 seconds. This alarm is generated when the handler usage of a RegionServer exceeds the threshold (90% for five consecutive times by default). This alarm is cleared if the handler usage is lower than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19021	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

RegionServer may not be able to provide services externally. As a result, the concurrent read/write processing become slow, or requests fail.

Possible Causes

- The value of a handler is too small.
- Hotspotting occurs.

Handling Procedure

View alarm location information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, locate the row that contains the alarm whose **Alarm ID** is **19021**, and view the service instance and host name in **Location**.

Check the handler configuration.

Step 2 Choose **Cluster** > **Services** > **HBase** and click the **Configurations** tab. In the upper right corner of the page, search for **hbase.regionserver.handler.count** and check whether its value is too small. The default value is **200**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Change the value of this parameter to a larger value and save the configuration. Choose **Cluster** > **Services** > **HBase**, click the **Instance** tab, select the affected RegionServer instances, and choose **More** > **Instance Rolling Restart**. In the displayed dialog box, enter the username and password. In the **Instance Rolling Restart** dialog box, click **OK** and wait until the rolling restart is complete.

Step 4 After the configuration takes effect, check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Check whether cluster hotspotting occurs.

Step 5 On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **HMaster(Active)** following **HMaster WebUI** to go to the web UI of the HBase instance. In the **Region Servers** area of the **Home** page, click **Requests** and check whether the requests in the **Filtered Read Request Count** and **Write Request Count** columns are evenly distributed.

- If yes, go to **Step 13**.
- If no, go to **Step 6**.

Step 6 Check whether regions are evenly distributed.

On FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **HMaster(Active)** following **HMaster WebUI** to go to the web UI of the HBase instance. In the **Region Servers** area of the **Home** page, click **Base Stats** and check whether the regions in the **Num.Regions** column are evenly distributed.

- If yes, go to **Step 13**.
- If no, go to **Step 7**.

Step 7 Log in to the faulty RegionServer node as user **omm**.

Step 8 Run the following commands to go to the client installation directory and set the environment variable:

cd *Client installation directory*

source bigdata_env

If the cluster uses the security mode, run the following command to perform security authentication:

kinit hbase

Enter the password as prompted (obtain the password from the MRS cluster administrator).

Step 9 Run the following commands to check whether the load balancing function is enabled. If the command output is **true**, the load balancing function is enabled.

hbase shell

balancer_enabled

```
hbase:004:0> balancer_enabled
true
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
Took 0.0165 seconds
=> true
```

- If yes, go to **Step 13**.
- If no, go to **Step 10**.

Step 10 Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

balance_switch true

balancer_enabled

NOTE

You are advised to enable and manually trigger the load balancing function during off-peak hours.

Step 11 Run the following command to manually trigger' the load balancing function:

balancer

Step 12 After the load balancing is complete, log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.197 ALM-19022 HBase Hotspot Detection Is Unavailable

Alarm Description

When the MetricController instance is installed for HBase, the alarm module checks the health status of the active HBase MetricController instance every 120

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

seconds. This alarm is generated when the active HBase MetricController instance does not exist or is unavailable and the hotspot detection function is unavailable.

This alarm is cleared when the active HBase MetricController instance recovers.

NOTE

This alarm applies only to MRS 3.3.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19022	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The HBase hotspot detection function is unavailable. Services are not affected. However, if request/data skew occurs, the system cannot report alarms and automatically recovers from hotspotting. Service requests may cause node overload, slow response, and request timeout.

Possible Causes

- The ZooKeeper service is abnormal.
- The HBase service is abnormal.
- In the current HBase service, the MetricController instance on the same node as the active HMaster instance is not started.
- The network is abnormal.

Handling Procedure

Check the ZooKeeper service status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 2**.

Step 2 In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the HBase service status.

Step 5 In the service list on FusionInsight Manager, check whether **Running Status** of HBase is **Normal**.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 In the alarm list, check whether the alarm ALM-19000 HBase Service Unavailable exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Rectify the fault by following the steps provided for **ALM-19000 HBase Service Unavailable**.

Step 8 Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the MetricController instance deployed on the same node as the active HMaster instance is started.

Step 9 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase**, and click **Instances** to check whether the **MetricController(Active)** instance exists.

- If yes, go to **Step 12**.
- If no, go to **Step 10**.

Step 10 Select the MetricController instance whose management IP address is the same as that of the active HMaster instance, and click **Start Instance**.

Step 11 After the MetricController instance is restarted, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 12**.

Check the network connectivity between the started MetricController instances and the active HMaster node.

Step 12 Log in to the node where the active HMaster instance is deployed and run **ping** *IP address of the node where the standby MetricController instance is deployed* to check whether the network connection between the started MetricController instances and the host where the active HMaster instance is deployed is normal.

- If yes, go to **Step 15**.
- If no, go to **Step 13**.

Step 13 Contact the network administrator to restore the network.

Step 14 After the network recovers, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Collect fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 17 In the **Host** area, select the host where the HMaster instance is deployed.

Step 18 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.198 ALM-19023 Region Traffic Restriction for HBase

Alarm Description

When the MetricController instance is installed for the HBase service, self-healing from hotspotting is automatically enabled. The alarm module checks whether there are regions whose request traffic is restricted due to hotspot issues in HBase every 120 seconds. This alarm is generated when the region where hotspot traffic is restricted is detected in HBase.

This alarm is cleared when the region is no longer a hotspot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm applies only to MRS 3.3.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19023	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the traffic of a hotspot region is restricted, the number of handlers for processing the requests in the region is limited. As a result, services requesting the region may slow down or retry upon failure.

Possible Causes

Too many requests are directed to a single region when the HBase service is accessed.

Handling Procedure

Check whether there are too many requests in a single region of HBase.

Step 1 Log in to FusionInsight Manager, and Choose **O&M** > **Alarm** > **Alarms**.

Step 2 In **Additional Information** of **Region Traffic Restriction for HBase**, view the reported table name and region information.

Step 3 On FusionInsight Manager, choose **Cluster** > **Service** > **HBase** and click the hyperlink on the right of HMaster web UI.

Step 4 Click **Table Details** and adjust service configurations in the region where the table in **Step 2** is deployed.

Step 5 Wait a moment and then check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 8 In the **Host** area, select the host where the HMaster instance is deployed.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm will be automatically cleared.

Related Information

None.

9.11.199 ALM-19024 RPC Requests P99 Latency on RegionServer Exceeds the Threshold

Alarm Description

The system checks P99 latency for RPC requests on each RegionServer instance of the HBase service every 30 seconds. This alarm is generated when P99 latency for RPC requests on a RegionServer exceeds the threshold for 10 consecutive times.

This alarm is cleared when P99 latency for RPC requests on a RegionServer instance is less than or equal to the threshold.

This alarm applies only to MRS 3.3.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19024	• **Critical**: The default threshold is 10 seconds. • **Major**: The default threshold is 5 seconds.	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If RPC requests P99 latency exceeds the threshold, the RegionServer cannot deliver normal service performance externally. For latency-sensitive services, a large number of service read and write requests may time out.

Possible Causes

- RegionServer GC duration is too long.
- The HDFS RPC response is too slow.
- RegionServer request concurrency is too high.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19024**, and view the service instance and host name in **Location**.

Check the GC duration of RegionServer.

Step 2 In the alarm list on FusionInsight Manager, check whether the "HBase GC Duration Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Rectify the fault by following the handling procedure of **ALM-19007 HBase GC Duration Exceeds the Threshold**.

Step 4 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check HDFS RPC response time.

Step 5 In the alarm list on FusionInsight Manager, check whether alarm "Average NameNode RPC Processing Time Exceeds the Threshold" is generated for the HDFS service on which the HBase service depends.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the handling procedure of **ALM-14021 Average NameNode RPC Processing Time Exceeds the Threshold**.

Step 7 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the number of concurrent processes on a RegionServer.

Step 8 In the alarm list on FusionInsight Manager, check whether the "Handler Usage of RegionServer Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Rectify the fault by following the handling procedure of **ALM-19021 Handler Usage of RegionServer Exceeds the Threshold**.

Step 10 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.200 ALM-19025 Damaged StoreFile in HBase

Alarm Description

The system checks the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories on HDFS of each HBase service every 120 seconds. This alarm is generated when there are files in the directories.

This alarm is cleared when the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories do not exist or are empty.

This alarm applies only to MRS 3.3.0 or later.

NOTE

hdfs://hacluster indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19025	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Data in the file may be lost, and data queried by the service may be inconsistent.

Possible Causes

The StoreFile files are damaged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19025**, and view the service in **Location**.

Step 2 Log in to the node where the HDFS and HBase clients are installed as the client installation user and run the following commands:

cd *Client installation directory*

source bigdata_env

kinit *Component service user* (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)

Step 3 Check the damaged StoreFile file.

- Run the following command to check whether the **/hbase/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 4**.

  hdfs dfs -ls -R hdfs://hacluster/hbase/autocorrupt

- Run the following command to check whether the **/hbase/MasterData/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 9**.

  hdfs dfs -ls -R hdfs://hacluster/hbase/MasterData/autocorrupt

Step 4 Run the following command to restore the StoreFile files in the **hdfs://hacluster/hbase/autocorrupt** directory:

hdfs debug recoverLease -path hdfs://hacluster/hbase/autocorrupt/*Name space*/Table/Region/Column family/*StoreFile files*

Step 5 Check whether the damaged StoreFile files are restored. If the following information is displayed, the restoration is successful:

```
recoverLease SUCCEEDED on hdfs://hacluster/hbase/autocorrupt/
default/h1/865665fe32db62dadada68b644359809/cf1/95f210f931ad44c99e4028470be7d292
```

If yes, go to **Step 6**.

If no, go to **Step 9**.

Step 6 Run the following command to move the files back to the **hdfs://hacluster/hbase/data** directory:

hdfs dfs -mv hdfs://hacluster/hbase/autocorrupt/*Name space*/Table/Region/Column family/*StoreFile files***hdfs://hacluster/hbase/data/***Name space*/Table/Region/Column family/*StoreFile files*

Step 7 Run the following command on HBase Shell to bring the region online again:

hbase shell

unassign'*Region*'

assign'*Region*'

Step 8 Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.201 ALM-19026 Damaged WAL Files in HBase

Alarm Description

The system checks the **hdfs://hacluster/hbase/corrupt** directory on the HDFS of each HBase service every 120 seconds. This alarm is generated when there are WAL files in the **/hbase/corrupt** directory.

This alarm is cleared when the **/hbase/corrupt** directory does not exist or does not contain WAL files.

This alarm applies only to MRS 3.3.0 or later.

NOTE

hdfs://hacluster indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19026	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the data in the damaged file is not flushed to disks, the data will be lost. As a result, some data queried by the service is inconsistent.

Possible Causes

The WAL files are damaged.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19026**, and view the service in **Location**.

Step 2 Log in to the node where the HDFS clients are installed as the client installation user and run the following commands:

cd *Client installation directory*

source bigdata_env

kinit *Component service user* (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)

Step 3 Run the following command to check the damaged WAL files and go to **Step 4**:

hdfs dfs -ls hdfs://hacluster/hbase/corrupt/*%2C*

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **HBase** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.202 ALM-20002 Hue Service Unavailable

Description

The system checks the Hue service status every 60 seconds. This alarm is generated if the Hue service is unavailable.

This alarm is cleared when the Hue service is normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
20002	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Users cannot perform interactive analysis and data processing with MRS on the Hue UI.

Possible Causes

- The internal KrbServer service on which the Hue service depends is abnormal.
- The internal DBService service on which the Hue service depends is abnormal.
- The network connection to the DBService is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check whether the KrbServer is abnormal.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, check whether the **KrbServer** running status is **Normal**.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Restart the KrbServer service.

Step 3 Wait for several minutes. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the DBService is abnormal.

Step 4 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 5 In the service list, check whether the **DBService** running status is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Restart the DBService.

NOTICE

When the service is rebooted, it becomes unavailable and can disrupt business operations.

Step 7 Wait for several minutes. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the network connection to the DBService is normal.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue** > **Instance**, record the IP address of the active Hue.

Step 9 Log in to the active Hue.

Step 10 Run the **ping** command to check whether communication between the host that runs the active Hue and the hosts that run the DBService is normal. (Obtain the IP addresses of the hosts that run the DBService in the same way as that for obtaining the IP address of the active Hue.)

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Contact the administrator to restore the network.

Step 12 Wait for several minutes. Check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- Hue
- Controller

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.203 ALM-23001 Loader Service Unavailable

Description

The system checks the Loader service availability every 60 seconds. This alarm is generated when the system detects that the Loader service is unavailable. This alarm is cleared when the Loader service is available.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23001	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When the Loader service is unavailable, the data loading, import, and conversion functions are unavailable.

Possible Causes

- The internal service on which the Loader service depends is abnormal.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The DBService service is abnormal.
  - The Yarn service is abnormal.
  - MapReduce is abnormal.
- Environment fault: The network is abnormal, which the Loader service cannot communicate with the depended internal services and cannot provide services.
- Software fault: The Loader service cannot run properly.

Procedure

Check the ZooKeeper service status.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** to check whether the ZooKeeper running status is **Normal**.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Choose **More** > **Restart Service** to restart the ZooKeeper service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 In the **Location** area of **Process Fault**, check whether **ServiceName** is **ZooKeeper**.

- If yes, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 7**.

Step 5 Rectify the fault by following the steps provided in **ALM-12007 Process Fault**.

Step 6 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the HDFS service status.

Step 7 On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

Step 9 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check the DBService status.

Step 10 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** to check whether the DBService running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 11**.

Step 11 Choose **More** > **Restart Service** to restart the DBService service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the MapReduce service status.

Step 12 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** to check whether the MapReduce running status is **Normal**.

- If yes, go to **Step 16**.
- If no, go to **Step 13**.

Step 13 Choose **More** > **Restart Service** to restart the MapReduce service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Check the Yarn status.

Step 14 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** to check whether the Yarn running status is **Normal**.

- If yes, go to **Step 16**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 15**.

Step 15 Choose **More** > **Restart Service** to restart the Yarn service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Step 16 On the FusionInsight Manager, check whether the alarm list contains **Yarn Service Unavailable**.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**.

Step 18 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check the network connection between Loader and dependent components.

Step 19 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader**.

Step 20 Click **Instance** and the LoaderServer instance list is displayed.

Step 21 Record the **Management IP Address** in the row of **LoaderServer(Active)**.

Step 22 Log in to the host where the active LoaderServer runs as **omm** user using the IP address obtained in **Step 21**.

Step 23 Run the **ping** command to check whether communication between the host that runs the active LoaderServer and the hosts that run the dependent components. (The dependent components include ZooKeeper, DBService, HDFS, MapReduce and Yarn. Obtain the IP addresses of the hosts that run these services in the same way as that for obtaining the IP address of the active LoaderServer.)

- If yes, go to **Step 26**.
- If no, go to **Step 24**.

Step 24 Contact the administrator to restore the network.

Step 25 In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 26**.

Collect fault information.

Step 26 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 27 Select the following nodes in the required cluster from the **Service** drop-down list:

- Zookeeper
- HDFS
- DBService

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Yarn
- MapReduce
- Loader

Step 28 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 29 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader**.

Step 30 Choose **More** > **Restart Service**, and click **OK**.

Step 31 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 32**.

Step 32 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.204 ALM-23003 Loader Task Execution Failure

Description

This alarm is generated immediately when the system detects that the Loader job fails. This alarm is cleared when the failed job is manually handled by a user. This alarm must be manually cleared.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23003	Minor	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
JobID	Specifies the ID of failed Loader job.
JobName	Specifies the failed Loader job.
UserName	Specifies the name of the user who submits the Loader job.
Details	Supplementary information for which the alarm is generated.

Impact on the System

This is a job-level alarm for Loader. The job execution fails, and you need to view specific logs to locate the failure cause. No execution result is returned. After the fault is rectified, you need to execute the task again. No impact on the Loader service.

Possible Causes

- Task parameters are incorrectly configured.
- Exceptions occur when Yarn is executing a job.

Procedure

Check whether task parameters are incorrectly configured.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and click the alarm drop-down list from the alarm list, obtain the **Alarm Cause**.

Step 2 If the alarm cause is "Failure to submit job", view error details in **Additional Information**, and go to the Loader WebUI to view the execution history of the job.

NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

Step 3 Submit the task again.

Step 4 Check whether the task executed successfully.

- If yes, go to **Step 9**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Check whether exceptions occur when Yarn is executing a job.

Step 5 On FusionInsight Manager, click the alarm drop-down list from the alarm list, obtain the **Alarm Cause**.

Step 6 Check whether the Yarn activity is executed properly in the **Alarm Cause**. If the alarm cause is "Yarn execution failed", the Yarn activity is abnormal.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Submit the task again.

Step 8 Please check whether the task executed successfully.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 In the alarm list, click **Clear** from **Operation** to manually clear the alarm. No further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 11 Select the following nodes in the required cluster from the **Service** drop-down list:

- DBService
- HDFS
- Loader
- MapReduce
- Yarn
- ZooKeeper

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

Related Information

None

9.11.205 ALM-23004 Loader Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of the Loader service every 60 seconds. The alarm is generated when the heap memory usage of a Loader instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. The alarm is cleared when the heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Full GC occurs frequently in Loader. The performance deteriorates and page responses are slow. If the memory overflows, Loader may fail to provide services for external systems. The Loader page cannot be accessed, interfaces cannot be called, and active/standby switchover is frequently performed due to exceptions.

Possible Causes

The heap memory of the Loader instance is overused or the heap memory is inappropriately allocated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Loader Heap Memory Usage Exceeds the Threshold** > **Location.** Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Loader Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the used heap memory of Loader reaches the threshold (the default value is 95% of the maximum heap memory) specified for Loader.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations**. Increase the value of **-Xmx** in **GC_OPTS** as required, and click **Save**. Click **OK**.

NOTE

- If this alarm is generated, the heap memory configured for the current Loader instance is insufficient for data transmission. You are advised to open the instance monitoring page, display the Loader heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Loader in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to similar values to avoid performance deterioration caused by heap size adjustment after each GC.
- Ensure that the sum of **-Xmx** and **XX:MaxPermSize** is not greater than the physical memory of the node server.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Loader** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.206 ALM-23005 Loader Non-Heap Memory Usage Exceeds the Threshold

Description

The system checks the non-heap memory usage of the Loader service every 30 seconds. The alarm is generated when the non-heap memory usage of a Loader instance exceeds the threshold (80% of the maximum memory) for 5 consecutive times. The alarm is cleared when the non-heap memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The Loader page may fail to be accessed and cannot provide services for external systems.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The non-heap memory of the Loader instance is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Loader Non-Heap Memory Usage Exceeds the Threshold** > **Location.** Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Loader Non Heap Memory Resource Percentage**. Click **OK**.

Step 3 Check whether the used non-heap memory of Loader reaches the threshold (the default value is 80% of the maximum non-heap memory) specified for Loader.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations** Search **LOADER_GC_OPTS** in the search box. If the **-XX: MaxPermSize** parameter is not configured, set the initial value to **-XX: MaxPermSize=256M** for the first time. (If the alarm persists after the first adjustment, perform the second adjustment by referring to the following note.) And click **Save**. Click **OK**.

NOTE

If this alarm is generated, the non-heap memory configured for the current Loader instance is insufficient for the service scenario. You are advised to open the instance monitoring page, open the Loader non-heap memory resource status monitoring chart, and observe the change trend of the non-heap memory used by Loader in the monitoring chart. Then change the value of **-XX:MaxPermSize** to twice the current non-heap memory usage or to another value to meet site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Loader** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.207 ALM-23006 Loader Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Loader service every 30 seconds. The alarm is generated when the direct memory usage of a Loader instance exceeds the threshold (80% of the maximum memory) for 5 consecutive times. The alarm is cleared when the direct memory usage of Loader is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Loader may fail to provide services for external systems. I/O or socket exceptions occur, and active/standby switchovers occur frequently.

Possible Causes

The direct memory of the Loader instance is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Loader Direct Memory Usage Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Memory** > **Loader Memory Usage Statistics**. Click **OK**.

Step 3 Check whether the used direct memory of Loader reaches the threshold (the default value is 80% of the maximum direct memory) specified for Loader.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations**. Search **LOADER_GC_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

NOTE

If this alarm is generated, the direct memory configured for the current Loader instance is insufficient for the service scenario. You are advised to open the instance monitoring page, display the Loader direct memory resource status monitoring chart, and observe the change trend of the direct memory used by Loader in the monitoring chart. Then change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory usage or to another value to meet site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Loader** in the required cluster from the **Service** drop-down list.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.208 ALM-23007 Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold

Description

The system checks GC time of the Loader process every 60 seconds. The alarm is generated when GC time of the Loader process exceeds the threshold (default value: **12 seconds**) for 5 consecutive times. The alarm is cleared when GC time is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Full GC occurs frequently, and the Loader service responds slowly. The Loader service may even break down and cannot provide services properly.

Possible Causes

Full GC occurs frequently, and the Loader service responds slowly. The Loader service may even break down and cannot provide services properly.

Procedure

Check GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **GC** > **Garbage Collection (GC) Time of Loader**. Click **OK**.

Step 3 Check whether GC time of the Loader process every second exceeds the threshold (default value: **12 seconds**).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader** > **Configurations**. Click **All Configurations**. Search **LOADER_GC_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

NOTE

If this alarm is generated, the heap memory configured for the current Loader instance cannot meet the heap memory required for data transmission. You are advised to handle the problem by referring to **Step 4** in section **ALM-23004 Loader Heap Memory Usage Exceeds the Threshold**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Loader** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.209 ALM-24000 Flume Service Unavailable

Alarm Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is automatically cleared after the Flume service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24000	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

All Flume instances are faulty.

Handling Procedure

Step 1 Log in to a Flume node as user **omm** and run the **ps -ef|grep "flume.role=server"** command to check whether the Flume process exists on the node.

- If yes, go to **Step 3**.
- If no, restart the faulty Flume node or Flume service and go to **Step 2**.

Step 2 In the alarm list, check whether alarm "Flume Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Collect the fault information.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 4 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.210 ALM-24001 Flume Agent Exception

Alarm Description

The Flume agent monitoring module monitors the Flume agent status. This alarm is generated when the Flume agent process is faulty (checked every 5 seconds) or the Flume agent fails to start (an alarm is reported immediately).

This alarm is cleared when the Flume agent process recovers, Flume agent starts successfully, and the alarm handling is completed.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24001	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
AgentId	Specifies the ID of the agent for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The Flume agent instance for which the alarm is generated cannot provide services properly, and the data transmission tasks of the instance are temporarily interrupted. Real-time data is lost during real-time data transmission.

Possible Causes

- The **JAVA_HOME** directory does not exist, or the Java permission is incorrect.
- The Flume agent directory permission is incorrect.
- The Flume agent fails to start.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check whether the JAVA_HOME directory exists or whether the JAVA permission is correct.

Step 1 Log in to the host for which the alarm is generated as user **root**.

Step 2 Obtain the installation directory of the Flume client for which the alarm is generated. (The value of **AgentId** can be obtained from **Location** of the alarm.)

ps -ef|grep *AgentId* **| grep -v grep | awk -F 'conf-file ' '{print $2}' | awk -F 'fusioninsight' '{print $1}'**

Step 3 Run the **su -** *Flume installation user* command to switch to the Flume installation user and run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/** command to go to the Flume configuration directory.

Step 4 Run the **cat ENV_VARS | grep JAVA_HOME** command.

Step 5 Check whether the **JAVA_HOME** directory exists. If both the command output in **Step 4** and **ll $JAVA_HOME/** are not empty, the **JAVA_HOME** directory exists.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Specify a correct **JAVA_HOME** directory.

Step 7 Run the **$JAVA_HOME/bin/java -version** command to check whether the Flume agent running user has the Java execution permission. If the Java version is displayed in the command output, the Java permission meets the requirement. Otherwise, the Java permission does not meet the requirement.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

JAVA_HOME is the environment variable exported during Flume client installation. You can also go to *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf** and run the **cat ENV_VARS | grep JAVA_HOME** command to view the variable value.

Step 8 Run the **chmod 750 $JAVA_HOME/bin/java** command to grant the Java execution permission to the Flume agent running user.

Check the directory permission of the Flume agent.

Step 9 Log in to the host for which the alarm is generated as user **root**.

Step 10 Run the following command to switch to the Flume agent installation directory:

cd *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/**

Step 11 Run the **ls -al * -R** command to check whether any file owner is the user running the Flume agent.

- If yes, go to **Step 12**.
- If no, run the **chown** command to change the file owner to the user who runs the Flume agent.

Check the Flume agent configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Run the **cat properties.properties | grep spooldir** and **cat properties.properties | grep TAILDIR** commands to check whether the Flume source type is spoolDir or tailDir. If any command output is displayed, the Flume source type is spoolDir or tailDir.

- If yes, go to **Step 13**.
- If no, go to **Step 17**.

Step 13 Check whether the data monitoring directory exists.

- If yes, go to **Step 15**.
- If no, go to **Step 14**.

NOTE

Run the **cat properties.properties | grep spoolDir** command to view the spoolDir monitoring directory.

```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep spoolDir
client.sources.aa1.spoolDir = /opt/liuxingcheng/flumeclient/sourcedata/flumesourcedata1
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Run the **cat properties.properties | grep parentDir** command to view the tailDir monitoring directory.

```
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]# cat properties.properties | grep parentDir
server.sources.AAAA.filegroups.F1.parentDir = /tmp/flumetest/taildir_data
[root@[redacted] /tmp/test/fusioninsight-flume-1.9.0/conf]#
```

Step 14 Specify a correct data monitoring directory.

Step 15 Check whether the Flume agent user has the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

- If yes, go to **Step 17**.
- If no, go to **Step 16**.

NOTE

Go to the monitoring directory as the Flume running user. If files can be created, the Flume running user has the read, write, and execute permissions on the monitoring directory.

Step 16 Run the **chmod 777** *Flume monitoring directory* command to grant the Flume agent running user the read, write, and execute permissions on the monitoring directory specified in **Step 13**.

Step 17 Check whether the components connected to the Flume sink are in safe mode.

- If yes, go to **Step 18**.
- If no, go to **Step 23**.

NOTE

If the sinks in the **properties.properties** configuration file are the HDFS sink and HBase sink, and the configuration file contains a keytab file, the components connected to the Flume sink are in safe mode.

If the sink in the **properties.properties** configuration file is the Kafka sink and ***.security.protocol** is set to **SASL_PLAINTEXT** or **SASL_SSL**, Kafka connected to the Flume sink is in safe mode.

Step 18 Run the **ll** *ketab path* command to check whether the keytab authentication path specified by the ***.kerberosKeytab** parameter in the configuration file exists.

- If yes, go to **Step 20**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 19**.

  NOTE

  To view the ketab path, run the **cat properties.properties | grep keytab** command.

Step 19 Change the value of **kerberosKeytab** in **Step 18** to the custom keytab path and go to **Step 21**.

Step 20 Go to **Step 18** and check whether the Flume agent running user has the permission to access the keytab authentication file. If the keytab path is returned, the user has the permission. Otherwise, the user does not have the permission.

- If yes, go to **Step 22**.
- If no, go to **Step 21**.

Step 21 Run the **chmod 755** *ketab file* command to grant the read permission on the keytab file specified in **Step 19**, and restart the Flume process.

Step 22 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 23**.

Collect fault information.

Step 23 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 24 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 25 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 26 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.211 ALM-24003 Flume Client Connection Interrupted

Alarm Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in three consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24003	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
Client IP Address	Specifies the IP address of the Flume client.
Client Name	Specifies the agent name of the Flume client.
Sink Name	Specifies the sink name of Flume Agent.

Impact on the System

The communication between the Flume client and the server fails. The Flume client cannot send data to the Flume server.

Possible Causes

- The network connection between the Flume client and the server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Handling Procedure

Check the network connection between the Flume client and the server.

Step 1 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 2 Run the **ping** *Flume server IP address* command to check whether the network connection between the Flume client and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

Check whether the Flume client's process is normal.

Step 3 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 4 Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 5**.
- If no, go to **Step 11**.

Check the Flume client configuration.

Step 5 Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

Step 6 Run the **cd** *Flume client installation directory*/**fusioninsight-flume-1.9.0/conf/** command to go to Flume's configuration directory.

Step 7 Run the **cat properties.properties** command to query the current configuration file of the Flume client.

Step 8 Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Modify the **properties.properties** configuration file.

Check whether the alarm is cleared.

Step 10 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect the fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Collect logs in the **/var/log/Bigdata/flume-client** directory on the Flume client using a transmission tool.

Step 15 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.212 ALM-24004 Exception Occurs When Flume Reads Data

Alarm Description

The alarm module monitors the Flume source status. This alarm is generated when the duration in which the source cannot read data exceeds the threshold.

The default threshold is **0**, indicating that this function is disabled. You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **NoDatatime** parameter of required the source.

The alarm is cleared when the source reads the data and the alarm handling is complete.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24004	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
AgentId	Specifies the ID of the agent for which the alarm was generated.
ComponentType	Specifies the type of the component for which the alarm was generated.
ComponentName	Specifies the name of the component for which the alarm was generated.

Impact on the System

If data is found in the data source but the Flume source continuously fails to read data, the collection is stopped.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The Flume source is faulty, so data cannot be sent.
- The network is faulty, so the data cannot be sent.

Handling Procedure

Check whether the Flume source is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for keyword **type = spooldir** in the file, and check whether the Flume source type is spoolDir.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 View the spoolDir monitoring directory to check whether all files are already transferred.

- If yes, no further action is required.
- If no, go to **Step 5**.

NOTE

The monitoring directory of spoolDir is specified by the **.spoolDir** parameter in the **properties.properties** configuration file. If all files in the monitoring directory have been transferred, the file name extension of all files in the monitoring directory is **.COMPLETED**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.source.kafka.KafkaSource** in the file, and check whether the Flume source type is Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Check whether the topic data configured by the Kafka source has been used up.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services** > **Flume** > **Instances**.

Step 6 Go to the Flume instance page of the faulty node to check whether the **Source Speed Metrics** in the alarm is **0**.

- If yes, go to **Step 11**.
- If no, go to **Step 7**.

Check the network connectivity between the node with the IP address configured for the Flume source and the faulty node.

Step 7 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume source type is Avro.

- If yes, go to **Step 8**.
- If no, go to **Step 11**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume source* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

Step 9 Contact the network administrator to restore the network.

Step 10 Wait for a while and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.213 ALM-24005 Exception Occurs When Flume Transmits Data

Alarm Description

The alarm module monitors the capacity status of Flume Channel. The alarm is generated immediately when the duration that Channel is fully occupied exceeds the threshold or the number of times that Source fails to send data to Channel exceeds the threshold.

The default threshold is **10**. You can change the threshold by modifying the **channelfullcount** parameter of the related channel in the **properties.properties** configuration file in the **conf** directory.

The alarm is cleared when the space of Flume Channel is released and the alarm handling is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24005	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
AgentId	Specifies the ID of the agent for which the alarm was generated.
ComponentType	Specifies the type of the component for which the alarm was generated.
ComponentName	Specifies the name of the component for which the alarm was generated.

Impact on the System

If the disk usage of Flume Channel increases continuously, the time required for importing data to a specified destination prolongs. When the disk usage of Flume Channel reaches 100%, the Flume agent process pauses.

Possible Causes

- Flume Sink is faulty, so the data cannot be sent.
- The network is faulty, so the data cannot be sent.

Handling Procedure

Check whether Flume Sink is faulty.

Step 1 Open the **properties.properties** configuration file on the local PC, search for **type = hdfs** in the file, and check whether the Flume sink type is HDFS.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 On FusionInsight Manager, check whether **HDFS Service Unavailable** alarm is generated in the alarm list and whether the HDFS service is stopped in the service list.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the alarm is reported, clear it according to the handling suggestions of **ALM-14000 HDFS Service Unavailable**; if the HDFS service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 3 Open the **properties.properties** configuration file on the local PC, search for **type = hbase** in the file, and check whether the Flume sink type is HBase.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, check whether **HBase Service Unavailable** alarm is generated in the alarm list and whether the HBase service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of **ALM-19000 HBase Service Unavailable**; if the HBase service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 5 Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.sink.kafka.KafkaSink** in the file, and check whether the Flume sink type is Kafka.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 On FusionInsight Manager, check whether **Kafka Service Unavailable** alarm is generated in the alarm list and whether the Kafka service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of **ALM-38000 Kafka Service Unavailable**; if the Kafka service is stopped, start it. Then, go to **Step 7**.
- If no, go to **Step 7**.

Step 7 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Flume** > **Instance**.

Step 8 Go to the Flume instance page of the faulty node to check whether the indicator **Sink Speed Metrics** is 0.

- If yes, go to **Step 13**.
- If no, go to **Step 9**.

Check the network connection between the faulty node and the node that corresponds to the Flume Sink IP address.

Step 9 Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume sink type is Avro.

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume sink* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 13**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 11**.

Step 11 Contact the network administrator to restore the network.

Step 12 In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect the fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.214 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the Flume service every 60 seconds. This alarm is generated when the heap memory usage of the Flume instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24006	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the heap memory overflows, the service may break down and the Flume instance may be unavailable.

Possible Causes

The heap memory of the Flume instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the heap memory used by Flume reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.11.215 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the Flume service every 60 seconds. This alarm is generated when the direct memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the Flume direct memory usage is less than or equal to the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24007	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the direct memory overflows, the service may break down and the Flume instance may be unavailable.

Possible Causes

The direct memory of the Flume process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Direct Memory Resource Percentage**. Then, click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the direct memory used by Flume reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.216 ALM-24008 Flume Server Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the Flume service every 60 seconds. This alarm is generated when the non-heap memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24008	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the non-heap memory overflows, the service may break down and the Flume instance may be unavailable.

Possible Causes

The non-heap memory of the Flume instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **Flume Non-Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Non-Heap Memory Resource Percentage**. Then, click **OK**.

Step 3 Check whether the non-heap memory used by Flume reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxPermSize** to twice the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

9.11.217 ALM-24009 Flume Server Garbage Collection (GC) Time Exceeds the Threshold

Alarm Description

The system checks the GC duration of the Flume process every 60 seconds. This alarm is generated when the GC duration of the Flume process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24009	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Flume data transmission efficiency decreases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The heap memory of the Flume process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **GC Duration Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the target cluster* > **Services** > **Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Garbage Collection (GC) Duration of Flume**. Then, click **OK**.

Step 3 Check whether the GC duration of the Flume process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

- During the restart, the Flume service is interrupted.
- During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

9.11.218 ALM-24010 Flume Certificate File Is Invalid or Damaged

This section applies to MRS 3.2.0 or later.

Alarm Description

Flume checks whether the Flume certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24010	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The Flume certificate file is invalid or damaged.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24010 Flume Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the **ls -l** command to check whether the **flume_sChat.crt** file exists.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Run the **openssl x509 -in flume_sChat.crt -text -noout** command to check whether certificate details are displayed properly.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.219 ALM-24011 Flume Certificate File Is About to Expire

This section applies to MRS 3.2.0 or later.

Alarm Description

Flume checks whether the Flume certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24011	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Currently, there is no impact on the system.

Possible Causes

The Flume certificate file is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24011 Flume Certificate Is About to Expire**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

Step 3 Run the following command to go to the Flume service certificate directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the Flume user certificate:

openssl x509 -noout -text -in flume_sChat.crt

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the following command to go to the Flume script directory:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 7 Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -f *Custom certificate password of the Flume role on the server* **-g** *Custom certificate password of the Flume role on the client*

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 8 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 6** to **Step 7**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Flume** for the target cluster.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

- If no, no further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Select **MonitorServer** in the required cluster for **Service**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.223 ALM-24015 Flume MonitorServer Certificate File Has Expired

This section applies to MRS 3.2.0 or later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Description

MonitorServer checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the MonitorServer certificate file becomes valid again.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24015	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The Flume client cannot access the Flume server.

Possible Causes

The MonitorServer certificate file has expired.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing **ALM-24015 MonitorServer Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

Check whether the certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Run the following command to go to the MonitorServer certificate file directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf

Step 4 Run the following command to check the effective time and expiration time of the user certificate to determine whether the certificate file is still in the validity period:

openssl x509 -noout -text -in ms_sChat.crt

- If yes, go to **Step 9**.
- If no, go to **Step 5**.

Step 5 Run the following command to go to the Flume script directory:

cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin

Step 6 Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

sh geneJKS.sh -m *Custom password of the MonitorServer certificate on the server* **-n** *Custom password of the MonitorServer certificate on the client*

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

  NOTE

  The custom certificate passwords must meet the following complexity requirements:
  - Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
  - Contain 8 to 64 characters.
  - Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

Step 7 Log in to the Flume node for which the alarm is generated as user **omm** and repeat **Step 5** to **Step 6**. Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Select **MonitorServer** in the required cluster for **Service**.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.224 ALM-25000 LdapServer Service Unavailable

Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the system detects that both the active and standby LdapServer services are abnormal.

This alarm is cleared when the system detects that one or two LdapServer services are normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25000	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The running status of the component that depends on the LdapServer becomes faulty. As a result, Kerberos authentication fails in the cluster or OS user cache synchronization is abnormal, and component services are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Procedure

Check whether the nodes where the two SlapdServer instances of the LdapServer service are located are faulty.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **LdapServer** > **Instance**. Go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances reside.

Step 2 Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer process is normal.

Step 6 Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Process Fault** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Check whether the service and host name in the alarm are consistent with the LdapServer service and host name.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Handle the alarm according to "ALM-12007 Process Fault".

Step 9 Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On the FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 11 Select **LdapServer** in the required cluster from the **Service**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.225 ALM-25004 Abnormal LdapServer Data Synchronization

Description

The system checks the LdapServer data every 30 seconds. This alarm is generated when the data on the active and standby LdapServers of Manager is inconsistent for 12 consecutive times. This alarm is cleared when the data on the active and standby LdapServers is consistent.

The system checks the LdapServer data every 30 seconds. This alarm is generated when the LdapServer data in the cluster is inconsistent with that on Manager for 12 consecutive times. This alarm is cleared when the data is consistent.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

LdapServer data inconsistency occurs because the LdapServer data in Manager is damaged or the LdapServer data in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.
- The amount of Oldap data exceeds the threshold (10 MB by default).

Procedure

Check whether the network where the LdapServer nodes reside is faulty.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact O&M personnel and log in to the nodes corresponding to IP 1. Run the ping command to check whether the IP address of the management plane of the active OMS node can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Contact the network administrator to recover the network and check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the LdapServer processes are normal.

Step 4 On the **Alarm** page of FusionInsight Manager, check whether the **OLdap Resource Abnormal** exists.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Clear the alarm by following the steps provided in **ALM-12004 OLdap Resource Abnormal**.

Step 6 Check whether **Abnormal LdapServer Data Synchronization** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 7**.

Step 7 On the **Alarm** page of FusionInsight Manager, check whether **Process Faul**t is generated for the LdapServer service.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Handle the alarm according to **ALM-12007 Process Fault**.

Step 9 Check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the LdapServer processes are normal.

Step 10 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Record the IP address of HostName in the alarm locating information as "IP1" (if multiple alarms exist, record the IP addresses as "IP1", "IP2", and "IP3" respectively). Choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Configurations**. Record the port number of LdapServer as "PORT". (If the IP address in the alarm locating information is the IP address of the standby management node, choose **System** > **OMS** > **oldap** > **Modify Configuration** and record the listening port number of LdapServer.)

Step 11 Log in to the nodes corresponding to IP1 as user **omm**.

Step 12 Run the following command to check whether errors are displayed in the queried information.

ldapsearch -H ldaps://*IP1*:*PORT* -LLL -x -D cn=root,dc=hadoop,dc=com -W -b ou=Peoples,dc=hadoop,dc=com

After running the command, enter the **LDAP** administrator password. Contact the system administrator to obtain the password.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Recover the LdapServer and OMS nodes using data backed up before the alarm is generated.

NOTE

Use the OMS data and LdapServer data backed up at the same point in time to recover the data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

Step 14 Check whether alarm **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check whether the data volume of the Oldap exceeds the threshold (10 MB by default). (This step applies only to versions earlier than MRS 3.3.0. For MRS 3.3.0 and later versions, go to **Step 18**.)

Step 15 Log in to the active OMS node as user **omm**.

Step 16 Run the following command to check whether the directory contains **.mdb** files.

ll /srv/BigData/ldapData/oldap/data/

- If yes, check and record the size of the **.mdb** file and go to **Step 17**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 18**.

Step 17 Run the following command to view the Oldap configuration and record the value of **Map size** (the default value is **10485760** bytes, that is, 10 MB)

mdb_stat -e /srv/BigData/ldapData/oldap/data/

Check whether the size of the **.mdb** file with **Step 16** records reaches the value of **Map size.**

- If yes, contact O&M personnel.
- If no, go to **Step 18**.

Collect fault information.

Step 18 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 19 Select **LdapServer** in the required cluster and **OmsLdapServer** from the **Service**.

Step 20 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 21 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.226 ALM-25005 nscd Service Exception

Alarm Description

The system checks the status of the nscd service every 60 seconds. This alarm is generated when the nscd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25005	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The **id** command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The nscd service is not started.
- The network is faulty, and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Handling Procedure

Check whether the nscd service is started.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user **root**. Run the **ps -ef | grep nscd** command on the node and check whether the **/usr/sbin/nscd** process is started.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Run the **service nscd restart** command as user **root** to restart the nscd service. Then run the **ps -ef | grep nscd** command to check whether the nscd service is started.

- If yes, go to **Step 4**.
- If no, go to **Step 15**.

Step 4 Wait for 5 minutes and run the ps -ef | grep nscd command again as user root. Check whether the service exists.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Check whether the network is faulty, and whether the LDAP server can be accessed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Log in to the alarmed node as user **root** and run the **ping** command to check whether the network connectivity between this node and the LdapServer node is normal.

- If yes, go to **Step 6**.
- If no, contact network administrators to troubleshoot the fault.

Check whether the NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command to check whether the **passwd**, **group**, **services**, **netgroup**, and **aliases** of NameService are correctly configured.

The correct parameter configurations are as follows:

passwd: **compat ldap**; **group**: **compat ldap**; **services**: **files ldap**; **netgroup**: **files ldap**; **aliases**: **files ldap**

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Log in to the alarmed node as user **root**. Run the **cat /etc/nscd.conf** command to check whether the **enable-cache passwd**, **positive-time-to-live passwd**, **enable-cache group**, and **positive-time-to-live group** in the configuration file are correctly configured.

The correct parameter configurations are as follows:

enable-cache passwd: **yes**; **positive-time-to-live passwd**: **600**; **enable-cache group**: **yes**; **positive-time-to-live group**: **3600**

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Run the **/usr/sbin/nscd -i group** and **/usr/sbin/nscd -i passwd** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 9 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 10 Run the **vi /etc/nscd.conf** command as user **root**. Correct the configurations in **Step 7** and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to **Step 11**.
- If no, go to **Step 15**.

Step 11 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **nscd Service Exception** alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check whether frame freezing occurs when running a command in the operating system.

Step 12 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Run the **cat /var/log/messages** command to check whether the nscd frequently restarts or the error information "Can't contact LDAP server" exists.

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780: Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780: Can't contact LDAP server
```

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Run the **vi$BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/ldap.conf** command to enter the editing mode, press **Insert** to start editing, and then change the first two IP addresses of the URI configuration item.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq!** to save the settings and exit.

Run the **service nscd restart** command to restart the nscd service. Wait 5 minutes and run the **id admin** command again. Check whether the command execution is slow.

- If yes, go to **Step 15**.
- If no, log in to other faulty nodes and repeat **Step 12** to **Step 14** to check whether the first LdapServer node in the URI before modifying **/etc/ldap.conf** is faulty. For example, check whether the service IP address is unreachable, the network delay is too long, or other abnormal software is deployed.

Collect the fault information.

Step 15 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 16 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **LdapClient** for the target cluster.

Step 17 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.227 ALM-25006 Sssd Service Exception

Description

The system checks the status of the sssd service every 60 seconds. This alarm is generated when the sssd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The id command may fail to obtain the LDAP data, affecting upper-layer services.

Possible Causes

- The sssd service is not started or is incorrectly started.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

Procedure

Check whether the sssd service is correctly started.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

Step 2 Contact the O&M personnel to access the node using IP1 as user root. Run the **ps -ef | grep sssd** command and check whether the **/usr/sbin/sssd** process is started.

- If the process is started, go to **Step 3**.
- If the process is not started, go to **Step 4**.

Step 3 Check whether the sssd process queried in **Step 2** has three subprocesses.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Run the **service sssd restart** command as user **root** to restart the sssd service. Then run the **ps -ef | grep sssd** command to check whether the sssd process is normal.

In the normal state, the **/usr/sbin/sssd** process has three subprocesses: **/usr/libexec/sssd/sssd_be**, **/usr/libexec/sssd/sssd_nss**, and **/usr/libexec/sssd/sssd_pam**.

- If it exists, go to **Step 9**.
- If it does not exist, go to **Step 13**.

Check whether the LDAP server can be accessed.

Step 5 Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.

- If the network is normal, go to **Step 6**.
- If the network is faulty, contact network administrators to troubleshoot the fault.

Check whether NameService is normal.

Step 6 Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd** and **group** configurations of NameService.

The correct parameter configurations are as follows: **passwd: files sss** and **group: files sss**.

- If the configurations are correct, go to **Step 7**.
- If the configurations are incorrect, go to **Step 8**.

Step 7 Run the **/usr/sbin/sss_cache -G** and **/usr/sbin/sss_cache -U** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If results are queried, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 8 Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in **Step 6** and save the file. Run the **service sssd restart** command to restart the sssd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If it exists, go to **Step 9**.
- If no result is queried, go to **Step 13**.

Step 9 Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **sssd Service Exception** alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm persists, go to **Step 10**.

Check whether frame freezing occurs when running a command in the operating system.

Step 10 Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Run the **cat /var/log/messages** command to check whether the sssd frequently restarts or the error information **Can't contact LDAP server** exists.

sssd restart example:

```
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb  7 11:38:16 10-132-190-105 sssd: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb  7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Run the **vi $BIGDATA_HOME/tmp/random_ldap_ip_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/sssd/sssd.conf** command to reverse the first two IP addresses of the **ldap_uri** configuration item, save the settings, and exit.

Run the **ps -ef | grep sssd** command to query the ID of the sssd process, kill it, and run the **/usr/sbin/sssd -D -f** command to restart the sssd service. Wait 5 minutes and run the **id admin** command again.

Check whether the command execution is slow.

- If yes, go to **Step 13**.
- If no, log in to other faulty nodes and run **Step 10** to **Step 12**. Collect logs and check whether the first ldapserver node in the ldap_uri before

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

modifying **/etc/sssd/sssd.conf** is faulty. For example, check whether the service IP address is unreachable, the network latency is too long, or other abnormal software is deployed.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 14 Select **LdapClient** in the required cluster from the **Service**.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.228 ALM-25007 Number of SlapdServer Connections Exceeds the Threshold

Alarm Description

The system checks the number of process connections on the SlapdServer node every 30 seconds and compares the actual number with the threshold. This alarm is generated when the number of process connections exceeds the threshold (**1000** by default) for multiple times (**5** by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the number of process connections is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of process connections is less than or equal to 90% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25007	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

SlapdServer may respond slowly or become unavailable. Kerberos authentication times out or OS user caches cannot be synchronized. Component services are faulty.

Possible Causes

- There are too many SlapdServer connections.
- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether there are too many SlapdServer process connections.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **LdapServer**.

Step 2 On the LdapServer dashboard page, observe the SlapdServer process connections and decrease the connections based on service requirements.

Step 3 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **LdapServer** > **Other** > **SlapdServer Service Connections**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Change the trigger count and alarm threshold based on the actual number of process connections, and apply the changes.

Step 6 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **LdapServer** for the target cluster.

Step 9 Specify **Hosts** for collecting logs, which is optional. By default, all hosts are selected.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.229 ALM-25008 SlapdServer CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the SlapdServer node every 30 seconds and compares the actual usage with the threshold. This alarm is generated when the SlapdServer CPU usage exceeds the threshold for multiple times (**5** by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the SlapdServer CPU usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the SlapdServer CPU usage is less than or equal to 90% of the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25008	Critical (default threshold: 85%) Major (default threshold: 75%)	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

SlapdServer may respond slowly or become unavailable. Kerberos authentication times out or OS user caches cannot be synchronized. Component services are faulty.

Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **LdapServer** > **Other** > **SlapdServer Service Total CPU Percentage**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 2**.

Step 2 Change the trigger count and alarm threshold based on the actual CPU usage, and apply the changes.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the CPU usage reaches the upper limit.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the right pane, click this alarm and obtain the host name in **Location**.

Step 5 Choose **Cluster** > **Services** > **LdapServer**, click the **Instance** tab, and click the SlapdServer instance corresponding to the host name in **Step 4**.

Step 6 On the dashboard of the instance, observe the real-time data of the **CPU Usage of a Single SlapdServer Instance** chart for about 5 minutes and check whether the CPU usage exceeds the threshold (**75%** by default) for multiple times.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Check whether the status of other SlapdServer instances is normal. For details, see **Step 5** to **Step 6**.

- If yes, contact the MRS cluster administrator to evaluate whether to expand the capacity of SlapdServer instances. Then, go to **Step 8**.
- If no, repair the faulty SlapdServer instance and go to **Step 8**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **LdapServer** for the target cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.230 ALM-25500 KrbServer Service Unavailable

Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the system detects that the KrbServer service is abnormal.

This alarm is cleared when the system detects that the KrbServer service is normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25500	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The running status of the component that depends on the KrbServer becomes faulty. As a result, the Kerberos authentication of the cluster fails, and the component services are abnormal.

Possible Causes

- The node where the KrbServer service locates is faulty.
- The OLdap service is abnormal.

Procedure

Check whether the node where the KrbServer service locates is faulty.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **KrbServer** > **Instance**. Go to the KrbServer instance page and view the host name of the node where the KrbServer service is deployed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Handle the alarm according to "ALM-12006 Node Fault".

Step 5 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the OLdap service is normal.

Step 6 On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **OLdap Resource Abnormal** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm according to "ALM-12004 OLdap Resource Abnormal".

Step 8 Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **KrbServer** in the required cluster from the **Service**.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.231 ALM-25501 Too Many KerberosServer Requests

Alarm Description

The system checks the number of requests processed by the KerberosServer node every 30 seconds. This alarm is generated when the number of requests exceeds the threshold for multiple consecutive times (5 by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the number of process connections is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of requests is less than or equal to 90% of the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25501	Critical (default threshold: 15,000) Major (default threshold: 10,000)	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Details	Specifies alarm details.

Impact on the System

KerberosServer responds slowly. As a result, Kerberos authentication times out and component services are in error.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- There are too many KerberosServer requests.
- The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether there are too many KerberosServer requests.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **KrbServer** to go to the KrbServer overview page.

Step 2 Observe the **Total KerberosServer Requests** chart and reduce the number of KerberosServer authentication requests based on site requirements. If the number of KerberosServer authentication requests cannot be determined, contact the O&M personnel.

If no chart is available, click the drop-down arrow on the right, select **Customize**, select the desired item, and click **OK**.

Step 3 Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **KrbServer** > **Other** > **Total KerberosServer Requests**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Change the trigger count and alarm threshold based on the actual number of requests, and apply the changes.

Step 6 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **KrbServer** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.232 ALM-26051 Storm Service Unavailable

Description

The system checks the Storm service status every 30 seconds. This alarm is generated when all Nimbus nodes in the cluster are abnormal and the Storm service is unavailable.

This alarm is cleared when the Storm service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26051	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Storm service, and users cannot perform new Storm tasks.

Possible Causes

- The Kerberos cluster is faulty.
- The ZooKeeper cluster is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the status of the Kerberos cluster. (Skip this step if the normal mode is used.)

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**.

Step 2 Check whether the running status of the Kerberos service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 See the related maintenance information of **ALM-25500 KrbServer Service Unavailable**.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it, else see the related maintenance information of **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check the status of the active and standby Nimbus nodes.

Step 8 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to go to the Nimbus Instances page.

Step 9 Check whether only one Nimbus node that is in the **Active** state in **Roles**.

- If yes, go to **Step 13**.
- If no, go to **Step 10**.

Step 10 Select two Nimbus role instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Log in to the FusionInsight Manager portal again, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to check whether the running status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting Fault Information

Step 13 On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Select the following nodes in the required cluster from the **Service** drop-down list:

- KrbServer

  NOTE

  KrbServer logs do not need to be downloaded in normal mode.
- ZooKeeper
- Storm

Step 15 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.233 ALM-26052 Number of Available Supervisors of the Storm Service Is Less Than the Threshold

Description

The system periodically checks the number of available Supervisors every 60 seconds and compares the number of available Supervisors with the threshold. This alarm is generated when the number of available Supervisors is less than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster*.

This alarm is cleared when the number of available Supervisors is greater than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26052	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Existing tasks in the cluster cannot be performed. The cluster can receive new Storm tasks, but cannot perform these tasks.

Possible Causes

The status of some Supervisors in the cluster is abnormal.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Supervisor** to go to the Storm service management page.

Step 2 In **Roles**, check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for 30 seconds, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 5 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 6 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.234 ALM-26053 Storm Slot Usage Exceeds the Threshold

Description

The system checks the slot usage every 60 seconds and compares the actual slot usage with the threshold. This alarm is generated when the slot usage is greater than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds**.

This alarm is cleared when the slot usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26053	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

New Storm tasks cannot be performed.

Possible Causes

- The status of some Supervisors in the cluster is abnormal.
- The status of all Supervisors is normal, but the processing capability is insufficient.

Procedure

Check the Supervisor status.

Step 1 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance** to go to the Storm instance management page.

Step 2 Check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to **Step 4**.
- If no, go to **Step 10**.

Step 4 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Increase the number of slots in each Supervisor.

Step 5 Log in to the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations**.

Step 6 Increase the number of ports in the **supervisor.slots.ports** parameter of each Supervisor role and restart the instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Expand the capacity of the Supervisors.

Step 9 Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

  NOTE

  Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

Collect fault information.

Step 10 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 11 Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.235 ALM-26054 Nimbus Heap Memory Usage Exceeds the Threshold

Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Storm Nimbus exceeds the threshold (80% of the maximum memory by default) for 5 consecutive times.

Users can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Storm** > **Nimbus** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26054	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

When the heap memory usage of Storm Nimbus is overhigh, frequent GCs occur. In addition, a memory overflow may occur so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Storm Nimbus instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Check the heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Heap Memory Usage of Storm Nimbus Exceeds the Threshold** > **Location**. Check the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize** > **Nimbus** > **Heap Memory Usage of Nimbus**. Click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the used heap memory of Nimbus reaches the threshold (The default value is 80% of the maximum heap memory) specified for Nimbus.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations** > **All Configurations** > **Nimbus** > **System**. Change the value of **-Xmx** in **NIMBUS_GC_OPTS** based on site requirements, and click **Save**. Click **OK**.

NOTE

- You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.
- The number of Workers grows as the Storm cluster scale increases. You can increase the value of **GC_OPTS** for Nimbus. The recommended value is as follows: If the number of Workers is 20, set **-Xmx** to a value greater than or equal to 1 GB. If the number of Workers exceeds 100, set **-Xmx** to a value greater than or equal to 5 GB.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTE

During the restart of the service or instance, services are interrupted. After the service or instance is restarted, services are restored.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select the following node in the required cluster from the **Service** drop-down list.

- NodeAgent
- Storm

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.236 ALM-27001 DBService Service Unavailable

Description

The alarm module checks the DBService service status every 30 seconds. This alarm is generated when the system detects that DBService service is unavailable.

This alarm is cleared when DBService service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27001	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in some services exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Procedure

Check whether the floating IP address exists in the cluster environment.

Step 1 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance**.

Step 2 Check whether the active instance exists.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 3**.
- If no, go to **Step 9**.

Step 3 Select the active DBServer instance and record the IP address.

Step 4 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.

- If yes, go to **Step 5**.
- If no, go to **Step 9**.

Step 5 Run the **ping** *floatip* command to check whether the DBService floating IP address can be pinged successfully.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host that corresponds to the DBService floating IP address as user **root**, and run the command to delete the floating IP address.

ifconfig *interface* **down**

Step 7 On the FusionInsight Manager home page, choose **Cluster > Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether DBService is restarted successfully.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 14**.

Check the status of the active DBServer instance.

Step 9 Select the DBServer instance whose role status is abnormal and record the IP address.

Step 10 On the **Alarm** page, check whether **Process Fault** occurs in the DBServer instance on the host that corresponds to the IP address.

- If yes, go to **Step 11**.
- If no, go to **Step 19**.

Step 11 Handle the alarm according to "ALM-12007 Process Fault".

Step 12 Wait for about 5 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Check the status of the active and standby DBServers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Log in to the host that corresponds to the preceding IP address as user **root**, and run the **su - omm** command to switch to user **omm**.

Step 14 Run the **cd ${DBSERVER_HOME}** command to go to the installation directory of the DBService.

Step 15 Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

```
HAMode
double

NodeName            HostName        HAVersion          StartTime           HAActive

10_5_89_66          gaussDB         Standby_normal     Normal              Active_standby
```

- If yes, go to **Step 16**.
- If no, go to **Step 19**.

Step 16 Check whether the active and standby HA processes are in the abnormal state.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 On FusionInsight Manager, choose **Cluster > Services** > **DBService** > **More** > **Restart Service** to restart DBService, and check whether the system displays a message indicating that the restart is successful.

- If yes, go to **Step 18**.

  NOTE

  The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

- If no, go to **Step 19**.

Step 18 Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 19**.

Collect fault information.

Step 19 On FusionInsight Manager, choose **O&M** > **Log > Download**.

Step 20 Select **DBService** in the required cluster and **NodeAgent** from the **Service**.

Step 21 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 22 Contact the O&M personnel and send the collected logs.

----End

9.11.237 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

Alarm Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
27003	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Handling Procedure

Check whether the network between the active DBService server and the standby DBService server is normal.

Step 1 In the alarm list on FusionInsight Manager, click ⌄ in the row where the alarm is located in the real-time alarm list and view the address of the standby DBService node.

Step 2 Log in to the active DBService node as user **root**.

To obtain the IP address of the active DBService node, log in to Manager and choose **Cluster** > **Services** > **DBService** > **Instances**.

Step 3 Run the following command to check whether the standby DBService server is accessible:

```
ping heartbeat IP address of the standby DBService server
```

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 7 Select the following nodes in the required cluster from the **Service**:

- DBService
- Controller
- NodeAgent

Step 8 Click ✎ in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 9 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.238 ALM-27004 Data Inconsistency Between Active and Standby DBServices

Description

The system checks the data synchronization status between the active and standby DBService every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27004	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies the HA name of the local DBService.
Peer DBService HA Name	Specifies the HA name of the peer DBService.
SYNC_PERCENT	Specifies the synchronization percentage.

Impact on the System

When data is not synchronized between the active and standby DBServer and the active instance becomes abnormal, the data may be lost or abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The standby node disk space is full.
- The CPU usage of the GaussDB process on the active DBService node is high. You need to locate the failure cause based on logs.

Procedure

Check whether the network between the active and standby nodes is normal.

Step 1 On FusionInsight Manager, choose **Cluster > Services > DBService > Instance**, check the service IP address of the standby DBServer instance.

Step 2 Log in to the active DBService node as user **root**.

Step 3 Run the **ping** *Standby DBService heartbeat IP address* command to check whether the standby DBService node is reachable.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the standby DBService is normal.

Step 6 Log in to the standby DBService node as user **root**.

Step 7 Run the **su - omm** command to switch to user **omm**.

Step 8 Go to the **${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

Check whether the standby node disk space is full. (Skip this check for versions later than MRS 3.1.2.)

Step 9 Log in to the standby DBService node as user **root**.

Step 10 Run the **su - omm** command to switch to user **omm**.

Step 11 Go to the **${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cd ${DBSERVER_HOME}

source .dbservice_profile

echo ${DBSERVICE_DATA_DIR}

Step 12 Run the **df -h** command to view the system disk partition usage information.

Step 13 Check whether the DBService data directory space is full.

- If yes, go to **Step 14**.
- If no, go to **Step 16**.

Step 14 Expand the disk capacity of the node.

Step 15 After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 17 In the **Service** area, select **DBService** of the target cluster and **OS**, **OS Statistics**, and **OS Performance** under **OMS**, and click **OK**.

Step 18 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 19 Contact the O&M personnel and send the collected logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.239 ALM-27005 Database Connections Usage Exceeds the Threshold

Description

The system checks the usage of the number of database connections of the nodes where DBServer instances are located every 30 seconds and compares the usage with the threshold. If the usage exceeds the threshold for five consecutive times (this number is configurable, and 5 is the default value), the system generates this alarm. The default usage threshold is 90%, and you can configure it based on site requirements.

The trigger count is configurable. This alarm is cleared in the following scenarios:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The trigger count is 1, and the usage of the number of database connections is less than or equal to the threshold.
- The trigger count is greater than 1, and the usage of the number of database connections is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Upper-layer services may fail to connect to the DBService database, affecting services.

Possible Causes

- Too many database connections are used.
- The maximum number of database connections is improperly configured.
- The alarm threshold or alarm trigger count is improperly configured.

Procedure

Checking whether too many data connections are used

Step 1 On FusionInsight Manager, click DBService in the service list on the left navigation pane. The DBService monitoring page is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Observe the number of connections used by the database user. Based on the service scenario, reduce the number of database user connections.

Step 3 Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

Checking whether the maximum number of database connections is properly configured

Step 4 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Configurations**. On the displayed page, select the **All Configurations** tab, and increase the maximum number of database connections based on service requirements. Click **Save**. In the displayed **Save configuration** dialog box, click **OK**.

Step 5 After the maximum number of database connections is changed, restart DBService (do not restart the upper-layer services).

Procedure: Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the displayed page, choose **More** > **Restart Service**. Enter the password of the current login user and click **OK**. Do not select **Restart upper-layer services.**, click **OK**.

NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

Step 6 After the service is restarted, wait for 2 minutes and check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Checking whether the alarm threshold or trigger count is properly configured

Step 7 Log in to FusionInsight Manager and change the alarm threshold and alarm trigger count based on the actual database connection usage. Choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click the pencil icon next to **Trigger Count**. In the displayed dialog box, change the trigger count.

NOTE

Trigger Count: If the usage of the number of database connections exceeds the threshold consecutively for more than the value of this parameter, an alarm is generated.

Based on the actual database connection usage, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click **Modify** in the **Operation** column. In the **Modify Rule** dialog box, modify the required parameters and click **OK**.

Step 8 Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If it is not, go to **Step 9**.

Collect fault information

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Select **DBService** in the required cluster from the **Service**.

Step 11 Specify the host for collecting logs by setting the **Host** parameter that is optional. By default, all hosts are selected.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.240 ALM-27006 Disk Space Usage of the Data Directory Exceeds the Threshold

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds and compares the disk usage with the threshold. The alarm is generated when the disk space usage exceeds the threshold for five consecutive times (the default value). The number of consecutive times is configurable. The disk space usage threshold of the data directory is set to 80% by default, which is configurable as well.

The value of **hit number** is configurable. When the value is set to **1** and the disk space usage is lower than or equal to the threshold, the alarm is cleared. When the value is greater than 1 and the disk space usage is lower than 90% of the threshold, the alarm is cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27006	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- The DBService service process cannot provide the API for data writing.
- When the disk space usage of the data directory exceeds 90%, the database enters the read-only mode and "Database Enters the Read-Only Mode" is generated. As a result, service data cannot be written to the database.

Possible Causes

- The alarm threshold is improperly configured.
- The data volume of the database is too large or the disk configuration cannot meet service requirements, causing excessive disk usage.

Procedure

Check whether the threshold is set properly.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **DBService** > **Database** > **Disk Space Usage of the Data Directory** to check whether the alarm threshold is proper (the default value 80% is a proper value).

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Change the alarm threshold based on the actual service situation.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory is lower than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether large files are incorrectly written into the disk.

Step 5 Log in to the active DBService node as user **omm**.

Step 6 Run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

source $DBSERVER_HOME/.dbservice_profile

find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Handle the large files based on the actual scenario and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 10 Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.241 ALM-27007 Database Enters the Read-Only Mode

Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds. The alarm is generated when the disk space usage exceeds 90%.

The alarm is cleared when the disk space usage is lower than 80%.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27007	Critical	Yes

Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

Impact on the System

- Service data is lost.
- Data cannot be written for upper-layer services and the data is lost.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Procedure

Check whether the disk space usage reaches the upper limit.

Step 1 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory exceeds 90%.

- If yes, go to **Step 3**.
- If no, go to **Step 13**.

Step 3 Log in to the active management node of the DBServer as user **omm** and run the following commands to check whether the database enters the read-only mode:

source $DBSERVER_HOME/.dbservice_profile

gsql -U omm -W *password* **-d postgres -p 20051**

show default_transaction_read_only;

NOTE

In the preceding commands, *password* indicates the password of user **omm** of the DBService database. You can run the **\q** command to exit the database.

Check whether the value of **default_transaction_read_only** is **on**.

```
POSTGRES=# show default_transaction_read_only;
 default_transaction_read_only
-------------------------------
 on
(1 row)
```

- If yes, go to **Step 4**.
- If no, go to **Step 13**.

Step 4 Run the following commands to open the **dbservice.properties** file:

source $DBSERVER_HOME/.dbservice_profile

vi ${DBSERVICE_SOFTWARE_DIR}/tools/dbservice.properties

Step 5 Change the value of **gaussdb_readonly_auto** to **OFF**.

Step 6 Run the following command to open the **postgresql.conf** file:

vi ${DBSERVICE_DATA_DIR}/postgresql.conf

Step 7 Delete **default_transaction_read_only = on**.

Step 8 Run the following command for the configuration to take effect:

gs_ctl reload -D ${DBSERVICE_DATA_DIR}

Step 9 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the right of the alarm "Database Enters the Read-Only Mode", click **Clear** in the **Operation** column. In the dialog box that is displayed, click **OK** Manually clear the alarm.

Step 10 Log in to the active management node of the DBServer as user **omm** and run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

source $DBSERVER_HOME/.dbservice_profile

find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Handle the files that are incorrectly written into the directory based on the actual scenario.

Step 12 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage is lower than 80%.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **DBService** for the target cluster.

Step 15 Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

Step 16 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 17 Contact O&M personnel and send the collected fault logs.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

9.11.242 ALM-29000 Impala Service Unavailable

Alarm Description

The alarm module checks the Impala service status every 30 seconds. This alarm is generated if the Impala service is abnormal.

This alarm is cleared after the Impala service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29000	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

When the Impala service is abnormal, you cannot perform cluster operations on Impala through FusionInsight Manager. The Impala service functions are unavailable.

Possible Causes

- The Hive service is abnormal.
- The KrbServer service is abnormal.
- The Impala process is abnormal.
- There are too many JDBC or ODBC connections.

Handling Procedure

Check whether the services on which Impala depends are normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** to check whether Hive and KrbServer are stopped.

- If yes, start the stopped services and go to **Step 2**.
- If no, go to **Step 3**.

Step 2 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether the **Impala Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether ALM-16004 Hive Service Unavailable and ALM-25500 KrbServer Service Unavailable exist.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Rectify the fault by following the handling procedure of "ALM-16004 Hive Service Unavailable" and "ALM-25500 KrbServer Service Unavailable". Then, check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the Impala process is normal.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. Check whether ALM-12007 Process Fault exists in the alarm list.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Rectify the fault by following the handling procedure of "ALM-12007 Process Fault", and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether there are too many JDBC or ODBC connections.

Step 7 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether "ALM-29005 Number of JDBC Connections to Impalad Exceeds the Threshold" or "ALM-29006 Number of ODBC Connections to Impalad Exceeds the Threshold" exists.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Rectify the fault by referring to the handling procedure of "ALM-29005 Number of JDBC Connections to Impalad Exceeds the Threshold" or "ALM-29006 Number of ODBC Connections to Impalad Exceeds the Threshold". Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None

9.11.243 ALM-29004 Impalad Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the Impalad process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

Alarm Attributes

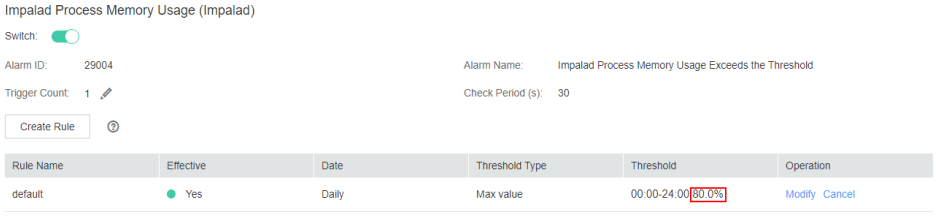
Alarm ID	Alarm Severity	Auto Cleared
29004	Minor	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The memory usage is too high. Some query tasks may fail due to insufficient memory.



Possible Causes

The Impalad process is executing a large number of query tasks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **CPU and Memory** > **Impalad Process Memory Usage (Impalad)** and check the threshold.

Step 2 If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, check whether the alarm is automatically cleared. During this period, some tasks may fail to be executed or may be canceled due to insufficient memory. In this case, try again.

NOTE

If the memory usage always exceeds the threshold, the cluster capacity needs to be expanded.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

The alarm is automatically cleared after the burst concurrent tasks are complete.

9.11.244 ALM-29005 Number of JDBC Connections to Impalad Exceeds the Threshold

Alarm Description

The system checks the number of client connections to the Impalad node every 30 seconds. This alarm is generated when the number of client connections exceeds the customized threshold (60 by default).

This alarm is automatically cleared when the number of client connections is less than the threshold.

Alarm Attributes

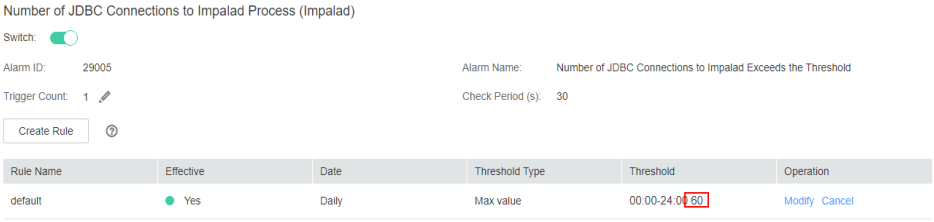
Alarm ID	Alarm Severity	Auto Cleared
29005	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

New client connections may be blocked or even fail.

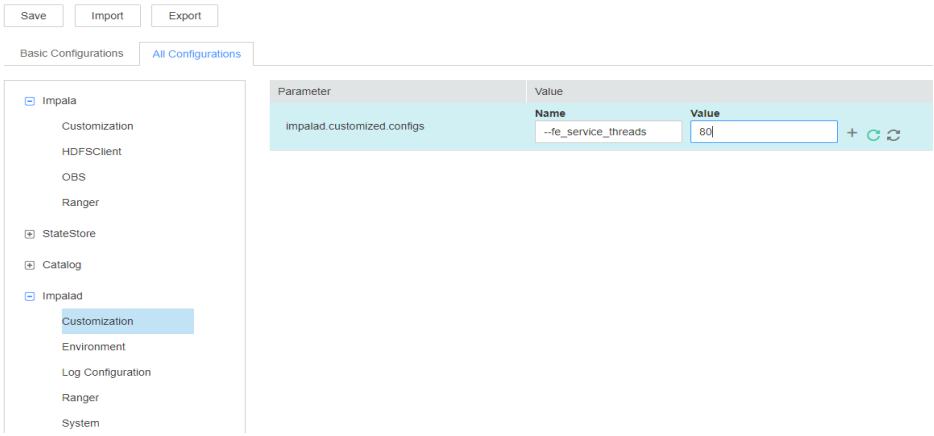


Possible Causes

Too many connections have been established with the Impala server or the threshold is too small.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

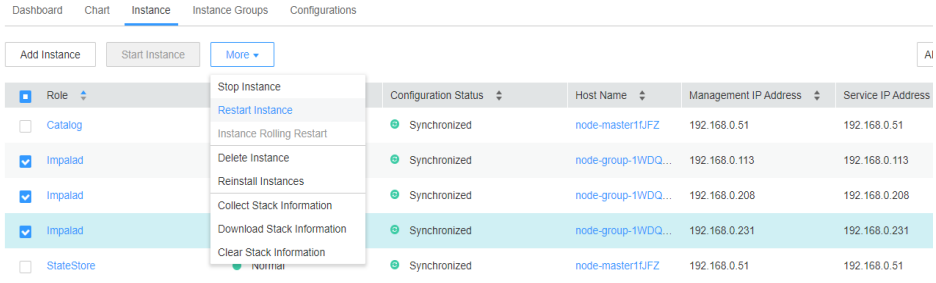
Handling Procedure



Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **Connections** > **Number of JDBC Connections to Impalad Process** to check the configured threshold.

Step 2 Check the number of JDBC applications connected to Impalad and stop idle applications. Check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 3** to change the number of concurrent client connections.



Step 3 On FusionInsight Manager, choose **Cluster** > **Impala** > **Configurations** > **All Configurations** > **Impalad** > **Customization**. Add the customized parameter **--fe_service_threads**. The default value of this parameter is **64**. Change the value as required and click **Save**.

Step 4 After the query tasks on all clients are complete, click the **Instances** tab. Select all Impalad instances, and restart them.

NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

9.11.246 ALM-29007 Impalad Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the Impalad process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29007	Minor	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The memory usage is too high. Some query tasks may fail due to insufficient memory.

Possible Causes

The Impalad process is executing a large number of query tasks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **CPU and Memory** > **Impalad Process Memory Usage (Impalad)** and check the threshold.

Step 2 If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, check whether the alarm is automatically cleared. During this period, some tasks may fail to be executed or may be canceled due to insufficient memory. In this case, try again.

NOTE

If the memory usage always exceeds the threshold, the cluster capacity needs to be expanded.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

The alarm is automatically cleared after the burst concurrent tasks are complete.

9.11.251 ALM-29013 Impalad FGC Time Exceeds the Threshold

Alarm Description

The system checks the FGC time of the Impalad service every 60 seconds. This alarm is generated when the FGC time exceeds the threshold (12 seconds) for five consecutive times. This alarm is cleared when the FGC time is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29013	Major	Yes

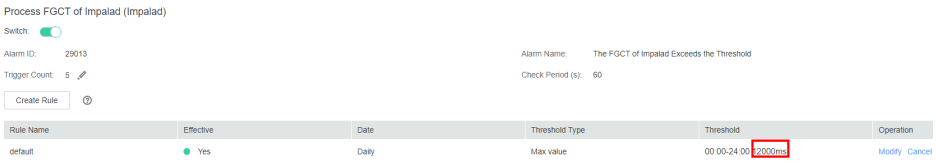
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data read and write are affected.



Possible Causes

The memory of the node instance is overused or the heap memory is inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC time.

Step 1 Choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **Process FGCT** > **Process FGCT of Impalad (Impalad)**, and check the threshold (12s by default).

Step 2 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the alarm whose **Alarm ID** is **29013** exists in the alarm list.

- If yes, go to **3**.
- If no, no further action is required.

Step 3 On FusionInsight Manager, choose **Cluster** > **Impala**, click the **Instances** tab, select the Impalad instance for which the alarm is generated, then click the **Chart** tab, locate the **Process FGCT** chart, and check whether the FGC time is greater than the threshold in **1**.

- If yes, go to **4**.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **Process FGCT** > **Process FGCT of Impalad (Impalad)**, and change the threshold to a value less than the time obtained in **3**. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.252 ALM-29014 Catalog FGC Time Exceeds the Threshold

Alarm Description

The system checks the FGC time of the Catalog service every 60 seconds. This alarm is generated when the FGC time exceeds the threshold (12 seconds) for five consecutive times. This alarm is cleared when the FGC time is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29014	Major	Yes

Alarm Parameters

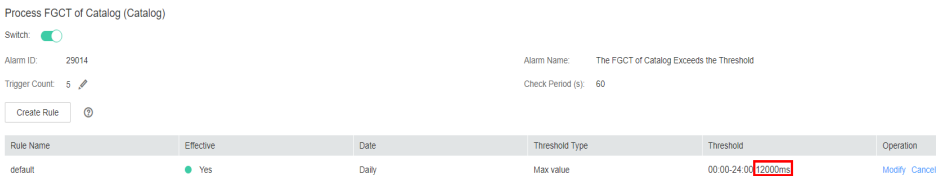
Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data read and write are affected.



Possible Causes

The memory of the node instance is overused or the heap memory is inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC time.

Step 1 Choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **Impala** > **Process FGCT** > **Process FGCT of Catalog (Catalog)**, and check the threshold (12s by default).

Step 2 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether the alarm whose **Alarm ID** is **29014** exists in the alarm list.

- If yes, go to **3**.
- If no, no further action is required.

Step 3 On FusionInsight Manager, choose **Cluster** > **Impala**, click the **Instance** tab, select the Catalog instance for which the alarm is generated, then click the **Chart** tab, locate the **Process FGCT** chart, and check whether the FGC time is greater than the threshold in **1**.

- If yes, go to **4**.
- If no, go to **5**.

Step 4 Choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, choose **Impala** > **Process FGCT** > **Process FGCT of Catalog (Catalog)**, and change the threshold to a value less than the time obtained in **3**. Then, check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to 5.

Collect fault information.

Step 5 On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.253 ALM-29015 Catalog Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the Catalog process every 30 seconds. This alarm is generated when the system detects that the memory usage exceeds the default threshold (80%).

This alarm is automatically cleared when the system detects that the memory usage of the process falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29015	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Description
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The memory usage is too high. Some query tasks may fail due to insufficient memory.

Possible Causes

The memory of the node instance is overused or the memory is inappropriately configured.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > **Impala** > **CPU and Memory** > **Catalog Process Memory Usage (Impalad)** and check the threshold.

Step 2 If the alarm threshold is smaller than 80%, increase the alarm threshold as required and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 If the threshold is greater than 80%, check whether a large number of concurrent query tasks exist when the alarm is generated. A large number of concurrent query tasks will cause the memory usage to increase sharply. After the tasks are complete, check whether the alarm is automatically cleared. During this period, some tasks may fail to be executed or may be canceled due to insufficient memory. In this case, try again.

NOTE

If the memory usage always exceeds the threshold, the cluster capacity needs to be expanded.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.254 ALM-29016 Impalad Instance in the Sub-healthy State

Alarm Description

In MRS 3.1.5, the system checks every 60 seconds whether the Hive Server2 HTTP port (28000) of Impalad responds to cURL requests. This alarm is generated when the returned result has been incorrect for 20 seconds in two consecutive times. This alarm is cleared when the system correctly responds within 20 seconds.

In other MRS versions, the system checks every 60 seconds whether Impalad can execute **select 1**. This alarm is generated when the returned result has been incorrect for 20 seconds in two consecutive times. This alarm is cleared when the SQL statement is correctly executed within 20 seconds.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29016	Minor	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If Impalad cannot execute SQL or experiences SQL execution timeouts, data read and write will be affected.

Possible Causes

The Impalad service maintains too many queries.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Impala** > **Impalad Web UI**. On the displayed page, click any node to go to the web UI.

Step 2 On the web UI, click **/backends** to view the Impala instance list. Locate the instance for which the alarm is generated and click **Web UI**. After the web UI of the subhealthy node is displayed, click **/queries** to check the task execution status and check whether any task is executed slowly.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 After the task is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Impala** > **Instances**, select the Impala instance for which the alarm is generated, click **More**, and select **Restart Instance**. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

Collect fault information.

Step 5 On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Impala** for the target cluster.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.255 ALM-29104 Tserver Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the memory usage of the Kudu Tserver process every 60 seconds. This alarm is generated when the system detects that the memory usage of the Kudu Tserver process exceeds the threshold.

This alarm is cleared when the memory usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29104	Critical	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

The memory usage of the KuduTserver instance is too high.

Handling Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, locate alarm **ALM-29104 Tserver Process Memory Usage Exceeds the Threshold** and view the alarm source.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > **Kudu**. Locate the threshold of this alarm and check whether the Kudu instance memory usage exceeds the threshold. If yes, rectify the fault or change the threshold.

Step 3 Choose **O&M** > **Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.256 ALM-29106 Tserver Process CPU Usage Exceeds the Threshold

Alarm Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the system detects that the CPU usage of the Kudu Tserver process is too high.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the CPU usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29106	Critical	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

The CPU usage of a KuduTserver instance is too high.

Handling Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, locate alarm **ALM-29106 Tserver Process CPU Usage Exceeds the Threshold** and view the alarm source.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > **Kudu**. Locate the alarm threshold and check whether the CPU usage of the cluster Kudu instance exceeds the threshold. If yes, rectify the fault or change the threshold.

Step 3 Choose **O&M** > **Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 6 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

9.11.257 ALM-29107 Tserver Process Memory Usage Exceeds the Threshold

Alarm Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the memory usage of the Kudu Tserver process exceeds the threshold.

This alarm is cleared when the memory usage of the Tserver process becomes normal and the system considers that the Kudu instance service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
29107	Critical	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Type	Parameter	Description
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service.

Possible Causes

The memory usage of the KuduTserver instance is too high.

Handling Procedure

Handle the Kudu instance exceptions.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, locate alarm **ALM-29107 Tserver Process Memory Usage Exceeds the Threshold** and view the alarm source.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > **Kudu**. Locate the alarm threshold, compare the memory usage of the KuduTserver instance in the cluster with the threshold, and find the node whose memory usage exceeds the threshold.

Add nodes or reschedule jobs to reduce the memory usage of the Tserver node or change the threshold.

Step 3 Choose **O&M** > **Alarm** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

9.11.258 ALM-38000 Kafka Service Unavailable

Alarm Description

The system checks the Kafka service status every 30 seconds. This alarm is generated when the Kafka service is unavailable.

This alarm is cleared when the Kafka service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38000	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Kafka service, and users cannot perform new Kafka tasks.

Possible Causes

- The KrbServer service is faulty (for non-normal clusters).
- The ZooKeeper service is abnormal or does not respond.
- The Broker instances in the Kafka cluster are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the status of the KrbServer service. (Skip this step if the normal mode is used.)

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **KrbServer**.

Step 2 Check whether the running status of the KrbServer service is **Normal**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

Step 3 Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**.

Step 4 Perform **Step 2** again.

Check the status of the ZooKeeper cluster.

Step 5 Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 If ZooKeeper service is stopped, start it. Otherwise, rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

Step 7 Perform **Step 5** again.

Check the Broker status.

Step 8 Choose **Cluster** > **Services** > **Kafka** and click **Instances**. The Kafka instance page is displayed.

Step 9 Check whether all instances in **Roles** are running properly.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Select all Broker instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

⚠ CAUTION

During the restart of the Broker instance, if the current Topic is a single copy and is on the current Broker node, the Kafka service will be interrupted. Otherwise, the Kafka service will not be affected.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Choose **Cluster** > **Services** > **Kafka** and check whether the service status is **Normal**.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 14 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 15 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 16 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.259 ALM-38001 Insufficient Kafka Disk Capacity

Description

The system checks the Kafka disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated when the disk usage is greater than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds**. Under the service list, choose **Kafka > Disk > Broker Disk Usage (Broker)** and change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the Kafka disk usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Kafka disk usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38001	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

Kafka data write operations are affected.

Possible Causes

- The configuration (such as number and size) of the disks for storing Kafka data cannot meet the requirement of the current service traffic, due to which the disk usage reaches the upper limit.
- Data retention time is too long, due to which the data disk usage reaches the upper limit.
- The service plan does not distribute data evenly, due to which the usage of some disks reaches the upper limit.

Procedure

Check the disk configuration of Kafka data.

Step 1 On the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, locate the alarm and obtain **HostName** from **Location**.

Step 3 Click **Cluster** > *Name of the desired cluster* > **Hosts**.

Step 4 In the host list, click the host name obtained in **Step 2**.

Step 5 Check whether the **Disk** area contains the partition name in the alarm.

- If yes, go to **Step 6**.
- If no, manually clear the alarm and no further operation is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Check whether the disk partition usage contained in the alarm reaches 100% in the **Disk** area.

- If yes, handle the alarm by following the instructions in **Related Information**.
- If no, go to **Step 7**.

Check the Kafka data storage duration.

Step 7 Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**.

Step 8 Check whether the value of parameter **disk.adapter.enable** is set to **true**.

- If yes, go to **Step 10**.
- If no, go to **Step 9**.

Step 9 Set the value of **disk.adapter.enable** to **true**. Check whether the value of **adapter.topic.min.retention.hours** is properly set.

- If yes, go to **Step 10**.
- If no, adjust the data retention period based on service requirements.

NOTICE

If the disk auto-adaptation function is enabled, some historical data of specified topics is deleted. If the retention period of some topics cannot be adjusted, click **All Configurations** and add the topics to the value of the **disk.adapter.topic.blacklist** parameter.

Step 10 Wait 10 minutes and check whether the usage of faulty disks reduces.

- If yes, wait until the alarm is cleared.
- If no, go to **Step 11**.

Check the Kafka data plan.

Step 11 In the **Instance** area, click **Broker**. In the **Real Time** area of Broker, Click the drop-down menu in the Chart area and choose **Customize** to customize monitoring items.

Step 12 In the dialog box, select **Disk** > **Broker Disk Usage** and click **OK**.

The Kafka disk usage information is displayed.

Step 13 View the information in **Step 12** to check whether there is only the disk parathion for which the alarm is generated in **Step 2**.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Perform disk planning and mount a new disk again. Go to the **Instance Configurations** page of the node for which the alarm is generated, modify **log.dirs**, add other disk directories, and restart the Kafka instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If the current topic has multiple replicas during the instance rolling restart, there is no impact on the Kafka service. Otherwise, the Kafka service will be unavailable during the restart, and upper-layer services that depend on the service will be affected.

Step 15 Determine whether to shorten the data retention time configured on Kafka based on service requirements and service traffic.

- If yes, go to **Step 16**.
- If no, go to **Step 17**.

Step 16 Log in to FusionInsight Manager, select **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations**, and click **All Configurations**. In the search box on the right, enter **log.retention.hours**. The value of the parameter indicates the default data retention time of the topic. You can change the value to a smaller one.

NOTE

- For a topic whose data retention time is configured alone, the modification of the data retention time on the Kafka Service Configuration page does not take effect.
- To modify the data retention time for a topic, use the Kafka client command-line interface (CLI) to configure the topic.

  Example: **kafka-topics.sh --zookeeper "***ZooKeeper IP address***:2181/kafka" --alter --topic "***Topic bane***" --config retention.ms= "***retention time***"**

Step 17 Check whether the usage of some disks reaches the upper limit due to unreasonable configuration of the partitions of some topics. For example, the number of partitions configured for a topic with large data volume is smaller than the number of disks. In this case, the data is not evenly allocated to disks.

NOTE

If you do not know which topics have a large amount of service data, perform the following steps:

1. Log in to an instance node based on the host node information obtained in **Step 2**.
2. Go to the data directory (directory specified by **log.dirs** before the modification in **Step 14**).
3. Run the following command to check whether there is topic with partition that use large disk space.

   du -h --max-depth=1 ./

- If yes, go to **Step 18**.
- If no, go to **Step 19**.

Step 18 In the Kafka client CLI, run the following command to perform partition capacity expansion for the topic:

kafka-topics.sh --zookeeper "*ZooKeeper IP address***:2181/kafka" --alter --topic "***Topic name***" --partitions="***New number of partitions***"**

NOTE

- You are advised to set the new number of partitions to a multiple of the number of Kafka data disks.
- The step may not quickly clear the alarm, and you need to modify the data retention time in **Step 11** to gradually balance data allocation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 19 Determine whether to perform capacity expansion.

NOTE

You are advised to perform capacity expansion for Kafka when the current disk usage exceeds 80%.

- If yes, go to **Step 20**.
- If no, go to **Step 21**.

Step 20 Expand the disk capacity and check whether the alarm is cleared after capacity expansion.

- If yes, no further action is required.
- If no, go to **Step 22**.

Step 21 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 22**.

Collect fault information.

Step 22 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 23 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 24 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 25 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

Step 1 Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**, stop the Broker instance whose status is **Restoring**, record the management IP address of the node where the Broker instance is located, and record **broker.id**. The value can be obtained by using the following method: Click the role name. On the **Configurations** page, select **All Configurations**, and search for the **broker.id** parameter.

Step 2 Log in to the recorded management IP address as user **root**, and run the **df -lh** command to view the mounted directory whose disk usage is 100%, for example, **${BIGDATA_DATA_HOME}/kafka/data1**.

Step 3 Go to the directory and run the **du -sh *** command to view the size of each file in the directory. Check whether there are files in addition to the files in the **kafka-logs** directory, and determine whether these files can be deleted or migrated.

- If yes, go to **Step 8**.
- If no, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Go to the **kafka-logs** directory, run the **du -sh *** command, select a partition folder to be moved. The naming rule is **Topic name-Partition ID**. Record the topic and partition.

Step 5 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the **kafka-logs** directory in the same way.

1. Decrease the number in the second line in the file. (To remove multiple directories, the number deducted is equal to the number of files to be removed.)
2. Delete the line of the to-be-removed partition. (The line structure is "Topic name Partition ID Offset". Save the data before deletion. Subsequently, the content must be added to the file of the same name in the destination directory.)

Step 6 Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the destination data directory. For example, **${BIGDATA_DATA_HOME}/kafka/data2/kafka-logs** in the same way.

- Increase the number in the second line in the file. (To move multiple directories, the number added is equal to the number of files to be moved.)
- Add the to-be moved partition to the end of the file. (The line structure is "Topic name Partition ID Offset". You can copy the line data saved in **Step 5**.)

Step 7 Move the partition to the destination directory. After the partition is moved, run the **chown omm:wheel -R** *Partition directory* command to modify the directory owner group for the partition.

Step 8 Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to start the Broker instance.

Step 9 Wait for 5 to 10 minutes and check whether the health status of the Broker instance is **Normal**.

- If yes, resolve the disk capacity insufficiency problem according to the handling method of "ALM-38001 Insufficient Kafka Disk Space" after the alarm is cleared.
- If no, contact the O&M personnel.

----End

9.11.260 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold

Description

The system checks the Kafka service status every 60 seconds. The alarm is generated when the heap memory usage of a Kafka instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage is less than or equal to 90% of the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38002	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the broker instance breaks down. As a result, the broker cannot provide read and write services properly.

Possible Causes

The heap memory of the Kafka instance is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **Kafka Heap Memory Usage Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Heap Memory Usage of Kafka**, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the used heap memory of Kafka reaches 95% of the maximum heap memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Check the heap memory size configured for Kafka.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations**> **Broker(Role)** > **Environment**. Increase the value of **KAFKA_HEAP_OPTS** by referring to the Note.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Heap Memory Usage of Kafka** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Heap Memory Used by Kafka.**

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 7 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.261 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold

Description

The system checks the direct memory usage of the Kafka service every 30 seconds. This alarm is generated when the direct memory usage of a Kafka instance exceeds the threshold (80% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the direct memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

this alarm is cleared when the direct memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38004	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the broker instance breaks down. As a result, the broker cannot provide read and write services properly.

Possible Causes

The direct memory of the Kafka instance is overused or the direct memory is inappropriately allocated.

Procedure

Check the direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services > Kafka > Instance. Click the instance for which the alarm is**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

generated to go to the page for the instance. Click the drop-down menu in the **Chart** area, choose **Customize** > **Process** > **Kafka Direct Memory Usage**, and click **OK**.

Step 3 Check whether the used direct memory of Kafka reaches 80% of the maximum direct memory specified for Kafka.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the direct memory size configured for the Kafka.

Step 4 On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka**. On the displayed page, click **Configurations** and then choose **All Configurations** > **Broker(Role)** > **Environment**. Increase the value of **-Xmx** in the **KAFKA_HEAP_OPTS** parameter.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Kafka Direct Memory Usage** by referring to **Step 2**, and set the value of **KAFKA_HEAP_OPTS** to twice the value of **Direct Memory Used by Kafka.**

Step 5 Save the configuration and restart the Kafka service.

NOTE

If rolling restart is performed and the current Topic has multiple copies, services are not affected. Otherwise, the Kafka service will be unavailable during the restart, and upper-layer services that depend on the Kafka service will be affected.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.262 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold

Description

The system checks the garbage collection (GC) duration of the Broker process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the GC duration is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the GC duration is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38005	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

A long GC duration of the Broker process may interrupt the services.

Possible Causes

The Kafka GC duration of the node is too long or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the GC duration.

Step 1 On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** > **GC Duration of the Broker Process Exceeds the Threshold** > **Location**. Check the host name of the instance involved in this alarm.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Process** > **Broker GC Duration per Minute**, and click **OK**.

Step 3 Check whether the GC duration of the Broker process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Check the heap memory size configured for the Kafka.

Step 4 On the FusionInsight Manager, choose **Cluster** > **Services** > **Kafka**. On the displayed page, click **Configurations** and then choose **All Configurations** > **Broker(Role)** > **Environment**. Increase the value of **-Xmx** in the **KAFKA_HEAP_OPTS** parameter.

NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to set the value of **KAFKA_HEAP_OPTS** to twice the value of **Heap Memory Utilization of Kafka**. On the FusionInsight Manager portal, choose **Cluster** > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Process** > **Heap Memory Utilization of Kafka** to check the value of heap memory used by Kafka.

Step 5 Save the configuration and restart the Kafka service.

NOTE

If rolling restart is performed and the current Topic has multiple copies, services are not affected. Otherwise, the Kafka service will be unavailable during the restart, and upper-layer services that depend on the Kafka service will be affected.

Step 6 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.263 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold

Description

The system checks the percentage of Kafka partitions that are not completely synchronized to the total number of partitions every 60 seconds. This alarm is generated when the percentage exceeds the threshold (50% by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Too many Kafka partitions that are not completely synchronized affect service reliability. In addition, data may be lost when leaders are switched.

Possible Causes

Some nodes where the Broker instance resides are abnormal or stop running. As a result, replicas of some partitions in Kafka are out of the in-sync replicas (ISR) set.

Procedure

Check Broker instances.

Step 1 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 2 Check whether faulty nodes exist among all Broker nodes.

- If yes, record the host name of the node and go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Check whether any fault alarm is generated for the host in **Step 2**. If yes, clear the alarm based on the alarm guide.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.

Step 5 Check whether stopped nodes exist among all Broker instance.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Select all stopped Broker instances and click **Start Instance**.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 9 Select **Kafka** in the required cluster from the **Service** drop-down list.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.264 ALM-38007 Status of Kafka Default User Is Abnormal

Description

The system checks the default user of Kafka every 60 seconds. This alarm is generated when the system detects that the user status is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the user status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38007	Critical	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka default user status is abnormal.

Impact on the System

If the Kafka default user status is abnormal, metadata synchronization between Brokers and interaction between Kafka and ZooKeeper will be affected, affecting service production, consumption, and topic creation and deletion.

Possible Causes

- The Sssd service is abnormal.
- Some Broker instances stop running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check whether the Sssd service is abnormal.

Step 1 On the FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **Status of Kafka Default User Is Abnormal** > **Location** to check the host name of the instance for which the alarm is generated.

Step 2 Find the host information in the alarm information and log in to the host.

Step 3 Run the **id -Gn kafka** command and check whether "No such user" is displayed in the command output.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms**. Check whether there is **Sssd Service Exception** in the alarm information. If there is, handle the alarm based on alarm information.

Check the running status of the Broker instance.

Step 5 On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instance page is displayed.

Step 6 Check whether there are stopped nodes on all Broker instances.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Select all stopped Broker instances and click **Start Instance**.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 10 In the **Service** area, select **Kafka** in the required cluster.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.265 ALM-38008 Abnormal Kafka Data Directory Status

Description

The system checks the Kafka data directory status every 60 seconds. This alarm is generated when the system detects that the status of a data directory is abnormal.

Trigger Count is set to **1**. This alarm is cleared when the data directory status becomes normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
DirName	Specifies the directory name for which the alarm is generated.
Trigger Condition	Specifies the condition that the Kafka data directory status is abnormal.

Impact on the System

If the Kafka data directory status is abnormal, the current replicas of all partitions in the data directory are brought offline, and the data directory status of multiple nodes is abnormal at the same time. As a result, some partitions may become unavailable.

Possible Causes

- The data directory permission is tampered with.
- The disk where the data directory is located is faulty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the permission on the faulty data directory.

Step 1 Find the host information in the alarm information and log in to the host.

Step 2 In the alarm information, check whether the data directory and its subdirectories belong to the **omm:wheel** group.

- If yes, record the host name of the node and go to **Step 4**.
- If no, go to **Step 3**.

Step 3 Restore the owner group of the data directory and its subdirectories to **omm:wheel**.

Check whether the disk where the data directory is located is faulty.

Step 4 In the upper-level directory of the data directory, create and delete files as user **omm**. Check whether data read/write on the disk is normal.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Replace or repair the disk where the data directory is located to ensure that data read/write on the disk is normal.

Step 6 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Kafka** > **Instance**. On the Kafka instance page that is displayed, restart the Broker instance on the host recorded in **Step 2**.

NOTE

During the restart of the Broker instance, if the current Topic is a single copy and is on the current Broker node, the Kafka service will be interrupted. Otherwise, the Kafka service will not be affected.

Step 7 After Broker is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** area, select **Kafka** in the required cluster.

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.266 ALM-38009 Busy Broker Disk I/Os (Applicable to Versions Later Than MRS 3.1.0)

NOTE

This section applies to versions later than MRS 3.1.0.

Alarm Description

The system checks the I/O status of each Kafka disk every 60 seconds. This alarm is generated when the disk I/O of a Kafka data directory on a broker exceeds the threshold (80% by default).

Its **Trigger Count** is **3**. This alarm is cleared when the disk I/O is lower than the threshold (80% by default).

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38009	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
	DataDirectory Name	Specifies the name of the Kafka data directory with frequent disk I/Os.

Impact on the System

The disk partition has frequent I/Os. Data may fail to be written to the Kafka topic for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- There are many replicas configured for the topic.
- The parameter for batch writing producer's messages is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

Handling Procedure

Check the number of topic replicas.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Location** field of the alarm details, view the host name for which this alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Kafka** > **KafkaTopic Monitor**, and sort topics by the number of replicas in descending order. Check whether topics with more than three replicas are experiencing high traffic.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 If such topics are found, click the topic name and verify whether the IP address resolved from the host name obtained in **Step 1** is included among the hosts for all partitions of the topic. If it is, reduce the topic's replication factor to 3.

Perform the operations below on the Kafka client to replan replicas for Kafka topics.

1. Log in to the node where the Kafka client is installed as the client installation user.
2. Run the following command to switch to the client installation directory, for example, **/opt/client/Kafka/kafka/bin**:
   ```
   cd /opt/client/Kafka/kafka/bin
   ```
3. Run the following command to configure environment variables:
   ```
   source /opt/client/bigdata_env
   ```
4. Run the following command to perform user authentication (skip this step for a cluster in normal mode):
   ```
   kinit Component service user
   ```
5. Run the following command to replan the replicas of Kafka topics:
   ```
   kafka-reassign-partitions.sh --bootstrap-server <Kafka cluster IP address:21007> --command-config ../config/client.properties --reassignment-json-file {manual assignment json file path} --execute
   ```

   To obtain the IP address of the Kafka cluster, log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka** > **Instances**. Check and record the service IP address of any Broker instance. The port number of the Kafka cluster is 21007 if Kerberos authentication is enabled for the cluster (the cluster is in security mode) and is 21005 if Kerberos authentication is disabled for the cluster (the cluster is in normal mode).

   Example:

   ```
   /opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --bootstrap-server 192.168.0.90:21007,192.168.0.91:21007,192.168.0.92:21007 --command-config /opt/client/Kafka/kafka/config/client.properties --reassignment-json-file expand-cluster-reassignment.json --execute
   ```

   In the **expand-cluster-reassignment.json** file, specify the target brokers to which the topic's partitions will be migrated. The JSON content should follow this format:

   ```
   {"partitions":[{"topic": "topicName","partition": 1,"replicas": [1,2,3] }],"version":1}.
   ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the partition planning of the topic.

Step 5 On the **KafkaTopic Monitor** page, view **Topic Input Traffic** in the **Topic Traffic** area of each topic, obtain the topic with the largest value, and check the partitions of this topic as well as information about the host of these partitions.

Step 6 Log in to the host queried in **Step 5** and run the following command to check the **%util** value of each disk:

```
iostat -d -x
```

```
:/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162)      06/26/19        _x86_64_

Device:         rrqm/s   wrqm/s     r/s     w/s    rsec/s    wsec/s avgrq-sz avgqu-sz   await  svctm  %util
xvda              0.04    44.44    1.26   21.94     43.62    531.02    24.78     0.03    1.44   0.56   1.30
xvde              0.16   431.84   13.78   82.51    284.32   4115.90    45.70     0.06    1.41   0.64   6.21
```

- If the **%util** value of each disk exceeds the threshold (**80%** by default), expand the Kafka disk capacity. After the capacity expansion, replan the topic partitions by referring to **Step 3**.
- If the **%util** values of the disks vary greatly, check the disk partition configuration of Kafka.

  For example, check the value of **log.dirs** in the **${BIGDATA_HOME}/FusionInsight_HD_*/x_x_Broker/etc/server.properties** file.

  Run the following command to view the **Filesystem** information:

  ```
  df -h log.dirs value
  ```

  The command output is as follows.

  ```
  :/opt/R3/FusionInsight_Manager/software/packs # df -h /srv/BigData/kafka/data1/kafka-logs/
  Filesystem      Size  Used Avail Use% Mounted on
  /dev/xvda2       36G   21G   14G  62% /
  :/opt/R3/FusionInsight_Manager/software/packs #
  ```

- If the partition where Filesystem is located matches the partition with a high **%util** value, plan Kafka partitions on idle disks, configure **log.dirs** as an idle disk directory, and replan topic partitions by referring to **Step 3**. Ensure that the partitions of the topic are evenly distributed to each disk.

Step 7 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, repeat **Step 5** to **Step 6** three times. Then, go to **Step 8**.

Step 8 Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 11 Click the edit icon in the upper right corner and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.267 ALM-38010 Topics with Single Replica

Description

The system checks the number of replicas of each topic every 60 seconds on the node where the Kafka Controller resides. This alarm is generated when there is one replica for a topic.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38010	Major	No

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
TopicName	Specifies the list of topics for which the alarm is generated.

Impact on the System

There is the single point of failure (SPOF) risk for topics with only one replica. When the node where the replica resides becomes abnormal, the partition does not have a leader, and services on the topic are affected.

Possible Causes

The number of replicas for the topic is incorrectly configured.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the number of replicas for the topic.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, click ⌄ of this alarm, and view the **TopicName** list in **Location**.

Step 2 Check whether replicas need to be added for the topic for which the alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On the FusionInsight client, re-plan topic replicas and describe the partition distribution of the topic in the **add-replicas-reassignment.json** file in the following format: {"partitions":[{"topic": "*topic name*","partition": 1,"replicas": [1,2] }],"version":1}. Then, run the following command to add replicas:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--execute**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --execute

Step 4 Run the following command to check the task execution progress:

kafka-reassign-partitions.sh --zookeeper *{zk_host}:{port}*/**kafka --reassignment-json-file** *{manual assignment json file path}* **--verify**

For example:

/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --verify

Step 5 After completing the handling operations or confirming that the alarm has no impact, manually clear the alarm on FusionInsight Manager.

Step 6 After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 In the **Service** area, select **Kafka** in the required cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearing

If the alarm has no impact, manually clear the alarm.

Related Information

None

9.11.268 ALM-38011 User Connection Usage on Broker Exceeds the Threshold

Description

The system checks the number of connections of each user on Broker every 30 seconds. This alarm is generated when the connection usage of a user on the Broker exceeds the threshold (80% by default) for five consecutive times.

The number of times that smoothing is performed is **5**. This alarm is cleared when the connection usage of a user on the Broker is less than the threshold.

The alarm can be automatically cleared. However, if the number of connections of a user suddenly becomes **0** and no connection is created, the alarm cannot be automatically cleared. In this case, you need to manually clear it.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
38011	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
UserName	Specifies the username for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the number of connections of a user is excessive, the user cannot create new connections to the Broker.

Possible Causes

- The number of connections (created by a user) used by the client exceeds the preset threshold.
- The threshold for the connection usage does not meet service requirements.

Handling Procedure

Check the number of connections established by the same user on the client.

Step 1 On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Alarms** > **User Connection Usage on Broker Exceeds the Threshold**. Check the host name and username of the Broker instance for which the alarm is generated in **Location**.

Step 2 On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the icon area, choose **Customize** > **Other**, and select **User Connection Usage on Broker**, **Maximum Number of User Connections on Broker**, and **Number of User Connections on Broker** to view the number of the current user connections on the Broker.

Step 3 Observe the number of real-time connections of the current alarm user and check whether the real-time monitoring data of the current user exists.

- If yes, go to **Step 4**.
- If no, the current user has disconnected all connections. You need to clear the alarm manually, and no further action is required.

  NOTE

  After the alarm user disconnects all connections, the monitoring data of the user disappears. In this case, the alarm will not be automatically cleared. You need to manually clear it.

Step 4 Check whether the user is authorized by the service side.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

Step 5 Run the following command on the client to limit the number of connections of the user. There are two configuration rules based on the following commands:

1. For the specific Broker and user, run the following command:

   kafka-configs.sh --bootstrap-server *<broker ip:port>* **--alter --add-config 'max.connections.per.user.overrides=[***<username>***:***<connection.number>***]' --entity-type brokers --entity-name** *<broker.id>* **--command-config Kafka/kafka/config/producer.properties**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

For unauthorized users, confirm with the service side to reduce the maximum number of connections of an unauthorized user or set the maximum number of connections to **0**.

In the command, you need to specify the IP address and port number of Broker, set values of configuration items, and specify the **brokerId** and **username**. Here, the user refers to the authorized Kerberos user.

The configuration updated using the command line tool takes effect dynamically. The configuration becomes invalid after the service is restarted. To make the configuration take effect after the restart, log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker** > **Server**, and update the configuration to **max.connections.per.user.overrides**.

2. For the specific use and default Broker (that is, all Broker instances in the cluster), run the following command:

   kafka-configs.sh --bootstrap-server *<broker ip:port>* **--alter --add-config 'max.connections.per.user.overrides=[***<username>***:***<connection.number>***]' --entity-type brokers ---entity-default --command-config Kafka/kafka/config/client.properties**

   Example:

   kafka-configs.sh --bootstrap-server 10.153.3.26:21007 --alter --add-config 'max.connections.per.user.overrides=[showcase:4]' --entity-type brokers --entity-name 1 --command-config Kafka/kafka/config/client.properties

Step 6 Check whether the maximum number of connections is **0** and whether the number of connections of the current user decreases or remains unchanged according to **Step 2**.

- If yes, manually clear the alarm and no further action is required.
- If no, go to **Step 7**.

Step 7 Check whether the number of real-time connections and connection usage of the current user are sharply increased when they are compared with historical data, and whether have exceeded the specified maximum number of connections.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

NOTE

If there is an obvious increase after the comparison and the maximum number of connections has reached the preset value, the connections of the user may be abnormal. You need to confirm with the service party.

Check whether the number of user connections meets service requirements.

Step 8 Check whether the number of connections of the user meets service requirements.

- If yes, go to **Step 9**.
- If no, contact the service party to rectify the fault.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If the number of user connections is abnormal, contact the service party to rectify the fault from the following aspects:

- Check whether new services are added so that the number of user connections increases sharply.
- Check whether handle leakage occurs on the code at the service side.

Step 9 Consider whether to increase the maximum number of connections of the user.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Increase the maximum number of connections based on the service requirements. Set the number of connections of the user on the Kafka client. For details, see **Step 5**.

Step 11 Wait for several minutes and then check whether the alarm is automatically cleared.

- If yes, go to **Step 12**.
- If no, go to **Step 2**.

Step 12 Determine whether to add the user to the whitelist based on service requirements on the service side.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

NOTE

To add a user to the whitelist, you need to restart the Kafka service. However, this operation will cause service interruption and affect service running. Therefore, you must confirm with the service side before performing this operation.

Step 13 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)** > **Server**, and add the user to the **max.connections.per.user.whitelist** configuration item.

Step 14 Restart the service for the modification to take effect. In addition, you need to manually clear the alarm, and no further action is required.

Collect the fault information.

Step 15 On the FusionInsight Manager homepage, choose **O&M** > **Log** > **Download**.

Step 16 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.269 ALM-38012 Number of Broker Partitions Exceeds the Threshold

Alarm Description

The system checks the number of partitions on each Broker instance of the Kafka service every 30 seconds. You can view the number of partitions on the Broker instance dashboard page. This alarm is generated when the number of partitions on a Broker instance exceeds the threshold. You can choose **O&M** > **Alarm** > **Thresholds** > **Kafka** and change the threshold. This alarm is cleared when the number of partitions is less than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38012	Critical (default threshold: 6000) Major (default threshold: 3000)	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The number of Broker partitions exceeds the threshold. Too many partitions increase the Broker load and cause bottlenecks in memory, disk I/O, and CPU resources. As a result, the request response becomes slow or even times out.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- Broker partitions are unevenly distributed, or the Kafka cluster usage exceeds the specifications.
- There are many useless topics.

Handling Procedure

Check whether partitions are evenly distributed on Broker.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the **Location** field of the alarm details, view the service instance and host for which the alarm is generated.

Step 2 Choose **Cluster** > **Services** > **Kafka** > **Chart**, select **Partition** from the **Chart Category** area, zoom in **Number of Partitions-All Instances** in the upper right corner, and click **Distribution** to check whether partitions are evenly distributed on Broker.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 If the partitions on Broker are balanced, the Kafka cluster exceeds the specifications. In this case, add Broker instances. Then, go to **Step 5**.

On FusionInsight Manager, choose **Cluster** > **Services** > **Kafka** > **Instances**, click **Add Instance**, and add Broker instances as prompted.

Step 4 Click the uneven distribution bar on the rightmost. If the number of partitions on only the Broker node for which the alarm is generated is too large, perform data balancing.

Step 5 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether there are many useless topics.

Step 6 Check whether useless topics exist in the cluster.

- If yes, perform the following steps to delete useless topics: **Deleting topics is a high-risk operation. Before deleting topics, ensure that the topics are not used.**
  a. Log in to Manager as a user who has the permission to access the Kafka web UI.
  b. Choose **Cluster** > **Services** > **Kafka**. On the right of **KafkaManager Web UI**, click the URL to access the Kafka web UI.
  c. Choose **Topics**.
  d. In the **Operation** column of the target topic, click **Action** and select **Delete**.
  e. In the dialog box that is displayed, click **OK**.
     The default built-in topics cannot be deleted.
- If no, go to **Step 8**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.270 ALM-38013 Produce Request Latency in the Request Queue Exceeds the Threshold

Alarm Description

The system checks the latency of Produce requests on Broker instances in the request queue every 30 seconds. This alarm is generated when the latency of Produce requests on a Broker instance in the request queue has exceeded the threshold for 10 consecutive times.

This alarm is cleared when the latency of Produce requests in the request queue is less than or equal to the threshold.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38013	Critical (default threshold: 60000) Major (default threshold: 30000)	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The latency of Produce requests on the Broker instance in the request queue exceeds the threshold. As a result, the request queue is congested, and the response time of write requests increases. For latency-sensitive services, a large number of write requests may time out.

Possible Causes

- The number of threads used by the Broker instance to process requests is incorrectly configured.
- A slow disk fault has occurred.
- The Broker disk I/O is busy.
- Broker partitions are unevenly distributed, and hotspotting has occurred.

Handling Procedure

Check whether the number of threads used by the Broker instance to process requests is appropriate.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka**. On the page that is displayed, click **Configurations** and then **All Configurations**.

Step 2 Search for and check the value of **num.io.threads**. If the value is too small, increase it. You are advised to change the value to twice the number of CPU cores. The maximum value is **64**. Save the configuration.

Step 3 Click the **Instances** tab, select all Broker instances, click **More**, and select **Instance Rolling Restart**.

NOTE

Services may be affected or interrupted during the restart. Restart the instances during off-peak hours.

Step 4 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Check whether a slow disk fault has occurred.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Location** field of the alarm details, view the host name for which this alarm is generated.

Step 6 Check whether alarm **Slow Disk Fault** or **Disk Unavailable** is generated for the same node in **Step 5**.

- If yes, rectify the fault by following the handling procedure of **ALM-12033 Slow Disk Fault** or **ALM-12063 Disk Unavailable**.
- If no, go to **Step 8**.

Step 7 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the Broker disk I/O is busy.

Step 8 Check whether alarm **Busy Broker Disk I/Os** exists on the node for which this alarm is generated in **Step 5**.

- If yes, rectify the fault by following the handling procedure of **ALM-38009 Busy Broker Disk I/Os** and then go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether Broker partitions are evenly distributed and hotspotting has occurred.

Step 10 Choose **Cluster** > **Services** > **Kafka** > **Chart**, select **Partition** from the **Chart Category** area, zoom in **Number of Partitions-All Instances** in the upper right corner, and click **Distribution** to check whether partitions are evenly distributed on Broker.

- If yes, go to **Step 13**.
- If no, go to **Step 11**.

Step 11 Click the uneven distribution bar on the rightmost, and check whether the node obtained in **Step 5** is included in the unevenly distributed instances. If it is, perform data balancing.

Step 12 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.274 ALM-38017 Partition Reassignment Duration Exceeds the Threshold

Alarm Description

The system checks the partition reassignment time every 10 minutes. The check interval can be modified by the Kafka configuration **auto.reassign.check.interval.ms**. This alarm is generated when the partition reassignment triggered by a Broker scale-out takes more time than the threshold (1440 minutes by default, which can be modified by the Kafka configuration **reassignment.total.time.threshold**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the partition workload balancing is complete.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38017	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the cluster service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

The Kafka service has unbalanced load for a long time, which may deteriorate the read and write performance.

Possible Causes

The amount of data in a partition to be migrated is too large, and the allowed triffic is low.

Handling Procedure

Step 1 Log in to the Kafka web UI.

1. Log in to FusionInsight Manager as a user who has the permission to access the Kafka web UI.
2. Choose **Cluster** > **Services** > **Kafka**.
3. On the right of **KafkaManager Web UI**, click the URL to access the Kafka web UI.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Click **Current Reassign Status** to view the partition reassignment tasks.

Step 3 Check the status of the partitions that are being migrated. If the progress remains unchanged for a long time, click **Modify Reassignment Throttle** to check whether the value of the **Throttle** parameter is too small.

- If yes, adjust the **Throttle** parameter during off-peak hours and click **OK** to accelerate the migration. Run the command in **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for 10 minutes and check whether the partition migration progress changes significantly.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.275 ALM-38018 Kafka Consumer Lag

Alarm Description

If you have configured a threshold to report Kafka consumer lag on the **Alarms** page of Kafka UI (there is no such rule by default), the system reports the alarm based on the following rules:

The system checks the topics subscribed to by all consumer groups every 60 seconds. This alarm is generated when the system detects that the difference (lag) between the consumption progress (offset) and the log end offset of the latest message generated in the partition is too large for five consecutive times, and the consumer log exceeds the threshold configured in the alarm rule.

This alarm is cleared when the system detects that the difference (lag) between the offsets is lower than the configured threshold for five consecutive times.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

This alarm applies only to MRS 3.5.0 or later.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
38018	User-defined by threshold (Critical/ Major)	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	ServiceName	Specifies the cluster service for which the alarm was generated.
	ConsumerGroup	Name of the Kafka consumer group for which the alarm is generated.
Additional Information	TopicName	Specifies the Kafka topic for which the alarm is generated.
	ConsumerLag	Specifies the number of messages yet to be consumed by the consumers in the Kafka topic for which the alarm is generated.

Impact on the System

Messages in Kafka topics are retained for a limited period (seven days by default). If messages are not consumed in time, data will be lost.

Possible Causes

- The new consumer group starts consuming messages from the beginning topic, leading to consumer lag.
- The threshold of the consumer lag alarm rule configured by the user is too small.
- The Kafka topic traffic increases sharply, and a large number of messages are generated in a short period of time.
- It takes a long time for the downstream system to process the Kafka messages in the topic.

Handling Procedure

Check whether the consumer group is new.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. View the alarm details. In the **Location** information area, view the name of the Kafka

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

consumer group for which the alarm is generated. In the **Additional Information** area, view the topic name.

Step 2 Check whether the consumer group is new.

- If yes, go to **Step 3**.

  NOTE

  In a new consumer group, the new consumer starts consuming messages from the beginning topic, which can cause a consumer lag alarm. This alarm is automatically cleared once the downstream consumer finishes processing the topic messages.

- If no, go to **Step 4**.

Step 3 Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the alarm rule configuration is improper.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Kafka**. On the right of KafkaManager web UI, click the URL link to access the Kafka UI. Click **Alarms** and check whether the configured threshold of the consumer lag alarm is proper.

- If yes, go to **Step 6**.
- If no, reconfigure the threshold, save the configuration, and go to **Step 5**.

Step 5 Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the topic traffic increases sharply.

Step 6 On the Kafka UI, click **Topics** and check whether a large number of messages are generated in a short period of time.

- If yes, go to **Step 7**.

  NOTE

  If the alarm is caused by a soaring increase in topic traffic, the alarm is automatically cleared after the downstream system consumes topic messages.

- If no, go to **Step 8**.

Step 7 Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether it takes a long time for the downstream system to process messages in the Kafka topic.

Step 8 Check whether the downstream system is consuming messages from the topic at a slow pace.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Analyze the reason why downstream jobs cannot quickly consume the topic messages and rectify the fault to accelerate the consumption. Wait 5 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.276 ALM-43001 Spark2x Service Unavailable

Alarm Description

The system checks the Spark2x service status every 300 seconds. This alarm is generated when the Spark2x service is unavailable.

This alarm is cleared when the Spark2x service recovers.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
43001	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- HDFS is abnormal.
- Yarn is abnormal.
- The corresponding Hive service is abnormal.
- The Spark2x assembly package is abnormal.
- The NameNode memory is insufficient.
- The memory of the Spark process is insufficient.

Handling Procedure

If the alarm is abnormal Spark2x assembly packet, the Spark packet is abnormal. Wait for about 10 minutes. The alarm is automatically cleared.

Check whether service unavailability alarms exist in services that Spark2x depends on.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**.

Step 2 Check whether the following alarms exist in the alarm list:

- ALM-25500 KrbServer Service Unavailable
- ALM-25000 LdapServer Service Unavailable
- ALM-13000 ZooKeeper Service Unavailable
- ALM-14000 HDFS Service Unavailable
- ALM-18000 Yarn Service Unavailable

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- ALM-16004 Hive Service Unavailable
- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Handle the alarms based on the troubleshooting methods provided in the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the NameNode memory is insufficient.

Step 4 Check whether the NameNode memory is insufficient.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Restart the NameNode to release the memory. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Check whether the memory of the Spark process is insufficient.

Step 6 Check whether the memory of the Spark process is insufficient due to memory-related modifications.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Ensure that the memory of the Spark process is sufficient or expand the cluster capacity. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 In the **Service** area, select the following nodes of the desired cluster. (Hive is the specific Hive service determined based on **ServiceName** in the alarm location information).

- KrbServer
- LdapServer

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- ZooKeeper
- HDFS
- Yarn
- Hive

Step 10 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.277 ALM-43006 Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43006	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the direct memory usage of the JobHistory2x process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

Possible Causes

The heap memory of the JobHistory2x Process is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43006**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum heap memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 On the FusionInsight Manager portal, choose **Cluster** > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is **4 GB**. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > **Spark2x** > **Memory** > **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.278 ALM-43007 Non-Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43007	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the non-heap memory usage of the JobHistory2x process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The non-heap memory of the JobHistory2x Process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43007**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum non-heap memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the non-heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. You can change the value of **-XX:MaxMetaspaceSize** in **SPARK_DAEMON_JAVA_OPTS** according to the following rules: Ratio of the JobHistory2x non-heap memory usage to the **Threshold** of **JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** in the alarm period.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds > Spark2x** > **Memory** >**JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.279 ALM-43008 The Direct Memory Usage of the JobHistory2x Process Exceeds the Threshold

Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the direct memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43008	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Meaning
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the direct memory usage of the JobHistory2x process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

Possible Causes

The direct memory of the JobHistory2x Process is overused or the direct memory is inappropriately allocated.

Procedure

Check direct memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43008**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum direct memory specified for JobHistory2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Spark2x** > **Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Direct Memory of JobHistory2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JobHistory2x process in the corresponding period and obtain the maximum value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 On the FusionInsight Manager portal, choose **Cluster> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **-XX:MaxDirectMemorySize** in **SPARK_DAEMON_JAVA_OPTS** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. It is recommended that the value be less than or equal to the value of **SPARK_DAEMON_MEMORY**.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds > Spark2x** > **Memory** > **JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

Step 5 Restart all JobHistory2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log > Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.280 ALM-43009 JobHistory2x Process GC Time Exceeds the Threshold

Description

The system checks the garbage collection (GC) time of the JobHistory2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > **Spark2x** > **GC Time** > **Total GC time in milliseconds (JobHistory2x)**. This alarm is cleared when the JobHistory2x GC time is shorter than or equal to the threshold.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43009	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

The process performance deteriorates, and the process can even be unavailable. Historical execution records of Spark tasks cannot be queried.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The memory of JobHistory2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JobHistory2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JobHistory2x** > **Default**. The default value of **SPARK_DAEMON_MEMORY** is **4 GB**. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

Step 4 Restart all JobHistory2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log > Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

9.11.281 ALM-43010 Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43010	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the heap memory usage of the JDBCServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer2x process is unavailable, and Spark JDBC tasks are slow or fail to run.

Possible Causes

The heap memory of the JDBCServer2x Process is overused or the heap memory is inappropriately allocated.

Procedure

Check heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43010**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JDBCServer2x Process reaches the threshold (default value is 95%) of the maximum heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Statistics for the heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster> Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **SPARK_DRIVER_MEMORY** is 4 GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JDBCServer2x to the **Threshold** of the **JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds > Spark2x** > **Memory** > **JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Related Information

None

9.11.282 ALM-43011 Non-Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of an JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43011	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the non-heap memory usage of the JDBCServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer2x process is unavailable, and Spark JDBC tasks are slow or fail to run.

Possible Causes

The non-heap memory of the JDBCServer2x Process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43011**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > **Memory** > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JDBCServer2x Process reaches the threshold (default value is 95%) of the maximum non-heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

area, choose **Customize** > **Memory > Statistics for the non-heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. You can change the value of **-XX: MaxMetaspaceSize** in **spark.driver.extraJavaOptions** according to the following rules: Ratio of the JDBCServer2x non-heap memory usage to the **Threshold** of **JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds > Spark2x** > **Memory** > **JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log >Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.283 ALM-43012 Direct Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the direct heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43012	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

Impact on the System

If the direct memory usage of the JDBCServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer2x process is unavailable, and Spark JDBC tasks are slow or fail to run.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The direct heap memory of the JDBCServer2x Process is overused or the direct heap memory is inappropriately allocated.

Procedure

Check direct heap memory usage.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43012**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize** > Memory > **JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct heap memory of the JDBCServer2x Process reaches the threshold of the maximum direct heap memory specified for JDBCServer2x.

- If yes, go to **Step 3**.
- If no, go to **Step 7**.

Step 3 On the FusionInsight Manager home page, choose **Cluster** > **Services** > **Spark2x** > **Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize** > **Memory > Direct Memory of JDBCServer2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

Step 4 On the FusionInsight Manager portal, choose **Cluster > Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Tuning**. The default value of **-XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JDBCServer2x to the **Threshold** of the **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. It is recommended that the parameter value be less than or equal to the value of **SPARK_DRIVER_MEMORY**. In the case of large service volume and high service concurrency, you are advised to add instances.

NOTE

On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds > Spark2x** > **Memory** > **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

Step 5 Restart all JDBCServer2x instances.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

Step 8 Select **Spark2x** in the required cluster from the **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.284 ALM-43013 JDBCServer2x Process GC Time Exceeds the Threshold

Alarm Description

The system checks the garbage collection (GC) time of the JDBCServer2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > **Spark2x** > **GC Time** > **Total GC time in milliseconds (JDBCServer2x)**. This alarm is cleared when the JDBCServer2x GC time is shorter than or equal to the threshold.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
43013	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

If the GC duration exceeds the threshold, the performance of the JDBCServer2x process deteriorates, and the process can even be unavailable. As a result, Spark JDBC tasks are slow or fail to run.

Possible Causes

The memory of JDBCServer2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC time.

Step 1 On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43013**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Spark2x** > **Instances** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area, choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of JDBCServer2x** from the drop-down list box in the upper right corner, and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 On the FusionInsight Manager portal, choose **Cluster** > **Services** > **Spark2x** > **Configurations**, and click **All Configurations**. Choose **JDBCServer2x** > **Default**. The default value of **SPARK_DRIVER_MEMORY** is 4 GB. If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all JDBCServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.285 ALM-43017 JDBCServer2x Process Full GC Number Exceeds the Threshold

Description

The system checks the number of Full garbage collection (GC) times of the JDBCServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

checks.) You can change the threshold by choosing **O&M > Alarm** > **Thresholds** > **Spark2x** > **GC number** > **Full GC Number of JDBCServer2x**. This alarm is cleared when the Full GC number of the JDBCServer2x process is less than or equal to the threshold.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43017	Major	Yes

Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the full GC times exceed the threshold, the performance of the JDBCServer2x process deteriorates, and the process can even be unavailable. As a result, Spark JDBC tasks become slow or even fail.

Possible Causes

The heap memory usage of the JDBCServer2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 Choose **Cluster** > **Services** > **Spark2x** > **Instance**. On the displayed page, click the JDBCServer2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize** > **GC Number** > **Full GC Number of JDBCServer2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JDBCServer2x process is greater than the threshold (default value: 12).

- If it is, go to **Step 3**.
- If it is not, go to **Step 6**.

Step 3 Choose **Cluster** > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JDBCServer2x** > **Tuning**. The default value of **SPARK_DRIVER_MEMORY** is **4 GB**. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

Step 4 Restart all JDBCServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 Log in to FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service** drop-down list.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

9.11.286 ALM-43018 JobHistory2x Process Full GC Number Exceeds the Threshold

Description

The system checks the number of Full garbage collection (GC) times of the JobHistory2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M** > **Alarm > Thresholds** > **Spark2x** > **GC number** > **Full GC Number of JobHistory2x**. This alarm is cleared when the Full GC number of the JobHistory2x process is less than or equal to the threshold.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Alarm Severity	Auto Clear
43018	Major	Yes

Parameters

Name	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The process performance deteriorates, and the process can even be unavailable. Historical execution records of Spark tasks cannot be queried.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The heap memory usage of the JobHistory2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.

Step 2 Choose **Cluster** > **Services** > **Spark2x** > **Instance**. On the displayed page, click the JobHistory2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize** > **GC Number** > **Full GC Number of JobHistory2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JobHistory2x process is greater than the threshold (default value: 12).

- If it is, go to **Step 3**.
- If it is not, go to **Step 6**.

Step 3 Choose **Cluster** > **Services** > **Spark2x** > **Configurations** > **All Configurations**. On the displayed page, choose **JobHistory2x** > **Default.** The default value of **SPARK_DAEMON_MEMORY** is **4 GB**. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

Step 4 Restart all JobHistory2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 5 After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 6**.

Collect fault information.

Step 6 Log in to FusionInsight Manager, and choose **O&M** > **Log** > **Download**.

Step 7 Select **Spark2x** in the required cluster from the **Service**.

Step 8 Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

9.11.287 ALM-43019 Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Severity	Auto Clear
43019	Major	Yes

Parameters

Parameter	Description
Source	Identifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the heap memory usage of the IndexServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer2x process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated.

Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43019**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Instance Status** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the heap memory used by the IndexServer2x process has reached the upper limit (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Instance Status** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Statistics for the heap memory of the IndexServer2x process** > **OK**. Based on the alarm generation time, check the values of the used heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configuration** > **IndexServer2x** > **Tuning**. The default value of the **SPARK_DRIVER_MEMORY** parameter is **4 GB**. You can change the value based on the ratio of the maximum heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 Check whether the alarm is cleared in 10 minutes.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.288 ALM-43020 Non-Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the non-heap memory usage of the IndexServer2x process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Severity	Auto Clear
43020	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
Source	Identifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the non-heap memory usage of the IndexServer2x process is too high, the performance deteriorates, and memory overflow even occurs. As a result, the IndexServer2x process is unavailable, and Carbon tasks with indexing enabled become slow or fail.

Possible Causes

The non-heap memory of the IndexServer2x process is overused or the non-heap memory is inappropriately allocated.

Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43020**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Instance Status** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the non-heap memory used by the process has reached the upper limit (95% by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Statistics for the non-heap memory of the IndexServer2x process** > **OK**. Based on the alarm generation time, check the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

values of the used non-heap memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Performance**. You can change the value of **-XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** in the alarm period.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 Check whether the alarm is cleared in 10 minutes.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.289 ALM-43021 Direct Memory Usage of the IndexServer2x Process Exceeds the Threshold

Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the direct heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Severity	Auto Clear
43021	Major	Yes

Parameters

Parameter	Description
Source	Identifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the direct memory usage of the IndexServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer2x process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The direct heap memory of the IndexServer2x process is overused or the direct heap memory is inappropriately allocated.

Procedure

Check direct heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43021**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **IndexServer2x Memory Usage Statistics** > **OK**. Check whether the direct memory used by the process has reached the threshold.

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 7**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance**. Click the IndexServer2x that reported the alarm to go to the **Instance Status** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize** > **Memory** > **Direct Memory of IndexServer2x** > **OK**. Based on the alarm generation time, check the values of the used direct memory of the process in the corresponding period and obtain the maximum value.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Tuning**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, increase the value by one time.

NOTE

On FusionInsight Manager, you can choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **Memory** > **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** to view the threshold.

Step 5 Restart all IndexServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 6 Check whether the alarm is cleared in 10 minutes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.290 ALM-43022 IndexServer2x Process GC Time Exceeds the Threshold

Description

The system checks the GC time of the IndexServer2x process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Time** > **IndexServer2x Total GC time**. This alarm is cleared when the IndexServer2x GC time is shorter than or equal to the threshold.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

Attribute

Alarm ID	Severity	Auto Clear
43022	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
Source	Identifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC duration exceeds the threshold, the performance of the IndexServer2x process deteriorates, and the process can even be unavailable. As a result, Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, GC occurs frequently.

Procedure

Check the GC time.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43022**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance** and click the IndexServer2x for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize** > **GC Time** > **Garbage Collection (GC) Time of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (12 seconds by default).

- If the threshold is reached, go to **Step 3**.
- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Default**. The default value of the **SPARK_DRIVER_MEMORY** is 4 GB. You can increase the value 1.5 times to its default. If this alarm is still generated occasionally after the adjustment, increase the value by 0.5 times. Double the value if the alarm is reported frequently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Restart all IndexServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 5 Check whether the alarm is cleared in 10 minutes.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

Reference

None

9.11.291 ALM-43023 IndexServer2x Process Full GC Number Exceeds the Threshold

Description

The system checks the Full GC number of the IndexServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (12) for three consecutive times. To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Spark2x** > **GC Number** > **Full GC Number of IndexServer2x**. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold.

NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Severity	Auto Clear
43023	Major	Yes

Parameters

Parameter	Description
Source	Identifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the GC times exceeds the threshold, the performance of the IndexServer2x process deteriorates, and the process can even be unavailable. As a result, Carbon tasks with indexing enabled are slow or fail to run.

Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

Procedure

Check the number of Full GCs.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43023**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Instance** and click the IndexServer2x for which the alarm is generated to enter the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize** > **Full GC Number of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the full GC number is larger than the threshold (default value: 12).

- If the threshold is reached, go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the threshold is not reached, go to **Step 6**.

Step 3 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark2x** > **Configurations** > **All Configurations** > **IndexServer2x** > **Performance**. The default value of the **SPARK_DRIVER_MEMORY** is **4 GB**. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is reported frequently, double the value. In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Restart all IndexServer2x instances.

NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

Step 5 Check whether the alarm is cleared in 10 minutes.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

9.11.292 ALM-43028 JDBCServer Session Overflow

Alarm Description

This alarm is generated when the JDBCServer process forwards requests and triffic control is triggered due to insufficient session resources. In this case, too many requests are sent to the JDBCServer process, exceeding the processing capability of the JDBCServer process.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
43028	Minor (default threshold: 9 for three consecutive times) Critical (default threshold: 12 for three consecutive times)	No

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

Impact on the System

Requests that cannot be processed are responded with a failure message.

Possible Causes

The JDBCServer process on the node is overloaded.

Handling Procedure

Check the source of the requests for connecting to the JDBCServer service.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and select the alarm whose ID is **43028**. Check the role name and the IP address of the host where the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Spark** > **Instances**, click the JDBCServer for which this alarm is generated, and click **jdbcserver-audit** in the **Log** column on the left.

Step 3 Click the download button in the lower left corner to download the logs to the local PC.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Search for **UserIP** in the logs, collect statistics on the IP addresses of the clients that submit a large number of requests, and limit the traffic of these clients to reserve resources for other clients.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm needs to be cleared manually.

Related Information

None.

9.11.293 ALM-43029 JDBCServer Job Submission Timed Out

Alarm Description

After a user submits a JDBC job, the system attempts to create a JDBCServer process and establish a session connection. This alarm is generated if the preset thresholds are exceeded before the connection is established. There are two configuration parameters affecting alarm triggering:

- **spark.thriftserver.proxy.create.session.monitor.enabled**: whether to enable the alarm function. The default value is **true** for the cluster.
- **spark.thriftserver.proxy.create.session.timeout.threshold**: Maximum time allowed for submitting a JDBC job. This alarm is reported when the system detects that the job does not start after the threshold is exceeded. The unit is second. The default value is 180s.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
43029	Major	No

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	User_Queue	Name of the user who submits the alarm and the queue for which the alarm is generated.

Impact on the System

The JDBC job submission time increases due to high system load, which may also affect the job execution efficiency. The job can start properly after this alarm is reported because the detection is asynchronous.

Possible Causes

The JDBCServer on the node is overloaded. The cluster health reflected by the system metrics and job execution status is not good.

Handling Procedure

Check the JDBCServer instance for which the alarm is generated.

Step 1 On FusionInsight Manager, choose O&M > Alarm > Alarms and select the alarm whose ID is 43029. Check the role name and the IP address of the host where the alarm is generated in **Location**. Check the username and queue in **Additional Information**.

Re-executing Affected JDBCServer Jobs

Step 2 Choose **Cluster** > **Services** > **Yarn** > **ResourceManager (Active)** to log in to the YARN web UI. Find the corresponding application based on the username and queue name in **Additional Information** and check whether the job submission is affected based on the driver log and Spark UI. Confirm and record the affected job to execute it again.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **Spark** > **Instances**, click the JDBCServer for which this alarm is generated, and choose **More** > **Restart Instance**.

Step 4 Choose **O&M** > **Alarm** > **Alarms**, search for the reported alarm, and click **Clear** in the **Operation** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Execute the affected job and check whether the alarm is triggered again for the job.

- If no, no further action is required.
- If yes, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Spark** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm needs to be cleared manually.

Related Information

None.

9.11.294 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

Alarm Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to configure a resource group. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to configure the threshold of each resource group.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
44004	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

Handling Procedure

Step 1 Choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to adjust the resource group configuration.

Step 2 You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to modify the threshold of each resource group.

Step 3 Collect the fault information.

1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
3. Contact O&M personnel and send the collected logs.

----End

9.11.295 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold

Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Coordinator** > **Presto Process Garbage Collection Time** > **Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44005	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44005** and then check the role name in **Location** and confirm the IP address of the instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Choose **Components** > **Presto** > **Instances** > **Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**. Choose **Presto** > **Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On FusionInsight Manager, choose **O&M** > **Log** > **Download**.
2. Expand the **Service** drop-down list, select **Presto** for the target cluster, and click **OK**.
3. Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
4. Contact the O&M personnel and send the collected logs.

9.11.296 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold

Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Worker** > **Presto Garbage Collection Time** > **Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44006	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44006**. Then check the role name in **Location** and confirm the IP address of the instance.
3. Choose **Components** > **Presto** > **Instances** > **Worker** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**, and choose **Presto** > **Worker**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Expand the **Service** drop-down list, select **Presto** for the target cluster, and click **OK**.
3. Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

9.11.297 ALM-45000 HetuEngine Service Unavailable

Alarm Description

The system checks the HetuEngine service status every 300 seconds. This alarm is generated when the HetuEngine service is unavailable.

This alarm is cleared when the HetuEngine service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45000	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

FusionInsight Manager cannot be used to perform operations on the HetuEngine cluster, and HetuEngine functions are unavailable.

Possible Causes

- The KrbServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The Yarn service is abnormal.
- The DBService service is abnormal.
- The Hive service is abnormal.
- There are no HSBroker instances in HetuEngine.

Handling Procedure

Check the KrbServer service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarm**.

Step 2 In the alarm list, check whether the "ALM-25500 KrbServer Service Unavailable" alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Clear the alarm according to the alarm help in **ALM-25500 KrbServer Service Unavailable**.

Step 4 In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the ZooKeeper service status.

Step 5 In the alarm list, check whether the alarm "ALM-12007 Process Fault" is generated.

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 In the alarm list, click ⌄ in the row that contains the "Process Fault" alarm. Check whether the name of the service for which the alarm is generated is ZooKeeper in **Location Information**.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Clear the alarm according to the alarm help in **ALM-12007 Process Fault**.

Step 8 In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the HDFS service status.

Step 9 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Clear the alarm according to the alarm help in **ALM-14000 HDFS Service Unavailable**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 11 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Check the YARN service status.

Step 12 In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to **Step 13**.
- If no, go to **Step 15**.

Step 13 Clear the alarm according to the alarm help in **ALM-18000 YARN Service Unavailable**.

Step 14 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check the DBService service status.

Step 15 In the alarm list, check whether the "ALM-27001 DBService Service Unavailable" alarm is generated.

- If yes, go to **Step 16**.
- If no, go to **20**.

Step 16 Clear the alarm according to the alarm help in **ALM-27001 DBService Service Unavailable**.

Step 17 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **20**.

Check the Hive service status.

Step 18 In the alarm list, check whether the "ALM-16004 Hive Service Unavailable" alarm is generated.

- If yes, go to **Step 19**.
- If no, go to **20**.

Step 19 Clear the alarm according to the alarm help in **ALM-16004 Hive Service Unavailable**.

Step 20 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **20**.

Check whether there are no HSBroker instances in HetuEngine.

Step 21 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 22 Check whether there are no HSBroker instances.

- If yes, click **Add Instance** to add one.
- If no, go to **23**.

Step 23 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **23**.

Check the network connection between HetuEngine and ZooKeeper, HDFS, YARN, DBService, and Hive.

Step 24 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.

Step 25 Click the host name in the **HSBroker** row and record the management IP address in the **Basic Information** area.

Step 26 Log in to the host where HSBroker resides as user **omm** using the IP address obtained in **Step 25**.

Step 27 Run the **ping** command to check whether the network connection between the host where HSBroker resides and the hosts where ZooKeeper, HDFS, Yarn, DBService, and Hive reside is in the normal state.

- If yes, go to **Step 30**.
- If no, go to **Step 28**.

Step 28 Contact the network administrator to restore the network.

Step 29 In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 30**.

Collect fault information.

Step 30 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 31 Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.

Step 32 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 33 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 34 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

9.11.298 ALM-45001 Faulty HetuEngine Compute Instances

Alarm Description

The system checks the HetuEngine compute instance status every 60 seconds. This alarm is generated when a HetuEngine compute instance is faulty.

This alarm is cleared when all faulty HetuEngine compute instances are restored.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45001	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

SQL tasks submitted to the faulty compute instance of HetuEngine will fail.

Possible Causes

- The HDFS service is abnormal.
- The Yarn service is abnormal.
- Yarn queue resources are insufficient.
- The process of compute instances is faulty.
- The number of Worker progresses in the faulty compute instance is 0.

Handling Procedure

Check the HDFS service status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Clear the alarm according to the alarm help in **ALM-14000 HDFS Service Unavailable**.

Step 3 In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check the YARN service status.

Step 4 In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Clear the alarm according to the alarm help in **ALM-18000 YARN Service Unavailable**.

Step 6 In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check the YARN queue resource status.

Step 7 In the alarm list, check whether the "ALM-18022 Insufficient YARN Queue Resources" alarm is generated.

- If yes, go to **8**.
- If no, go to **Step 10**.

Step 8 Clear the alarm according to the alarm help in **ALM-18022 Insufficient YARN Queue Resources**.

Step 9 In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check the HetuEngine compute instance status.

Step 10 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI and choose **Cluster** > **Services > HetuEngine**.

Step 11 In the **Basic Information** area on the **Dashboard** tab page, click the link next to **HSConsole WebUI** to access the HSConsole page.

Step 12 On the compute instance page, check whether any compute instances are in the **FAULT** state.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 13 Check whether there are compute instances with no Worker progress.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 In the **Operation** column of the target compute instance, click **Start** and wait until the instance is started.

Step 15 In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 16**.

Collect fault information.

Step 16 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 17 Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.

Step 18 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 19 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 20 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.299 ALM-45004 Tasks Stacked on HetuEngine Compute Instance

Alarm Description

The system checks the number of running tasks on a HetuEngine compute instance every 30 seconds. This alarm is generated when the number of running tasks is greater than 50.

This alarm is cleared when the number of tasks running on the HetuEngine compute instance is no more than 50.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45004	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Running Queries Backlog	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instance deteriorates and the SQL response becomes slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Tasks Stacked on HetuEngine Compute Instance**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area in the **Dashboard** tab, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resource configured for the compute instance is proper. (The minimum resources are used by default. You can adjust the configuration based on the site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on the site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 End the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.300 ALM-45005 CPU Usage of HetuEngine Compute Instance Exceeded the Threshold

Alarm Description

The system checks the average CPU usage of HetuEngine compute instances every 30 seconds. This alarm is generated when the average CPU usage of the instances is greater than 90%.

This alarm is cleared when the CPU usage of the HetuEngine compute instances is no more than 90%.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45005	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Cpu Usage Exceeds The Threshold	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instances deteriorates and the response to SQL statements becomes slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Tasks Stacked on HetuEngine Compute Instance**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area in the **Dashboard** tab, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resource configured for the compute instance is proper. (The minimum resources are used by default. You can adjust the configuration based on the site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on the site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 End the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

----End

Alarm Clearance

9.11.301 ALM-45006 Memory Usage of a HetuEngine Compute Instance Exceeded the Threshold

Alarm Description

The system checks the memory usage of HetuEngine compute instances every 30 seconds. This alarm is generated when the memory usage of the instance is greater than 80%.

This alarm is cleared when the memory usage of the HetuEngine compute instance is no more than 80%.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45006	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Memory Usage Exceeds The Threshold	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instance deteriorates and the response to service SQL statements becomes slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Tasks Stacked on HetuEngine Compute Instance**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area in the **Dashboard** tab, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resource configured for the compute instance is proper. (The minimum resources are used by default. You can adjust the configuration based on the site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on the site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 End the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M engineers and provide the collected logs.

9.11.302 ALM-45007 Number of Workers of a HetuEngine Compute Instance Is Less Than the Threshold

Alarm Description

The system checks the number of Workers of a HetuEngine compute instance every 60 seconds. This alarm is generated when the number of Workers is less than 80% of the initial value.

This alarm is cleared when the number of Workers running on the HetuEngine compute instance is no less than 80% of the initial value.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45007	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Worker Less Threshold	Specifies the tenant name of the compute instance for which the alarm is generated and how much the threshold is exceeded.

Impact on the System

The performance of the compute instance deteriorates and the SQL response becomes slow.

Possible Causes

- YARN queue resources are insufficient.
- A large number of tasks are running, causing OMM memory overflow on Worker nodes. As a result, the number of Worker nodes decreases.

Handling Procedure

Check whether YARN resource queue resources are sufficient.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **Number of Workers of a HetuEngine Compute Instance Is Less Than the Threshold**, check the **Additional Information** of the alarm, and view and record the tenant name for which the alarm is generated.

Step 3 Click **Tenant Resources**, select the tenant of the compute instance, and check whether the resource quota of the tenant is sufficient.

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Increase the maximum percentage of the tenant's resources based on the actual usage.

Step 5 Wait 5 to 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether there is a large number of running tasks.

Step 6 Choose **Cluster** > **Services** > **HetuEngine**.

Step 7 In the **Basic Information** area on the **Dashboard** tab page, click the link next to **HSConsole Web UI** to access the HSConsole page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 Check whether the number of running tasks exceeds 50.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Reduce the number of jobs submitted at a time or add compute instance resources based on service requirements.

Step 11 Wait 5 to 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.303 ALM-45008 Query Latency of HetuEngine Compute Instances Exceeds the Threshold

Alarm Description

The system checks the query latency of HetuEngine compute instances every 30 seconds. This alarm is generated when the query latency of a HetuEngine compute instance is greater than or equal to 60 seconds.

This alarm is cleared when the query latency is less than 60s.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45008	Warning	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Running Queries Delay	Specifies the tenant name of the compute instance for which the alarm was generated and how much the threshold is exceeded.

Impact on the System

If the query latency of the HetuEngine compute instance exceeds the threshold, the SQL response of the service is slow.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms**. In the right pane, click alarm **Query Latency of HetuEngine Compute Instances Exceeds the Threshold**, and view and record the tenant name in **Additional Information**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area on the **Dashboard** page, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resources configured for the compute instance are proper. (The minimum resources are used by default. You can adjust the configuration based on site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

Step 6 Click **Configure**, add resources to the target compute instance based on site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Stop the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 13 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 15 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Contact O&M personnel and provide the collected logs.

----End

9.11.304 ALM-45009 Task Failure Rate of HetuEngine Compute Instances Exceeds the Threshold

Alarm Description

The system checks the task failure rate of HetuEngine compute instances every 30 seconds. This alarm is generated when the task failure rate of a HetuEngine compute instance is greater than or equal to 50%.

This alarm is cleared when the task failure rate is less than 50%.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45009	Warning	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Task Failure Rate	Specifies the tenant name of the compute instance for which the alarm was generated and how much the threshold is exceeded.

Impact on the System

If the task failure rate of HetuEngine compute instances is too high, service running is adversely affected. You need to locate and rectify the fault in a timely manner.

Possible Causes

- The compute instance specification is too small.
- Large SQL tasks occupy too many compute resources. No resource is available for other tasks, and the compute instance cannot respond quickly. As a result, tasks are stacked.
- The possible causes of SQL execution failures include incorrect syntax, incorrect permissions, and improper parameter settings.

Handling Procedure

Check whether compute instance resources are properly configured.

Step 1 Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI.

Step 2 Choose **O&M** > **Alarm** > **Alarms**. In the right pane, click alarm **Task Failure Rate of HetuEngine Compute Instances Exceeds the Threshold**, and view and record the tenant name in **Additional Information**.

Step 3 Choose **Cluster** > **Services** > HetuEngine. In the **Basic Information** area on the **Dashboard** page, click the link next to **HSConsole Web UI**. The HSConsole page is displayed.

Step 4 On the **Compute Instance** page, click **Configure** in the **Operation** column of the tenant to which the compute instance belongs. Check whether the resources configured for the compute instance are proper. (The minimum resources are used by default. You can adjust the configuration based on site requirements.)

- If yes, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Return to the compute instance list, click **Stop Instances** in the **Operation** column, and stop instances as prompted.

NOTICE

Tasks submitted to the stopped compute instances will be interrupted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Click **Configure**, add resources to the target compute instance based on site requirements, and click **OK**. Click **Start Instances** and start instances as prompted.

Step 7 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are large SQL tasks.

Step 8 On the **Compute Instances** page, expand the instances of the tenant and click **LINK** in the **WebUI** column of a compute instance to view the status of all tasks.

Step 9 In the **Sort** column, select **Execution Time** to sort the running tasks and check whether there are tasks that have been running for hours.

- If yes, go to **Step 10**.
- If no, select all failed tasks in the **Failed** column, collect detailed error information about SQL running in the computing instance, and go to **Step 14**.

Step 10 Stop the tasks that have been running for a long time based on service requirement and optimize the service SQL statements.

Step 11 Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, select all failed tasks in the **Failed** column, collect detailed error information about SQL running in the computing instance, and go to **Step 14**.

Locate the stack where the SQL statement fails to be executed.

Step 12 Choose **Compute Instance**. In the right pane, click **LINK** in the **WebUI** column of the compute instance. On the details page, click **Failed** and select all error types to filter out all failed SQL statements.

Step 13 Click **Query ID** on the left of the SQL statement that reports the error. On the details page, view the error stack information and go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 15 Expand the **Service** drop-down list, select **HetuEngine** for the target cluster, and click **OK**.

Step 16 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 17 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 18 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.305 ALM-45175 Average Time for Calling OBS Metadata APIs Is Greater than the Threshold

Alarm Description

The system checks whether the average duration for calling OBS metadata APIs is greater than the threshold every 30 seconds. This alarm is generated when the number of consecutive times that the average time exceeds the specified threshold is greater than the number of smoothing times.

This alarm is automatically cleared when the average duration for calling the OBS metadata APIs is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45175	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the average time for calling the OBS metadata APIs exceeds the threshold, the upper-layer big data computing services may be affected. To be more specific, the execution time of some computing tasks will exceed the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

Frame freezing occurs on the OBS server, or the network between the OBS client and the OBS server is unstable.

Handling Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Average Time for Calling the OBS Metadata API Exceeds the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Average time of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Average Time for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.306 ALM-45176 Success Rate of Calling OBS Metadata APIs Is Lower than the Threshold

Alarm Description

The system checks whether the success rate of calling OBS metadata APIs is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45176	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS metadata APIs is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Handling Procedure

Check the heap memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Metadata API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.307 ALM-45177 Success Rate of Calling OBS Data Read APIs Is Lower than the Threshold

Alarm Description

The system checks whether the success rate of calling APIs for reading OBS data is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is automatically cleared when the success rate of calling APIs for reading OBS data is greater than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45177	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the success rate of calling the OBS APIs for reading data is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

Possible Causes

An execution exception or severe timeout occurs on the OBS server.

Handling Procedure

Check the heap memory usage.

Step 1 On the **FusionInsight Manager** homepage, choose **O&M** > **Alarm** > **Alarms** > **Success Rate for Calling the OBS Data Read API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Services** > **meta** > **Instance** > **meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS data read operation interface calls** from **OBS data read operation**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Success Rate for Calling the OBS Data Read API**. Increase the threshold or smoothing times as required.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.309 ALM-45179 Number of Failed OBS readFully API Calls Exceeds the Threshold

Alarm Description

The system checks whether the number of failed OBS readFully API calls exceeds the threshold every 30 seconds. This alarm is generated when the number of failed API calls exceeds the threshold.

This alarm is automatically cleared when the number of failed OBS readFully API calls is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45179	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Certain upper-layer big data computing tasks will fail to execute.

Possible Causes

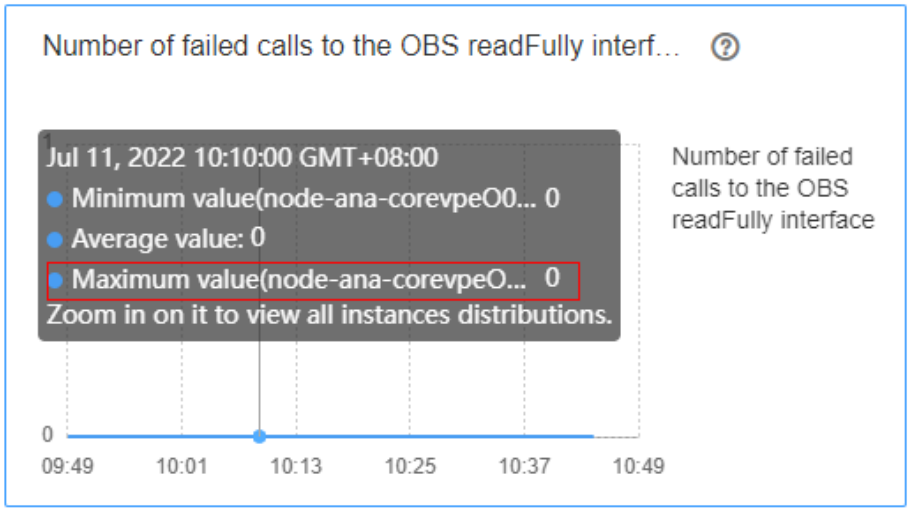
An execution exception or severe timeout occurs on the OBS server.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds**. On the **Thresholds** page, choose **meta** > **Number of failed calls to the OBS readFully interface**. In the right pane, set **Threshold** or **Trigger Count** to a larger value as required.

Step 2 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.



Step 3 Contact OBS O&M personnel to check whether the OBS service is normal.

- If yes, go to **Step 4**.
- If no, contact OBS O&M personnel to restore the OBS service.

Collect fault information.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **meta**. On the page that is displayed, click the **Chart** tab. On this tab page, select **OBS data read operation** in the **Chart Category** area. In the **Number of failed calls to the OBS readFully interface-All Instances** chart, view the host name of the instance that has the maximum number of failed OBS readFully API calls. For example, the host name is **node-ana-corevpeO003**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Choose **O&M** > **Log** > **Download** and select **meta** and **meta** under it for **Service**.

Step 6 Select the host obtained in **Step 4** for **Hosts**.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

9.11.312 ALM-45182 Number of Throttled OBS Operations Exceeds the Threshold

Alarm Description

The system checks whether the number of throttled OBS operations exceeds the threshold every 30 seconds. This alarm is generated when the number of throttled OBS operations exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is automatically cleared when the number of throttled OBS operations is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45182	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Certain upper-layer big data computing tasks will fail to execute.

Possible Causes

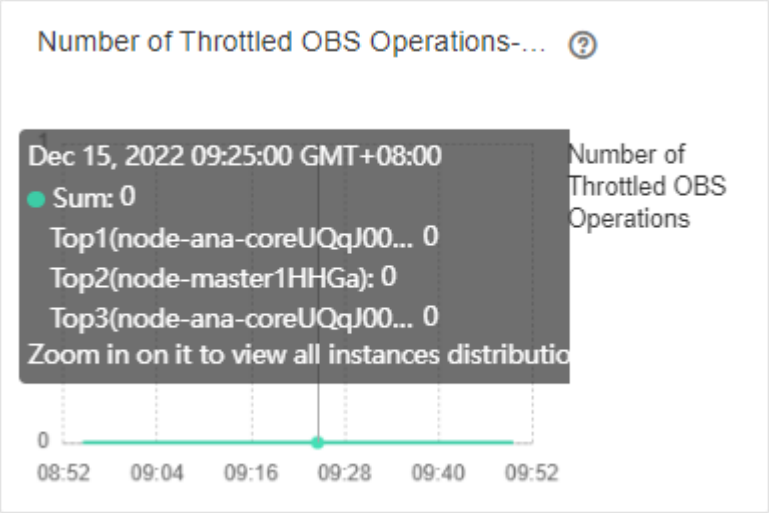
The frequency of requesting OBS APIs is too high.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Thresholds**. On the **Thresholds** page, choose **meta** > **Number of Throttled OBS Operations**. In the right pane, set **Threshold** or **Trigger Count** to a larger value as required.

Step 2 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.



Step 3 Contact OBS O&M personnel to check whether the OBS service is normal.

- If yes, go to **Step 4**.
- If no, contact OBS O&M personnel to restore the OBS service.

9.11.313 ALM-45275 Ranger Service Unavailable

Alarm Description

The alarm module checks the Ranger service status every 180 seconds. This alarm is generated if the Ranger service is abnormal.

This alarm is cleared after the Ranger service recovers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45275	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

When the Ranger service is unavailable, Ranger cannot work properly and the native Ranger UI cannot be accessed.

Possible Causes

- The DBService service on which Ranger depends is abnormal.
- The RangerAdmin role instance is abnormal.

Handling Procedure

Check the DBService process status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, check whether the ALM-27001 DBService Service Unavailable alarm is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Rectify the DBService service fault by following the handling procedure of **ALM-27001 DBService Service Unavailable**. After the DBService alarm is cleared, check whether the "Ranger Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check all RangerAdmin instances.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Log in to the node where the RangerAdmin instance is located as user **omm** and run the **ps -ef|grep "proc_rangeradmin"** command to check whether the RangerAdmin process exists on the current node.

- If yes, go to **Step 5**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 4**.

> **NOTICE**
>
> During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Step 4 In the alarm list, check whether the alarm "Ranger Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

Related Information

None

9.11.314 ALM-45276 Abnormal RangerAdmin Status

Alarm Description

The alarm module checks the RangerAdmin service status every 60 seconds. This alarm is generated if RangerAdmin is unavailable.

This alarm is automatically cleared after the RangerAdmin service recovers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45276	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Role for which the alarm is generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

If the status of a RangerAdmin is abnormal, access to the Ranger native UI is not affected. If there are two abnormal RangerAdmin instances, the Ranger native UI cannot be accessed and operations such as creating, modifying, and deleting policies are unavailable.

Possible Causes

The RangerAdmin port is not started.

Handling Procedure

Check the port process.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated.

Step 2 Log in to the node where the faulty RangerAdmin instance is located as user **root**.

Switch to user **omm**:

```
su - omm
```

Run the following command to obtain the PID of the RangerAdmin process:

```
ps -ef|grep "proc_rangeradmin" | grep -v grep | awk -F ' ' '{print $2}'
```

Run the following command to check whether the RangerAdmin process monitors the port (21401 for a cluster in security mode and 21400 for a cluster in normal mode):

```
netstat -anp | grep Process ID | grep LISTEN
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 3**.

> **NOTICE**
>
> During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Step 3 In the alarm list, check whether the "Abnormal RangerAdmin Status" alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect the fault information.

Step 4 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

9.11.315 ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the RangerAdmin instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45277	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the RangerAdmin instance is high or the heap memory is improperly allocated.

Handling Procedure

Check the heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by RangerAdmin reaches the threshold (95% of the maximum heap memory by default).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.316 ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the direct memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the direct memory usage of RangerAdmin is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45278	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the RangerAdmin instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Handling Procedure

Check the direct memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by RangerAdmin reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for RangerAdmin cannot meet the direct memory required by the RangerAdmin process. You are advised to check the direct memory usage of RangerAdmin and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by RangerAdmin. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

9.11.317 ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the non-heap memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45279	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The non-heap memory usage of the RangerAdmin instance is high or the non-heap memory is improperly allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **RangerAdmin Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by RangerAdmin reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the RangerAdmin instance cannot meet the non-heap memory required by the RangerAdmin process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to the twice of the current non-heap memory usage or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.318 ALM-45280 RangerAdmin GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the RangerAdmin process every 60 seconds. This alarm is generated when the GC duration of the RangerAdmin process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45280	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The RangerAdmin responds slowly.

Possible Causes

The heap memory of the RangerAdmin instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45280 RangerAdmin GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **RangerAdmin GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the RangerAdmin process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **RangerAdmin** > **Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

9.11.319 ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the UserSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45281	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory usage of the UserSync instance is high or the heap memory is improperly allocated.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **UserSync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by UserSync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

9.11.320 ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the UserSync service every 60 seconds. This alarm is generated when the direct memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the UserSync direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45282	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the UserSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm. Check the name of the instance host for which the alarm is generated.

Step 2 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Ranger** > **Instances**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the **Chart** area and choose **Customize** > **CPU and Memory** > **UserSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the UserSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On the FusionInsight Manager homepage, choose **Cluster** > **Services** > **Ranger** > **Instances** > **UserSync** > **Instance Configuration**. Click **All Configurations**, and choose **UserSync** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on service requirements and save the configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If this alarm is generated, the direct memory configured for UserSync cannot meet the direct memory required by the UserSync process. Check the direct memory usage of UserSync and change the value of -XX:MaxDirectMemorySize in GC_OPTS to the twice of the direct memory used by UserSync. You can change the value based on service requirements. For details, see Step 2.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

> **NOTICE**
>
> During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 9 Send the collected fault logs to O&M personnel for help.

9.11.324 ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the TagSync service every 60 seconds. This alarm is generated when the direct memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the TagSync direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45286	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the TagSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the direct memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the TagSync reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TagSync cannot meet the direct memory required by the TagSync process. You are advised to check the direct memory usage of TagSync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TagSync. You can change the value based on the actual service scenario. For details, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45287	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The non-heap memory of the TagSync process is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TagSync Non Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by TagSync reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TagSync instance cannot meet the non-heap memory required by the TagSync process. You are advised to change the **-XX:MaxPermSize** value of **GC_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.326 ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold

Alarm Description

The system checks the GC duration of the TagSync process every 60 seconds. This alarm is generated when the GC duration of the TagSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45288	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

TagSync responds slowly.

Possible Causes

The heap memory of the TagSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45288 TagSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **TagSync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the TagSync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **TagSync** > **Instance Configuration**. Click **All Configurations** and choose **TagSync** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter based on the site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect the fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.327 ALM-45289 PolicySync Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the PolicySync service every 60 seconds. This alarm is generated when the heap memory usage of the PolicySync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45289	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Heap memory overflow may cause service breakdown.

Possible Causes

The heap memory of the PolicySync instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45289 PolicySync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **PolicySync Heap Memory Usage**. Click **OK**.

Step 3 Check whether the heap memory used by PolicySync reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for PolicySync cannot meet the heap memory required by the PolicySync process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by PolicySync. You can change the value based on the actual service scenario. Refer to **Step 2** to view the PolicySync heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.328 ALM-45290 PolicySync Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the PolicySync service every 60 seconds. This alarm is generated when the direct memory usage of the PolicySync instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the PolicySync direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45290	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service breakdown.

Possible Causes

The direct memory of the PolicySync process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45290 PolicySync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **PolicySync Direct Memory Usage**. Click **OK**.

Step 3 Check whether the direct memory used by the PolicySync reaches the threshold (90% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If this alarm is generated, the direct memory configured for PolicySync cannot meet the requirements of the PolicySync process. You are advised to check the direct memory usage of PolicySync and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to twice (depending on the actual scenario) of the direct memory used by PolicySync. For how to view the PolicySync direct memory usage, see **Step 2**.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.329 ALM-45291 PolicySync Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the non-heap memory usage of the PolicySync service every 60 seconds. This alarm is generated when the non-heap memory usage of the PolicySync instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45291	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Non-heap memory overflow may cause service breakdown.

Possible Causes

The non-heap memory of the PolicySync instance is overused or the non-heap memory is inappropriately allocated.

Handling Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45291 PolicySync Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **PolicySync Non-Heap Memory Usage**. Click **OK**.

Step 3 Check whether the non-heap memory used by PolicySync reaches the threshold (90% of the maximum heap memory by default).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the PolicySync instance cannot meet the non-heap memory required by the PolicySync process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to twice that of the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.330 ALM-45292 PolicySync GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the PolicySync process every 60 seconds. This alarm is generated when the GC duration of the PolicySync process exceeds

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the threshold for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45292	Critical (default threshold: 20,000 ms) Major (default threshold: 12,000 ms)	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

PolicySync responds slowly.

Possible Causes

The heap memory of the PolicySync process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45292 PolicySync GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**. Select the role corresponding to the host name of the instance for which the alarm is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **PolicySync GC Duration**. Click **OK**.

Step 3 Check whether the GC duration of the PolicySync process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance** > **PolicySync**. Click **Instance Configuration** and then **All Configurations**, and choose **PolicySync** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for PolicySync cannot meet the heap memory required by the PolicySync process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by PolicySync. You can change the value based on the actual service scenario. Refer to **Step 2** to view the PolicySync heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.331 ALM-45293 Ranger User Synchronization Exception

Alarm Description

The system checks synchronization status of the UserSync process every 5 minutes. This alarm is generated when a synchronization exception occurs. This alarm is cleared when user synchronization becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45293	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the trigger condition, that is, an exception occurs during Ranger user synchronization.

Impact on the System

Unsynchronized users cannot access the native Ranger page and set permission policies for other users. As a result, some users may fail to access services that require Ranger permissions.

Possible Causes

The RangerAdmin instance is abnormal.

The UserSync instance is abnormal.

The LDAP service is abnormal.

Handling Procedure

Check whether the UserSync is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45293 Ranger User Synchronization Exception**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger** > **Instance**, select the UserSync instance on the host for which the alarm is generated, and check whether the instance status is abnormal.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **Ranger**, click **Instances**, and click **UserSync**. On the displayed page, click **More** > **Restart Instance**, or restart the Ranger service.

Step 4 Check whether the alarm is cleared in 5 to 10 minutes.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the RangerAdmin is abnormal.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** to check whether alarm "ALM-45275 Ranger Service Unavailable" is reported.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Rectify the fault by following the handling procedure of "ALM-45275 Ranger Service Unavailable".

Step 7 Check whether the alarm is cleared in 5 to 10 minutes.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the LDAP service is abnormal.

Step 8 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** to check whether alarm "ALM-25000 LdapServer Service Unavailable" is reported.

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Clear the alarm according to the handling procedure of "ALM-25000 LdapServer Service Unavailable".

Step 10 Check whether the alarm is cleared in 5 to 10 minutes.

- If yes, no further action is required.
- If no, go to **Step 11**.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.332 ALM-45294 RangerKMS Process Is Abnormal

Alarm Description

The RangerKMS process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45294	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the alarm triggering condition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

Handling Procedure

Check whether the process is in the D, Z, or T state.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in **Step 2**.

Step 2 Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

Step 3 Run the following command to check the process state:

ps ww -eo stat,cmd| grep -w Dproc_rangerkms | grep -v grep | awk '{print$1}'

Step 4 Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to **Step 5**.
- If the output does not contain abnormal states, go to **Step 7**.

Step 5 Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **Ranger** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.333 ALM-45425 ClickHouse Service Unavailable

Alarm Description

The alarm module checks the ClickHouse instance status every 60 seconds. This alarm is generated when the alarm module detects that all ClickHouse instances are abnormal.

This alarm is cleared when the system detects that any ClickHouse instance is restored and the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45425	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The ClickHouse service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the ClickHouse service. The ClickHouse service function is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The configuration information in the **metrika.xml** file in the component configuration directory of the faulty ClickHouse instance node is inconsistent with that of the corresponding ClickHouse instance in the ZooKeeper.

Handling Procedure

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**, and locate the abnormal ClickHouse instance based on the alarm information.

- If yes, go to **Step 2**.
- If no, go to **Step 9**.

Step 2 Log in to the host where the ClickHouse service is abnormal and ping the IP address of another normal ClickHouse instance node to check whether the network connection is normal.

- If yes, go to **Step 3**.
- If no, contact the network administrator to repair the network.

Step 3 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Run the following command to query the value of **macros.id**:

select substitution from system.macros where macro='id';

Step 4 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *Service IP address of the node where the ZooKeeper role instance is located*:*client port*

Step 5 Run the following command to check whether the ClickHouse cluster topology information can be obtained.

get /clickhouse/config/*value of* ***macros.id*** *in* **Step 3**/**metrika.xml**

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 Log in to the host where the ClickHouse instance is abnormal and go to the configuration directory of the ClickHouse instance.

cd ${BIGDATA_HOME}**/FusionInsight_ClickHouse_***Version***/**x_x_**ClickHouseServer/etc**

cat metrika.xml

Step 7 Check whether the cluster topology information on ZooKeeper obtained in **Step 5** is the same as that in the **metrika.xml** file in the component configuration directory in **Step 6**.

- If yes, check whether the alarm is cleared. If the alarm persists, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. Then, check whether the service status is normal and whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect the fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 11 Choose the corresponding host form the host list.

Step 12 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.334 ALM-45426 ClickHouse Service Quantity Quota Usage in ZooKeeper Exceeds the Threshold

Alarm Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45426	Major (default)	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the number of znodes may exceed the configured threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

Handling Procedure

Check the number of znodes created by ClickHouse on ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *service IP address of the node where the ZooKeeper role instance locates*:*client port*

Step 2 Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

If the preceding information indicates that the quota configuration is incorrect, go to **Step 3**.

If no, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to **Step 1**.

Step 5 Run the following command and check whether the ratio of the **count** value of **Output stat** to the **count** value of **Output quota** in the command output is greater than **0.9**:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **count** value of **Output stat** is **2667**, and the **count** value of **Output quota** is **200000**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 6**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**. Click **Configurations** and then **All Configurations**. Search for **clickhouse.zookeeper.quota.node.count**, set it to a value twice the **count** of **Output stat** in **Step 5**. **Do not use a value larger than 6000000. Otherwise, there will be high risks. Exercise caution when setting this parameter.**

Step 7 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

NOTICE

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

Collect the fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 10 Choose the corresponding host form the host list.

Step 11 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.335 ALM-45427 ClickHouse Service Capacity Quota Usage in ZooKeeper Exceeds the Threshold

Alarm Description

The alarm module checks the quota usage of the ClickHouse service in the ZooKeeper every 60 seconds. This alarm is generated when the alarm module detects that the usage exceeds the threshold (90%).

This alarm is cleared when the system detects that the usage is lower than the threshold and the alarm is cleared.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45427	Major (default)	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

After the ZooKeeper quantity quota of the ClickHouse service exceeds the threshold, you cannot perform cluster operations on the ClickHouse service on FusionInsight Manager. As a result, the ClickHouse service cannot be used.

Possible Causes

- When table data is created, inserted, or deleted, the ClickHouse creates znodes on ZooKeeper nodes. As the service volume increases, the capacity of znodes may exceed the configured threshold.
- No quota limit is set for the metadata directory **/clickhouse** of ClickHouse in ZooKeeper.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the znode capacity of the ClickHouse in the ZooKeeper.

Step 1 Log in to the host where the ZooKeeper client is located and log in to the ZooKeeper client.

Switch to the client installation directory.

Example: **cd /opt/client**

Run the following command to configure environment variables:

source bigdata_env

Run the following command to authenticate the user (skip this step in common mode):

kinit *Component service user*

Run the following command to log in to the client tool:

zkCli.sh -server *Service IP address of the node where the ZooKeeper role instance is located*:*client port*

Step 2 Run the following command to check the quota used by the ClickHouse in the ZooKeeper and check whether the quota information is correctly set:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Quota for path /clickhouse does not exist.
```

- If the preceding information indicates that the quota configuration is incorrect, go to **Step 3**.
- If not, go to **Step 5**.

Step 3 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click **Configurations** and click **All Configurations**. On this sub-tab page, search for **quotas.auto.check.enable** to check whether its value is **true**.

If the value is not **true**, change the value to **true** and click **Save**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **More**, and select **Synchronize Configuration**. After the synchronization is successful, go to **Step 1**.

Step 5 Run the following command and check whether the ratio of the **bytes** value of **Output stat** to the **bytes** value of **Output quota** in the command output is greater than **0.9**:

listquota /clickhouse

```
absolute path is /zookeeper/quota/clickhouse
Output quota for /clickhouse count=200000,bytes=1000000000
Output stat for /clickhouse count=2667,bytes=60063
```

In the preceding information, the **bytes** value of **Output stat** is **60063**, and the **bytes** value of **Output quota** is **1000000000**.

- If yes, go to **Step 6**.
- If no, check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**. Click **Configurations** and then **All Configurations**. Search for **clickhouse.zookeeper.quota.size**, set it to a value twice the **bytes** of **Output stat** in **Step 5**. **Do not use a value larger than 6000000. Otherwise, there will be high risks. Exercise caution when setting this parameter.**

Step 7 Restart the ClickHouse instance for which the alarm is generated, and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, perform **Step 6** again, and check whether the alarm is cleared 5 minutes later. If the alarm persists, go to **Step 8**.

NOTICE

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 10 Choose the corresponding host form the host list.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

9.11.336 ALM-45428 ClickHouse Disk I/O Exception

Alarm Description

This alarm is generated when the alarm module detects EIO or EROFS errors during ClickHouse read and write every 60 seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45428	Major (default)	No

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

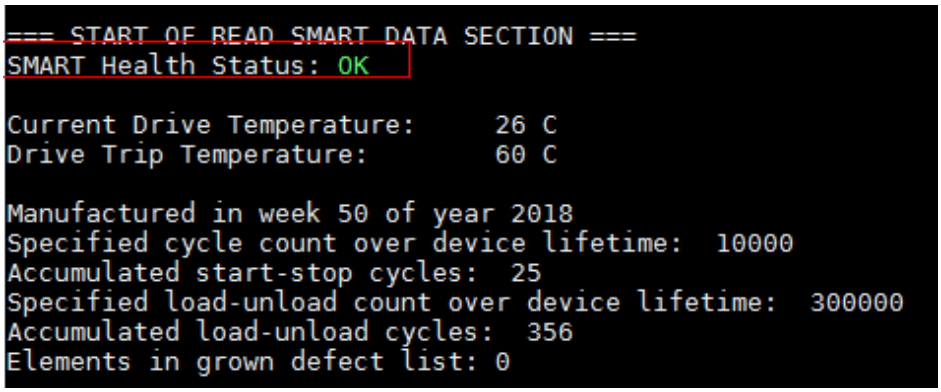
- ClickHouse fails to read and write data. The INSERT, SELECT, and CREATE operations on the local tables may be abnormal. Distributed tables are not affected.
- Services are affected, and I/Os fail.

Possible Causes

The disk is aged or has bad sectors.

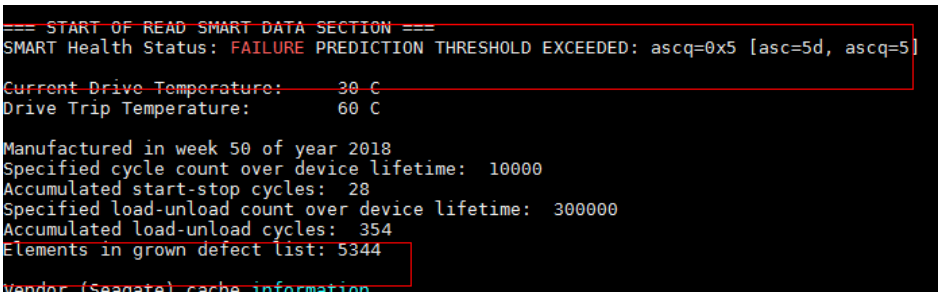
Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45428 ClickHouse Disk I/O Exception**. Check the role name and the IP address of the host where the alarm is generated in **Location**.



Step 2 Use PuTTY to log in to the node for which the fault is generated as user **root**.

Step 3 Run the **df -h** command to check the mount directory and find the disk mounted to the faulty directory.



Step 4 Run the **smartctl -a /dev/sd***Faulty disk* command to check the disk. In the command, *Faulty disk* indicates the disk obtained in **Step 3**.

- If **SMART Health Status: OK** is displayed, as shown in the following figure, the disk is healthy. In this case, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the number following **Elements in grown defect list** is not 0, as shown in the following figure, the disk may have bad sectors. If **SMART Health Status: FAILURE** is displayed, the disk is in the sub-health state. In this case, contact O&M personnel.

Step 5 After the fault is rectified, manually clear the alarm on FusionInsight Manager and check whether the alarm is generated again during the periodic check.

- If yes, go to **Step 6**.
- If no, no further action is required.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Choose the corresponding host form the host list.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

If the alarm has no impact, manually clear the alarm.

9.11.337 ALM-45429 Table Metadata Synchronization Failed on the Added ClickHouse Node

NOTE

This section applies only to MRS 3.1.2 or later.

Alarm Description

This alarm is generated when the local table corresponding to the distributed table fails to be created during ClickHouse capacity expansion.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45429	Major	No

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The distributed table fails to be queried.

Possible Causes

A node is stopped or faulty during capacity expansion.

Handling Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**.

Step 2 Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 4**.

Step 3 Start the instance or rectify the instance fault until all instances are running properly.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm and the faulty host based on the location information.

Step 5 Log in to the faulty host as user **omm**.

Step 6 Run the following commands to initialize environment variables:

source *Cluster installation directory*/**FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/ENV_VARS**

source *Cluster installation directory*/**FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/clickhouse-env.sh**

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}

Step 7 Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

sh *Cluster installation directory*/**FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true**

Step 8 Run the following command to view the log information and check whether the metadata has been synchronized:

vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log

- If the synchronization is complete, go to **Step 9**.
- If the synchronization fails, go to **Step 10**.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

Step 12 Choose the corresponding host form the host list.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm needs to be manually cleared after the fault is rectified.

9.11.338 ALM-45430 Permission Metadata Synchronization Failed on the Added ClickHouse Node

NOTE

This section applies only to MRS 3.1.2 or later.

Alarm Description

This alarm is generated when user and permission information fails to be synchronized during ClickHouse capacity expansion.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45430	Major	No

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The created user does not have operation permissions on the node.

Possible Causes

A node is stopped or faulty during capacity expansion.

Handling Procedure

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Check whether an instance is stopped, decommissioned, or faulty.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Start the instance or rectify the instance fault until all instances are running properly.

Step 4 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm and the faulty host based on the location information.

Step 5 Log in to the faulty host as user **omm**.

Step 6 Run the following commands to initialize environment variables:

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/ENV_VARS

source ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc/clickhouse-env.sh

export CLICKHOUSE_CONF_DIR=${CLICKHOUSE_CONF_DIR}

Step 7 Run the following command to run the metadata synchronization tool to synchronize metadata from the existing node to the faulty node:

sh ${BIGDATA_HOME}/FusionInsight_ClickHouse_*/install/FusionInsight-ClickHouse-*/clickhouse/sbin/clickhouse-create-meta.sh true

Step 8 Run the following command to view the log information and check whether the metadata has been synchronized:

vim /var/log/Bigdata/clickhouse/clickhouseServer/start.log

If the synchronization is complete, go to **Step 9**.

If the synchronization fails, go to **Step 10**.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the **Alarm ID** column, locate the corresponding alarm and click **Clear** in the **Operation** column. In the displayed dialog box, click **OK** to manually clear the alarm.

Collect the fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **ClickHouse** for the target cluster, and click **OK**.

Step 12 Choose the corresponding host form the host list.

Step 13 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 14 Send the collected fault logs to O&M personnel for help.

----End

9.11.339 ALM-45431 Improper ClickHouse Instance Distribution for Topology Allocation

Alarm Description

The ClickHouseServer instance distribution does not meet the topology allocation requirements.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45431	Critical	No

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Some ClickHouseServer instances are unavailable.

Possible Causes

During installation or capacity expansion, the number of instances or allocation mode does not meet the topology requirements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, locate the row that contains the alarm, and analyze the cause based on **Location** and **Additional Information**.

Step 2 Handle the alarm based on the additional alarm information and handling method in the following table.

Additional Information	Remarks	Handling Method
n ClickHouseServer instances should be added to other AZ.	This alarm is generated when a single cluster is deployed in cross-AZ DR mode. The ClickHouseServer instance deployment does not meet the cross-AZ DR topology allocation requirements. As a result, some instances cannot work properly.	1. On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click the **Instance** tab, locate the row that contains the alarm, view the host name in **Location**, and find the AZ for which the alarm is generated in the AZ column based on the host name. 2. On the **Instance** page, click **Add Instance** to add *n* ClickHouseServer instances to other AZs except the AZ where the alarm is generated.
n ClickHouseServer instances should be added.	This alarm is generated when a non-single-cluster is deployed in the default deployment mode of cross-AZ DR. The number of ClickHouseServer instances in the cluster is less than an even number. As a result, some instances cannot work properly.	1. Determine the number (*n*) of ClickHouseServer instances to be added based on the alarm information. 2. On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click the **Instance** tab, and add *n* ClickHouseServer instances to the cluster.

9.11.340 ALM-45432 ClickHouse User Synchronization Process Fails

Alarm Description

The system checks the status of the ClickHouse user role synchronization process every 5 minutes. This alarm is generated when the system detects that the ClickHouse user role synchronization process is faulty or the user role synchronization fails.

This alarm is automatically cleared when the ClickHouse user role synchronization process or function becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45432	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Some ClickHouseServer instances are unavailable.

Possible Causes

- The ClickHouse user role synchronization process is not started properly or exits abnormally.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The ClickHouse user role synchronization process fails to synchronize user role information because the LdapServer service is faulty.

Handling Procedure

Check whether the ClickHouse user role synchronization process is normal.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, search for **ALM-45432 ClickHouse User Synchronization Process Fails**.

Step 2 Check the host name and additional information in the alarm details.

- If the additional information is "Process clickhouse-ugsync is not exit.", go to **Step 3**.
- If the additional information is "Process clickhouse-ugsync sync user failed.", go to **Step 6**.

Step 3 Log in to the faulty host as user **omm** and run the following command to check whether the ClickHouse user role synchronization process is normal:

ps -ef | grep 'clickhouse-ugsync'

Abnormal result of the synchronization process:

```
[omm@server-2110081635-0001 ~]$ ps -ef | grep 'clickhouse-ugsync'
omm      20104 13146  0 15:57 pts/7    00:00:00 grep --color=auto clickhouse-ugsync
```

- If yes, the alarm is automatically cleared. If the alarm is cleared, no further action is required. If the alarm persists, go to **Step 8**.
- If no, go to **Step 4**.

Step 4 Log in to the faulty host as user **omm** and run the following command to check whether the crontab daemon task is correctly configured:

crontab -l

Normal setting of the crontab daemon task:

```
*/5 * * * * bash /xxxxx/clickhouse_ugsync_check.sh >/dev/null 2>&1
```

- If yes, check whether the alarm is cleared 5 minutes later. If the alarm is cleared, no further action is required. If the alarm persists, go to **Step 8**.
- If no, go to **Step 5**.

Step 5 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**. On the page that is displayed, click the **Instance** tab. On this tab page, find the abnormal ClickHouseServer instance based on the fault information, and restart it. Wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the LdapServer service is normal.

Step 6 Log in to FusionInsight Manager, choose **Cluster** > **Services**, and check whether **Running Status** of LdapServer is **Normal**.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 7 Handle the LdapServer service unavailable alarm according to ALM-25000 LdapServer Service Unavailable.

After **Running Status** of LdapServer becomes **Normal**, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 9 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **ClickHouse** for the target cluster.

Step 10 Expand the **Hosts** list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.341 ALM-45433 ClickHouse AZ Topology Exception

Alarm Description

If the cross-AZ HA function is enabled for a cluster where ClickHouse has been deployed, the ClickHouse topology remains unchanged. This alarm is generated when the cross-AZ HA does not take effect if backup nodes of the same shard are in the same AZ.

This alarm is automatically cleared when the system detects that all shards meet the cross-AZ HA deployment requirements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45433	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The current deployment of the ClickHouse service does not support cross-AZ HA.

Possible Causes

After cross-AZ HA is enabled, all backup nodes of a shard are in the same AZ.

Handling Procedure

Modify the AZ of backup nodes.

Step 1 Log in to the node where the client is installed as the client installation user. Run the following command to switch to the client installation directory:

cd *{Client installation path}*

Step 2 Run the following command to configure environment variables:

source bigdata_env

Step 3 Run the following command to authenticate the user (skip this step in normal mode):

kinit *Component service user*

Step 4 Run the following command to log in to the client tool:

zkCli.sh -server *Service IP address of the node where the ZooKeeper instance resides*:*Client port*

Step 5 Run the following command to view the current topology:

get /clickhouse/topo

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> If the ClickHouse is installed with multiple services, run the **get /clickhouse{-n}/topo** command. For example, if the ClickHouse-1 is installed, run the **get /clickhouse-1/topo** command.

```
[zk: 192.168.20.36:24002(CONNECTED) 0] get /clickhouse/topo

<topo>
 <mcluster>
  <shard id="14" index="1">
   <server id="15">
    <replica>1</replica>
    <az>AZ1</az>
    <host>192-168-20-205</host>
    <port>21427</port>
   </server>
   <server id="16">
    <replica>2</replica>
    <az>AZ1</az>
    <host>192-168-20-2205</host>
    <port>21427</port>
   </server>
  </shard>
 </mcluster>
</topo>
```

Step 6 Select a host from the desired shard and deploy the host in another AZ.

Step 7 Log in to FusionInsight Manager, click **Host**, select the host you have deployed in **Step 6** and choose **More** > **Reinstall** to reinstall the host.

Step 8 Choose **Cluster** > **Cross-AZ HA**, click **Configure AZ and Policy** and change the AZ information of the reinstalled host to the AZ planned in the **Step 6**.

Step 9 Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 11 Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **ClickHouseServer** for the target cluster.

Step 12 Expand the **Hosts** list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 13 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.342 ALM-45434 A Single Replica Exists in the ClickHouse Data Table

Description

This alarm is generated when a single replica is detected in a custom logical cluster after the custom logical cluster is enabled for ClickHouse.

This alarm is automatically cleared when the system detects that the custom logical cluster uses multiple replicas.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45434	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If a hardware fault occurs, data cannot be restored.

Possible Causes

The **metrika.xml** file in the ClickHouse configuration directory contains single-replica configuration.

Procedure

Check whether the configuration in metrika.xml of the ClickHouse instance is correct.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click ⌄ to view the name of the host for which the alarm is generated. On the **Hosts** page, view the host IP address based on the host name.

Step 2 Log in to the host where the ClickHouse instance is abnormal, go to the configuration directory of the ClickHouse instance, and run the following commands:

cd ${BIGDATA_HOME}**/FusionInsight_ClickHouse_***Version***/**x_x_**ClickHouseServer/etc**

cat metrika.xml

Step 3 View the number of shards in each custom logical cluster and check that a single replica exists. Then, go to **Step 4**.

NOTE

If a shard contains only one node, a single replica exists in a logical cluster, as shown in the following:

```
<shard>
 <internal_replication>true</internal_replication>
 <replica>
  <host>host-name1</host>
  <port>port</port>
  <user>clickhouse</user>
  <password/>
 </replica>
</shard>
```

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.11.343 ALM-45435 Inconsistent Metadata of ClickHouse Tables

Alarm Description

This alarm is generated when the metadata in a distributed table or in the local table of the distributed table has been inconsistent for 180 min.

This alarm is automatically cleared when the metadata in the distributed table or in the local table of the distributed table becomes consistent.

Metadata consistency includes:

- Consistent quantity, name, sequence, and type of each column in the table
- Consistent partition keys
- Consistent sorting keys
- Consistent primary keys
- Consistent sampling keys

NOTE

If this alarm exists, table metadata is inconsistent in the ClickHouse cluster to which the current node belongs. The inconsistency may be caused by multiple reasons, not limited to those mentioned in additional information.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45435	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Table	Specifies the database name and table name for which the alarm is generated.

Impact on the System

Subsequent operations such as INSERT and ALTER on the table may fail.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

Table metadata modification fails or is not executed on one or more ClickHouseServer nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Check whether any task is being executed for the table to which the alarm is generated.

Run the following command to check whether any SQL task is being executed:

select * from system.processes where current_database='*Database name***' and query like '%***Table name***%'**

Run the following command to check whether a mutation task is being executed:

select * from system.mutations where database=*'Database name'* **and table=***'Table name'***;**

- If the query result is empty, go to **Step 4**.
- If the query result contains error information, rectify the fault accordingly. If the fault cannot be rectified based on the error information, go to **Step 6**.
- If the query result contains information about an on-going task with no error, the SQL/mutation task is being executed.

  Wait for 5 minutes. If the alarm is cleared, no further action is required. If the alarm persists, go to **Step 4**.

Step 4 Modify the table structure, delete a table, or add a table based on service requirements until the table metadata of all nodes in the cluster is consistent. After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 If the table has been deleted, manually clear the alarm and check whether the alarm is reported again.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 6**.
- If no, no further action is required.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.344 ALM-45436 Skew ClickHouse Table Data

Alarm Description

This alarm is generated when data skew occurs in the local table of a distributed table between ClickHouse nodes. This alarm is automatically cleared when data becomes balanced.

Data skew check method:

- If **min_table_check_data_bytes** is set to **0**, data skew check is disabled.
- If **min_table_check_data_bytes** is greater than **0**, data skew check is enabled.

After data skew check is enabled, if the data volume in a table is less than the **min_table_check_data_bytes** value, no alarm will be reported due to data skew. When the data volume is greater than the **min_table_check_data_bytes** value and the data volume difference between the same table on different nodes is greater than the percentage specified in **min_table_data_varies_rate**, data skew occurs and this alarm is reported.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45436	Minor	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Table	Specifies the database name and table name for which the alarm is generated.

Impact on the System

SQL execution efficiency may be lowered.

Possible Causes

The data write policy is improper, causing unbalanced data among nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- Security mode (with Kerberos enabled):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- Normal mode (with Kerberos disabled):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 View data distribution.

select FQDN(), database, table, sum(data_compressed_bytes) from clusterAllReplicas(*Name of the logical cluster***, system.parts) where database='***Database name***' and table='***Table name***' and active=1 group by (FQDN(), database, table);**

Step 4 Balance data with a few clicks or migrate data based on service requirements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.345 ALM-45437 Excessive Parts in the ClickHouse Table

Alarm Description

This alarm is generated when the number of parts exceeds the threshold specified by **part_num_threshold**.

This alarm is automatically cleared when the number of parts is less than the **part_num_threshold** value.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45437	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Table	Specifies the database name and table name for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Service errors may occur.

Possible Causes

The data distribution in the ClickHouse table is improper, or the background merge task is executed slowly.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- Security mode (with Kerberos enabled):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- Normal mode (with Kerberos disabled):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Run the following command to manually merge parts:

optimize table *Database name*.*Table name* **final;**

Step 4 Check whether the number of parts has decreased.

select FQDN(), database, table, count(1) from clusterAllReplicas(default_cluster, system.parts) where database='*Database name***' and table='***Table name***' and active=1 group by (FQDN(), database, table);**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. If the number of parts is less than the threshold, wait for 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5**.
2. If the number of parts does not decrease, check whether the partition key of the table is set properly. If the number of partitions is too large, rectify the service logic.
3. If the command output is empty, the table does not exist. This alarm is a historical alarm and can be ignored. Manually clear it.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.346 ALM-45438 ClickHouse Disk Usage Exceeds 80%

Alarm Description

The system checks the disk capacity of the ClickHouseServer node every 1 minute. This alarm is generated when the usage of the disk where the ClickHouse data directory or metadata directory resides exceeds 80%.

This alarm is automatically cleared when the usage of the disk where the ClickHouse data directory or metadata directory is located is lower than 80%.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45438	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskPath	Specifies the path of the disk for which the alarm is generated.

Impact on the System

The ClickHouse write operation may fail.

Possible Causes

The disk capacity of the ClickHouseServer node is too small.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Expand the disk capacity of the node for which the alarm is generated.

Step 3 Go to **Step 4** if the expansion fails or the alarm persists after the expansion.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.347 ALM-45439 ClickHouse Node Enters the Read-Only Mode

Alarm Description

The system checks the disk capacity of the ClickHouseServer node every 1 minute. This alarm is generated when the system detects that the disk capacity exceeds 90% and the ClickHouseServer node enters the read-only mode.

This alarm is automatically cleared when the system detects that the disk capacity is lower than 90% and the ClickHouseServer node exits the read-only mode.

NOTE

If the ClickHouseServer node is in read-only mode and you need to log in to the client to clear data, you can manually exit the read-only mode using the following method:

Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, search for **profiles.default.readonly**, and change its value to **0**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45439	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskPath	Specifies the path of the disk for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

After the ClickHouseServer node enters the read-only mode, all write, modification, and deletion operations fail.

Possible Causes

The disk usage of the ClickHouse node exceeds 90%.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Expand the disk capacity of the node for which the alarm is generated.

Step 3 Go to **Step 4** if the expansion fails or the alarm persists after the expansion.

NOTE

After the capacity expansion, this alarm can be automatically cleared only when **profiles.default.readonly** is **auto**. If its value has been manually changed, change it back to **auto**. If **profiles.default.readonly** needs to be set to **0** or **1** based on service requirements, manually clear this alarm.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.348 ALM-45440 Inconsistency Between ClickHouse Replicas

Alarm Description

When the number of ClickHouse replicas is greater than 1, the system periodically checks the replicated table. This alarm is generated if replicated table data is not

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

synchronized. This alarm is cleared when data in all replicated tables between replicas becomes synchronized.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45440	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Table	Specifies the table name for which the alarm is generated.

Impact on the System

The data reliability of the ClickHouse replicated table is affected, causing data differences and affecting the query result of the distributed table.

Possible Causes

- The ClickHouse service is overloaded.
- The connection between the ClickHouse and ZooKeeper is abnormal.

Handling Procedure

Check whether the ClickHouse service load is heavy.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the database name, table name, role name and IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Check whether a large amount of data is written. If yes, wait until the task is complete and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Run the following statement to check whether replicas are synchronized:

select table,absolute_delay, queue_size, inserts_in_queue, merges_in_queue from system.replicas where absolute_delay > 0 order by absolute_delay desc limit 10;

- If yes, go to **Step 6**.
- If no, go to **Step 9**.

Step 6 If **inserts_in_queue** contains a large amount of content to be inserted, run the following SQL statement to query the replica synchronization queue and locate the error cause:

SELECT database,table,type,any(last_exception),any(postpone_reason),min(create_time),max(last_attempt_time),max(last_postpone_time),max(num_postponed) AS max_postponed,max(num_tries) AS max_tries,min(num_tries) AS min_tries,countIf(last_exception != '') AS count_err,countIf(num_postponed > 0) AS count_postponed,countIf(is_currently_executing) AS count_executing,count() AS count_all FROM system.replication_queue GROUP BY database,table,type ORDER BY count_all DESC

Check whether an error message similar to the following is displayed:

```
Not executing fetch of part xxx because n fetches already executing, max n
```

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**, and check whether the value of **background_pool_size** is twice the number of cores on the node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Set this parameter to twice the number of cores on the node and synchronize the configuration. Wait for a while and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check the connectivity between ClickHouse and ZooKeeper.

Step 9 Log in to the node where the ClickHouseServer instance is located, go to **${BIGDATA_HOME}/FusionInsight_ClickHouse_*/*_*_ClickHouseServer/etc**, and check whether the port numbers of the ClickHouseServer and ZooKeeper in the **config.xml** file are the same, as shown in the following information in bold:

NOTE

To view the ZooKeeper port number, choose **Cluster** > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** on FusionInsight Manager, and check the value of **clientPort**.

```
<zookeeper>
  <session_timeout_ms>10000</session_timeout_ms>
  <node index="1">
    <host>server-2110082001-0019</host>
    <port>24002</port>
  </node>
  <node index="2">
    <host>server-2110082001-0018</host>
    <port>24002</port>
  </node>
  <node index="3">
    <host>server-2110082001-0017</host>
    <port>24002</port>
  </node>
</zookeeper>
```

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Change the port number to the ZooKeeper port number, restart the ClickHouseServer instance, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

NOTICE

During the instance restart, the instance is unavailable, and the ClickHouse service on that instance fails to be executed.

Collect fault information.

Step 11 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 12 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 13 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 14 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 15 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.349 ALM-45441 Zookeeper Disconnected

Alarm Description

The system checks the connection between ClickHouse and ZooKeeper every minute. This alarm is generated when the connection fails. The alarm is reported because the ZooKeeper connection is abnormal. If the connection fails for three consecutive times, the system generates an alarm.

This alarm is automatically cleared when the system detects that the connection is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45441	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If ClickHouse is disconnected from ZooKeeper, the ClickHouse service cannot be used.

Possible Causes

- The ZooKeeper service is abnormal.
- The ClickHouse service is overloaded.

Handling Procedure

Check whether ZooKeeper is normal.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ZooKeeper** > **quorumpeer**.

Step 2 Check whether ZooKeeper instances are normal.

- If yes, go to **Step 6**.
- If no, go to **Step 3**.

Step 3 Select instances whose status is not good and choose **More** > **Restart Instance**.

NOTICE

During the instance restart, the instance is unavailable, and the ZooKeeper service on the current instance node fails to be executed.

Step 4 Check whether the instance status is good after restart.

- If yes, go to **Step 5**.
- If no, go to **Step 10**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the ClickHouse service load is heavy.

Step 6 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 7 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host IP address of the ClickHouseServer instance that reports the alarm **--user** *User name* **--password --port** 9440

Step 8 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Check whether a large amount of data is written. If yes, wait until the task is complete and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 12 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.350 ALM-45442 Too Many Concurrent SQL Statements

Alarm Description

The alarm module checks the number of concurrent ClickHouse requests every 30 seconds. This alarm is generated when the number of concurrent ClickHouse requests exceeds the concurrency threshold configured on the UI.

This alarm is cleared when the system detects that the actual number of concurrent requests is less than concurrency threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45442	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If there are too many concurrent SQL statements, a large number of system resources are consumed. As a result, system response becomes slow.

Possible Causes

The ClickHouse service is overloaded.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Choose **Cluster** > **ClickHouse** > **Instance**, select an instance based on the alarm information. Choose **Chart** > **Concurrency** to check whether the actual number of concurrent SQL statements is greater than SQL concurrency threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Confirm with the user whether a large number of tasks were being executed during the alarming period.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 On FusionInsight Manager, choose **O&M** and click **Alarm** > **Thresholds** in the navigation pane on the left. On the displayed page, click **ClickHouse** > **Concurrency** and adjust the threshold, or wait until the task is complete. Check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.351 ALM-45443 Slow SQL Queries in the Cluster

Alarm Description

The system checks slow SQL queries for ClickHouse every 1 minute. This alarm is generated when the execution time of a SQL statement is longer than or equal to the slow SQL threshold.

This alarm is automatically cleared when the system detects that the execution time of the SQL statement is shorter than the slow SQL threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45443	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The performance of the ClickHouse service deteriorates, which slows the response of other services. If there are too many slow SQL statements, the service may be unavailable.

Possible Causes

- The ClickHouse service is overloaded.
- The execution of SQL statements takes a long time.

Handling Procedure

Check whether the ClickHouse service load is heavy.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port --secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port**

Step 3 Run the following statement to check whether data is frequently written to the system table. If yes, wait until the service execution is complete and check whether the alarm is cleared.

SELECT query_id, user, FQDN(), elapsed, query FROM system.processes ORDER BY query_id;

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 4**.

Checking whether the SQL statements take a long time.

Step 4 Check the logical cluster to which the alarm object belongs. Log in to FusionInsight Manager, click **Cluster**, choose **Services** > **ClickHouse**, and click **Logic Cluster**. On the displayed page, choose **Query Management** > **Ongoing Slow Queries**. Check which SQL statements take a long time on the displayed page, confirm with the user to adjust services, optimize slow SQL statements, and check whether the optimization is successful.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 After the SQL statements are complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.352 ALM-45444 Abnormal ClickHouse Process

Alarm Description

The health check module checks ClickHouse instances every 30 seconds. If the number of consecutive failures exceeds the threshold, an alarm is reported. In this case, the ClickHouse process may stop responding and services cannot be properly executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45444	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the ClickHouse process is abnormal, services cannot run properly.

Possible Causes

The ClickHouse process runs improperly.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--user** *Username* **--password --port** 9000

Step 3 Run the following statement to check whether the result can be properly returned:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SELECT 1;

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 7 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.353 ALM-45445 Failed to Send Data Files to Remote Shards When ClickHouse Writes Data to a Distributed Table

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

The ClickHouse instance checks the distributed table every 300 seconds. If the number of consecutive failures exceeds the threshold, an alarm is generated. In this case, the node where the ClickHouse instance writes data to the distributed table cannot send data files to remote shard nodes.

This alarm is cleared when the number of consecutive failures falls below the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45445	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The results of operations such as distributed table queries are abnormal.

Possible Causes

The status of some ClickHouse shard nodes is abnormal.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address of the hostname in **Location**.

Step 2 Log in to the node where the client is installed as the client installation user and run the following commands:

cd *{Client installation path}*

source bigdata_env

- For a cluster with Kerberos authentication enabled (security mode):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance for which the alarm is reported* **--port** 9440 **--secure**

- For a cluster with Kerberos authentication disabled (normal mode):

  clickhouse client --host *IP address of the ClickHouseServer instance for which the alarm is reported* **--user** *Username* **--password --port** 9000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Run the following SQL statement to obtain the shard based on the value of **data_path**. For example, if the value of **data_path** is **/srv/Bigdata/clickhouse/data1.../shard2_all_replicas**, the desired shard is **shard2**.

select database, table, data_path, data_files, error_count from system.distribution_queue where data_files != 0 and error_count != 0;

Step 4 Run the following SQL statement to obtain the node IP address (value of the **host** field in the system table **system.clusters**) of the shard where data fails to be sent to (**shard_num** obtained in **Step 3**):

select * from system.clusters;

Step 5 Log in to the ClickHouse node (IP address obtained in **Step 2**) by referring to **Step 4**, run the following statement, and check whether the result can be returned:

SELECT 1;

If yes, go to **Step 6**.

If no, go to **Step 10**.

Step 6 Log in to the ClickHouse node (IP address obtained in **Step 2**) by referring to **Step 4**, run the following statement (**database_name** and **table_name** indicate the database name and table name of the local table corresponding to the distributed table):

select name,type from system.columns where database='*database_name***' and table='***table_name***'**

Step 7 Log in to the ClickHouse node for which the alarm is generated by referring to **Step 2** and run the following statement (**database_name** and **table_name** indicate the database name and table name of the distributed table to which data is written):

select name,type from system.columns where database='*database_name***' and table='***table_name***'**

Step 8 Check whether the results obtained in **Step 6** and **Step 7** are the same.

If yes, go to **Step 10**.

If no, ensure that the column information of the distributed table is consistent with that of the corresponding local table, and then try to write data to the distributed table.

Step 9 Wait for several minutes and check whether the alarm is cleared.

If yes, no further action is required.

If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 12 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 14 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.354 ALM-45446 Mutation Task of ClickHouse Is Not Complete for a Long Time

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

The system checks mutation tasks every 5 minutes. This alarm is generated when the system detects that a mutation task has been running for at least **slow_mutation_cost_time** minutes. This alarm is automatically cleared when the system does not detect any running mutation task or the running time of a mutation task is less than **slow_mutation_cost_time** minutes.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45446	Minor	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

- Server resources are occupied, and the performance of the ClickHouse service deteriorates.
- Data is inconsistent.

Possible Causes

The data volume is too large. As a result, the mutation task runs slowly or is suspended.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Log in to the node where the client is installed and run the following commands:

cd *{Client installation path}*

source bigdata_env

- Security mode (with Kerberos enabled):

  kinit *Component service user*

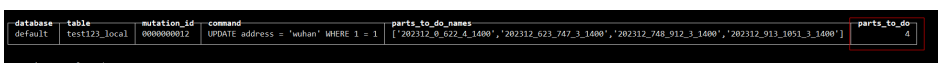
  clickhouse client --host *IP address of the ClickHouseServer instance for which the alarm is reported* **--port** 21427 **--secure**

- Normal mode (with Kerberos disabled):

  clickhouse client --host *IP address of the ClickHouseServer instance for which the alarm is reported* **--user** *Username* **--password --port** 21423

Step 3 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse**, click **Configurations** and then **All Configurations**. Search for the value of the **slow_mutation_cost_time** parameter, enter the parameter value in the following SQL statement, and run the following statement to check whether any result is returned:

SELECT * FROM system.mutations WHERE is_done = 0 AND create_time < now() - INTERVAL *The value* **SECOND**



NOTE

Add the actual value of **slow_mutation_cost_time** to the preceding statement.

- If yes, go to **Step 4**.
- If no, go to **Step 7**.

Step 4 Wait for a while and run the statement in **Step 3** again. Check whether the value of **parts_to_do** in the returned result decreases.

- If yes, wait until the mutation task is complete.
- If no, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 If the value of **parts_to_do** remains unchanged, stop the mutation task. Run the following statement and run the statement in **Step 3** again to check whether the current mutation task is in the returned result list:

KILL MUTATION WHERE database = '*Database name***' AND table = '***Table name***' AND mutation_id ='mutation ID'**

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Wait for several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 9 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.355 ALM-45447 ClickHouse Table Read-Only

NOTE

This section applies only to MRS 3.3.1 or later.

Alarm Description

The system checks the table status every minute. This alarm is generated when the system detects that a table is read-only. This alarm is automatically cleared when no table is read-only.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45447	MRS 3.3.1-LTS and MRS 3.5.0-LTS: Major MRS 3.5.0-LTS.x and MRS 3.5.0-LTS or later: Minor	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

- Data cannot be written to or modified.
- Data synchronization in the replication table is interrupted, causing data inconsistency.

Possible Causes

The ZooKeeper is overloaded and metadata is lost.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address of the hostname in **Location**.

Step 2 Log in to the node where the client is installed and run the following commands:

cd *{Client installation path}*

source bigdata_env

- Security mode (with Kerberos enabled):

  kinit *Component service user*

  clickhouse client --host *IP address of the ClickHouseServer instance that reports the alarm* **--port** 21427 **--secure**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Normal mode (with Kerberos disabled):

  clickhouse client --host *IP address of the ClickHouseServer instance for which the alarm is reported* **--user** *Username* **--password --port** 21423

Step 3 Run the following SQL statement to check whether any table is in the read-only state:

select database,table from system.replicas where is_readonly = 1

- If yes, go to **Step 4**.
- If no, go to **Step 8**.

Step 4 Specify the database and table queried in **Step 3** in the following SQL statements and run them in sequence. Then, run the SQL statement in **Step 3** and check whether the result contains the read-only table.

system restore replica *database.table*;

system restart replica *database.table*;

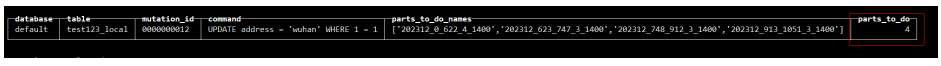
- If yes, go to **Step 5**.
- If no, go to **Step 8**.

Step 5 Specify the database and table queried in **Step 3** in the following SQL statements and run them in sequence. Then, run the SQL statement in **Step 3** and check whether the result contains the read-only table.

detach table *database.table*;

attach table *database.table*;

- If yes, go to **Step 6**.
- If no, go to **Step 8**.



Step 6 Run the following SQL statement to view the structure information of the read-only table. In the statement, database and table are those queried in **Step 3**.

show create table *database.table*;

Step 7 Run the following SQL statement to delete the read-only table and create a read-only table based on the table structure information in **Step 6**. Wait for several minutes, run the SQL statement in **Step 3**, and check whether the result contains the read-only table.

drop table database.table no delay;

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Wait several minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 11 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 12 Click the edit icon in the upper right corner and select a time span starting 1 hour before and ending 1 hour after when the alarm was generated. Then, click **Download** to collect the logs.

Step 13 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.356 ALM-45448 Rapid Increase of Znodes Used by ClickHouse

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

Metadata in ClickHouse is stored on ZooKeeper Znodes. The number of occupied Znodes may increase sharply even if service requirements do not change greatly. This alarm is generated when the number of occupied Znodes in two hours exceeds the threshold. If a large amount of data is imported or services are migrated, ignore this alarm.

This alarm is cleared when the system detects that the increase in two hours is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45448	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

ZooKeeper server resources are occupied. The number of Znodes will reach the upper limit in a short period of time, affecting the ClickHouse service.

Possible Causes

- If the ClickHouse service volume retains at large scale, increase the value of **ZNODE_GROWTH_LIMIT** on the ClickHouse configuration page.
- Major service changes, migration, and data import have been performed in ClickHouse.

Handling Procedure

Step 1 Choose **Cluster** > **ClickHouse** > **Instances** > **All Configurations**, and search for **ZNODE_GROWTH_LIMIT**, increase the value of **ZNODE_GROWTH_LIMIT**. The default value is **100000**, the maximum value is **200000**, and the value is configured based a step of 50000. Wait for 2 hours and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 2**.

Step 2 Confirm with the service party whether there are new service requests or a large amount of data is imported or migrated during the period when the alarm is reported.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait for 2 hours and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.357 ALM-45449 The Counter Number of zxid Used by ClickHouse Exceeds the Threshold

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

ClickHouse uses ZooKeeper Transaction ID (**zxid**) to manage transactions. The **zxid** is a 64-bit number used to keep consistency of the distributed system. The **zxid** has two parts: the high order 32-bits for the epoch and the low order 32-bits for the counter. The epoch number represents the lifecycle of the leader, and the counter number indicates the location of a transaction in the request. Each time a new transaction is generated, the counter number is automatically increased by 1. When the value of **zxid** reaches the maximum value, that is, the counter number reaches **0xffffffff**, the cluster forcibly elects the leader and ZooKeeper is unavailable in a short period. The system checks the counter number every two hours. This alarm is generated when the counter number of **zxid** exceeds the threshold.

This alarm is cleared when the counter number is smaller than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45449	Warning	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

ZooKeeper leader election is forcibly triggered at an uncertain time, which may interrupt the ClickHouse service.

Possible Causes

The counter number of ZooKeeper zxid exceeds the threshold.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **ZooKeeper**. On the **Dashboard** page of the ZooKeeper service, click **More** and select **Service Rolling Restart** in the upper right corner. In the displayed dialog box, enter the password and click **OK**. On the **Service Rolling Restart** page, click **OK** and wait until the rolling restart of the ZooKeeper service is complete.

NOTE

Restart the ZooKeeper service during off-peak hours of ClickHouse.

Step 2 Wait for 2 hours and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Collect fault information.

Step 3 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 4 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 5 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.358 ALM-45450 ClickHouse Failed to Obtain a Temporary Agency Credential

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

After the cold-hot separation function and an agency are configured, the system checks the status of the temporary agency credential every minute. This alarm is generated when the temporary agency credential fails to be obtained for three consecutive times.

This alarm is automatically cleared when the system successfully obtains the temporary agency credential.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45450	Critical	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The system cannot access OBS after the temporary agency credential expires. Operations such as reading and writing cold data in OBS cannot be performed on tables configured with cold and hot separation policies.

Possible Causes

- The OBS parameters configured for ClickHouse are incorrect.
- The IAM service is abnormal.

Handling Procedure

Step 1 Check whether the cold and hot separation configuration is correct. If the configuration is incorrect, modify the configuration and restart the ClickHouse instance. Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 2**.

Collect fault information.

Step 2 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 3 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 4 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.359 ALM-45451 ClickHouse Failed to Access OBS

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

When cold-hot separation is enabled, the system checks the OBS access every minute. This alarm is generated when the system detects that OBS cannot be accessed for three consecutive times.

This alarm is automatically cleared when the system successfully accesses OBS.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45451	Critical	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

For tables configured with the cold-hot separation policy, cold data on OBS cannot be read or written. Hot data on local disks cannot be moved to OBS.

Possible Causes

- Parameters such as the endpoint used by ClickHouse to access OBS are incorrect.
- OBS is abnormal.

Handling Procedure

Step 1 Check whether the cold and hot separation configuration is correct. If the configuration is incorrect, modify the configuration and restart the ClickHouse instance. Wait for 3 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 2**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 3 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 4 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 5 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 6 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.360 ALM-45452 ClickHouse's Local Disk Space Is Below the Cold-Hot Separation Threshold

NOTE

This section is available for MRS 3.3.1 or later version only.

Alarm Description

When cold-hot separation is enabled, the system checks the remaining space of the local disk specified in the cold-hot separation policy every 5 minutes. This alarm is generated if the remaining space is lower than the **move_factor** threshold.

This alarm is automatically cleared when the remaining space of the local disk is greater than the **move_factor** threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45452	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

Some hot data on the local disk is moved to OBS, affecting the read and write performance of the system.

Possible Causes

The local disk capacity configured for cold-hot separation on the ClickHouseServer node is too small.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address of the hostname in **Location**.

Step 2 Expand the disk capacity of the node for which the alarm is generated.

Step 3 Check whether the alarm is cleared after disk expansion.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **ClickHouse** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M personnel and provide the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.361 ALM-45475 A Single Replica Exists in the Kudu Data Table

Alarm Description

The system checks the replica status of the Kudu data table. This alarm is generated when a single replica is detected in the Kudu data table.

This alarm is cleared when all Kudu data tables have multiple replicas or no data.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45475	Major	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

A hardware fault, for example, a slow disk or a faulty disk, may cause Kudu data loss.

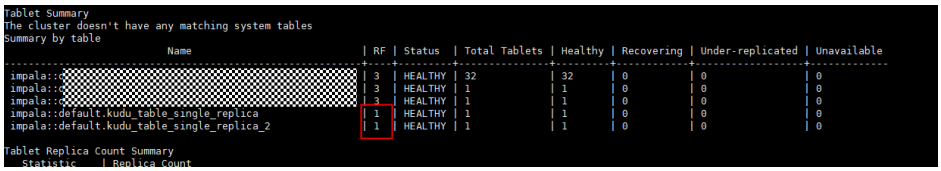
Handling Procedure

Step 1 Log in to the node where the MRS cluster client is installed as user **root** and switch to user **omm**.

su - omm

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Initialize the client.



source /opt/Bigdata/client/bigdata_env

Step 3 If Kerberos authentication (in security mode) is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication (in normal mode) is not enabled for the cluster, skip this step.

kinit *{Username}*

Step 4 Run the following command to check whether there is a table whose **RF** is **1**:

kudu cluster ksck *<master_addresses>*

master_addresses: The value is in the format of *KuduMaster service IP address 1*:**7051,***KuduMaster service IP address 2*:**7051,***KuduMaster service IP address 3*:**7051**.

KuduMaster service IP address: You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kudu** > **Instances** to view the service IP address of the KuduMaster instance.

- If yes, consider whether to keep the single-replica table. You are advised to recreate the table and select at least three replicas for it.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.362 ALM-45476 Number of Tablets of the KuduTServer Process Exceeds the Threshold

Alarm Description

The system checks the Kudu monitoring metrics every 60 seconds. This alarm is generated when the number of tablets of the KuduTServer process exceeds the threshold.

This alarm is cleared when the number of tablets of the KuduTServer process becomes normal and the system considers that the Kudu service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45476	Minor	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the number of tablets exceeds the threshold, the query performance of the Kudu engine deteriorates.

Possible Causes

The TServer usage is too high or the TServer load is unbalanced.

Handling Procedure

Handle the Kudu instance exception.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm**, and check whether alarm **ALM-45476 Number of Tablets of the KuduTServer Process Exceeds the Threshold** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > **Kudu**. Locate the threshold of this alarm and check whether the number of tablets of the KuduTServer process exceeds the threshold. If yes, change the threshold.

Step 3 Wait for several minutes, choose **O&M** > **Alarm**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.363 ALM-45477 Failed to Restore Data After a Disk of Kudu Is Replaced

Alarm Description

This alarm is generated when Kudu fails to restore data by invoking the script in SetupTool after a disk is replaced.

This alarm is cleared when the data is successfully restored.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45477	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

Kudu fails to restore data, and historical data is unavailable.

Possible Causes

Kudu fails to restore the UUID or the data from the remote end.

Handling Procedure

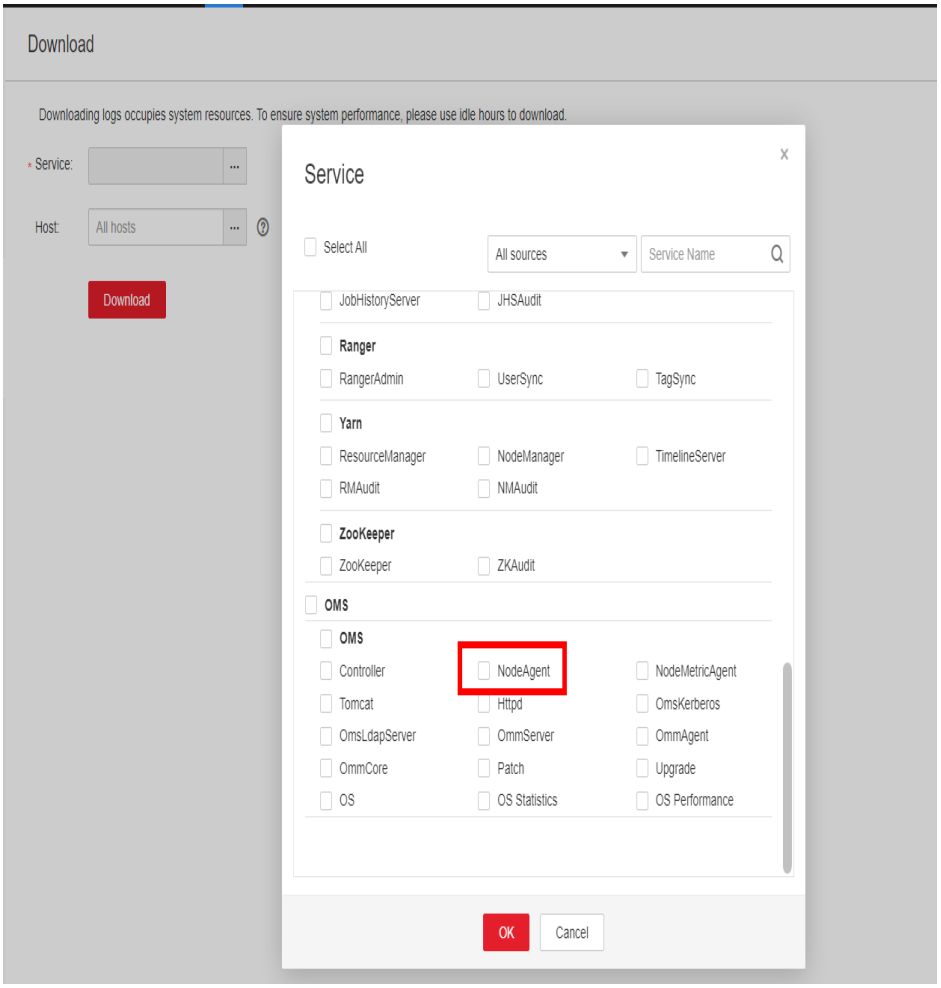
Collect fault information.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 2 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 3 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



NOTE

Collect NodeAgent logs and check whether data is successfully restored after the disk replacement.

The logs are saved in the following directory:

/var/log/Bigdata/nodeagent/scriptlog/disk_manager_notify.log

Figure 9-13 Collecting NodeAgent logs

Step 4 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.364 ALM-45478 Kudu Failed Data Balancing

Alarm Description

The system periodically balances data among Kudu data tables. This alarm is generated when the system detects that the data balancing API returns a failure response.

This alarm is cleared when the Kudu data balancing API is successfully called.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45478	Major	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

Failed to call the data balancing API. The Kudu component may be abnormal.

Possible Causes

The segment or replica in the Kudu data table is lost.

Handling Procedure

Handle the Kudu instance exception.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. On the displayed page, locate alarm **ALM-45478 Kudu Failed Data Balancing**.

Step 2 In the **Location** field, record the host name and role name.

Step 3 Choose **Cluster** > **Services** > **Kudu** > **Instances**. Click the role name for the host name obtained in **Step 2** and restore the instance. Then, check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 On the Kudu web UI, check whether any segment or replica is missing.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.365 ALM-45479 Number of Tablets of the Tserver Process Exceeds the Threshold

Alarm Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the number of tablets of the Tserver process exceeds the threshold.

This alarm is cleared when the number of tablets of the Tserver process becomes normal and the system considers that the Kudu service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45479	Minor	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If the number of tablets exceeds the threshold, the query performance of the Kudu engine deteriorates.

Possible Causes

The Tserver usage is too high or the Tserver load is unbalanced.

Handling Procedure

Handle the Kudu instance exception.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether alarm **ALM-45479 Number of Tablets of the Tserver Process Exceeds the Threshold** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 6**.

Step 2 Choose **O&M** > **Alarm** > **Thresholds** > **Kudu**, locate the threshold of this alarm, compare the threshold with the monitored number of tablets in the Tserver process of the cluster, and handle the alarm accordingly.

- If the threshold is not properly set, change the threshold and go to **Step 5**.
- If the Tserver load is unbalanced, go to **Step 3**.
- If the Tserver usage is too high, delete obsolete tables or add Tserver nodes, and go to **Step 3**.

Step 3 Log in to the Kudu node where the number of tablets exceeds the threshold.

Step 4 Run the following commands to balance the load of the cluster (during off-peak hours, recommended):

su omm

cd /opt/Bigdata/FusionInsight_Kudu_xxx/install/FusionInsight-Kudu-xxx/kudu/bin

./kudu cluster rebalance <master_addresses> [-tables=<tables>]

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The preceding parameters can be obtained from the KuduMaster web UI. The **tables** parameter is optional.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.366 ALM-45480 Tablet Leaders of a Tserver Process Are Unevenly Distributed

Alarm Description

The system checks the Kudu service status every 60 seconds. This alarm is generated when the ratio of tablet leaders of a Tserver process to total tablet leaders in the cluster exceeds the threshold.

This alarm is cleared when the ratio of tablet leaders of a Tserver process to total tablet leaders in the cluster becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45480	Minor	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

If Tserver tablet leaders are unevenly distributed, the query performance of the Kudu engine deteriorates.

Possible Causes

- Tserver instances are added or restarted.
- The threshold is not properly set.

Handling Procedure

Handle the uneven distribution of tablet leaders.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether alarm **ALM-45480 Tablet Leaders of a Tserver Process Are Unevenly Distributed** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 8**.

Step 2 Log in to the Kudu node where the number of tablet leaders exceeds the threshold.

Step 3 Run the following commands to manually adjust the number of tablet leaders:

su omm

cd /opt/Bigdata/FusionInsight_Kudu_*xxx*/install/FusionInsight-Kudu-xxx/kudu/bin

./kudu tablet leader_step_down *<master_addresses>* *<tablet_id>* **[-new_leader_uuid=***<new_tablet_server_uuid>***]**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **master_addresses**: The value is in the format of **KuduMaster service IP address 1:7051,KuduMaster service IP address 2:7051,KuduMaster service IP address 3:7051**.

  KuduMaster service IP address: You can log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kudu** > **Instances** to view the service IP address of the KuduMaster instance.
- **tablet_id**: tablet ID to be adjusted.

  You can log in to Manager, choose **Cluster** > **Services** > **Kudu**, and click **KuduMaster(KuduMaster)** next to **KuduMaster WebUI** to access the KuduMaster web UI. Choose **Tables** on the menu bar, click the ID in the **Table Id** column, and obtain the target tablet ID in **Detail**.
- **new_tablet_server_uuid**: ID of the target tablet servers.

  You can log in to the KuduMaster web UI, choose **Tablet Servers** on the menu bar, and view the UUID.
- **new_leader_uuid**: You are advised to set the UUID of the node with a small number of tablet leaders.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Change the threshold.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and check whether alarm **ALM-45480 Tablet Leaders of a Tserver Process Are Unevenly Distributed** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Choose **Cluster** > **Kudu** > **Configurations** > **All Configurations** > **KuduMaster**, locate the alarm threshold parameter **TABLET_LEADER_UNBALANCE_SCALE**, change the value, and rolling-restart all Kudu Masters to make the configuration take effect.

Step 7 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Kudu** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

9.11.367 ALM-45481 KuduTserver Has Full Disks

Alarm Description

The system checks Kudu disk metrics every 60 seconds. This alarm is generated when the number of fully occupied disks for a Tserver is not 0.

This alarm is automatically cleared when the number of fully occupied disks for the Tserver becomes 0.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45481	Major	Yes

Alarm Parameters

Type	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Users cannot use the Kudu service properly.

Possible Causes

The disk configuration cannot meet service requirements, and the disk space used by the Kudu service is insufficient.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the disk capacity and delete unnecessary files and data tables.

Step 1 Log in to FusionInsight Manager. In the alarm list, click the drop-down arrow in the row that contains the alarm, and view the role name and the IP address of the hostname in **Location**.

Step 2 Log in to the node for which the alarm is generated as user **root** and run the **df -h** command to check the mount directory where the disk usage is 100%.

Step 3 Run the **find / -xdev -size +500M;** command to view files larger than 500 MB in the directory obtained in **Step 2**. Check whether such files are mistakenly written to the directory.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Delete the mistakenly written files and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Check whether Kudu contains unnecessary data tables.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Use **kudu table delete <master_addresses> <table_name> [-nomodify_external_catalogs]** to delete unnecessary tables.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Contact the disk administrator to expand the disk capacity.

Step 9 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, select **Kudu** for the target cluster, and click **OK**.

Step 12 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Send the collected fault logs to O&M personnel for help.

9.11.368 ALM-45585 IoTDB Service Unavailable

Alarm Description

The system checks the IoTDB service status every 300 seconds. This alarm is generated when the IoTDB service is unavailable. This alarm is cleared when the IoTDB service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45585	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The IoTDB service is unavailable for read and write operations.

Possible Causes

- The KrbServer service is abnormal.
- More than 50% of IoTDBServer instances are faulty.

Handling Procedure

Check whether the KrbServer service on which the IoTDB depends is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether ALM-25500 KrbServer Service Unavailable exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by referring to **ALM-25500 KrbServer Service Unavailable**.

Step 4 After ALM-25500 is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether IoTDBServer instances are faulty.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**.

Step 6 Check whether the percentage of faulty IoTDBServer instances exceeds 50%. If yes, restart the faulty IoTDBServer instances and check whether the status is restored.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

9.11.369 ALM-45586 IoTDBServer Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the IoTDBServer process status every 60 seconds. The alarm is generated when the heap memory usage of the IoTDBServer process exceeds the threshold (90% of the maximum memory).

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45586	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The data read and write performance of the IoTDBServer process deteriorates, memory overflow occurs, and the IoTDBServer process breaks down.

Possible Causes

The heap memory of the IoTDBServer process is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check the heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45586**, view the role name in **Location**, and check the instance IP address.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **IoTDBServer Heap Memory Resource Percentage**, and click **OK**. Check whether the used non-heap memory of the IoTDBServer process reaches 90% (by default) of the maximum non-heap memory specified for IoTDBServer.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Configuration**, click **All Configurations**, choose **IoTDBServer** > **System**, and increase the value of **-Xmx** in the **GC_OPTS** parameter.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.370 ALM-45587 IoTDBServer GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the IoTDBServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for three consecutive times. You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **GC** > **Total GC duration of IoTDBServer process (IoTDBServer)** to change the threshold. This alarm is cleared when the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45587	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The IoTDBServer process may be unavailable for data read and write operations.

Possible Causes

The heap memory of the IoTDBServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45587**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **GC**. In the dialog box that is displayed, select **Garbage Collection (GC) Time of IoTDBServer**, and click **OK**. Check whether the GC time of the IoTDBServer process is greater than 12 seconds.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Configuration**, click **All Configurations**, choose **IoTDBServer** > **System**, and increase the value of **-Xmx** in the **GC_OPTS** parameter.

NOTE

- The default value of **-Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect the fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.371 ALM-45588 IoTDBServer Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the IoTDBServer service every 60 seconds. This alarm is generated when the direct memory usage of the IoTDBServer instance exceeds the threshold (90% of the maximum memory) for five consecutive times. This alarm is cleared when the IoTDBServer direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45588	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Direct memory overflow may cause service unavailability, and the IoTDBServer process may be unavailable for data read and write operations.

Possible Causes

The direct memory of the IoTDBServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **45588**, view the role name in **Location**, and check the instance IP address.

Step 2 Choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Instance**. Click the IoTDBServer for which the alarm is generated to go to **Dashboard**. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **IoTDBServer Direct Buffer Resource Percentage**, and click **OK**.

Step 3 Check whether the direct memory used by the IoTDBServer reaches the threshold (90% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **IoTDB** > **Configuration**, click **All Configurations**, choose **IoTDBServer** > **System**, increase the value of **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter as required, and save the configuration.

NOTE

- If this alarm is generated, the direct memory configured for the IoTDBServer process cannot meet the requirements of the IoTDBServer process.
- You are advised to set **-XX:MaxDirectMemorySize** in **GC_OPTS** to twice the direct memory used by the IoTDBServer process. (You can change the value based on the actual service scenario.)
- To obtain the size of the direct memory used by the IoTDBServer process, choose **Customize** > **Memory** > **IoTDBServer Direct Memory Resource Status**. If **GC_OPTS** does not contain the **-XX:MaxDirectMemorySize** parameter, add it manually.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect the fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **IoTDBServer** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.372 ALM-45589 ConfigNode Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the ConfigNode process every 60 seconds. This alarm is generated when the heap memory usage of the ConfigNode process exceeds the threshold (90% of the maximum memory). This alarm is cleared when the heap memory usage of the ConfigNode process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45589	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The data read and write performance of the ConfigNode process deteriorates, memory overflow occurs, and the ConfigNode process breaks down.

Possible Causes

The heap memory configured for the node is improper. As a result, the usage exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check the heap memory configuration.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click  in front of this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster** > **Services** > **IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained in **Step 1**, and check whether **ConfigNode Heap Memory Usage** on the **Dashboard** tab page reaches the threshold specified for the ConfigNode process.

If the chart is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Memory**. In the dialog box that is displayed, select **ConfigNode Heap Memory Usage** and click **OK**.

NOTE

You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **Memory** > **ConfigNode Heap Memory Usage (ConfigNode)** to view the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Choose **Cluster** > **Services** > **IoTDB**. Click **Configurations** then **All Configurations**, click **ConfigNode**, and choose **System**. Set **-Xmx** in **GC_OPTS** to a larger value and save the configuration.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value of **-Xmx** by 0.5 times. If this alarm is frequently generated, double the value of **-Xmx**.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Dashboard**. Click **Restart Service** to restart the IoTDB service for the configuration to take effect.

NOTICE

During the restart of the IoTDB service, read and write requests are interrupted.

Step 5 Wait for about 120 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

9.11.373 ALM-45590 ConfigNode GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the ConfigNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for three consecutive times. This alarm is cleared when the GC duration is less than the threshold.

NOTE

You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **GC** > **Total GC duration of ConfigNode process (ConfigNode)** to increase the threshold by 20% each time.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45590	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The data read and write performance of the ConfigNode process may deteriorate.

Possible Causes

The heap memory configured on the node is improper. As a result, GC occurs frequently.

Handling Procedure

Check the heap memory configuration.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the real-time alarm list, click in the row containing this alarm and view the role name and instance IP address in **Location**.

Step 2 Choose **Cluster** > **Services** > **IoTDB**. Click **Instance**, click the ConfigNode corresponding to the IP address obtained by **Step 1**. Switch to the **Dashboard** tab page, locate the **Total GC Duration of ConfigNode** chart, and check whether the GC duration of the ConfigNode process exceeds the threshold.

If the GC duration of ConfigNode is not displayed, click the drop-down list in the upper right corner of the chart area and choose **Customize** > **GC**. In the displayed dialog box, select **Total GC Duration of ConfigNode** and click **OK**.

NOTE

You can choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **IoTDB** > **GC** > **Total GC duration of ConfigNode process (ConfigNode)** to view the threshold.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Choose **Cluster** > **Services** > **IoTDB**. Click **Configurations** then **All Configurations**, click **ConfigNode**, and choose **System**. Set **-Xmx** in **GC_OPTS** to a larger value and save the configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The default value of -**Xmx** is **2G**.
- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Dashboard**. Click **Restart Service** to restart the IoTDB service for the configuration to take effect.

NOTICE

During the restart of the IoTDB service, read and write requests are interrupted.

Step 5 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 8 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

9.11.379 ALM-45596 Procedure Execution Failed

Alarm Description

Procedures are the tasks managed and executed by the ConfigNode leader. This alarm is generated when a procedure fails to be executed. This alarm is cleared when the procedure is successfully executed.

NOTE

This section applies to MRS 3.3.0 or later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45596	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
ProcedureInformation	Specifies the procedure-related information.

Impact on the System

Operation consistency is affected.

Possible Causes

- The task for adding IoTDB replicas fails to be executed.
- The task for deleting the storage group fails to be executed.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, locate this alarm, and click .

Step 2 Check the value of **ProcedureInformation** in **Location**. The value starts with the procedure type and contains main information about the procedure.

Check whether the task for adding replicas fails.

Step 3 Check whether the value of **ProcedureInformation** starts with **AddRegionProcedure** or **ReJoinDataNodeProcedure**.

- If yes, the task fails. Go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Wait for half an hour. If the region is successfully added, the alarm is automatically cleared. Otherwise, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the task for deleting the storage group fails.

Step 5 Check whether the value of **ProcedureInformation** starts with **DeleteStorageGroupProcedure**.

- If yes, the storage group fails to be deleted. Go to **Step 6**.
- If no, go to **Step 7**.

Step 6 Delete the storage group displayed in **ProcedureInformation** again on the IoTDB client. If the deletion is successful, the alarm is automatically cleared. Otherwise, go to **Step 7**.

Collect fault information.

Step 7 Choose **Cluster** > **Services** > **IoTDB** > **Instance** to view the hosts where all IoTDBServer and ConfigNode instances are located.

Step 8 Choose **O&M** > **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **IoTDB** for the target cluster, and click **OK**.

Step 10 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the host queried in **Step 7**, and click **OK**.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.380 ALM-45615 CDL Service Unavailable

Alarm Description

The system checks the CDL health status every 60 seconds. This alarm is generated when the CDL health status is **DOWN**. This alarm is cleared when the system detects that the CDL health status is **UP**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45615	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The CDL service is abnormal. You cannot use FusionInsight Manager to perform cluster operations on the CDL service. The CDL service function is unavailable.

Possible Causes

All CDLService or CDLConnector instances of the CDL service are abnormal, and the Kafka service is unavailable.

Handling Procedure

Check whether the Kafka service on which the CDL service depends is abnormal.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether ALM-38000 Kafka Service Unavailable exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by referring to **ALM-38000 Kafka Service Unavailable**.

Step 4 After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether CDL instances are faulty.

Step 5 On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **CDL** > **Instance**.

Step 6 Check whether all CDLService and CDLConnector instances are faulty.

- If yes, restart the CDL service and choose **Cluster** > *Name of the desired cluster* > **Services** > **CDL** > **More** > **Restart Service**. If the fault persists after the restart, go to **Step 7** and contact O&M personnel to check CDL logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **CDL** for the target cluster.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

After the service is restored, the system automatically clears the alarm.

Related Information

None

9.11.381 ALM-45616 CDL Job Execution Exception

Alarm Description

The system checks whether a CDL job is normal every 60 seconds. This alarm is reported when the CDL job is abnormal. This alarm is cleared when the job is restored or stopped.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45616	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Username	Specifies the username of the job for which the alarm was generated.

Impact on the System

CDL jobs fail, and real-time data integration is interrupted.

Possible Causes

The CDL task fails to be executed due to incorrect parameter settings or other reasons. On the **Job Management** page of the CDL web UI, locate the row where the job is located and click **Failed**/**Abnormal running** in the **Status** column to view the failure cause, or view the failure cause in the logs.

Handling Procedure

Step 1 Log in to FusionInsight Manager as a user who has the CDL job creation or administrator permission.

Step 2 Choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, click ⌄ in the row where **Alarm ID** is **45616**, and view the name of the job for which this alarm is generated in **Location**.

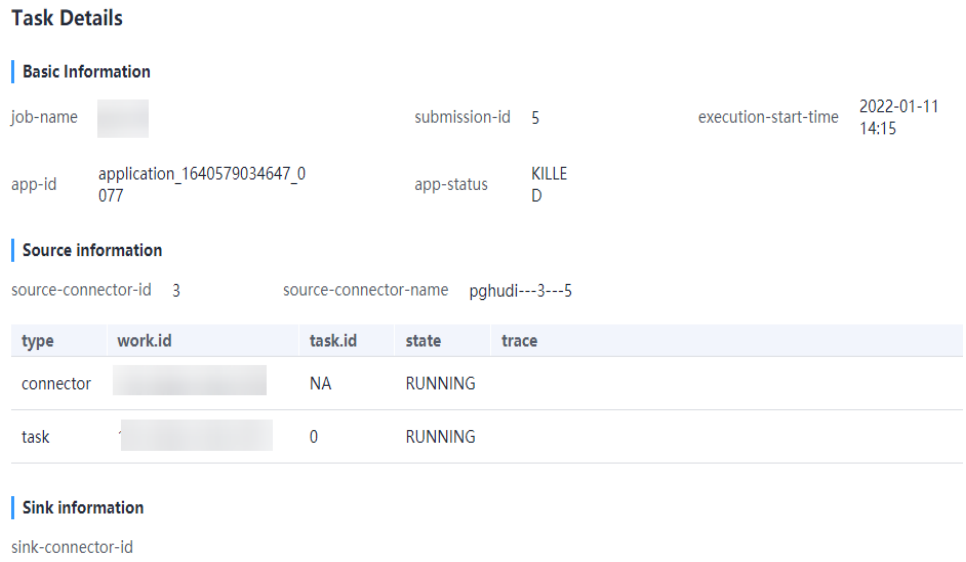
Step 3 Choose **Cluster** > **Services** > **CDL** and click the link next to **CDLService UI** to go to the CDL web UI.

Step 4 Locate the row where the failed job is located based on the job name obtained in **Step 2**, and click **Abnormal running** or **Failed** in the **Status** column.

Step 5 On the page that is displayed, view the error information and rectify the fault. For example, **Figure 9-14** shows that the task running on Yarn is manually killed. For details, see trace error information, as shown in **Figure 9-15**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 9-14 CDL job exception



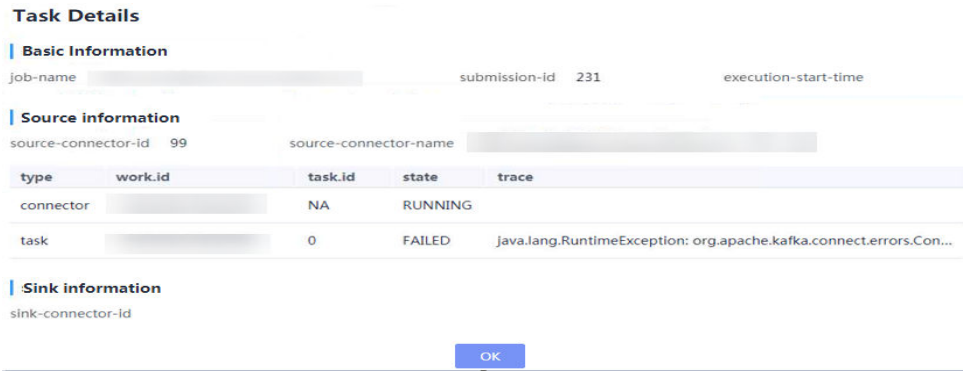


Figure 9-15 Trace error information

Step 6 Rectify the fault based on the error information, execute the task again, and check whether the task can be executed successfully.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect the fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Select **CDL** in the required cluster for **Service**.

Step 9 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

After the job is successfully restored or stopped, the alarm is cleared if it has been reported.

Related Information

None

9.11.382 ALM-45617 Data Queued in the CDL Replication Slot Exceeds the Threshold

Alarm Description

If too many WALs are stacked in PostgreSQL, the PostgreSQL disk space may be used up. The system checks whether the amount of data queued in the replication slot configured for a CDL job exceeds the threshold every 5 minutes. This alarm is generated when the amount of data queued in the replication slot exceeds the threshold. This alarm is cleared when the number of data queued in the replication slot falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45617	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.
DBName	Specifies the database for which the alarm was generated.
SlotName	Specifies the database replication slot for which the alarm was generated.
Lag	Specifies the data queued in the slot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The disk space of the source PostgreSQL database may be used up and the database cannot provide services.

Possible Causes

The CDL job is abnormal, and data processing stops; the source database is updated quickly, and CDL data processing is slow.

Handling Procedure

Step 1 Log in to FusionInsight Manager as a user who has the CDL job creation or administrator permission.

Step 2 Choose **O&M**. In the navigation pane on the left, choose **Alarm** > **Alarms**, click  in the row where **Alarm ID** is **45617**, and view the name of the job for which this alarm is generated in **Location**.

Step 3 Check whether **ALM-45616 CDL Job Execution Exception** is displayed in the alarm list.

- If yes, handle the alarm by referring to **ALM-45616 CDL Job Execution Exception**.
- If no, go to **Step 4**.

Step 4 Choose **Cluster** > **Services** > **CDL**. Click the link next to **CDLService UI** to go to the CDL web UI and check whether the job is displayed in the job list based on its name obtained in **Step 2**.

- If yes, check whether the job is abnormal.
  - If it is abnormal, go to **Step 5**.
  - If it is not, data processing is slow. Contact O&M personnel.
- If no, go to **Step 7**.

Step 5 Click **Abnormal** or **Failed** in the row where the job is located and rectify the fault based on the error information displayed on the page.

Step 6 After rectifying the fault, run the job again and check whether the job can be executed successfully.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **CDL** for the target cluster.

Step 9 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

This alarm is cleared when the amount of data queued in the replication slot is less than the threshold. You do not need to manually clear the alarm.

Related Information

None

9.11.383 ALM-45635 FlinkServer Job Execution Failure

This section applies to MRS 3.1.2 or later.

Alarm Description

The system checks whether FlinkServer jobs fail to be executed every 10 seconds. This alarm is generated when a FlinkServer job fails. This alarm is cleared when the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45635	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.

Impact on the System

This alarm is a job-level alarm and does not affect FlinkServer. You need to view Flink job logs to find out the failure cause.

Possible Causes

You can view failure causes in specific logs.

Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

If yes, go to **Step 4**.

If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.
2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster** > **Services** > **Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More** > **Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, select **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***User name*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

After the job is successfully restarted, the alarm is cleared if it has been reported.

Related Information

None

9.11.384 ALM-45636 Flink Job Checkpoints Keep Failing

This section applies to MRS 3.1.2 or a version between 3.1.2 and 3.3.0.

Alarm Description

The system checks the number of consecutive checkpoint failures based on the configured alarm checking interval. This alarm is generated when the number of consecutive checkpoint failures of a FlinkServer job reaches the configured threshold. This alarm is cleared when checkpoints are recovered or the job is successfully restarted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45636	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.
Username	Specifies the username of the job for which the alarm is generated.

Impact on the System

The Flink job may fail. You need to check the status and logs of the Flink job to locate the fault. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view failure causes in specific logs.

Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

If yes, go to **Step 4**.

If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.
2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster** > **Services** > **Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More** > **Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, select **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***User name*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when Flink job checkpoints are recovered or the job is successfully restarted.

Related Information

None

9.11.385 ALM-45636 Number of Consecutive Checkpoint Failures of a Flink Job Exceeds the Threshold

This section applies to MRS 3.3.1 or later.

Alarm Description

The system checks the number of consecutive checkpoint failures based on the configured alarm checking interval. This alarm is generated when the number of consecutive checkpoint failures of a FlinkServer job reaches the configured threshold. This alarm is cleared when checkpoints are recovered or the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45636	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	ApplicationName	Specifies the name of the application for which the alarm was generated.
	JobName	Specifies the job for which the alarm was generated.
	UserName	Specifies the username for which the alarm was generated.
Additional Information	ThresholdValue	Specifies the threshold value for triggering the alarm.
	CurrentValue	Specifies the value that triggered the alarm.

Impact on the System

The Flink job may fail. You need to check the status and logs of the Flink job to locate the fault. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view failure causes in specific logs.

Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 3 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Alarm Clearance

This alarm is cleared when FlinkServer job checkpoints are recovered or the job is successfully restarted.

Related Information

None.

9.11.386 ALM-45637 FlinkServer Task Is Continuously Under Back Pressure

This section applies to MRS 3.1.2 or later.

Alarm Description

The system checks the back pressure duration of FlinkServer tasks based on the configured alarm checking interval. This alarm is generated when the back pressure duration of a FlinkServer task reaches the configured threshold. This alarm is cleared when the task back pressure is recovered or the job is successfully restarted.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45637	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.

Impact on the System

Continuous back pressure of Flink jobs may cause performance problems or checkpoint failures. As a result, Flink jobs fail. You need to check the status and logs of the Flink jobs to locate the cause. This is a job-level alarm and has no impact on FlinkServer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

You can view the causes in the specific logs.

Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

If yes, go to **Step 4**.

If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.
2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

   NOTE

   You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster** > **Services** > **Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More** > **Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, select **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***User name*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when FlinkServer task back pressure is recovered or the job is successfully restarted.

9.11.387 ALM-45638 Number of Restarts After FlinkServer Job Failures Exceeds the Threshold

Alarm Description

The system checks the number of FlinkServer job restarts based on the alarm checking interval. This alarm is generated when the number exceeds the configured threshold. This alarm is cleared when the job is restarted.

This alarm handling guide is targeted for MRS clusters of versions 3.1.2 to 3.2.0. For those MRS clusters of version 3.2.0 or later, see ALM-45638 Number of Restarts After Flink Job Failures Exceeds the Threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45638	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
JobName	Specifies the job for which the alarm was generated.

Impact on the System

Flink jobs are frequently restarted due to the failures. You need to locate the cause. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

You can view the causes in the specific logs.

Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

If yes, go to **Step 4**.

If no, go to **Step 6**.

Step 4 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.
2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster** > **Services** > **Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More** > **Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 5 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, select **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***User name*/**logs/***Application ID of the failed job* directory.

Step 7 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

Related Information

None

9.11.388 ALM-45638 Number of Restarts After Flink Job Failures Exceeds the Threshold

Description

The system checks the number of FlinkServer job restarts at intervals defined by the parameter **metrics.reporter.alarm.interval** (default value: 30s). This alarm is generated when the number exceeds the configured threshold. This alarm is cleared when the job is restarted.

The alarm threshold is calculated as follows: Threshold = Percentage of failed restarts that trigger an alarm x Maximum number of allowed job restarts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The default threshold in MRS 3.2.1 or later is 3 (calculated by rounding up 80% x 3).

- Percentage of failed restarts that trigger an alarm: specified by the parameter **metrics.reporter.alarm.job.alarm.failure.restart.rate**. The default value is 80.
- Maximum number of allowed job restarts: The value varies depending on the restart strategy configured for the current Flink job. The default restart strategy is **fixed-delay** in MRS 3.2.1 or later.
  - If the restart strategy is **none**, this alarm is not triggered. (The default restart strategy is **none** in versions earlier than MRS 3.2.1).
  - If the restart strategy is **failure-rate**, the default maximum number of allowed restarts is **1** (**restart-strategy.failure-rate.max-failures-per-interval**).

    In this case, the alarm threshold is 1 (calculated by rounding up 80% × 1). This means that if the job restarts even once, the system will generate an alarm.
  - If the restart strategy is **fixed-delay**, the default maximum number of allowed restarts is **3** (**restart-strategy.fixed-delay.attempts**).

    In this case, the alarm threshold is 3 (calculated by rounding up 80% × 3). This means that if the job restarts three times, the system will generate an alarm.

This section applies to MRS 3.2.0-LTS.1 or later.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45638	Major	Yes

Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.
Username	Specifies the username of the job for which the alarm is generated.

Impact on the System

If the number of Flink job restarts exceeds the configured threshold, the job fails repeatedly and restarts frequently. In such cases, the job developer should check

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the job logs to identify the root cause of the failure. This alarm is a Flink job alarm and does not affect FlinkServer.

Possible Causes

You can view the causes in the specific logs.

Procedure

Step 1 Log in to the MRS Manager using a user who has the FlinkServer management operation permission, Manager interface management permission, and Yarn WebUI access permission.

Step 2 Open the FusionInsight Manager page. In the alarm list, click ⌄ in the row where this alarm is located to view the task name in the alarm details.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the Yarn page.

Step 4 Locate the failed job based on its name displayed in **Location**, search for and record the application ID of the failed job, and check whether the job logs are available on the Yarn page.

If yes, go to **Step 5**.

If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.
2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

   NOTE

   You can also log in to Manager as a user who has the FlinkServer management permission, choose **Cluster** > **Services** > **Flink**, click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management** and choose **More** > **Job Monitoring** in the **Operation** column to view the TaskManager logs.

Step 6 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 7 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page.

Step 8 Select **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***User name*/**logs/***Application ID of the failed job* directory.

Step 9 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

Related Information

None

9.11.389 ALM-45639 Checkpointing of a Flink Job Times Out

Alarm Description

The system checks the checkpointing timeout of Flink jobs every 30 seconds. This alarm is generated if the checkpointing timeout of a Flink job is longer than the threshold (600 seconds by default). This alarm is cleared when the checkpointing timeout of a job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45639	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName (available in MRS 3.2.1 or later)	Specifies the name of the application for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.
UserName	Specifies the username for which the alarm is generated.

Impact on the System

The checkpointing fails. You need to locate the cause. This is a job-level alarm and has no impact on FlinkServer.

Possible Causes

The job may be in the sub-healthy state. The possible causes are as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The memory for the TaskManager of the job is insufficient.
- The state memory is too large, making checkpointing time-consuming.

Handling Procedure

Step 1 Log in to Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45639 Checkpointing of a Flink Job Times Out**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the failed task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.
2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view TaskManager logs.

   NOTE

   You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 6 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 7 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**logs/***Application ID of the failed job* directory.

Step 8 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is cleared when the checkpointing timeout a Flink job is less than or equal to the threshold.

Related Information

None

9.11.390 ALM-45640 FlinkServer Heartbeat Interruption Between the Active and Standby Nodes

This section applies to MRS 3.2.0 or later.

Alarm Description

This alarm is generated when the FlinkServer active node or standby node does not receive heartbeat messages from the peer for 30 seconds (heartbeat interruption duration configured in keepalive).

This alarm is cleared when the heartbeat recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45640	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The impact varies depending on the cause. If the heartbeat is interrupted due to active node faults, the standby node will take over services as the active node. If the heartbeat is interrupted due to other reasons, for example, network problems, two active nodes may exist because the standby node has become the active node. Data synchronization between the active and standby nodes is abnormal, but FlinkServer can still provide services.

Possible Causes

- The active or standby FlinkServer instance is in the stopped state.
- The NIC of the floating IP address of the HA system used by the FlinkServer node is incorrectly configured. FlinkServer fails to be started.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The link between the active and standby FlinkServer nodes is abnormal.

Handling Procedure

Check the status of the active and standby FlinkServer instances.

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Flink** > **Instance**, and check the state of FlinkServer is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Select the abnormal FlinkServer instance and start the instance. After the instance is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

NOTICE

During the restart, the FlinkServer instance cannot provide services, but submitted jobs are not affected.

Check whether the link between the standby FlinkServer nodes is normal.

Step 3 Choose **Cluster** > **Services** > **Flink** > **Instance**, and check the two service IP addresses of FlinkServer.

Step 4 Log in to the server where the abnormal FlinkServer instance locates as the **root** user.

Step 5 Run the following command to check whether the server of the other FlinkServer instance is reachable:

ping *IP address of the other FlinkServer instance*

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 6 Ask the network administrator to handle the network exception.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the logs of the node where the abnormal FlinkServer instance locates contains error information.

Step 8 Log in to the server where the abnormal FlinkServer instance locates as the **root** user.

Step 9 Open the log file in the default directory **/var/log/Bigdata/flink/flinkserver/prestart.log** and check whether there is error message **Float ip** *x.x.x.x* **is invalid**.

- If yes, go to **Step 10**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 12**.

Step 10 On FusionInsight Manager, choose **Cluster** > **Services** > **Flink** > **Configurations** > **All Configurations** and search for **flink.ha.floatip**. Change the parameter value to the correct floating IP address, save the configuration, and restart the Flink service.

NOTICE

- Contact the network engineer to obtain the new floating IP address.
- During the service restart, FlinkServer cannot provide services, but submitted jobs are not affected.
- During the restart, the FlinkServer instance cannot provide services, but submitted jobs are not affected.

Step 11 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect the fault information.

Step 12 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 13 Select the Flink service in the required cluster for **Service**.

Step 14 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 16 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.391 ALM-45641 Data Synchronization Exception Between the Active and Standby FlinkServer Nodes

This section applies to MRS 3.2.0 or later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Description

The system checks data synchronization between the active and standby FlinkServer nodes every 60 seconds. This alarm is generated when the standby FlinkServer node fails to synchronize files with the active FlinkServer node.

This alarm is cleared when the standby FlinkServer synchronizes files with the active FlinkServer.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45641	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

After an active/standby switchover, some configurations may be lost. Some jobs and connections of the FlinkServer are interrupted, but the FlinkServer can still provide services properly.

Possible Causes

- The link between the active and standby FlinkServer nodes is interrupted.
- The synchronization file does not exist or the file permission is required.

Handling Procedure

Check whether the network between the active and standby FlinkServer is in normal state.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Instance**. View and record the IP addresses of active and standby FlinkServer.

Step 2 Log in to the active FlinkServer node as the **root** user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Run the following command to check whether the standby FlinkServer is reachable:

ping *IP address of the standby FlinkServer*

- If yes, go to **Step 6**.
- If no, go to **Step 4**.

Step 4 Contact the network administrator to check whether the network is faulty.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check whether the storage space of the /srv/BigData/LocalBackup directory is insufficient.

Step 6 Run the following command to check whether the storage space of the **/srv/BigData/LocalBackup** directory is insufficient:

df -hl /srv/BigData/LocalBackup

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

Step 7 Run the following command to clear unnecessary backup files:

rm -rf *Directory to be cleared*

The following are two examples:

rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443

Step 8 On FusionInsight Manager, choose **O&M** > **Backup and Restoration** > **Backup Management**.

In the **Operation** column of the backup task, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

Step 9 Wait for 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

Check whether the synchronization file exists and whether the file permission is valid.

Step 10 Run the following command to check whether the synchronization file exists:

find /srv/BigData/ -name "sed*"

find /opt -name "sed*"

- If yes, go to **Step 11**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 12**.

Step 11 Run the following command to check the synchronization file information and permission queried in **Step 10**:

ll *Path of the file you want to search for*

- If the file size is 0 and all values in the permission column are -, the file is a junk file. Run the following command to delete it:

  rm -rf *Files to be deleted*

  Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to **Step 12**.
- If the file size is not 0, go to **Step 12**.

Step 12 View the log file generated when the alarm is reported.

1. Run the following command to go to the HA run log file path of the current cluster:

   cd /var/log/Bigdata/flink/flinkserver/ha/runlog
2. Decompress log file and view the logs generated when the alarm is reported.

   For example, if the name of the file is **ha.log.2021-03-22_12-00-07.gz**, run the following command:

   gunzip *ha.log.2021-03-22_12-00-07.gz*

   vi *ha.log.2021-03-22_12-00-07*

   Check whether error information is displayed before and after the alarm generation time in the logs.

   – If it is displayed, rectify the fault based on the error information. Go to **Step 13**.

   For example, if the following error information is displayed, the directory permission is required. In this case, obtain the directory permission that is the same as the permission on a normal node.

   – If no, go to **Step 14**.

Step 13 Wait for about 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

Collect fault information.

Step 14 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 15 Select FlinkServer information from **Services** and click **OK**.

Step 16 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.

Step 17 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 18 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.392 ALM-45642 RocksDB Continuously Triggers Write Traffic Limiting

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when RocksDB for a job continuously triggers write traffic limiting, that is, the RocksDB write rate is not 0. This alarm is cleared when the RocksDB write rate of the job becomes 0.

The **rocksdb.actual-delayed-write-rate** parameter specifies the RocksDB write rate of a job. Value **0** indicates that the rate is not limited, and other values indicate traffic limiting.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45642	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
JobName	Specifies the job for which the alarm is generated.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

When the rate at which Flink jobs write data to RocksDB is not 0, write traffic limiting is triggered. The possible causes are as follows:

- There are too many MemTables. As a result, write traffic is limited or write stops, and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- The size of SST files at level 0 is too large, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether write traffic limiting or write stop is caused due to too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether write traffic limiting or write stop is caused due to too many SST files at level 0.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether write traffic limiting or write stop is caused because the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 13 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45642 RocksDB Continuously Triggers Write Traffic Limiting**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the native Yarn page.

Figure 9-20 Application ID of a job

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 16**.
- If no, go to **Step 18**.

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 9-21 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs.

   Figure 9-22 Clicking the ID in the Attempt ID column

   

   Figure 9-23 Clicking Logs

   NOTE

   You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 17 View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 18 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Step 19 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

9.11.393 ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the MemTable size of RocksDB for a job continuously exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.get.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the MemTable size of RocksDB for the job is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45643	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

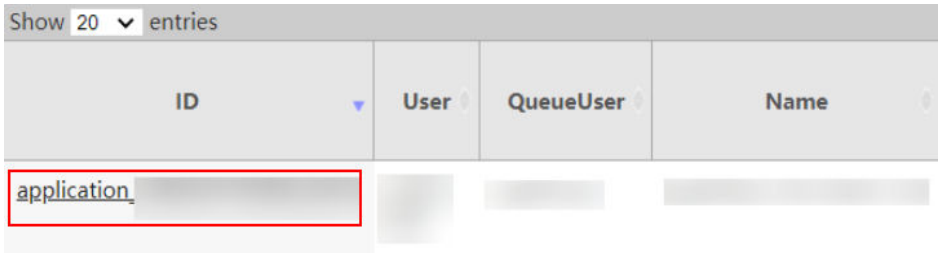
The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

The write pressure of RocksDB is high.

Handling Procedure

Check TaskManager logs for the write pressure of RocksDB and collect logs.



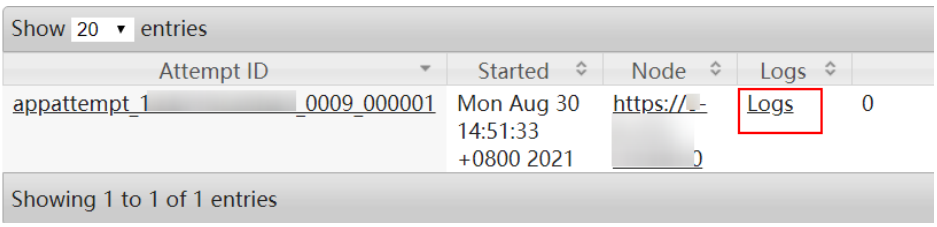
Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 9-24 Application ID of a job



- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

   Figure 9-25 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 7**.

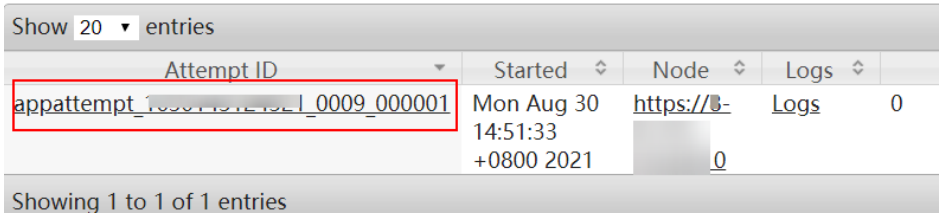

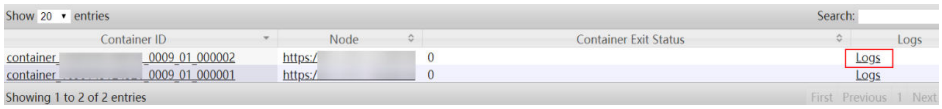

Figure 9-27 Clicking Logs

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Check whether the write pressure of RocksDB is high.

Step 7 Check whether the value of **rocksdb.size-all-mem-tables** (unit: byte) in the TaskManager monitoring logs (keyword **RocksDBMetricPrint**) is greater than or equal to the total write buffer size (Total write buffer = **write_buffer_size** x **max_write_buffer_number**).

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 8**.

Table 9-123 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.writebuffer.count	– 2 – **4**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Number of buffers – **2** to **10** are recommended. Adjust the value based on service requirements.
state.backend.rocksdb.writebuffer.size	64MB	– Buffer size – **64MB** to **256MB** are recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Value	Description
state.backend.rocksdb.thread.num	– 2 – **4**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Number of flush threads. Increase the number of threads to quickly flush memory data to disks. – When the number of threads is increased, the number of vCores also needs to be increased. – **2** to **10** are recommended.

- If no, go to **Step 9**.

Step 8 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45644	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

Possible causes are as follows:

- The compaction pressure of RocksDB is too high, and **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** are generated.
- There are too many SST files at level 0.

Handling Procedure

Check whether the compaction pressure of RocksDB is too high and ALM-45646 is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold-Crossing** .

Step 4 After ALM-45646 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the compaction pressure of RocksDB is too high and ALM-45647 is generated.

Step 5 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 7 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether there are too many SST files at level 0.

Step 8 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 9 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 10 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 11 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 9-28 Application ID of a job

Related Information

None.

9.11.395 ALM-45645 Pending Flush Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the number of pending flush requests of RocksDB for a job continuously reaches *n* times the number of flush/compaction threads. This alarm is cleared when the number of pending flush requests of RocksDB for the job is less than or equal to the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The number of flush/compaction threads is the value of **state.backend.rocksdb.thread.num**. The default value is **2**. If **SPINNING_DISK_OPTIMIZED_HIGH_MEM** is enabled, the default value is **4**.
- The **metrics.reporter.alarm.job.alarm.rocksdb.background.jobs.multiplier** parameter specifies *n* times the number of flush/compaction threads. The default value is **2**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45645	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

The number of pending flush requests of RocksDB for the Flink job is too large.

Handling Procedure

Check TaskManager logs for the number of pending flush requests and collect logs.

Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

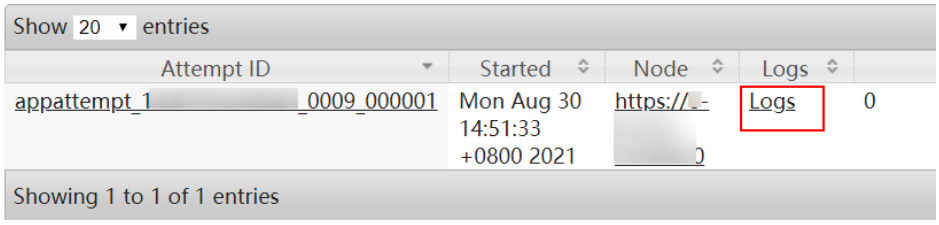
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45645 Pending Flush Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 9-32 Application ID of a job



- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

Figure 9-33 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 7**.

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 6 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Check whether there are too many pending flush requests.

Step 7 Check whether the sum of the values of **rocksdb.mem-table-flush-pending** and **rocksdb.compaction-pending** in TaskManager monitoring logs (keyword **RocksDBMetricPrint**) is greater than *n* times the number of RocksDB threads (**metrics.reporter.alarm.job.alarm.rocksdb.background.jobs.multiplier**, 2 by default). If it is, you can increase the number of RocksDB threads.

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 8**.

  Table 9-125 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.thread.num	– 2 – **4**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Number of flush threads. Increase the number of threads to quickly flush memory data to disks. – When the number of threads is increased, the number of vCores also needs to be increased. – **2** to **10** are recommended.

- If no, go to **Step 9**.

Step 8 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.396 ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the number of pending compaction requests of RocksDB for a job continuously reaches *n* times the number of flush/compaction threads. This alarm is cleared when the number of pending compaction requests of RocksDB for the job is less than or equal to the threshold.

- The number of flush/compaction threads is the value of **state.backend.rocksdb.thread.num**. The default value is **2**. If **SPINNING_DISK_OPTIMIZED_HIGH_MEM** is enabled, the default value is **4**.
- The **metrics.reporter.alarm.job.alarm.rocksdb.background.jobs.multiplier** parameter specifies *n* times the number of flush/compaction threads. The default value is **2**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45646	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

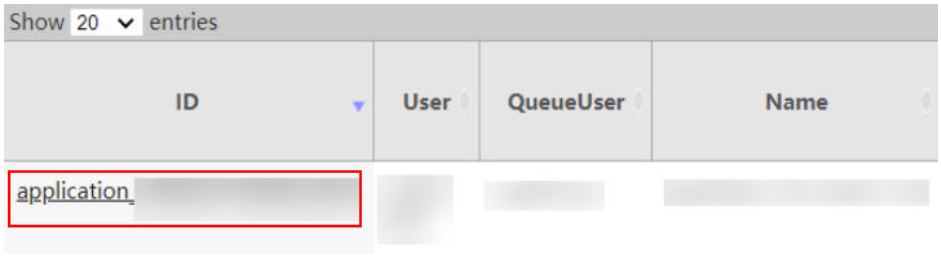
The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

The number of pending compaction requests of RocksDB for the Flink job is too large.

Handling Procedure

Check TaskManager logs for the number of pending compaction requests and collect logs.



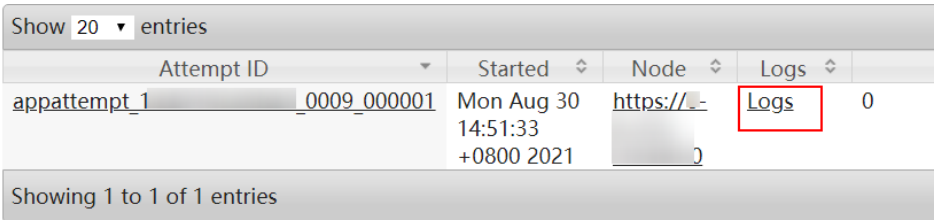
Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45646 Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 4 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 9-36 Application ID of a job



- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

9.11.397 ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the estimated pending compaction size of RocksDB for a job continuously exceeds the threshold. This alarm is cleared when the estimated pending compaction size of RocksDB for the job is less than or equal to the threshold.

The threshold of the estimated pending compaction size is the smaller value of the following two parameters:

- **state.backend.rocksdb.soft-pending-compaction-bytes-limit**. The default value is **64GB**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **state.backend.rocksdb.hard-pending-compaction-bytes-limit**. The default value is **256GB**.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45647	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

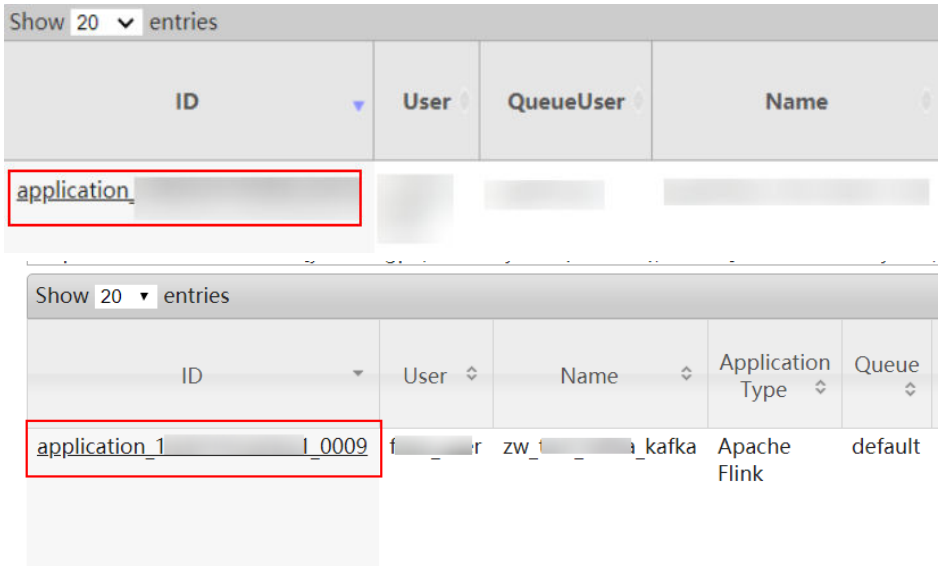
Possible Causes

The estimated compaction data size of RocksDB is too large.

Handling Procedure

Check TaskManager logs for the estimated compaction data size and collect logs.

Step 1 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.



Step 2 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 3 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

9.11.398 ALM-45648 RocksDB Frequently Encounters Write-Stopped

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when RocksDB for a job continuously encounters the **is-write-stopped** state. This alarm is cleared when RocksDB for the job no longer or does not continuously encounter the **is-write-stopped** state within an alarm reporting interval.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45648	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

The possible causes are as follows:

- There are too many MemTables and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- There are too many SST files at level 0, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether there are too many MemTables.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the number of SST files at level 0 is too large.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

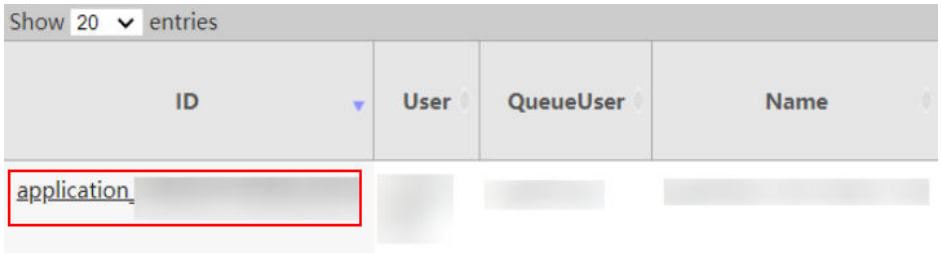
- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.



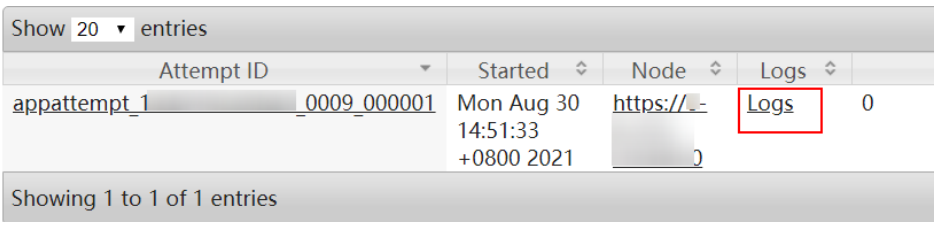
Step 12 Log in to Manager as a user who has the management permission for the current Flink job.

Step 13 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45648 RocksDB Frequently Encounters Write-Stopped**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 14 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 15 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 9-44 Application ID of a job



- If yes, go to **Step 16**.
- If no, go to **Step 18**.

Step 16 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

9.11.399 ALM-45649 P95 Latency of RocksDB Get Requests Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the P95 latency of RocksDB Get requests exceeds the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.get.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the P95 latency of RocksDB Get requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45649	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

The possible causes are as follows:

- There are too many SST files at level 0, causing slow queries. In addition, **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The cache hit ratio is lower than 60%, causing frequent swap-ins and swap-outs of the block cache.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check whether the number of SST files at level 0 is too large.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

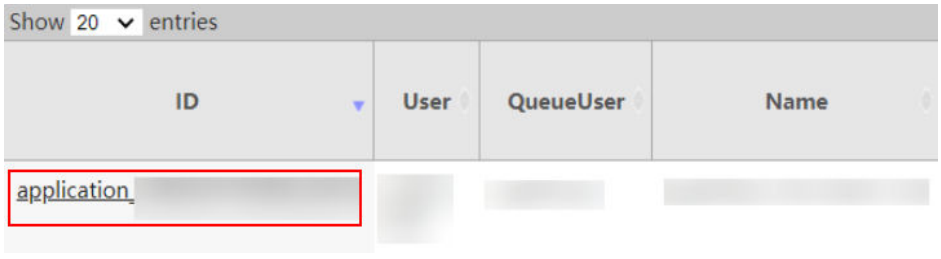
- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check the cache hit ratio in TaskManager logs and collect logs.



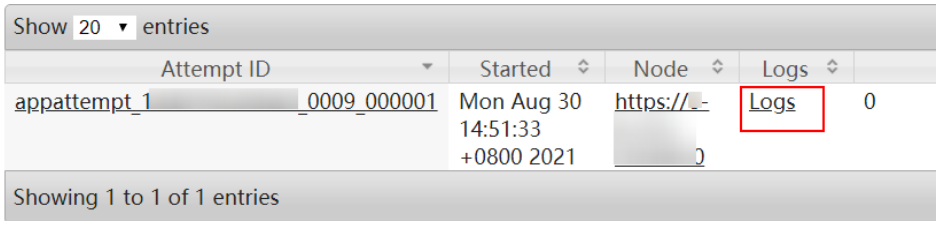
Step 5 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

Step 6 Choose **O&M** > **Alarm** > **Alarms** > **ALM-45649 P95 Latency of RocksDB Get Requests Continuously Exceeds the Threshold**, view **Location**, and obtain the name of the task for which the alarm is generated.

Step 7 Choose **Cluster** > **Services** > **Yarn** and click the link next to **ResourceManager WebUI** to go to the native Yarn page.

Step 8 Locate the abnormal task based on its name displayed in **Location**, search for and record the application ID of the job, and check whether the job logs are available on the Yarn page.

Figure 9-48 Application ID of a job



- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Click the application ID of the failed job to go to the job page.

1. Click **Logs** in the **Logs** column to view JobManager logs.

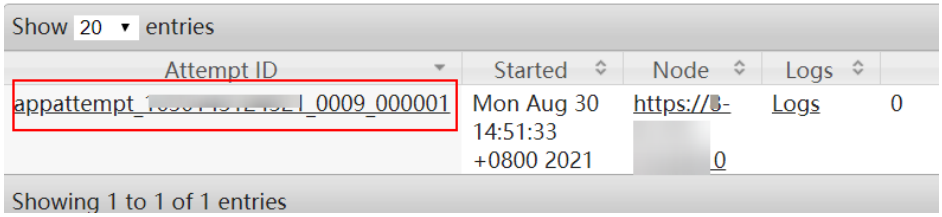
Figure 9-49 Clicking Logs

2. Click the ID in the **Attempt ID** column and click **Logs** in the **Logs** column to view and save TaskManager logs. Then go to **Step 11**.

Figure 9-50 Clicking the ID in the Attempt ID column



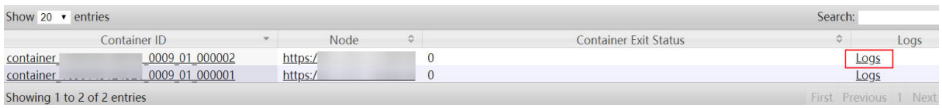


Figure 9-51 Clicking Logs

NOTE

You can also log in to Manager as a user who has the management permission for the current Flink job. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 10 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username*/**bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Check whether the cache hit ratio is too low.

Step 11 Check the values of **rocksdb.block.cache.hit** (cache hit) and **rocksdb.block.cache.miss** (cache miss) in TaskManager monitoring logs (keyword **RocksDBMetricPrint**). Calculate the hit ratio using the following formula and check whether it is less than 60%:

rocksdb.block.cache.hit/(rocksdb.block.cache.hit+rocksdb.block.cache.miss)

- If yes, adjust the values of the following custom parameters on the job development page of the Flink web UI, save the settings, and go to **Step 12**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 9-128 Custom parameters

Parameter	Default Value	Description
state.backend.rocksdb.block.cache-size	– 8MB – **256MB**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Cache size – **8MB** to **1GB** are recommended.
state.backend.rocksdb.block.blocksize	– 4KB – **128KB**: enables **SPINNING_DISK_OPTIMIZED_HIGH_MEM**.	– Block size – **4KB** to **256KB** are recommended.
state.backend.rocksdb.use-bloom-filter	false	– Whether to speed up indexing. If it is **true**, each new SST file will contain a Bloom filter. – **true** is recommended.

- If no, go to **Step 13**.

Step 12 Restart the job and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Step 13 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.400 ALM-45650 P95 Latency of RocksDB Write Requests Continuously Exceeds the Threshold

This section applies to MRS 3.3.0 or later.

Alarm Description

The system checks the RocksDB monitoring data of jobs at the user-specified alarm reporting interval (**metrics.reporter.alarm.job.alarm.rocksdb.metrics.duration**, 180s by default). This alarm is generated when the P95 latency of RocksDB write requests exceeds

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the threshold (**metrics.reporter.alarm.job.alarm.rocksdb.write.micros.threshold**, 50000 microseconds by default). This alarm is cleared when the P95 latency of RocksDB write requests is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45650	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
ApplicationName	Specifies the name of the application for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
JobName	Specifies the job for which the alarm is generated.

Impact on the System

The checkpoint performance of Flink jobs is affected. There is no impact on the FlinkServer.

Possible Causes

The possible causes are as follows:

- There are too many MemTables. As a result, write traffic is limited or write stops, and **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** is generated.
- There are too many SST files at level 0, and **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** is generated.
- The estimated compaction size exceeds the threshold, and **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** is generated.

Handling Procedure

Check whether write traffic limiting or write stop is caused due to too many MemTables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by following the instructions provided in section **ALM-45643 MemTable Size of RocksDB Continuously Exceeds the Threshold**.

Step 4 After ALM-45643 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the number of SST files at level 0 is too large.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by following the instructions provided in section **ALM-45644 Number of SST Files at Level 0 of RocksDB Continuously Exceeds the Threshold**.

Step 8 After ALM-45644 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the estimated compaction size exceeds the threshold.

Step 9 In the alarm list, check whether **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold** exists.

- If yes, go to **Step 10**.
- If no, go to **Step 12**.

Step 10 Handle the alarm by following the instructions provided in section **ALM-45647 Estimated Pending Compaction Size of RocksDB Continuously Exceeds the Threshold**.

Step 11 After ALM-45647 is cleared, wait a few minutes and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 12**.

Collect fault information.

Step 12 Log in to FusionInsight Manager as a user who has the FlinkServer management permission.

NOTE

You can also log in to Manager as a user who has the FlinkServer management permission. Choose **Cluster** > **Services** > **Flink**, and click the link next to **Flink WebUI**. On the displayed Flink web UI, click **Job Management**, click **More** in the **Operation** column, and select **Job Monitoring** to view TaskManager logs.

Step 17 View the job logs to rectify the fault, or contact the O&M personnel and send the collected fault logs. No further action is required.

If logs are unavailable on the Yarn page, download logs from HDFS.

Step 18 On Manager, choose **Cluster** > **Services** > **HDFS**, click the link next to **NameNode WebUI** to go to the HDFS page, choose **Utilities** > **Browse the file system**, and download logs in the **/tmp/logs/***Username***/bucket-logs-tfile/***Last four digits of the task application ID/Application ID of the task* directory.

Step 19 View the logs of the failed job to rectify the fault, or contact the O&M personnel and send the collected fault logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.401 ALM-45652 Flink Service Unavailable

This section applies to MRS 3.3.0 or later.

Alarm Description

The alarm module checks the Flink status every 60 seconds. This alarm is generated when the Flink service is unavailable. This alarm is cleared when the Flink service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45652	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the job for which the alarm is generated.

Impact on the System

Flink jobs cannot be submitted with FlinkServer and the Flink client.

Possible Causes

The ZooKeeper, HDFS, Yarn, KrbServer, or DBService service on which Flink depends is unavailable.

Handling Procedure

Check the alarm cause of **Flink Service Unavailable**.

If the alarm cause is ZooKeeper abnormality, check the ZooKeeper service on which Flink depends.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 In the alarm list, check whether "ALM-13000 ZooKeeper Service Unavailable" exists.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Handle the alarm by referring to **ALM-13000 ZooKeeper Service Unavailable**.

Step 4 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

If the alarm cause is HDFS abnormality, check the HDFS service on which Flink depends.

Step 5 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 6 In the alarm list, check whether "ALM-14000 HDFS Service Unavailable" exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

Step 7 Handle the alarm by referring to **ALM-14000 HDFS Service Unavailable**.

Step 8 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 9**.

If the alarm cause is YARN abnormality, check the YARN service on which Flink depends.

Step 9 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**.

Step 10 In the alarm list, check whether "ALM-18000 Yarn Service Unavailable" exists.

- If yes, go to **Step 11**.
- If no, go to **Step 13**.

Step 11 Handle the alarm by referring to **ALM-18000 Yarn Service Unavailable**.

Step 12 After the alarm is cleared, wait a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collect fault information.

Step 13 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 14 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 15 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

Step 16 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.402 ALM-45653 Invalid Flink HA Certificate File

This section applies to MRS 3.3.0 or later.

Alarm Description

Flink checks whether the HA certificate file is valid (whether the certificate exists and whether its format is correct) in the first health check or at 01:00:00 every day. This alarm is generated when the certificate file is invalid. This alarm is automatically cleared when the certificate file becomes valid again.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45653	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

FlinkServer in active/standby mode cannot provide services for external systems, and Flink jobs cannot be submitted on the FlinkServer.

Possible Causes

The HA certificate file is invalid.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45653 Invalid Flink HA Certificate File**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **ls -l** command to check whether the **server.crt** file exists.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Run the **openssl x509 -in server.crt -text -noout** command and check whether the command output is normal.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

Step 6 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin** command to go to the Flink script directory.

Step 7 Run the **sh proceed_ha_ssl_cert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 11 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.403 ALM-45654 Flink HA Certificate Is About to Expire

This section applies to MRS 3.3.0 or later.

Alarm Description

Flink checks whether the HA certificate file is about to expire in the first health check or at 01:00:00 every day. This alarm is generated when the remaining validity period is less than or equal to 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45654	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the certificate expires, the HA function of the FlinkServer in active/standby mode is affected. Flink jobs cannot be submitted on the FlinkServer. For FlinkServers in dual-active mode, the HA function is not affected.

Possible Causes

The HA certificate is about to expire.

Handling Procedure

View alarm information.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** > **ALM-45654 Flink HA Certificate Is About to Expire**, view **Location**, obtain the name of the host for which the alarm is generated, and click the host name to view its IP address.

Check whether the HA certificate file in the system is valid. If it is not, generate a new one.

Step 2 Log in to the host for which the alarm is generated as user **omm**.

Step 3 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/ha/local/cert** command to go to the directory where the HA certificate is stored.

Step 4 Run the **openssl x509 -noout -text -in server.crt** command to query the effective time and due time of the HA certificate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Perform **Step 6** to **Step 7** during off-peak hours to update the certificate file as needed.

Step 6 Run the **cd ${BIGDATA_HOME}/FusionInsight_Flink_*/install/FusionInsight-Flink-*/flink/sbin** command to go to the Flink script directory.

Step 7 Run the **sh proceed_ha_ssl_cert.sh** command to generate a new HA certificate. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 On the node where the standby FlinkServer instance is located, repeat **Step 6** to **Step 7**. Then, check whether the alarm is cleared 1 minute later.

- If yes, go to **Step 9**.
- If no, go to **Step 10**.

Step 9 Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 10**.
- If no, no further action is required.

Collect fault information.

Step 10 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 11 Expand the **Service** drop-down list, and select **Flink** for the target cluster.

Step 12 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 13 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.405 ALM-45736 Guardian Service Unavailable

Alarm Description

The alarm module checks the Guardian service status every 60 seconds. This alarm is generated if Guardian is unavailable.

This alarm is cleared after Guardian recovers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45736	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Guardian cannot work properly, and OBS cannot be accessed.

Possible Causes

- The HDFS service on which the Guardian service depends is abnormal.
- The TokenServer role instance is abnormal.

Handling Procedure

Check the HDFS service status.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the page that is displayed, check whether **ALM-14000 HDFS Service Unavailable** is reported.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

Step 2 Clear this alarm according to the alarm help provided for **ALM-14000 HDFS Service Unavailable**.

After the alarm is cleared, wait a few minutes and check whether the **Guardian Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Check all TokenServer instances.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Log in to the node where the TokenServer instance resides as user **omm** and run the **ps -ef|grep "guardian.token.server.Server"** command to check whether the TokenServer process exists on the node.

- If yes, go to **Step 5**.
- If no, restart the faulty TokenServer instance and go to **Step 4**.

Step 4 In the alarm list, check whether the **Guardian Service Unavailable** alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 7 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.406 ALM-45737 TokenServer Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the TokenServer service every 60 seconds. This alarm is generated when the heap memory usage of the TokenServer instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

This alarm is automatically cleared when the system detects that the heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45737	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the heap memory of the Guardian TokenServer instance overflows, OBS cannot be accessed.

Possible Causes

The heap memory of the TokenServer instance is overused or the heap memory is inappropriately allocated.

Handling Procedure

Check heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45737 TokenServer Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TokenServer Heap Memory Usage**. Then click **OK**.

Step 3 Check whether the heap memory used by TokenServer reaches the threshold (95% of the maximum heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** >

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

System. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TokenServer cannot meet the heap memory required by the TokenServer process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.407 ALM-45738 TokenServer Direct Memory Usage Exceeds the Threshold

Alarm Description

The system checks the direct memory usage of the TokenServer service every 60 seconds. This alarm is generated when the direct memory usage of the TokenServer instance exceeds the threshold (80% of the maximum memory) for five consecutive times.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is automatically cleared when the system detects that the TokenServer direct memory usage is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45738	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the direct memory of the Guardian TokenServer instance overflows, OBS cannot be accessed.

Possible Causes

The direct memory of the TokenServer process is overused or the direct memory is inappropriately allocated.

Handling Procedure

Check the direct memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45738 TokenServer Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Customize > **CPU and Memory** > **TokenServer Direct Memory Usage**. Then click **OK**.

Step 3 Check whether the direct memory used by TokenServer reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the direct memory configured for TokenServer cannot meet the direct memory required by the TokenServer process. You are advised to check the direct memory usage of TokenServer and change the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** to the twice of the direct memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer direct memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

9.11.408 ALM-45739 TokenServer Non-Heap Memory Usage Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the TokenServer service every 60 seconds. This alarm is generated when the non-heap memory usage of the TokenServer instance exceeds the threshold (80% of the maximum memory) for five consecutive times.

This alarm is automatically cleared when the system detects that the non-heap memory usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45739	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

If the non-heap memory of the Guardian TokenServer instance overflows, OBS cannot be accessed.

Possible Causes

The non-heap memory of the TokenServer instance is overused or the non-heap memory is inappropriately allocated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check non-heap memory usage.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45739 TokenServer Non-Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **CPU and Memory** > **TokenServer Non-Heap Memory Usage**. Then click **OK**.

Step 3 Check whether the non-heap memory used by TokenServer reaches the threshold (80% of the maximum non-heap memory by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** > **System**. Set **-XX: MaxPermSize** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the non-heap memory size configured for the TokenServer instance cannot meet the non-heap memory required by the TokenServer process. You are advised to change the value of **-XX:MaxPermSize** in **GC_OPTS** to twice that of the current non-heap memory size or change the value based on site requirements.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

9.11.409 ALM-45740 TokenServer GC Duration Exceeds the Threshold

Alarm Description

The system checks the GC duration of the TokenServer process every 60 seconds. This alarm is generated when the GC duration of the TokenServer process exceeds the threshold (12 seconds by default) for five consecutive times.

This alarm is automatically cleared when the system detects that the GC duration is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45740	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

TokenServer responds slowly, and OBS cannot be accessed.

Possible Causes

The heap memory of the TokenServer process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms** > **ALM-45740 TokenServer GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize** > **GC** > **TokenServer GC Duration**. Then click **OK**.

Step 3 Check whether the GC duration of the TokenServer process collected every minute exceeds the threshold (12 seconds by default).

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 On FusionInsight Manager, choose **Cluster** > **Services** > **Guardian**. On the page that is displayed, click the **Instance** tab. On this tab page, choose **TokenServer** > **Instance Configuration**. Click **All Configurations**, and choose **TokenServer** > **System**. Set **-Xmx** in the **GC_OPTS** parameter to a larger value based on site requirements and save the configuration.

NOTE

If this alarm is generated, the heap memory configured for TokenServer cannot meet the heap memory required by the TokenServer process. You are advised to change the value of **-Xmx** in **GC_OPTS** to twice that of the heap memory used by TokenServer. You can change the value based on the actual service scenario. Refer to **Step 2** to view the TokenServer heap memory usage.

Step 5 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

NOTICE

During service or instance restart, Guardian may fail to be accessed and jobs cannot access OBS.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 On FusionInsight Manager, choose **O&M** > **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **Guardian** for the destination cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.410 ALM-45741 Failed to Call the ECS securitykey API

NOTE

This section applies only to MRS 3.3.0 or later.

Alarm Description

Guardian caches the temporary AK/SK of the ECS agency. When the cache does not exist or is about to expire, Guardian calls the securitykey API of ECS to update the AK/SK. This alarm is generated when calling to the API fails.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45741	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, OBS cannot be accessed.

Possible Causes

- No ECS agency is bound to the cluster.
- An underlying interface of ECS is abnormal.

Handling Procedure

Check whether an agency is bound to the cluster.

Step 1 Log in to the MRS console.

Step 2 In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to **4**.
- If no, go to **3**.

Step 3 Click **Select Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to **4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Guardian** for the target cluster.

Step 6 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.411 ALM-45742 Failed to Call the ECS Metadata API

Alarm Description

When Guardian calls an IAM API to obtain the temporary AK/SK, it needs to first obtain related metadata via the ECS Metadata API. This alarm is generated when Guardian fails to call the Metadata API.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
45742	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

The task may fail to obtain the temporary AK/SK for accessing OBS. As a result, OBS cannot be accessed.

Possible Causes

An underlying interface of ECS is abnormal.

Handling Procedure

Collect fault information.

Step 1 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Expand the **Service** drop-down list, and select **Guardian** for the target cluster.

Step 3 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 4 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.413 ALM-47001 MemArtsCC Service Unavailable

Alarm Description

The system checks the status of the ZooKeeper service on which the MemArtsCC depends every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is automatically cleared when the ZooKeeper service is normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
47001	Critical	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Description
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The service will be unavailable.

Possible Causes

The ZooKeeper service on which the MemArtCC service depends is unavailable.

Handling Procedure

Handling ZooKeeper exceptions

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. On the ZooKeeper dashboard page, check whether the ZooKeeper service is faulty.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the ZooKeeper fault based on the error information and alarm information and the ZooKeeper help document.

Step 3 After the ZooKeeper service becomes normal, wait for 60 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **MemArtsCC** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and send the collected logs.

9.11.414 ALM-47002 MemArtsCC Disk Fault

Alarm Description

The alarm module checks the status of the local disk used by MemArtsCC every 60 seconds. This alarm is generated when the alarm module detects that the disk status is abnormal. This alarm is cleared when the disk becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
47002	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

MemArtsCC becomes abnormal or its performance deteriorates.

Possible Causes

The disk used by MemArtsCC is damaged or the permission is read-only.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, search for "ALM-47002 MemArtsCC Disk Fault", and locate the abnormal disk directory based on the alarm information.

Step 2 Contact O&M engineers to check whether the disk is faulty.

- If yes, replace the disk, restart the CCSideCar and CCWorker roles of the faulty node, and go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 4**.

Step 3 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **MemArtsCC** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.415 ALM-47003 Memory Usage of the MemArtsCC Worker Process Exceeds the Threshold

Alarm Description

The system checks the memory usage of the CCWorker process of the MemArtsCC component every 30 seconds. This alarm is generated when the memory usage exceeds the threshold.

This alarm is cleared when the system detects that the memory usage of CCWorker process is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
47003	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm is generated.
	ServiceName	Specifies the service for which the alarm is generated.
	RoleName	Specifies the role for which the alarm is generated.
	HostName	Specifies the host for which the alarm is generated.

Impact on the System

The CCWorker process process may restart, which temporarily reduces the cache hit ratio.

Possible Causes

There is more disk space added to CCWorker, there is a sudden increase in service data, or the workload increases significantly when upper-layer computing services (such as Spark, Hive, and HetuEngine) sent many concurrent requests to the MemArtsCC component.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, search for **ALM-47003 Memory Usage of the MemArtsCC Worker Process Exceeds the Threshold**, and locate the abnormal MemArtsCC instance node based on the alarm information. Obtain the alarm threshold in additional information.

Step 2 Choose **Cluster** > **Services** > **MemArtsCC** > **Configurations** > **All Configurations** > **CCWorker (Role)**, search for the **memory_limit** parameter, and check the maximum available memory of the CCWorker instance in the current cluster. Check whether the service concurrency and data volume increase for a long time and the alarm is not automatically cleared.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 This alarm can be ignored temporarily. After the service peak hours, the alarm will be automatically cleared.

Step 4 Increase the maximum available memory in **Step 2** and click Save.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **MemArtsCC** for the target cluster.

Step 8 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Contact O&M personnel and send the collected logs.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.416 ALM-47004 Average Latency of MemArtsCC Worker Read Requests Exceeds the Threshold

Alarm Description

The system checks the average latency of all read requests to the MemArtsCC Worker process component every 30 seconds. This alarm is generated when the average latency exceeds the limit.

This alarm is cleared when the latency of MemArtsCC Worker read requests is lower than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
47004	Major	Yes

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Category	Parameter	Description
	HostName	Specifies the host for which the alarm was generated.

Impact on the System

The cache performance may deteriorate.

Possible Causes

There is a soaring increase of concurrent requests sent by upper-layer computing services (such as Spark, Hive, and HetuEngine). Or, the service load or disk load increases significantly that even a fault occurs.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, search for **ALM-47004 Average Latency of MemArtsCC Worker Read Requests Exceeds the Threshold**, and locate the abnormal MemArtsCC instance node based on the alarm information. Obtain the alarm threshold in additional information.

Step 2 On the **Alarms** page, check whether a disk fault alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Contact O&M engineers to rectify the disk fault. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 4 Ignore the alarm. Check whether the alarm is cleared when service load goes down.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **MemArtsCC** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Contact O&M engineers and send the collected logs.

9.11.417 ALM-50201 Doris Service Unavailable

Alarm Description

The alarm module checks the Doris service status every 60 seconds. This alarm is generated when the alarm module detects that all FE and BE instances are abnormal.

This alarm is cleared when any FE or BE instance recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50201	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

FusionInsight Manager cannot be used to perform cluster operations on the Doris service, and Doris service functions are unavailable.

Possible Causes

The FE and BE instances are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Restart the Doris service.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Doris**.

Step 2 On the page that is displayed, click **More** and select **Restart Service**. In the displayed dialog box, verify the password and click **OK** to restart the Doris service. After the service is started, go to **Step 3**.

NOTICE

During the restart of the Doris service, the Doris service is unavailable and cannot provide services for external systems. Tasks connected to the Doris service fail.

Step 3 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

9.11.418 ALM-50202 FE CPU Usage Exceeds the Threshold

Alarm Description

The system checks the CPU usage of the FE instance every 30 seconds. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold (**95%** by default) for multiple consecutive times (**3** by default).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when **Trigger Count** is **1** and the CPU usage is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the CPU usage is less than or equal to 85% of the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50202	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

The alarm threshold or alarm trigger count is improperly configured.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **CPU Usage of FE (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

NOTE

Trigger Count specifies how many times the threshold can be hit before an alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

9.11.422 ALM-50207 Ratio of Connections to the FE MySQL Port to the Maximum Connections Allowed Exceeds the Threshold

Alarm Description

The system checks the number of MySQL port connections every 30 seconds. This alarm is generated when the ratio of the number of current connections to the maximum number of FE port connections exceeds the threshold (95% by default). The maximum number of FE port connections in the current cluster is specified by the **qe_max_connection** parameter. The default value is **1024**.

This alarm is cleared when the number of MySQL port connections on the FE node is less than or equal to the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50207	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- After the MySQL client is connected to Doris, the connection is not closed.
- A large number of services are concurrently connected to Doris.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M**, and click **Alarm** > **Thresholds** in the navigation pane on the left. Click the name of the desired cluster > **Doris** > **Connection** > **FE MySQL Port Connections (FE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

NOTE

If there are a large number of connections, ensure there are only necessary connections. Otherwise, the service performance may be degraded or even the service may be unavailable.

Step 4 Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.423 ALM-50208 Failures to Clear Historical Metadata Image Files Exceed the Threshold

Alarm Description

The system checks the number of failures to clear historical metadata image files on the FE node every 30 seconds. This alarm is generated when the number of failures exceeds the threshold (**1** by default).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the system detects that the number of failures is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50208	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Doris metadata occupies more and more disk space, which may cause service exceptions.

Possible Causes

The Doris service is abnormal.

Handling Procedure

Check whether the Doris service is normal.

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Doris**.

Step 2 Check whether **Running Status** of the Doris service is **Normal**.

- If yes, go to **Step 4**.
- If no, go to **Step 3**.

Step 3 If the service process is not started, start it first and check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 4**.

Step 4 Check whether other Doris-related alarms are generated in the cluster. If yes, clear them by referring to the alarm help. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

None.

9.11.424 ALM-50209 Failures to Generate Doris Metadata Image Files Exceed the Threshold

Alarm Description

The system checks the number of failures to generate metadata image files on the FE node every 30 seconds. This alarm is generated when the number of failures exceeds the threshold (**1** by default).

This alarm is cleared when the system detects that the number of failures is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Alarm Type	Service Type	Auto Cleared
50209	Minor	Error handling	Doris	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Category	Parameter	Description
Location Information	Source	Specifies the cluster or system for which the alarm was generated.
	ServiceName	Specifies the service for which the alarm was generated.
	RoleName	Specifies the role for which the alarm was generated.
	HostName	Specifies the host for which the alarm was generated.
Additional Information	Detail	Specifies the alarm triggering condition.

Impact on the System

The non-master FE node cannot receive the latest metadata image file. As a result, the system reliability deteriorates.

Possible Causes

When the checkpoint thread of the Doris FE detects that the FE heap memory usage exceeds 75% (70% for MRS 3.5.0-LTS or later), the thread determines that the write operation to the image file fails.

Handling Procedure

Check the Doris service status.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50209**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **CPU and Memory** from chart categories on the left, and check whether the value of **FE Heap Memory Usage Rate** exceeds 75%. The value is 70% for MRS 3.5.0-LTS and later versions.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Choose **Cluster** > **Service** > **Doris**, and click the **Configurations** tab. Search for **FE_GC_OPTS** in the search box, and increase the value of **-Xmx**. The default value is **8GB**.

- If this alarm is occasionally generated, increase the value by 50%. If this alarm is frequently generated, double the value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Click **Save**. Click **Instances**, select an FE instance whose configuration has expired, and choose **More** > **Restart Instance**.

NOTICE

During FE instance restart, the tasks running on FE nodes will fail. The tasks on FE nodes that are not restarted are not affected.

Step 5 After restart, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 8 Click the edit icon in the upper right corner, and select a time span starting 10 minutes before and ending 10 minutes after when the alarm was generated. Then, click **Download** to collect the logs.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

Related Information

9.11.425 ALM-50210 Maximum Compaction Score of All BE Nodes Exceeds the Threshold

Alarm Description

The system checks the maximum compaction score of all BE nodes every 30 seconds. This alarm is generated when the maximum compaction score exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50210	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Query or write may be delayed.

Possible Causes

The number of concurrent service requests is large in the cluster, or the compaction queue is small.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Performance** > **Maximum compaction score of all BE nodes (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Step 5 Choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **BE(Role)** > **Customization**, add the **max_base_compaction_threads** parameter to **be.conf** with a value of **10**, and add the **max_cumu_compaction_threads** parameter with a value **20**.

Step 6 Click **Save**. Click **Instances**, select the BE instances whose configuration has expired, click **More**, and select **Restart Instance** to restart the Doris BE instances.

NOTICE

During BE instance restart, the tasks running on BE nodes will fail. The tasks on BE nodes that are not restarted are not affected.

Step 7 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.426 ALM-50211 FE Queue Length of BE Periodic Report Tasks Exceeds the Threshold

Alarm Description

The system checks the queue length of each BE periodic report task on FE every 30 seconds. This alarm is generated when the queue length exceeds the threshold (10 by default). This value indicates the number of report tasks waiting on the master FE node. A large value indicates a poor FE processing capability.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the system detects that the queue length of BE periodic report tasks on FE is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50211	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The processing capability of FE is insufficient, affecting the service query speed.

Possible Causes

The processing capability of the master FE node is insufficient due to a large number of concurrent service requests in the Doris cluster or insufficient memory for FE processes.

Handling Procedure

Check the GC duration.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50211**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **JVM** from **Chart Category** on the left, and check whether **Accumulated GC duration of the old generation** of the FE process is greater than 3 seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **FE(Role)** > **JVM**, and increase the value of **-Xmx** in **FE_GC_OPTS**. The default value is **8GB**.

- If this alarm is generated occasionally, increase the value by 0.5 times. If this alarm is generated frequently, double the parameter value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 5 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Queue Length of BE Periodic Report Tasks on the FE (FE)**.

Step 6 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 7 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 8 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.427 ALM-50212 Accumulated Old-Generation GC Duration of the FE Process Exceeds the Threshold

Alarm Description

The system checks the accumulated old-generation GC duration of the FE process every 30 seconds. This alarm is generated when the accumulated GC duration exceeds the threshold (3000 ms by default).

This alarm is cleared when the system detects that the accumulated old-generation GC duration of the FE process is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50212	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A long GC duration of the FE process may interrupt the services.

Possible Causes

The heap memory of the FE process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Handling Procedure

Check the GC duration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50212**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and click the **Chart** tab of the instance.

Select **JVM** from **Chart Category** on the left, and check whether **Accumulated GC duration of the old generation** of the FE process is greater than 3 seconds.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **FE(Role)** > **JVM**, and increase the value of **-Xmx** in **FE_GC_OPTS**. The default value is **8G**.

- If this alarm is occasionally generated, increase the value by 0.5 times. If this alarm is frequently generated, double the value.
- In the case of large service volume and high service concurrency, you are advised to add instances.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

9.11.428 ALM-50213 Number of Tasks Queuing in the FE Thread Pool for Interacting with BE Exceeds the Threshold

Alarm Description

The system checks the number of queuing tasks in the FE thread pool for interacting with BE every 30 seconds. This alarm is generated when the number of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

queuing tasks exceeds the threshold (10 by default). This FE thread pool is the working thread pool of ThriftServer. It is specified by **rpc_port** in the **fe.conf** file and is used to interact with BE.

This alarm is cleared when the system detects that the number of tasks queuing in the FE thread pool for interacting with BE is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50213	Minor	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The read and write of the Doris service slows down.

Possible Causes

There are a large number of concurrent service requests, causing too many queuing tasks.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Number of tasks that are queuing in the thread pool for interaction between the FE and the BE (FE)**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.429 ALM-50214 Number of Tasks Queuing in the FE Thread Pool for Task Processing Exceeds the Threshold

Alarm Description

The system checks the number of queuing tasks in the FE thread pool for processing tasks every 30 seconds. This alarm is generated when the number of queuing tasks exceeds the threshold (10 by default). This thread pool is used by the NIO MySQL Server to process tasks.

This alarm is cleared when the system detects that the number of tasks queuing in the FE thread pool for processing tasks is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50214	Minor	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The task execution of the entire system becomes slow and blocked.

Possible Causes

Large tasks may block the task execution of the queue.

Handling Procedure

Check the execution status of FE tasks.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit **log /var/log/Bigdata/audit/doris/fe/fe.audit.log** to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 2 After connecting to Doris, run the following command to check whether the default value of **queryTimeout** is too large. The default value is **300** seconds.

show variables like 'query_timeout';

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Run the following command to shorten the timeout period based on site requirements to block the tasks that take a long time:

set global query_timeout=*xxx***;**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Queue Length of Query Execution Thread Pool (BE)**.

Step 5 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 6 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 7 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.430 ALM-50215 Longest Duration of RPC Requests Received by Each FE Thrift Method Exceeds the Threshold

Alarm Description

The system checks the longest duration of RPC requests received by each FE Thrift method every 30 seconds. This alarm is generated when the longest duration exceeds the threshold (5000 ms by default).

This alarm is cleared when the longest duration of RPC requests received by each FE Thrift method is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50215	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A longer RPC duration indicates a higher performance load and slower network request processing, which may cause service congestion.

Possible Causes

- The network has a latency.
- There are too many concurrent large SQL tasks.

Handling Procedure

Step 1 Log in to the host where the faulty node is deployed as user **root** and run **ping** *IP addresses of all Doris nodes* to check whether the peer host can be pinged.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the network administrator to restore the network.

Step 3 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL Port Connections** chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit **log /var/log/Bigdata/audit/doris/fe/fe.audit.log** to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 4 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Performance** > **Longest duration of RPC requests received by each method of the FE thrift interface (FE)**.

Step 5 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 7 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 9 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.431 ALM-50216 Memory Usage of the FE Node Exceeds the Threshold

Alarm Description

The system checks the memory usage of the FE node every 30 seconds. This alarm is generated when the memory usage exceeds the threshold (95% by default).

This alarm is cleared when the memory usage of the FE node falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50216	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Task execution and client connection to the FE are affected.

Possible Causes

The FE heap memory is too small.

Handling Procedure

Check the FE heap memory usage.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Memory usage of the FE node (FE)**.

1. Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
2. Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 2 Log in to the FE node for which the alarm is generated as user **omm**, run the **top** command to check the memory usage of processes, locate the process with high memory usage, and check whether the process belongs to the current service and is running properly.

- If yes, go to **Step 3**.
- If no, isolate or stop the process, or adjust the memory size, and check whether the memory is released.

Step 3 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- During the restart of the Doris service, the Doris service is unavailable and cannot provide services for external systems. Tasks connected to the Doris service fail.
- During instance restart, the tasks running on the nodes of the instance will fail. The tasks on instance nodes that are not restarted are not affected.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.432 ALM-50217 Heap Memory Usage of the FE Node Exceeds the Threshold

Alarm Description

The system checks the heap memory usage of the FE node every 30 seconds. This alarm is generated when the heap memory usage exceeds the threshold (95% by default).

This alarm is cleared when the heap memory usage of the FE node falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50217	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Task execution and client connection to the FE are affected.

Possible Causes

The FE heap memory is too small.

Handling Procedure

Check heap memory usage.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, select the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Heap memory usage of the FE node (FE)**.

1. Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.
2. Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris** > **FE** > **Configurations** > **All Configurations**, search for the **FE_GC_OPTS** parameter, increase the value of **-Xmx** as required, click **Save**, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If this alarm is generated, the heap memory configured for the current Doris instance is not enough for data transmission. You are advised to open the instance monitoring page, display the Doris heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Doris in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to approximately the same value to prevent performance deterioration caused by heap size adjustment after each GC.
- The sum of **-Xmx** and **XX:MaxPermSize** cannot be greater than the actual physical memory of the node server.

Step 3 Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

NOTICE

- During the restart of the Doris service, the Doris service is unavailable and cannot provide services for external systems. Tasks connected to the Doris service fail.
- During instance restart, the tasks running on the nodes of the instance will fail. The tasks on instance nodes that are not restarted are not affected.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.433 ALM-50219 Length of the Queue in the Thread Pool for Query Execution Exceeds the Threshold

Alarm Description

The system checks the length of the waiting queue in the query execution thread pool every 30 seconds. This alarm is generated when the length exceeds the threshold (20 by default).

This alarm is cleared when the length of the waiting queue in the current query execution thread pool is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50219	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The task execution of the entire system becomes slow and blocked.

Possible Causes

Large tasks may block the task execution of the queue.

Handling Procedure

Check the execution status of tasks.

Step 1 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris**. Click the **Chart** tab, select **Connection** from **Chart Category** in the left pane, and view the **FE MySQL**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Port Connections chart. If the number of connections is large, click **Instances**, select the FE instance, and click the **Chart** tab. Select **CPU and Memory** from **Chart Category** and view the **CPU Usage of FE** chart. If the CPU usage is high, check the **Time** field in FE audit **log /var/log/Bigdata/audit/doris/fe/fe.audit.log** to collect statistics on the average task duration. If the value is also high, the alarm is caused by large concurrent tasks.

Step 2 After connecting to Doris, run the following command to check the **queryTimeout** value of the system:

show variables like 'query_timeout';

If the value is too large, run the **set global query_timeout=*xxx*;** command to shorten the timeout interval and block tasks that last for a long time.

Step 3 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Queue** > **Queue Length of Query Execution Thread Pool (BE)**.

Step 4 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 5 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 6 Wait 10 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collect fault information.

Step 7 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 8 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 9 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 10 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.434 ALM-50220 Error Rate of TCP Packet Receiving Exceeds the Threshold

Alarm Description

The system checks the rate of TCP packet receiving errors every 30 seconds. This alarm is generated when the error rate exceeds the threshold (5% by default).

This alarm is cleared when the error rate is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50220	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The task fails or data is lost.

Possible Causes

The network is faulty, so data cannot be sent.

Handling Procedure

Step 1 Log in to the host where the faulty node is deployed as user **root** and run **ping** *IP addresses of all Doris nodes* to check whether the peer host can be pinged.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Contact the network administrator to restore the network.

Step 3 Wait for a while and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.435 ALM-50221 BE Data Disk Usage Exceeds the Threshold

Alarm Description

The system checks the usage of BE data disks every 30 seconds. This alarm is generated when the disk usage exceeds the threshold (95% by default).

This alarm is cleared when the system detects that the disk usage is less than the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50221	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

New data fails to be written, and the task is interrupted.

Possible Causes

- The disk space of the cluster is full.
- Data skew occurs among BE nodes.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, and view the role name and the IP address for the hostname in **Location**.

Step 2 Expand the disk capacity of the node for which the alarm is generated.

Step 3 Go to **Step 4** if the expansion fails or the alarm persists after the expansion.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 6 Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the abnormal host, and click **OK**.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.436 ALM-50222 Disk Status of a Specified Data Directory on BE Is Abnormal

Alarm Description

The system checks the disk status of a specified data directory on BE every 30 seconds. This alarm is generated when the disk status is not **1** (**1** indicates the normal state and **0** indicates the abnormal state). This alarm is cleared when the disk status of the specified data directory on BE becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50222	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Service data may be unavailable, and data queries on the Doris client may fail.

Possible Causes

- The hard disk is faulty.
- The disk permissions are set incorrectly.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Handling Procedure

Check whether a disk alarm is generated.

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Modify disk permissions.

Step 4 Choose **O&M** > **Alarm** > **Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

Step 5 Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission for the faulty disk is **711** and whether the user is **omm**.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

Step 6 Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

chown omm:wheel data1

chmod 711 data1

Step 7 Choose **Cluster** > **Services** > **Doris** > **Instances**, select this BE instance, click **More**, and select **Restart Instance**. Wait 5 minutes and check whether an alarm is generated.

- If no, no further action is required.
- If yes, go to **Step 8**.

NOTICE

During BE instance restart, the tasks running on BE nodes will fail. The tasks on BE nodes that are not restarted are not affected.

Collect fault information.

Step 8 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 9 Expand the **Service** drop-down list, and select **Doris** and **OMS** for the target cluster.

Step 10 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 11 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.437 ALM-50223 Maximum Memory Required by BE Is Greater Than the Remaining Memory of the Machine

Alarm Description

The system checks whether the maximum memory required by BE is greater than the available memory every 30 seconds. This alarm is generated when the value is not **1** (**1** indicates that the maximum required memory is less than or equal to the available memory, and **0** indicates that the maximum required memory is greater than the available memory).

This alarm is cleared when the maximum required memory is less than or equal to the available memory.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50223	Major	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A task may fail to apply for memory when running.

Possible Causes

Too much BE node memory has been occupied by other processes, or the maximum memory set for the BE service is too large.

Handling Procedure

Check whether the maximum memory set for the BE node is proper.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **CPU and Memory** > **Relationship between the maximum memory size of the BE and the remaining memory size of the machine (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Log in to the BE node for which the alarm is generated as user **omm**, run the **top** command to check the memory usage of processes, locate the process with high memory usage, and check whether the process belongs to the current service and is running properly.

- If yes, go to **Step 6**.
- If no, isolate or stop the process, or adjust the memory size, and check whether the memory is released.

Step 6 Log in to the BE node for which the alarm is generated as user **omm** and run the **free -g** command to check the total memory and remaining memory in the system and estimate the memory usage.

Step 7 On FusionInsight Manager, choose **Cluster** > **Services** > **Doris** > **Configurations** > **All Configurations** > **BE(Role)** > **Memory** and decrease the value of **mem_limit**. This parameter specifies the maximum memory allowed for BE. Then save the modification and restart the BE instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

During BE instance restart, the tasks running on BE nodes will fail. The tasks on BE nodes that are not restarted are not affected.

Step 8 After the BE instance is restarted, wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Collect fault information.

Step 9 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 10 Expand the **Service** drop-down list, and select **Doris** for the target cluster.

Step 11 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 12 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.438 ALM-50224 Failures a Certain Task Type on BE Are Increasing

Alarm Description

The system checks whether the number of failed tasks of a certain type on BE is increasing every 30 seconds. This alarm is generated when the system detects that the value is not **1** (**1** indicates that the number of failed tasks of a certain type does not increase, and **0** indicates that the failed tasks of a certain type are increasing).

This alarm is cleared when the system detects that the number of failed tasks of a certain type on BE does not increase.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50224	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

A task fails to be executed repeatedly in a certain scenario.

Possible Causes

A BE exception may occur. As a result, the number of failed tasks increases in a certain scenario.

Handling Procedure

Check whether the alarm threshold or alarm trigger count is properly configured.

Step 1 Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds**, click the name of the desired cluster, and choose **Doris** > **Exception** > **Check whether the number of failed tasks of a certain type increases (BE)**.

Step 2 Click the edit button next to **Trigger Count**, change the number based on site requirements, and click **OK**.

Step 3 Click **Modify** in the **Operation** column, change the alarm threshold based on site requirements, and click **OK**.

Step 4 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 6 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 7 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

You need to manually clear the alarm after the fault is rectified.

9.11.439 ALM-50225 FE Instance Fault

Alarm Description

The system checks the FE process status every 30 seconds. This alarm is generated when the value is greater than **0** (**0** indicates that the FE process is normal and **1** indicates that the FE process is abnormal).

This alarm is cleared when the system detects that the FE process becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50225	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The FE instance is unavailable and cannot respond to client requests.

Possible Causes

The FE instance is faulty or restarted.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50225**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the FE instance for which the alarm is generated, and check whether **Running Status** of the instance is **Restoring**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.440 ALM-50226 BE Instance Fault

Alarm Description

The system checks the BE process status every 30 seconds. This alarm is generated when the value is greater than **0** (**0** indicates that the BE process is normal and **1** indicates that the BE process is abnormal).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the system detects that the BE process becomes normal.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50226	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The BE instance is unavailable and cannot provide the data read and write functions.

Possible Causes

The BE instance is faulty or restarted.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**. In the alarm list, view the role name and obtain the IP address of the instance in **Location** of the alarm whose ID is **50226**.

Step 2 Choose **Cluster** > **Services** > **Doris** > **Instances**, click the BE instance for which the alarm is generated, and check whether **Running Status** of the instance is **Restoring**.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

Step 3 Wait 2 minutes and check whether the alarm is automatically cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 4**.

Collect fault information.

Step 4 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 5 Expand the **Service** drop-down list, select **Doris** for the target cluster, and click **OK**.

Step 6 Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 7 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.441 ALM-50401 Number of JobServer Jobs Waiting to Be Executed Exceeds the Threshold

Alarm Description

The system checks the number of jobs submitted to JobServer every 30 seconds. This alarm is generated when the number of jobs to be executed exceeds 800.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50401	Critical (default threshold: 900) Major (default threshold: 800)	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

Too many JobServer jobs are detected in the queue. For details about the queue usage, see the **Additional Information** field of this alarm. The impacts are as follows:

1. When the number of JobServer jobs in the queue reaches the maximum (1000 by default), new jobs cannot be added.
2. Before the number of JobServer jobs in the queue reaches the maximum, new JobServer jobs cannot be submitted quickly. For example, it takes more time (even hours) to submit added jobs or add new jobs to Yarn.

Possible Causes

Too many jobs are submitted instantaneously.

Handling Procedure

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **JobGateway**.

Step 2 Click the **Instances** tab, click **Add Instance**, and add JobServer instances based on the number of submitted jobs.

Step 3 After the instances are added, restart the JobGateway service.

NOTICE

The job functions of JobGateway will become unavailable during the service restart.

Step 4 Wait 5 minutes and check whether the alarm is automatically cleared.

If yes, no further action is required.

If no, go to **Step 5**.

Collect fault information.

Step 5 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 6 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 7 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 8 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.442 ALM-50402 JobGateway Service Unavailable

Alarm Description

The system checks the JobGateway service status every 60 seconds. This alarm is generated when the JobGateway service is abnormal.

This alarm is cleared when the JobGateway service recovers.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50402	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The job functions related to the JobGateway component may be unavailable. For example, jobs cannot be submitted, terminated, or viewed on the MRS management plane, and MRS job management APIs (V2) cannot be called.

Possible Causes

The node where the JobGateway service locates is faulty.

Handling Procedure

Step 1 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **JobGateway**, and click the **Instance** tab. Check for JobServer or JobBalancer instances that are faulty or not started and view the host names of these instances.

Step 2 On the **Alarm** page of FusionInsight Manager, check whether the **NodeAgent Process Is Abnormal** alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the host name in the alarm information is the same as the host name in **Step 1**.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

Step 4 Clear the alarm by following the instructions provided in **ALM-12006 NodeAgent Process Is Abnormal**.

Step 5 In the alarm list, check whether alarm **JobGateway Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

9.11.443 ALM-50406 Failure Rate of the JobServer Job Submission API Exceeds the Threshold

Alarm Description

The system checks the failure rate of the JobServer job submission API every 30 seconds. This alarm is generated when the failure rate exceeds the threshold (80% by default).

This alarm is cleared when the failure rate falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50406	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

A job may fail to be submitted, for example, through the REST API.

Possible Causes

The JobServer instance on the node is abnormal.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, expand details of this alarm in the right pane, and obtain **HostName** of the node for which the alarm is generated in **Location**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **JobGateway** > **Instances**.

Step 3 Select the instance for which the alarm is generated, click **More**, and select **Instance Rolling Restart**.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

Step 4 Check whether the instance running status is normal after the restart.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 8 Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.444 ALM-50407 Failure Rate of the JobServer Job Query API Exceeds the Threshold

Alarm Description

The system checks the failure rate of the JobServer job query API every 30 seconds. This alarm is generated when the failure rate exceeds the threshold (80% by default).

This alarm is cleared when the failure rate falls below the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50407	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

A job may fail to be queried, for example, through the REST API.

Possible Causes

The JobServer instance on the node is abnormal.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, expand details of this alarm in the right pane, and obtain **HostName** of the node for which the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **JobGateway** > **Instances**.

Step 3 Select the instance for which the alarm is generated, click **More**, and select **Instance Rolling Restart**.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

Step 4 Check whether the instance running status is normal after the restart.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.445 ALM-50408 Failure Rate of the JobServer Job Termination API Exceeds the Threshold

Alarm Description

The system checks the failure rate of the JobServer job termination API every 30 seconds. This alarm is generated when the failure rate exceeds the threshold (80% by default).

This alarm is cleared when the failure rate falls below the threshold.

Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
50408	Critical	Yes

Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

Impact on the System

A job may fail to be terminated, for example, through the REST API.

Possible Causes

The JobServer instance on the node is abnormal.

Handling Procedure

Step 1 On FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, expand details of this alarm in the right pane, and obtain **HostName** of the node for which the alarm is generated in **Location**.

Step 2 On FusionInsight Manager, choose **Cluster** > **Services** > **JobGateway** > **Instances**.

Step 3 Select the instance for which the alarm is generated, click **More**, and select **Instance Rolling Restart**.

NOTE

Services may be affected or interrupted during the restart. You are advised to perform the restart during off-peak hours.

Step 4 Check whether the instance running status is normal after the restart.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Collect fault information.

Step 6 On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

Step 7 Expand the **Service** drop-down list, and select **JobGateway** for the target cluster.

Step 8 Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

Step 9 Send the collected fault logs to O&M personnel for help.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

Related Information

None.

9.11.446 ALM-12001 Audit Log Dump Failure (For MRS 2.*x* or Earlier)

Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. Audit logs can be successfully dumped if the dump server meets the configuration conditions. This alarm is generated when the audit log dump fails because the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12001	Minor	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system can only store a maximum of 50 dump files locally. If the fault persists on the dump server, the local audit log may be lost.

Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The disk space of the dump directory is insufficient.

Procedure

Step 1 Check whether the username, password, and dump directory are correct.

1. Check on the dump configuration page of MRS Manager to see if they are correct.
   - If yes, go to **Step 3**.
   - If no, go to **Step 1.2**.
2. Change the username, password, or dump directory, and click **OK**.
3. Wait 2 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Reset the dump rule.

1. On MRS Manager, choose **System** > **Dump Audit Log**.
2. Reset dump rules, set the parameters properly, and click **OK**.
3. Wait 2 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.447 ALM-12002 HA Resource Abnormal (For MRS 2.*x* or Earlier)

Description

The high availability (HA) software periodically checks the WebService floating IP addresses and databases of Manager. This alarm is generated when the HA software detects that the WebService floating IP addresses or databases are abnormal.

This alarm is cleared when the HA software detects that the floating IP addresses or databases are normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12002	Major	Yes

Parameter

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
RESName	Specifies the resource for which the alarm is generated.

Impact on the System

If the WebService floating IP addresses of Manager are abnormal, users cannot log in to or use Manager. If databases of Manager are abnormal, all core services and related service processes, such as alarms and monitoring functions, are affected.

Possible Causes

- The floating IP address is abnormal.
- The database is abnormal.

Procedure

Step 1 Check the floating IP address status of the active management node.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address and resource name of the alarm.
2. Log in to the active management node. Run the following commands to switch the user:

   sudo su - root

   su - omm
3. Go to the **${BIGDATA_HOME}/om-0.0.1/sbin/** directory, run the **status-oms.sh** script to check whether the floating IP address of the active Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

   Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
10-10-10-160 floatip Normal Normal Single_active
```

- If yes, go to **Step 2**.
- If no, go to **Step 1.4**.

4. Contact the O&M personnel to check whether the floating IP NIC exists.
   - If yes, go to **Step 2**.
   - If no, go to **Step 1.5**.
5. Contact O&M personnel to rectify the NIC fault.

   Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Check the database status of the active and standby management nodes.

1. Log in to the active and standby management nodes, run the **sudo su - root** and **su - ommdba** commands to switch to user **ommdba**, and run the **gs_ctl query** command to check whether the following information is displayed in the command output.

   Command output of the active management node:

   ```
   Ha state:
   LOCAL_ROLE: Primary
   STATIC_CONNECTIONS: 1
   DB_STATE: Normal
   DETAIL_INFORMATION: user/password invalid
    Senders info:
   No information
    Receiver info:
   No information
   ```

   Command output of the standby management node:

   ```
   Ha state:
   LOCAL_ROLE: Standby
   STATIC_CONNECTIONS: 1
   DB_STATE : Normal
   DETAIL_INFORMATION: user/password invalid
    Senders info:
   No information
    Receiver info:
   No information
   ```

   - If yes, go to **Step 2.3**.
   - If no, go to **Step 2.2**.
2. Contact the O&M personnel to check whether a network fault occurs and rectify the fault.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.448 ALM-12004 OLdap Resource Abnormal (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the Ldap resource in Manager is abnormal.

This alarm is cleared when the Ldap resource in Manager recovers and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12004	Major	Yes

Parameter

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Manager authentication services are unavailable and cannot provide security authentication and user management functions for web upper-layer services. Users may be unable to log in to Manager.

Possible Causes

The LdapServer process in Manager is abnormal.

Procedure

Step 1 Check whether the LdapServer process in Manager is normal.

1. Log in to the active management node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Run **ps -ef | grep slapd** to check whether the LdapServer resource process in the **${BIGDATA_HOME}/om-0.0.1/** directory of the configuration file is running properly.

   You can determine that the resource is normal as follows:

   a. Run **sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh** and find that **ResHAStatus** of the OLdap process is **Normal**.

   b. Run **ps -ef | grep slapd** and find that the slapd process occupies port 21750.

   – If yes, go to **Step 2**.

   – If no, go to **Step 3**.

Step 2 Run **kill -2** *PID of the LdapServer process* and wait 20 seconds. The HA starts the OLdap process automatically. Check whether the status of the OLdap resource is normal.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.449 ALM-12005 OKerberos Resource Abnormal (For MRS 2.*x* or Earlier)

Description

The alarm module monitors the status of the Kerberos resource in Manager. This alarm is generated when the Kerberos resource is abnormal.

This alarm is cleared when the alarm handling is complete and the Kerberos resource status recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12005	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to MRS Manager.

Possible Causes

The OLdap resource on which OKerberos depends is abnormal.

Procedure

Step 1 Check whether the OLdap resource on which OKerberos depends is abnormal in Manager.

1. Log in to the active management node.
2. Run the following command to check whether the OLdap resource managed by HA is normal:

   sh ${BIGDATA_HOME}/OMSV100R001C00x8664/workspace0/ha/module/hacom/script/status_ha.sh

   The OLdap resource is normal when the OLdap resource is in the **Active_normal** state on the active node and in the **Standby_normal** state on the standby node.

   - If yes, go to **Step 3**.
   - If no, go to **Step 2**.

Step 2 Resolve the problem by following the instructions in **ALM-12004 OLdap Resource Abnormal (For MRS 2.x or Earlier)**. After the OLdap resource status recovers, check whether the OKerberos resource is normal.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.450 ALM-12006 Node Fault (For MRS 2.*x* or Earlier)

Description

Controller checks the NodeAgent status every 30 seconds. This alarm is generated when Controller fails to receive the status report of a NodeAgent for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12006	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Services on the node are unavailable.

Possible Causes

The network is disconnected, or the hardware is faulty.

Procedure

Step 1 Check whether the network is disconnected or the hardware is faulty.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address of the alarm.
2. Log in to the active management node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Run the following command to check whether the faulty node is reachable:

   ping *IP address of the faulty host*

   a. If yes, go to **Step 2**.

   b. If no, go to **Step 1.4**.

4. Contact the O&M personnel to check whether the network is faulty.
   - If yes, go to **Step 2**.
   - If no, go to **Step 1.6**.
5. Rectify the network fault and check whether the alarm is cleared from the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 1.6**.
6. Contact the O&M personnel to check whether a hardware fault (for example, a CPU or memory fault) occurs on the node.
   - If yes, go to **Step 1.7**.
   - If no, go to **Step 2**.
7. Repair the faulty components and restart the node. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.451 ALM-12007 Process Fault (For MRS 2.*x* or Earlier)

Description

The process health check module checks the process status every 5 seconds. This alarm is generated when the process health check module detects that the process connection status is Bad for three consecutive times.

This alarm is cleared when the process can be connected.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12007	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The service provided by the process is unavailable.

Possible Causes

- The instance process is abnormal.
- The drive space is insufficient.

Procedure

Step 1 Check whether the instance process is abnormal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host name and service name of the alarm.
2. On the **Alarms** page, check whether the alarm **ALM-12006 Node Fault (For MRS 2.x or Earlier)** is generated.

   If yes, go to **Step 1.3**.

   If no, go to **Step 1.4**.
3. Handle the alarm by following the instructions in **ALM-12006 Node Fault (For MRS 2.x or Earlier)**.
4. Check whether the installation directory user, user group, and permission of the alarm role are correct. The correct user, user group, and the permission are **omm**, **ficommon**, and **750**, respectively.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 1.5**.
5. Run the following commands to set the permission to **750** and **User:Group** to **omm:ficommon**:

   chmod 750 *<folder_name>*

   chown omm:ficommon *<folder_name>*
6. Wait 5 minutes and check whether the ALM-12007 Process Fault alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Check whether the disk space is insufficient.

1. On the MRS cluster details page, click the alarm management tab and check whether ALM-12017 Insufficient Disk Capacity is generated in the alarm list.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 3**.
2. Handle the alarm by following the instructions in **ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier)**.
3. Wait 5 minutes and check whether the ALM-12017 Insufficient Disk Capacity alarm is cleared.

   If yes, go to **Step 2.4**.

   If no, go to **Step 3**.
4. Wait 5 minutes and check whether the alarm is cleared.

   If yes, no further action is required.

   If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.452 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the active Manager does not receive any heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12010	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local Manager HA Name	Specifies a local Manager HA.
Peer Manager HA Name	Specifies a peer Manager HA.

Impact on the System

When the active Manager process is abnormal, an active/standby failover cannot be performed, and services are affected.

Possible Causes

The link between the active and standby Manager servers is abnormal.

Procedure

Step 1 Check whether the network between the active and standby Manager servers is normal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the standby Manager server.
2. Log in to the active management node.
3. Run the following command to check whether the standby Manager is reachable:

   ping *heartbeat IP address of the standby Manager*

   - If yes, go to **Step 2**.
   - If no, go to **Step 1.4**.
4. Contact the O&M personnel to check whether the network is faulty.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Rectify the network fault and check whether the alarm is cleared from the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Log in to all Master nodes in the cluster and run the following commands to find all **sed** files and delete them:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

find /srv/BigData/ -name "sed*"

find /opt -name "sed*"

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.453 ALM-12011 Data Synchronization Exception Between the Active and Standby Manager Nodes (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12011	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local Manager HA Name	Specifies a local Manager HA.
Peer Manager HA Name	Specifies a peer Manager HA.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Because the configuration files on the standby Manager are not updated, some configurations will be lost after an active/standby switchover. Manager and some components may not run properly.

Possible Causes

The link between the active and standby Manager nodes is interrupted.

Procedure

Step 1 Check whether the network between the active and standby Manager servers is normal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the standby Manager server.
2. Log in to the active management node. Run the following command to check whether the standby Manager is reachable:

   ping *IP address of the standby Manager*

   - If yes, go to **Step 2**.
   - If no, go to **Step 1.3**.
3. Contact the O&M personnel to check whether the network is faulty.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2**.
4. Rectify the network fault and check whether the alarm is cleared from the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.454 ALM-12012 NTP Service Abnormal (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the NTP service on the current node fails to synchronize time with the NTP service on the active OMS node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the NTP service on the current node synchronizes time properly with the NTP service on the active OMS node.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12012	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The time on the node is inconsistent with that on other nodes in the cluster. Therefore, some MRS applications on the node may not run properly.

Possible Causes

- The NTP service on the current node cannot start properly.
- The current node fails to synchronize time with the NTP service on the active OMS node.
- The key value authenticated by the NTP service on the current node is inconsistent with that on the active OMS node.
- The time offset between the node and the NTP service on the active OMS node is large.

Procedure

Step 1 Check the NTP service on the current node.

1. Check whether the ntpd process is running on the node using the following method. Log in to the node for which the alarm is generated and run the **sudo su - root** command to switch to user **root**. Then run the following command to check whether the command output contains the ntpd process:

   ps -ef | grep ntpd | grep -v grep

   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Run **service ntp start** to start the NTP service.
3. Wait 10 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check whether the current node can synchronize time properly with the NTP service on the active OMS node.

1. Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

   If yes, go to **Step 2.2**.

   If no, go to **Step 3**.
2. Check whether the synchronization with the NTP service on the active OMS node is faulty.

   Log in to the node for which the alarm is generated, run the **sudo su - root** command to switch to user **root**, and run the **ntpq -np** command.

   If an asterisk (*) exists before the IP address of the NTP service on the active OMS node in the command output, the synchronization is in normal state. The command output is as follows:

   ```
   remote refid st t when poll reach delay offset jitter
   ==============================================================================
   *10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
   ```

   If there is no asterisk (*) before the IP address of the NTP service on the active OMS node, as shown in the following command output, and the value of **refid** is **.INIT.**, the synchronization is abnormal.

   ```
   remote refid st t when poll reach delay offset jitter
   ==============================================================================
   10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
   ```

   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
3. Rectify the fault, wait 10 minutes, and then check whether the alarm is cleared.

   An NTP synchronization failure is usually related to the system firewall. If the firewall can be disabled, disable it and then check whether the fault is rectified. If the firewall cannot be disabled, check the firewall configuration policies and ensure that port **UDP 123** is enabled (you need to follow specific firewall configuration policies of each system).

   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Check whether the key value authenticated by the NTP service on the current node is consistent with that on the active OMS node.

Run **cat** to check whether the authentication code whose key value index is 1 is the same as the value of the NTP service on the active OMS node.

- If yes, go to **Step 4.1**.
- If no, go to **Step 5**.

Step 4 Check whether the time offset between the node and the NTP service on the active OMS node is large.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Check whether the time offset is large in additional information of the alarm.
   - If yes, go to **Step 4.2**.
   - If no, go to **Step 5**.
2. On the **Hosts** page, select the host of the node, and choose **More** > **Stop All Roles** to stop all the services on the node.

   If the time on the alarm node is later than that on the NTP service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More** > **Start All Roles** to start the services on the node.

   If the time on the alarm node is earlier than that on the NTP service of the active OMS node, wait until the time offset is due and adjust the time of the alarm node. After adjusting the time, choose **More** > **Start All Roles** to start the services on the node.

   NOTE

   If you do not wait, data loss may occur.
3. Wait 10 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.455 ALM-12014 Device Partition Lost (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12014	Major	• Yes: MRS 1.9.3.10 and later patch versions • No: MRS 2.*x* and earlier versions

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

- The disk is removed.
- The disk is offline, or a bad sector exists on the disk.

Procedure

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the row that contains the alarm.

Step 3 In the **Alarm Details** area, obtain the values of **HostName**, **PartitionName**, and **DirName** from **Location**.

Step 4 Check whether the disk corresponding to **PartitionName** on **HostName** is inserted to the correct server slot.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Contact hardware engineers to remove the faulty disk.

Step 6 Use PuTTY to log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Run the **vi /etc/fstab** command to edit the file and delete the line containing **DirName**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.

Step 9 Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.

- If yes, perform **Step 10** for MRS 1.9.3.10 or later. For other versions, clear the alarm. No further action is required.
- If no, perform **Step 11**.

Step 10 Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, perform **Step 11**.

Step 11 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

MRS 1.9.3.10 and later patch versions: After the fault is rectified, the system automatically clears the alarm.

MRS 2.*x* and earlier versions: After the fault is rectified, the system does not automatically clear the alarm. You need to clear the alarm.

Reference

None

9.11.456 ALM-12015 Device Partition File System Read-Only (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

Attribute

Alarm ID	Alarm Severity	Auto Clear
12015	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

Possible Causes

The disk is faulty, for example, a bad sector exists.

Procedure

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the row that contains the alarm.

Step 3 In the **Alarm Details** area, obtain **HostName** and **PartitionName** from **Location**. **HostName** indicates the node for which the alarm is generated, and **PartitionName** indicates the partition of the faulty disk.

Step 4 Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.

Step 5 After the disk is removed, the system reports ALM-12014 Partition Lost. Handle the alarm by following the instructions in **ALM-12014 Device Partition Lost (For MRS 2.x or Earlier)**. After the handling, the alarm is automatically cleared.

9.11.457 ALM-12016 CPU Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the CPU usage every 30 seconds and compares the check result with the default threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

This alarm is cleared when the average CPU usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12016	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

- The alarm threshold or alarm hit number is improperly configured.
- The CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit.

Procedure

Step 1 Check whether the alarm threshold or alarm hit number is properly configured.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Log in to MRS Manager and change the alarm threshold and alarm hit number based on CPU usage.
2. Choose **System** > **Threshold Configuration** > **Device** > **Host** > **CPU** > **CPU Usage** > **CPU Usage** and change the alarm threshold based on the actual CPU usage.
3. Choose **System** > **Threshold Configuration** > **Device** > **Host** > **CPU** > **CPU Usage** > **CPU Usage** and change **hit number** based on the actual CPU usage.

   NOTE

   This option defines the alarm check phase. **Interval** indicates the alarm check period and **hit number** indicates the number of times when the CPU usage exceeds the threshold. An alarm is generated when the CPU usage exceeds the threshold for several times consecutively.
4. Wait 2 minutes and check whether the alarm is automatically cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Expand the system.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the node.
2. Log in to the node for which the alarm is generated.
3. Run **cat /proc/stat | awk 'NR==1'|awk '{for(i=2;i<=NF;i++)j+=$i;print "" 100 - ($5+$6) * 100 / j;}'** to check the system CPU usage.
4. If the CPU usage exceeds the threshold, expand the CPU capacity.
5. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.11.458 ALM-12017 Insufficient Disk Capacity (For MRS 2.*x* or Earlier)

Description

The system checks the host disk usage every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated if the disk usage exceeds the threshold.

To change the threshold, choose **System** > **Threshold Configuration**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the host disk usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12017	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Service processes become unavailable.

Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

Procedure

Step 1 Log in to MRS Manager and check whether the threshold is appropriate.

1. The default threshold is 90%. You can change the threshold to meet service requirements.
   - If yes, go to **Step 2**.
   - If no, go to **Step 1.2**.
2. Choose **System** > **Threshold Configuration** and change the alarm threshold based on the actual disk usage.
3. Wait 2 minutes and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 2**.

Step 2 Check whether the disk is a system disk.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host name and disk partition information.
2. Log in to the node for which the alarm is generated.
3. Run the **df -h** command to check the system disk partition usage. Check whether the disk is mounted to any of the following directories by using the disk partition name obtained in **Step 2.1**: **/**, **/boot**, **/home**, **/opt**, **/tmp**, **/var**, **/var/log**, **/boot**, and **/srv/BigData**.
   - If yes, the disk is a system disk. Then go to **Step 3.1**.
   - If no, the disk is not a system disk. Then go to **Step 2.4**.
4. Run the **df -h** command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in **Step 2.1**.
5. Check whether the disk is used by HDFS or Yarn.
   - If yes, expand the disk capacity for the Core node. Then go to **Step 2.6**.
   - If no, go to **Step 4**.
6. Wait 2 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Check whether large files are written to the disk.

1. Run the **find / -xdev -size +500M -exec ls -l {} \;** command to view files larger than 500 MB on the node. Check whether such files are written to the disk.
   - If yes, go to **Step 3.2**.
   - If no, go to **Step 4**.
2. Handle the large files and check whether the alarm is cleared 2 minutes later.
   - If yes, no further action is required.
   - If no, go to **Step 4**.
3. Expand the disk capacity.
4. Wait 2 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.459 ALM-12018 Memory Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the memory usage every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold. This alarm is generated when the detected memory usage exceeds the threshold.

This alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12018	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Processes respond slowly or do not work.

Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper threshold.

Procedure

Step 1 Expand the system.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address of the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Log in to the node for which the alarm is generated.
3. Run **free -m | grep Mem\: | awk '{printf("%s,", ($3-$6-$7) * 100 / $2)}'** to check the system memory usage.
4. If the memory usage exceeds the threshold, expand the memory capacity.
5. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.460 ALM-12027 Host PID Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default threshold. This alarm is generated when the PID usage exceeds the threshold.

This alarm is cleared when the host PID usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12027	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

No PID is available for new processes and service processes are unavailable.

Possible Causes

Too many processes are running on the node. You need to increase the value of **pid_max**. The system is abnormal.

Procedure

Step 1 Increase the value of **pid_max**.

1. On the MRS cluster details page, click the alarm from the real-time alarm list. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.
2. Log in to the node for which the alarm is generated.
3. Run the **cat /proc/sys/kernel/pid_max** command to check the value of **pid_max**.
4. If the PID usage exceeds the threshold, open the **/etc/sysctl.conf** file and change the value of **kernel.pid_max** to twice the value of **pid_max** queried in **Step 1.3**. If **kernel.pid_max** does not exist, add it to the end of the file.

   For example, change the parameter value to **kernel.pid_max=65536** and run the following command to make the parameter take effect immediately:

   sysctl -p

   NOTE

   The maximum value of **kernel.pid_max** is as follows:
   - 32-bit OS: **32768**
   - 64-bit OS: **4194304** (22nd power of 2)
5. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Check whether the system environment is abnormal.

1. Contact the O&M personnel to check whether the operating system is abnormal.
   - If yes, rectify the operating system fault and go to **Step 2.2**.
   - If no, go to **Step 3**.
2. Wait 5 minutes and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.461 ALM-12028 Number of Processes in the D State on the Host Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system periodically checks the number of D state processes of user **omm** on the host every 30 seconds and compares the number with the threshold. The number of processes in the D state on the host has a default threshold. This alarm is generated when the number of processes in the D state exceeds the threshold.

This alarm is cleared when the number is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12028	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

Excessive system resources are used and the service process responds slowly.

Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and a process is in the D state.

Procedure

Step 1 Check the process that is in the D state.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the host.
2. Log in to the node for which the alarm is generated.
3. Run the following commands to switch the user:

   sudo su - root

   su - omm
4. Run the following command as user **omm** to view the PID of the process that is in the D state:

   ps -elf | grep -v "\[thread_checkio\]" | awk 'NR!=1 {print $2, $3, $4}' | grep omm | awk -F' ' '{print $1, $3}' | grep D | awk '{print $2}'
5. Check whether the command output is empty.
   - If yes, the service process is running properly. Then go to **Step 1.7**.
   - If no, go to **Step 1.6**.
6. Switch to user **root** and run the **reboot** command to restart the alarm host.

   Restarting the host brings certain risks. Ensure that the service process runs properly after the restart.
7. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.11.462 ALM-12031 User omm or Password Is About to Expire (For MRS 2.*x* or Earlier)

Description

The system starts at 00:00 every day to check whether user **omm** and the password are about to expire every eight hours. This alarm is generated if the user or password is about to expire in 15 days.

The alarm is cleared when the validity period of user **omm** is changed or the password is reset and the alarm handling is complete.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12031	Minor	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The node trust relationship is unavailable and Manager cannot manage the services.

Possible Causes

User **omm** or the password is about to expire.

Procedure

Step 1 Check whether user **omm** and the password in the system are valid.

1. Log in to the faulty node.
2. Run the following command to view the information about user **omm** and the password:

   chage -l omm

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Check whether the user has expired based on the system message.
   a. View the value of **Password expires** to check whether the password is about to expire.
   b. View the value of **Account expires** to check whether the user is about to expire.

   NOTE

   If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2**.
4. Run the following command to modify the validity period configuration:
   - Run the following command to set a validity period for user **omm**:

     chage -E *'specified date'* **omm**
   - Run the following command to set the number of validity days for user **omm**:

     chage -M *'number of days'* **omm**
5. Check whether the alarm is cleared automatically in the next periodic check.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.11.463 ALM-12032 User ommdba or Password Is About to Expire (For MRS 2.*x* or Earlier)

Description

The system starts at 00:00 every day to check whether user **ommdba** and the password are about to expire every eight hours. This alarm is generated if the user or password is about to expire in 15 days.

The alarm is cleared when the validity period of user **ommdba** is changed or the password is reset and the alarm handling is complete.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12032	Minor	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The OMS database cannot be managed and data cannot be accessed.

Possible Causes

User **ommdba** or the password is about to expire.

Procedure

Step 1 Check whether user **ommdba** and the password in the system are valid.

1. Log in to the faulty node.
2. Run the following command to view the information about user **ommdba** and the password:

   chage -l ommdba
3. Check whether the user has expired based on the system message.
   a. View the value of **Password expires** to check whether the password is about to expire.
   b. View the value of **Account expires** to check whether the user is about to expire.

   NOTE

   If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If yes, go to **Step 1.4**.
- If no, go to **Step 2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Run the following command to modify the validity period configuration:
   - Run the following command to set a validity period for user **ommdba**:

     chage -E *'specified date'* **ommdba**
   - Run the following command to set the number of validity days for user **ommdba**:

     chage -M *'number of days'* **ommdba**
5. Check whether the alarm is cleared automatically in the next periodic check.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.464 ALM-12033 Slow Disk Fault (For MRS 2.*x* or Earlier)

Description

For MRS 2.*x* or earlier:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - The system runs the **iostat** command every 3 seconds, and detects that the **svctm** value exceeds 1000 ms for 10 consecutive periods within 30 seconds.
  - The system runs the **iostat** command every 3 seconds, and detects that more than 60% of I/O exceeds 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - The system runs the **iostat** command every 3 seconds, and detects that the **svctm** value exceeds 1000 ms for 10 consecutive periods within 30 seconds.
  - The system runs the **iostat** command every 3 seconds, and detects that more than 60% of I/O exceeds 20 ms within 300 seconds.

This alarm is automatically cleared when the preceding conditions have not been met for 15 minutes.

For MRS 1.9.3.10 or later:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 150 ms within 300 seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 20 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when none of the preceding conditions are met for three consecutive detection periods (30 or 300 seconds).

NOTE

For details about how to obtain the related parameters, see **Related Information**.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12033	• Minor: MRS 1.9.3.10 and later patch versions • Major: MRS 2.*x* and earlier versions	Yes

Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Host Name	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

Service performance deteriorates, service processing capabilities become poor, and services may be unavailable.

Possible Causes

The disk is aged or has bad sectors.

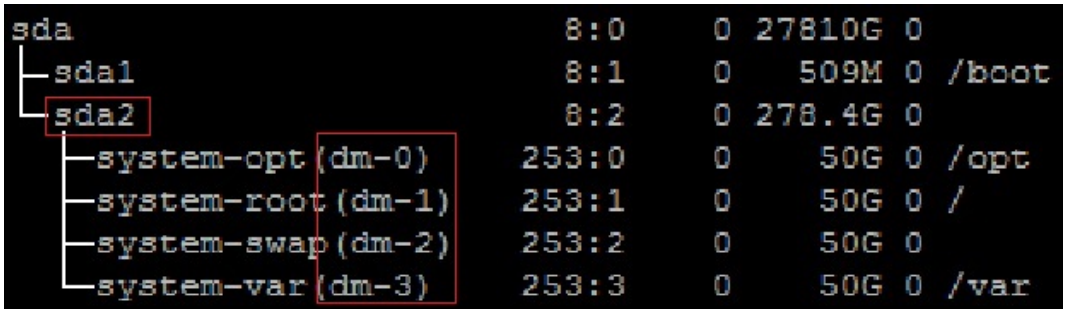
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the disk status.

Step 1 On the MRS cluster details page, click the alarm from the real-time alarm list. In the **Alarm Details** area, obtain information about the host for which the alarm is generated and information about the faulty disk.

Step 2 Check whether the node for which the alarm is generated is in a virtualization environment.



- If yes, go to **Step 3**.
- If no, go to **Step 6**.

Step 3 Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then, go to **Step 4**.

Step 4 Log in to the alarm node as user **root**, run the **df -h** command, and check whether the command output contains the value of the **DiskName** field.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

Step 5 Run the **lsblk** command to check whether the mapping between the value of **DiskName** and the disk has been created.

- If yes, go to **Step 6**.
- If no, go to **Step 21**.

Step 6 Log in to the alarm node as user **root**, run the **lsscsi | grep "/dev/sd[x]"** command to view the disk information, and check whether RAID has been set up.

NOTE

In the command, **/dev/sd[x]** indicates the disk name obtained in **Step 1**.

Example:

lsscsi | grep "/dev/sda"

In the command output, if **ATA**, **SATA**, or **SAS** is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, RAID has been set up.

- If yes, go to **Step 11**.
- If no, go to **Step 7**.

Step 7 Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports the SMART tool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

smartctl -i /dev/sda

In the command output, if "SMART support is: Enabled" is displayed, the hardware supports SMART. If "Device does not support SMART" or other information is displayed, the hardware does not support SMART.

- If yes, go to **Step 8**.
- If no, go to **Step 16**.

Step 8 Run the **smartctl -H --all /dev/sd[x]** command to check basic SMART information and determine whether the disk is working properly.

Example:

smartctl -H --all /dev/sda

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 9**.
- If no, go to **Step 17**.

Step 9 Run the **smartctl -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the disk is normal.

Example:

smartctl -l error -H /dev/sda

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to **Step 10**.
- If no, go to **Step 17**.

Step 10 Run the **smartctl -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 8** and **Step 9** to check whether the disk is working properly.

Example:

smartctl -t long /dev/sda

- If yes, go to **Step 16**.
- If no, go to **Step 17**.

Step 11 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command to check whether the hardware supports SMART.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- In the command, **[sat|scsi]** indicates the disk type. Both types need to be used.
- **[DID]** indicates the slot information. Slots 0 to 15 need to be used.

For example, run the following commands in sequence:

smartctl -d sat+megaraid,0 -H --all /dev/sda

smartctl -d sat+megaraid,1 -H --all /dev/sda

smartctl -d sat+megaraid,2 -H --all /dev/sda

...

Try the command combinations of different disk types and slot information. If "SMART support is: Enabled" is displayed in the command output, the disk supports SMART. Record the parameters of the disk type and slot information when a command is successfully executed. If "SMART support is: Enabled" is not displayed in the command output, the disk does not support SMART.

- If yes, go to **Step 12**.
- If no, go to **Step 15**.

Step 12 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]** command recorded in **Step 11** to check basic SMART information and determine whether the disk is normal.

Example:

smartctl -d sat+megaraid,2 -H --all /dev/sda

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated_Sector_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to **Step 13**.
- If no, go to **Step 17**.

Step 13 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]** command to check the Glist of the disk and determine whether the hard disk is working properly.

Example:

smartctl -d sat+megaraid,2 -l error -H /dev/sda

Check the **Command/Feature_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can perform step 9 to trigger the disk SMART self-check.

- If yes, go to **Step 14**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 17**.

Step 14 Run the **smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]** command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat **Step 12** and **Step 13** to check whether the disk is working properly.

Example:

smartctl -d sat+megaraid,2 -t long /dev/sda

- If yes, go to **Step 16**.
- If no, go to **Step 17**.

Step 15 If the configured RAID controller card does not support SMART, the disk does not support SMART. In this case, use the check tool provided by the corresponding RAID controller card vendor to rectify the fault. Then go to **Step 16**.

For example, LSI is a MegaCLI tool.

Step 16 On the alarm details page, click **Clear Alarm**. Check whether the alarm is reported on the same disk again.

If the alarm is reported for more than three times, replace the disk.

- If yes, go to **Step 17**.
- If no, no further action is required.

Replace the disk.

Step 17 On MRS Manager, choose **Alarms**.

Step 18 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 19 Replace a disk.

Step 20 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 21**.

Collect the fault information.

Step 21 On MRS Manager, choose **System** > **Export Log**.

Step 22 Contact O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

To obtain the related parameters, perform the following steps:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For MRS 2.*x* or earlier versions:

  Perform the following operations to detect slow disk faults:

  On the Linux platform, run the **iostat -x -t 1** command to check whether the I/O is faulty. Specifically, check the **svctm** value in the red box in the figure below.

  svctm indicates the I/O service time of the disk.

- For MRS 1.9.3.10 or later patch versions:

  The **svctm** value can be obtained through the following expression:

  svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)

  When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

  When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters in the preceding expression can be obtained as follows:

Obtain the parameter values from the data collected via the **cat /proc/diskstats** command run by the system every 3 seconds. The following shows an example.

In the data collected for the first time, the number in the fourth column is the value of **rd_ios_old**, the number in the eighth column is the value of **wr_ios_old**, and the number in the thirteenth column is the value of **tot_ticks_old**.

In the data collected for the second time, the number in the fourth column is the value of **rd_ios_new**, the number in the eighth column is the value of **wr_ios_new**, and the number in the thirteenth column is the value of **tot_ticks_new**.

In this case, the value of **svctm** is as follows:

(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197

9.11.465 ALM-12034 Periodic Backup Failure (For MRS 2.*x* or Earlier)

Description

This alarm is generated when a periodic backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12034	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task name.

Impact on the System

No backup package is available for a long time, so the system cannot be restored in case of exceptions.

Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

Procedure

Checking whether the disk space is insufficient

Step 1 On MRS Manager, choose **Alarms**.

Step 2 In the alarm list, click ⌄ of the alarm and obtain the task name from the **Location** area.

Step 3 Choose **System** > **Back Up Data**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Search for the backup task based on the task name and choose **More** > **View History** in the **Operation** column to view detailed information about the backup task.

Step 5 Choose **Details** > **View** and check whether message "Failed to backup xx due to insufficient disk space, move the data in the /srv/BigData/LocalBackup directory to other directories." exists.

- If yes, go to **Step 6**.
- If no, go to **Step 13**.

Step 6 Choose **Backup Path** > **View** to obtain the backup path.

Step 7 Log in to the node as user **root** and view the mounting details of the node.

df -h

Step 8 Check whether the available space of the node to which the backup path is mounted is less than 20 GB.

- If yes, go to **Step 9**.
- If no, go to **Step 13**.

Step 9 Check whether the backup package exists in the backup directory and whether the available space on the node to which the backup directory is mounted is less than 20 GB.

- If yes, go to **Step 10**.
- If no, go to **Step 13**.

Step 10 Ensure that the available space of the node to which the backup directory is mounted to be greater than 20 GB by moving backup packages out of the backup directory or deleting the backup packages.

Step 11 Start the backup task again and check whether the backup task is executed.

- If yes, go to **Step 12**.
- If no, go to **Step 13**.

Step 12 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 13**.

Collecting fault information

Step 13 On MRS Manager, choose **System** > **Export Log**.

Step 14 Contact O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.466 ALM-12035 Unknown Data Status After Recovery Task Failure (For MRS 2.*x* or Earlier)

Description

If a recovery task fails, the system attempts to automatically roll back. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the recovery task is successfully executed later.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12035	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task name.

Impact on the System

The data may be lost or the data status may be unknown, which may affect services.

Possible Causes

The possible cause of this alarm is that the component status does not meet the requirements before the restoration task is executed or an error occurs in a step during the restoration task. The error depends on the task details. You can obtain logs and task details to handle the alarm.

Procedure

Checking the component status

Step 1 Log in to MRS Manager and choose **Services**. On the page that is displayed, check whether the running status of the components meets the requirements. (OMS and DBService must be in the normal status, and other components must be stopped.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 7**.
- If no, go to **Step 2**.

Step 2 Restore the component status as required and start the recovery task again.

Step 3 Log in to MRS Manager and choose **Alarms**. In the alarm list, click the row containing the alarm and obtain the task name from the **Location** area.

Step 4 Choose **System** > **Recovery Management**. Search for the restoration task based on the task name and view the task details.

Step 5 Start the restoration task and check whether the task is executed.

- If yes, go to **Step 6**.
- If no, go to **Step 7**.

Step 6 After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Collecting fault information

Step 7 On MRS Manager, choose **System** > **Export Log**.

Step 8 Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.11.467 ALM-12037 NTP Server Abnormal (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the NTP server is abnormal.

This alarm is cleared when the NTP server recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12037	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the IP address of the NTP server for which the alarm is generated.

Impact on the System

The NTP server configured on the active OMS node is abnormal. In this case, the active OMS node cannot synchronize time with the NTP server and a time offset may be generated in the cluster.

Possible Causes

- The NTP server network is faulty.
- The NTP server authentication fails.
- The time cannot be obtained from the NTP server.
- The time obtained from the NTP server is not continuously updated.

Procedure

Step 1 Check the NTP server network.

1. On the MRS cluster details page, click the alarm from the real-time alarm list.
2. In the **Alarm Details** area, view the additional information to check whether the NTP server fails to be pinged.
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 2**.
3. Contact the O&M personnel to check the network configuration and ensure that the network between the NTP server and the active OMS node is in normal state. Then, check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Check whether the NTP server authentication fails.

1. Log in to the active management node.
2. Run **ntpq -np** to check whether the NTP server authentication fails. If **refid** of the NTP server is **.AUTH.**, the authentication fails.
   - If yes, go to **Step 5**.
   - If no, go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the time can be obtained from the NTP server.

1. View the alarm additional information to check whether the time cannot be obtained from the NTP server.
   - If yes, go to **Step 3.2**.
   - If no, go to **Step 4**.
2. Contact the O&M personnel to rectify the NTP server fault. After the NTP server is in normal state, check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Check whether the time obtained from the NTP server fails to be updated.

1. View the alarm additional information to check whether the time obtained from the NTP server fails to be updated.
   - If yes, go to **Step 4.2**.
   - If no, go to **Step 5**.
2. Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is in normal state, check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.468 ALM-12038 Monitoring Indicator Dump Failure (For MRS 2.*x* or Earlier)

Description

This alarm is generated when dumping fails after monitoring indicator dumping is configured on MRS Manager.

This alarm is cleared when dumping is successful.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12038	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The upper-layer management system fails to obtain monitoring indicators from the MRS Manager system.

Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

Procedure

Step 1 Contact the O&M personnel to check whether the network connection between the MRS Manager system and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the O&M personnel to restore the network and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Choose **System** > **Monitor Dumping Configuration** and check whether the FTP username, password, port, dump mode, and public key configured on the monitoring indicator dumping configuration page are consistent with those on the server.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Enter the correct configuration, click **OK**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Choose **System** > **Monitor Dumping Configuration** and check the configuration items, including the FTP username, save path, and dumping mode.

- If the FTP mode is used, go to **Step 6**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the SFTP mode is used, go to **Step 7**.

Step 6 Log in to the server. In the default path, check whether the save path (relative path) has the read and write permission on the FTP username.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 7 Log in to the server. In the default path, check whether the save path (absolute path) has the read and write permission on the FTP username.

- If yes, go to **Step 9**.
- If no, go to **Step 8**.

Step 8 Add the read and write permission and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Log in to the server and check whether the save path has sufficient disk space.

- If yes, go to **Step 11**.
- If no, go to **Step 10**.

Step 10 Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Step 11 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.469 ALM-12039 GaussDB Data Is Not Synchronized (For MRS 2.*x* or Earlier)

Description

The system checks the data synchronization status between the active and standby GaussDB nodes every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12039	Critical	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.
Local GaussDB HA IP	HA IP address of the local GaussDB.
Peer GaussDB HA IP	HA IP address of the peer GaussDB.
SYNC_PERSENT	Synchronization percentage.

Impact on the System

When data is not synchronized between the active and standby GaussDBs, the data may be lost or abnormal if the active instance becomes abnormal.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby GaussDB is abnormal.
- The disk space of the standby node is full.

Procedure

Step 1 Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the IP address of the standby GaussDB node.

Step 2 Log in to the active management node.

Step 3 Run the following command to check whether the standby GaussDB is reachable:

ping *heartbeat IP address of the standby GaussDB*

If yes, go to **Step 6**.

If no, go to **Step 4**.

Step 4 Contact the O&M personnel to check whether the network is faulty.

- If yes, go to **Step 5**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 6**.

Step 5 Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Log in to the standby GaussDB node.

Step 7 Run the following commands to switch the user:

sudo su - root

su - omm

Step 8 Go to the **${BIGDATA_HOME}/om-0.0.1/sbin/** directory.

Run the following command to check whether the resource status of the standby GaussDB is normal:

sh status-oms.sh

In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 15**.

Step 9 Log in to the standby GaussDB node.

Step 10 Run the following commands to switch the user:

sudo su - root

su - omm

Step 11 Run the **echo ${BIGDATA_DATA_HOME}/dbdata_om** command to obtain the GaussDB data directory.

Step 12 Run the **df -h** command to check the system disk partition usage.

Step 13 Check whether the disk where the GaussDB data directory is mounted is full.

- If yes, go to **Step 14**.
- If no, go to **Step 15**.

Step 14 Contact the O&M personnel to expand the disk capacity. After capacity expansion, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Step 15 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.470 ALM-12040 Insufficient System Entropy (For MRS 2.*x* or Earlier)

Description

The system checks the entropy at 00:00:00 every day and performs five consecutive checks each time. First, the system checks whether the rng-tools tool is enabled and correctly configured. If not, the system checks the current entropy. This alarm is generated if the entropy is less than 500 in the five checks.

This alarm is cleared if the true random number mode is configured, random numbers are configured in pseudo-random number mode, or neither the true random number mode nor the pseudo-random number mode is configured but the entropy is greater than or equal to 500 in at least one check among the five checks.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12040	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Decryption failures occur and functions related to decryption are affected, for example, DBService installation.

Possible Causes

The rngd service is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Go to the cluster details page and choose **Alarms**.

Step 2 View the alarm details to obtain the value of the **HostName** field in **Location**.

Step 3 Log in to the node for which the alarm is generated and run the **sudo su - root** command to switch to user **root**.

Step 4 Run the **/bin/rpm -qa | grep -w "rng-tools"** command. If the command is executed successfully, run the **ps -ef | grep -v "grep" | grep rngd | tr -d " " | grep "\-o/dev/random" | grep "\-r/dev/urandom"** command and view the command output.

- If the command is executed successfully, the rngd service is installed, correctly configured, and is running properly. Go to **Step 8**.
- If the command is not executed successfully, the rngd service is not running properly. Then go to **Step 5**.

Step 5 Run the following command to start the rngd service:

echo 'EXTRAOPTIONS="-r /dev/urandom -o /dev/random"' >> /etc/sysconfig/rngd

service rngd start

Step 6 Run the **service rngd status** command to check whether the rngd service is in the running state.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 7 Wait until 00:00:00 when the system checks the entropy again. Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to **Step 8**.

Step 8 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.471 ALM-12041 Permission of Key Files Is Abnormal (For MRS 2.*x* or Earlier)

Description

The system checks the permission, users, and user groups of key directories or files every hour. This alarm is generated if any of these is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared after the problem that causes abnormal permission, users, or user groups is solved.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12041	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PathName	Specifies the file path or file name.

Impact on the System

System functions are unavailable.

Possible Causes

The user has manually modified the file permission, user information, or user groups, or the system has experienced an unexpected power-off.

Procedure

Step 1 Check the file permission.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the details of the alarm, query the **HostName** (name of the alarmed host) and **PathName** (path or name of the involved file).
3. Log in to the alarmed node.
4. Run the **ll** *PathName* command to query the current user, permission, and user group of the file or path.
5. Go to the **${BIGDATA_HOME}/nodeagent/etc/agent/autocheck** directory and run the **vi keyfile** command. Search for the name of the involved file and query the correct permission of the file.
6. Compare the actual permission of the file with the permission obtained in **Step 1.5**. If they are different, change the actual permission, user information, and user group to the correct values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7. Wait until the next system check is complete and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.472 ALM-12042 Key File Configurations Are Abnormal (For MRS 2.*x* or Earlier)

Description

The system checks key file configurations every hour. This alarm is generated if any key configuration is abnormal.

This alarm is cleared after the configuration becomes normal.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12042	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PathName	Specifies the file path or file name.

Impact on the System

Functions related to the file are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

The user has manually modified the file configurations or the system has experienced an unexpected power-off.

Procedure

Step 1 Check the file configurations.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the details of the alarm, query the **HostName** (name of the alarmed host) and **PathName** (path or name of the involved file).
3. Log in to the alarmed node.
4. Manually check and modify the file configurations according to the criteria in **Related Information**.
5. Wait until the next system check is complete and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Related Information

- **Checking /etc/fstab**

  Check whether partitions configured in **/etc/fstab** exist in **/proc/mounts** and whether swap partitions configured in **/etc/fstab** match those in **/proc/swaps**.

- **Checking /etc/hosts**

  Run the **cat /etc/hosts** command. If any of the following situations exists, the file configurations are abnormal.
  - The **/etc/hosts** file does not exist.
  - The host name is not configured in the file.
  - The IP address of the host is duplicate.
  - The IP address of the host does not exist in the **ipconfig** list.
  - An IP address in the file is used by multiple hosts.

9.11.473 ALM-12043 DNS Parsing Duration Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the DNS parsing duration every 30 seconds. This alarm is generated when the DNS parsing duration exceeds the threshold (the default threshold is 20,000 ms) for multiple times (the default value is **2**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

You can change the threshold by choosing **System** > **Threshold Configuration** > **Device** > **Host** > **Network Status** > **DNS Resolution Duration** > **DNS Resolution Duration**.

This alarm is cleared when **hit number** is **1** and the DNS resolution duration is less than or equal to the threshold. This alarm is cleared when **hit number** is not **1** and the DNS resolution duration is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12043	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- Kerberos-based secondary authentication is slow.
- The ZooKeeper service is abnormal.
- The node is faulty.

Possible Causes

- The node is configured with the DNS client.
- The node is equipped with the DNS server and the DNS server is started.

Procedure

Check whether the node is configured with the DNS client.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 View the alarm details to obtain the value of the **HostName** field in **Location**.

Step 3 Use PuTTY to log in to the node for which the alarm is generated as user **root**.

Step 4 Run the **cat /etc/resolv.conf** command to check whether the DNS client is installed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If information similar to the following is displayed, the DNS client is installed and started:

```
nameserver 10.2.3.4
nameserver 10.2.3.4
```

- If yes, go to **Step 5**.
- If no, go to **Step 7**.

Step 5 Run the **vi /etc/resolv.conf** command to comment out the following content using the number signs (#) and save the file:

```
# nameserver 10.2.3.4
# nameserver 10.2.3.4
```

Step 6 Check whether this alarm is cleared after 5 minutes.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the node is equipped with the DNS server and the DNS server is started.

Step 7 Run the **service named status** command to check whether the DNS service is installed on the node.

If information similar to the following is displayed, the DNS server is installed and started:

```
Checking for nameserver BIND
version: 9.6-ESV-R7-P4
CPUs found: 8
worker threads: 8
number of zones: 17
debug level: 0
xfers running: 0
xfers deferred: 0
soa queries in progress: 0
query logging is ON
recursive clients: 4/0/1000
tcp clients: 0/100
server is up and running
```

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

Step 8 Run the **service named stop** command to stop the DNS server.

Step 9 Check whether this alarm is cleared after 5 minutes.

- If yes, no further action is required.
- If no, go to **Step 10**.

Step 10 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.474 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is **5**).

You can change the threshold by choosing **System** > **Threshold Configuration** > **Device** > **Host** > **Network Reading** > **Network Read Packet Rate Information** > **Read Packet Dropped Rate**.

This alarm is cleared when **hit number** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **hit number** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12045	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The service performance deteriorates or some services time out.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

Possible Causes

- An OS exception occurs.
- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network environment is abnormal.

Procedure

View the network packet dropped rate.

Step 1 Use PuTTY to log in to any non-alarm node in the cluster as user **omm** and run the **ping** *IP address of the node for which the alarm is generated* **-c 100** command to check whether packet drop occurs on the network.

```
# ping 10.10.10.12 -c 5
PING 10.10.10.12 (10.10.10.12) 56(84) bytes of data.
64 bytes from 10.10.10.11: icmp_seq=1 ttl=64 time=0.033 ms
64 bytes from 10.10.10.11: icmp_seq=2 ttl=64 time=0.034 ms
64 bytes from 10.10.10.11: icmp_seq=3 ttl=64 time=0.021 ms
64 bytes from 10.10.10.11: icmp_seq=4 ttl=64 time=0.033 ms
64 bytes from 10.10.10.11: icmp_seq=5 ttl=64 time=0.030 ms
--- 10.10.10.12 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4001ms   rtt min/avg/max/mdev =
0.021/0.030/0.034/0.006 ms
```

NOTE

- *IP address of the node for which the alarm is generated*: Query the IP address of the node for which the alarm is generated on the node management page of the MRS cluster details page based on the value of **HostName** in the alarm location information. Check both the IP addresses of the management plane and service plane.
- **-c**: number of check times. The default value is **100**.

- If yes, go to **Step 11**.
- If no, go to **Step 2**.

Check the system environment.

Step 2 Use PuTTY to log in to the active OMS node or the node for which the alarm is generated as user **omm**.

Step 3 Run the **cat /etc/*-release** command to check the OS type.

- If the OS is EulerOS, go to **Step 4**.

```
# cat  /etc/*-release                          EulerOS release 2.0 (SP2)
EulerOS release 2.0 (SP2)
```

- If the OS is SUSE, go to **Step 5**.

```
# cat /etc/*-release
SUSE Linux Enterprise Server 11 (x86_64)
VERSION = 11
PATCHLEVEL = 3
```

- Otherwise, go to **Step 11**.

Step 4 Run the **cat /etc/euleros-release** command to check whether the OS version is EulerOS 2.2.

```
# cat/etc/euleros-release
EulerOS release 2.0 (SP2)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, the alarm sending function cannot be enabled. Go to **Step 6**.
- If no, go to **Step 11**.

Step 5 Run the **cat /proc/version** command to check whether the SUSE kernel version is 3.0 or later.

```
# cat /proc/version
Linux version 3.0.101-63-default (geeko@buildhost) (gcc version 4.3.4 [gcc-4_3-branch revision 152973] (SUSE Linux) ) #1 SMP Tue Jun 23 16:02:31 UTC 2015 (4b89d0c)
```

- If yes, the alarm sending function cannot be enabled. Go to **Step 6**.
- If no, go to **Step 11**.

Step 6 Log in to MRS Manager and choose **System** > **Configuration** > **Threshold Configuration**.

Step 7 In the navigation pane of the **Threshold Configuration** page, choose **Network Reading** > **Network Read Packet Rate Information** > **Read Packet Dropped Rate**. In the right pane, check whether **Send Alarm** is selected.

- If yes, the alarm sending function is enabled. Go to **Step 8**.
- If no, the alarm sending function is disabled. Go to **Step 10**.

Step 8 In the right pane, deselect **Send Alarm** to shield alarm "Network Read Packet Dropped Rate Exceeds the Threshold."

Step 9 Go to the MRS cluster details page and choose **Alarms**.

Step 10 Search for alarm 12045 and manually clear the alarms that are not automatically cleared. No further action is required.

NOTE

The ID of alarm Network Read Packet Dropped Rate Exceeds the Threshold is 12045.

Check whether the NICs are bonded in active/standby mode.

Step 11 Use PuTTY to log in to the node for which the alarm is generated as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, as shown in the following figure, the bond mode is configured for the node. Go to **Step 12**.

```
# ls -l /proc/net/bonding/
total 0
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to **Step 14**.

```
# ls -l /proc/net/bonding/
ls: cannot access /proc/net/bonding/: No such file or directory
```

Step 12 Run the **cat /proc/net/bonding/bond0** command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

NOTE

In the preceding command, **bond0** is the name of the bond configuration file. Use the file name obtained in **Step 11**.

```
# cat /proc/net/bonding/bond0
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)

Bonding Mode: fault-tolerance (active-backup)
Primary Slave: eth1 (primary_reselect always)
Currently Active Slave: eth1
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
MII Status: up
MII Polling Interval (ms): 100
Up Delay (ms): 0
Down Delay (ms): 0

Slave Interface: eth0
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0

Slave Interface: eth1
MII Status: up
Speed: 1000 Mbps
Duplex: full
Link Failure Count: 1
Slave queue ID: 0
```

- If yes, the NICs are bonded in active/standby mode. Go to **Step 13**.
- If no, go to **Step 14**.

Step 13 Check whether the NIC specified by **NetworkCardName** in the alarm details is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to **Step 14**.

NOTE

To determine the standby NIC, check the **/proc/net/bonding/bond0** configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

Check whether the threshold is set properly.

Step 14 Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to **Step 17**.
- If no, go to **Step 15**.

Step 15 Choose **System** > **Threshold Configuration** > **Device** > **Host** > **Network Reading** > **Network Read Packet Rate Information** > **Read Packet Dropped Rate** and change the alarm threshold based on the actual service usage.

Step 16 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Check whether the network is normal.

Step 17 Contact the system administrator to check whether the network is normal.

- If yes, rectify the network fault and go to **Step 18**.
- If no, go to **Step 19**.

Step 18 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 19**.

Step 19 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.475 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is **5**).

You can change the threshold by choosing **System** > **Threshold Configuration** > **Device** > **Host** > **Network Writing** > **Network Write Packet Rate Information** > **Write Packet Dropped Rate**.

When the **hit number** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. When the **hit number** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12046	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The service performance deteriorates or some services time out.

Possible Causes

- The alarm threshold is improperly configured.
- The network environment is abnormal.

Procedure

Check whether the threshold is set properly.

Step 1 Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

Step 2 Choose **System** > **Threshold Configuration** > **Device** > **Host** > **Network Write Information** > **Network Write Packet Rate** > **Write Packet Dropped Rate** and change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network is normal.

Step 4 Contact the system administrator to check whether the network is normal.

- If yes, rectify the network fault and go to **Step 5**.
- If no, go to **Step 6**.

Step 5 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Step 6 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.478 ALM-12049 Read Throughput Rate Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the read throughput rate every 30 seconds. This alarm is generated when the read throughput rate exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System** > **Threshold Configuration** > **Device** > **Host** > **Network Reading** > **Network Read Throughput Rate** > **Read Throughput Rate**.

If the **hit number** is **1**, this alarm is cleared when the read throughput rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the read throughput rate is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12049	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The service system runs abnormally or is unavailable.

Possible Causes

- The alarm threshold is improperly configured.
- The network port rate does not meet service requirements.

Procedure

Check whether the threshold is set properly.

Step 1 Log in to MRS Manager and check whether the threshold (configurable, 80% by default) is appropriate.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

Step 2 Choose **System** > **Threshold Configuration** > **Device** > **Host** > **Network Reading** > **Network Read Throughput Rate** > **Read Throughput Rate** to change the alarm threshold based on the actual service usage.

Step 3 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Check whether the network port rate meets the requirements.

Step 4 In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and network port name of the host for which the alarm is generated.

Step 5 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 6 Run the **ethtool** *network port name* command to check the maximum network port rate **Speed**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

In a VM environment, you may fail to obtain the network port rate by running commands. You are advised to contact the system administrator to check whether the network port rate meets the requirements.

Step 7 If the read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

Step 8 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.480 ALM-12051 Disk Inode Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the disk inode usage every 30 seconds. This alarm is generated when the disk inode usage exceeds the threshold (the default threshold is 80%) for multiple times (the default value is 5).

You can change the threshold by choosing **System** > **Threshold Configuration** > **Device** > **Host** > **Disk** > **Disk Inode Usage** > **Disk Inode Usage**.

If the **hit number** is **1**, this alarm is cleared when the disk inode usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the disk inode usage is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12051	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Data cannot be written to the file system.

Possible Causes

- There are too many small files on the disk.
- The system is abnormal.

Procedure

There are too many small files on the disk.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and disk partitions of the host for which the alarm is generated.

Step 3 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 4 Run the **df -i** *partition name* command to check the current inode usage of the disk.

Step 5 If the inode usage exceeds the threshold, manually check whether the small files in the partition can be deleted.

- If yes, delete the files and go to **Step 6**.
- If no, adjust the capacity. Then go to **Step 7**.

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

Check whether the system environment is normal.

Step 7 Contact the operating system maintenance personnel to check whether the system environment is abnormal.

- If yes, rectify the operating system fault and go to **Step 8**.
- If no, go to **Step 9**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.481 ALM-12052 Usage of Temporary TCP Ports Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the usage of temporary TCP ports every 30 seconds. This alarm is generated when the usage of temporary TCP ports exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System** > **Threshold Configuration** > **Host** > **Network Status** > **TCP Ephemeral Port Usage** > **TCP Ephemeral Port Usage**.

If the **hit number** is **1**, this alarm is cleared when the usage of temporary TCP ports is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the usage of temporary TCP ports is less than or equal to 90% of the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12052	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Services on the host fail to establish connections with the external and services are interrupted.

Possible Causes

- The temporary ports do not meet service requirements.
- The system is abnormal.

Procedure

Expand the range of temporary ports.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.

Step 3 Use PuTTY to log in to the host for which the alarm is generated as user **omm**.

Step 4 Run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1** command to obtain the start port number. Run the **cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2** command to obtain the end port number. Subtract the start port number from the end port number to obtain the total number of temporary ports. If the total number of temporary ports is less than 28,232, the random port range of the OS is too small. In this case, contact the system administrator to expand the port range.

Step 5 Run the **ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}'|cut -d ':' -f 2 | awk '$1 >"***start port number***" {print $1}' | sort -u | wc -l** command to calculate the number of used temporary ports.

Step 6 Calculate the usage of temporary ports using the following formula: Usage of temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100. Check whether the usage exceeds the threshold.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 7 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

Check whether the system environment is normal.

Step 8 Run the following command to import the temporary file and view the frequently used ports in the **port_result.txt** file:

netstat -tnp > $BIGDATA_HOME/tmp/port_result.txt

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
netstat -tnp

Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp   0   0 10-120-85-154:45433
10-120-8:25009 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45434  10-120-8:25009 CLOSE_WAIT 94237/java
tcp   0   0 10-120-85-154:45435  10-120-8:25009 CLOSE_WAIT 94237/java
...
```

Step 9 Run the following command to check the processes that occupy a large number of ports:

ps -ef |grep *PID*

NOTE

- *PID* indicates the process ID of the port queried in **Step 8**.
- Run the following command to collect information about all processes in the system and check the processes that occupy a large number of ports:

  ps -ef > $BIGDATA_HOME/tmp/ps_result.txt

Step 10 Contact the system administrator to clear the processes that occupy a large number of ports. Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Step 11 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.482 ALM-12053 File Handle Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the handler usage every 30 seconds. This alarm is generated when the handle usage exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System** > **Threshold Configuration** > **Device** > **Host** > **Host Status** > **Host File Handle Usage** > **Host File Handle Usage**.

If the **hit number** is **1**, this alarm is cleared when the file handle usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the file handle usage is less than or equal to 90% of the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12053	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

The system applications fail to open files, access networks, and perform other I/O operations. The applications are running improperly.

Possible Causes

- The number of file handles does not meet service requirements.
- The system is abnormal.

Procedure

Increase the number of file handles.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.

Step 3 Use PuTTY to log in to the host for which the alarm is generated as user **root**.

Step 4 Run the **ulimit -n** command to check the maximum number of handles set in the system.

Step 5 If the file handle usage exceeds the threshold, contact the system administrator to increase the number of system file handles.

Step 6 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the system environment is normal.

Step 7 Contact the system administrator to check whether the OS is abnormal.

- If yes, rectify the operating system fault and go to **Step 8**.
- If no, go to **Step 9**.

Step 8 Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Step 9 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.483 ALM-12054 Invalid Certificate File (For MRS 2.*x* or Earlier)

Description

The system checks whether the certificate file is invalid (has expired or is not yet valid) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when the status of the newly imported certificate is valid.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12054	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The system reminds users that the certificate file is invalid. If the certificate file is invalid, some functions are restricted and cannot be used properly.

Possible Causes

No certificate (HA root certificate or HA user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

Procedure

Check the alarm cause.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the row that contains the alarm.

In the **Alarm Details** area, view the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, use PuTTY to log in to the active OMS management node as user **omm** and go to **Step 3**.
- If **HA root Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to **Step 4**.
- If **HA server Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to **Step 5**.

Check the validity period of the certificate files in the system.

Step 3 Check whether the current system time is in the validity period of the CA certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/cert/root/ca.crt** command to check the effective time and due time of the root certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 6**.

Step 4 Check whether the current system time is in the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

Step 5 Check whether the current system time is in the validity period of the HA user certificate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 8**.
- If no, go to **Step 7**.

  The following is an example of the effective time and expiration time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CountryName, ST=State, L=Locality, O=Organization, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Expiration time
```

Import certificate files.

Step 6 Import a new CA certificate file.

Contact O&M personnel to apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Step 7 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Step 8 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

9.11.484 ALM-12055 Certificate File Is About to Expire (For MRS 2.*x* or Earlier)

Description

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire with a validity period less than days set in the alarm threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is generated if the status of the newly imported certificate is valid.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12055	Minor	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system reminds users that the license is about to expire. If the license expires, some functions are restricted and cannot be used properly.

Possible Causes

The remaining validity period of the CA certificate, HA root certificate, or HA user certificate is smaller than the alarm threshold.

Procedure

Check the alarm cause.

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the real-time alarm list, click the row that contains the alarm.

In the **Alarm Details** area, view the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, use PuTTY to log in to the active OMS management node as user **omm** and go to **Step 3**.
- If **HA root Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to **Step 4**.
- If **HA server Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to **Step 5**.

Check the validity period of the certificate files in the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/cert/root/ca.crt** command to check the effective time and due time of the root certificate.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 4 Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

Step 5 Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in ${CONTROLLER_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

  The following is an example of the effective time and expiration time of a CA or HA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number:
            97:d5:0e:84:af:ec:34:d8
        Signature Algorithm: sha256WithRSAEncryption
        Issuer: C=CountryName, ST=State, L=Locality, O=Organization, OU=IT, CN=HADOOP.COM
        Validity
            Not Before: Dec 13 06:38:26 2016 GMT            // Effective time
            Not After : Dec 11 06:38:26 2026 GMT            // Expiration time
```

Import certificate files.

Step 6 Import a new CA certificate file.

Contact O&M personnel to apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

Step 7 Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, no further action is required.

Step 8 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.485 ALM-12180 Disk Card I/O (For MRS 2.*x* or Earlier)

Description

For MRS 2.*x* or earlier:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - The system collects data every 3 seconds, and detects that the **svctm** value exceeds 6s for 10 consecutive periods within 30 seconds.
  - The system collects data every 3 seconds, and detects that the **avgqu-sz** value is greater than 0, the IOPS or bandwidth is 0, and the **ioutil** value is greater than **99%** for 10 consecutive periods within 30 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - The system collects data every 3 seconds, and detects that the **svctm** value exceeds 2s for 10 consecutive periods within 30 seconds.
  - The system collects data every 3 seconds, and detects that the **avgqu-sz** value is greater than 0, the IOPS or bandwidth is 0, and the **ioutil** value is greater than **99%** for 10 consecutive periods within 30 seconds.

This alarm is automatically cleared when none of the conditions are met for 90 seconds.

For MRS 1.9.3.10 or later:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 6 seconds within 30 seconds in at least seven collection periods.
  - The system collects data every 3 seconds by default, and within 30 seconds, at least 10 collection cycles have a disk queue depth (**avgqu-sz**) > 0, IOPS = 0, or bandwidth = 0, and **ioutil** > 99%.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 1000 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 3 seconds within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. Disk queue depth (**avgqu-sz**) > 0 and IOPS = 0, or bandwidth = 0 and **ioutil** > 99% in at least 10 collection periods within 30 seconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 500 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when none of the conditions are met for three consecutive detection periods (30 or 300 seconds).

NOTE

For details about how to obtain related parameters, see **Related Information**.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12180	Major	Yes

Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DiskName	Specifies the disk for which the alarm is generated.

Impact on the System

A continuously high I/O usage may adversely affect service operations and result in service loss.

Possible Causes

The disk is aged.

Procedure

Replace the disk.

Step 1 Log in to FusionInsight Manager and choose **O&M** > **Alarm** > **Alarms**.

Step 2 View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

Step 3 Replace the faulty disk.

Step 4 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, perform **Step 5**.

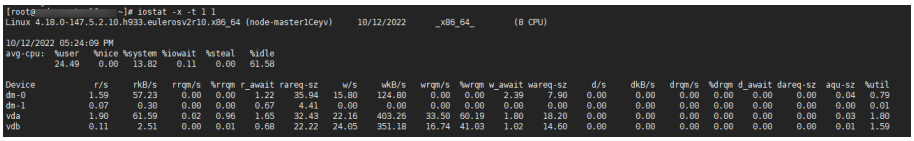
Collect the fault information.

Step 5 On MRS Manager, choose **System** > **Export Log**.

Step 6 Contact O&M engineers and send the collected logs.

----End

Alarm Clearing



This alarm is automatically cleared after the fault is rectified.

Related Information

To obtain the related parameters, perform the following steps:

- Run the following command in the OS to collect data:

  iostat -x -t 1 1

  The command parameters are as follows:

  avgqu-sz indicates the disk queue depth.

  The sum of **r/s** and **w/s** is the IOPS.

  The sum of **rkB/s** and **wkB/s** is the bandwidth.

  %util is the value of **ioutil**.

- The value of **svctm** is calculated as follows:

  svctm = (tot_ticks_new - tot_ticks_old) / (rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old)

  For MRS 2.*x* or earlier:

  If **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old** is **0**, then **svctm** is **0**.

  For MRS 1.9.3.10 or later:

  When the detection period is 30 seconds, if **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, then **svctm = 0**.

  When the detection period is 300 seconds and **rd_ios_new + wr_ios_new - rd_ios_old - wr_ios_old = 0**, if **tot_ticks_new - tot_ticks_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

  The parameters in the preceding expression can be obtained as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Obtain the parameter values from the data collected via the **cat /proc/diskstats** command run by the system every 3 seconds. The following shows an example.

In the data collected for the first time, the number in the fourth column is the value of **rd_ios_old**, the number in the eighth column is the value of **wr_ios_old**, and the number in the thirteenth column is the value of **tot_ticks_old**.

In the data collected for the second time, the number in the fourth column is the value of **rd_ios_new**, the number in the eighth column is the value of **wr_ios_new**, and the number in the thirteenth column is the value of **tot_ticks_new**.

In this case, the value of **svctm** is as follows:

(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197

9.11.486 ALM-12357 Failed to Export Audit Logs to OBS (For MRS 2.*x* or Earlier)

Description

If audit log transfer to OBS has been configured on MRS Manager, the system periodically transfers audit logs to OBS. This alarm is generated when the system cannot access OBS.

This alarm is cleared after the system exports audit logs to the OBS successfully.

Attribute

Alarm ID	Alarm Severity	Auto Clear
12357	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The local system saves a maximum of seven compressed service audit log files. If this alarm persists, local service audit logs may be lost.

The local system saves a maximum of 50 management audit log files (each file contains 100,000 records). If this alarm persists, local management audit logs may be lost.

Possible Causes

- Connection to the OBS server fails.
- The specified OBS file system does not exist.
- The user AK/SK information is invalid.
- The local OBS configuration cannot be obtained.

Procedure

Step 1 Log in to the OBS server and check whether the OBS server can be properly accessed.

- If yes, go to **Step 3**.
- If no, go to **Step 2**.

Step 2 Contact the maintenance personnel to repair OBS. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 On MRS Manager, choose **System** > **Export Audit Log**. Check whether the AK/SK information, file system name, and path are correct.

- If yes, go to **Step 5**.
- If no, go to **Step 4**.

Step 4 Correct the information. Then check whether the alarm is cleared when the export task is executed again.

NOTE

To check alarm clearance quickly, you can set the start time of audit log collection to 10 or 30 minutes later than the current time. After checking the result, restore the original start time.

- If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.487 ALM-13000 ZooKeeper Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the ZooKeeper service status every 30 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

ZooKeeper fails to provide coordination services for upper-layer components and the components depending on ZooKeeper may not run properly.

Possible Causes

- The ZooKeeper instance is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The disk capacity is insufficient.
- The network is faulty.
- The DNS is installed on the ZooKeeper node.

Procedure

Check the ZooKeeper service instance status.

Step 1 On the MRS cluster details page, choose **Components** > **ZooKeeper** > **quorumpeer**.

Step 2 Check whether the ZooKeeper instances are normal.

- If yes, go to **Step 6**.
- If no, go to **Step 3**.

Step 3 Select instances whose status is not good and choose **More** > **Restart Instance**.

Step 4 Check whether the instance status is good after restart.

- If yes, go to **Step 5**.
- If no, go to **Step 19**.

Step 5 On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

Check disk status.

Step 6 On the MRS cluster details page, choose **Components** > **ZooKeeper** > **quorumpeer**, and check the host information of each node housing the ZooKeeper instance.

Step 7 On the MRS cluster details page, click the **Nodes** tab and expand a node group.

Step 8 In the **Disk Usage** column, check whether the disk space of each node housing ZooKeeper instances is insufficient (disk usage exceeds 80%).

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

Step 9 Expand the disk capacity. For details, see **ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier)**.

Step 10 On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

Check network communication status.

Step 11 On the Linux node housing the ZooKeeper instance, run the **ping** command to check whether the host names of other nodes housing the ZooKeeper instances can be pinged successfully.

- If yes, go to **Step 15**.
- If no, go to **Step 12**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 12 Modify the IP addresses in **/etc/hosts** and add the mapping between host names and IP addresses.

Step 13 Run the **ping** command again to check whether the host names of other nodes housing the ZooKeeper instances can be pinged successfully.

- If yes, go to **Step 14**.
- If no, go to **Step 19**.

Step 14 On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 15**.

Check the DNS.

Step 15 Check whether the DNS is installed on the node housing the ZooKeeper instance. On the Linux node housing the ZooKeeper instance, run the **cat /etc/resolv.conf** command to check whether the file is empty.

- If yes, go to **Step 16**.
- If no, go to **Step 19**.

Step 16 Run the **service named status** command to check whether the DNS is started.

- If yes, go to **Step 17**.
- If no, go to **Step 19**.

Step 17 Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.

Step 18 On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 19**.

Step 19 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.11.488 ALM-13001 Available ZooKeeper Connections Are Insufficient (For MRS 2.*x* or Earlier)

Description

The system checks ZooKeeper connections every 30 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the number of used ZooKeeper instance connections is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, external connections cannot be handled.

Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not meet the requirement of the actual scenario.

Procedure

Step 1 Check the connection status.

1. On the MRS cluster details page, choose **Alarms** > **ALM-13001 Available ZooKeeper Connections Are Insufficient** > **Location**. Check the IP address of the node for which the alarm is generated.
2. Obtain the PID of the ZooKeeper process. Log in to the node for which this alarm is generated and run the **pgrep -f proc_zookeeper** command.
3. Check whether the PID can be successfully obtained.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the **lsof -i|grep $pid | awk '{print $9}' | cut -d : -f 2 | cut -d \> -f 2 | awk '{a[$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10** command based on the obtained PID value. (**$pid** is the PID obtained in the preceding step.)
5. Check whether the node IP addresses and the number of connections are successfully obtained.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 2**.
6. Obtain the ID of the port connected to the process. Run the **lsof -i|grep $pid | awk '{print $9}'|cut -d \> -f 2 |grep $IP| cut -d : -f 2** command based on the obtained PID and IP address. (**$pid** and **$IP** are the PID and IP address obtained in the preceding step.)
7. Check whether the port ID is successfully obtained.
   - If yes, go to **Step 1.8**.
   - If no, go to **Step 2**.
8. Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep $port**. (**$port** is the port ID obtained in the preceding step.)
9. Check whether the process ID is successfully obtained.
   - If yes, go to **Step 1.10**.
   - If no, go to **Step 2**.
10. Check whether connection leakage occurs on the process based on the obtained process ID.
    - If yes, go to **Step 1.11**.
    - If no, go to **Step 1.12**.
11. Close the process where connection leakage occurs and check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to **Step 1.12**.
12. On the MRS cluster details page, choose **Components** > **ZooKeeper** > **Service Configuration**. Set **Type** to **All**, choose **quorumpeer** > **Performance**, and change the value of **maxCnxns** to **20000** or more.
13. Check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.489 ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the ZooKeeper service status every 30 seconds. The alarm is generated when the memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

If the available ZooKeeper memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The memory usage of the ZooKeeper instance is overused or the memory is inappropriately allocated.

Procedure

Step 1 Check the memory usage.

1. On the MRS cluster details page, choose **Alarms** > **ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold** > **Location**. Check the IP address of the instance for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. On the MRS cluster details page, choose **Components** > **ZooKeeper** > **Instances** > **quorumpeer** (IP address of the instance for which the alarm is generated) > **Customize** > **ZooKeeper Heap And Direct Buffer Resource**. Check the heap memory usage.
3. Check whether the used heap memory of ZooKeeper reaches 80% of the maximum heap memory specified for ZooKeeper.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 1.6**.
4. On MRS Manager, choose **Services** > **ZooKeeper** > **Configuration** > **All** > **quorumpeer** > **System**. Increase the value of **-Xmx** in **GC_OPTS** as required.
5. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 1.6**.
6. On the MRS cluster details page, choose **Components** > **ZooKeeper** > **Instances** > **quorumpeer** (IP address of the instance for which the alarm is generated) > **Customize** > **ZooKeeper Heap And Direct Buffer Resource**. Check the direct buffer memory usage.
7. Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.
   - If yes, go to **Step 1.8**.
   - If no, go to **Step 2**.
8. On the MRS cluster details page, choose **Components** > **ZooKeeper** > **Service Configuration**. Set **Type** to **All** and choose **quorumpeer** > **System**.

   Increase the value of **-XX:MaxDirectMemorySize** in **GC_OPTS** as required.
9. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.490 ALM-14000 HDFS Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the service status of NameService every 30 seconds. This alarm is generated when the system considers that the HDFS service is unavailable because all the NameService services are abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14000	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- ZooKeeper is abnormal.
- All NameService services are abnormal.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page. On the **Components** tab page, check whether the health status of the ZooKeeper service is **Good**.
   - If yes, go to **Step 1.2**.
   - If no, go to **Step 2.1**.
2. Rectify the health status of the ZooKeeper service. For details, see **ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier)**. Then check whether the health status of the ZooKeeper service is **Good**.
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 3**.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 2.1**.

Step 2 Handle the NameService service exception alarm.

1. Go to the MRS cluster details page. On the **Alarms** page, check whether all NameService services have abnormal alarms.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 3**.
2. Handle the abnormal NameService services following the instructions in **ALM-14010 NameService Is Abnormal (For MRS 2.x or Earlier)** and check whether each NameService service exception alarm is cleared.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.491 ALM-14001 HDFS Disk Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the disk usage of the HDFS cluster every 30 seconds and compares the actual disk usage with the threshold. The HDFS cluster disk usage indicator has a default threshold. This alarm is generated when the HDFS disk usage exceeds the threshold.

This alarm is cleared when the disk usage of the HDFS cluster is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14001	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

The performance of writing data to HDFS is affected.

Possible Causes

The disk space configured for the HDFS cluster is insufficient.

Procedure

Step 1 Check the disk capacity and delete unnecessary files.

1. On the MRS cluster details page, choose **Components** > **HDFS**. The **Service Status** page is displayed.
2. In the **Charts** area, view the value of the monitoring indicator **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 3**.
3. Use the client on the cluster node and run the **hdfs dfsadmin -report** command to check whether the value of **DFS Used%** is less than 100% minus the threshold.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 3**.
4. Use the client on the cluster node and run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.
5. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 Expand the system.

1. Expand the disk capacity.
2. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.492 ALM-14002 DataNode Disk Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. The **Percentage of DataNode Capacity** indicator has a default threshold. This alarm is generated when the value of the **Percentage of DataNode Capacity** indicator exceeds the threshold.

This alarm is cleared when the value of the **Percentage of DataNode Capacity** indicator is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14002	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Insufficient disk space will impact read/write to HDFS.

Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

Procedure

Step 1 Check the cluster disk capacity.

1. Go to the MRS cluster details page. On the **Alarms** page, check whether the ALM-14001 HDFS Disk Usage Exceeds the Threshold alarm exists.
   - If yes, go to **Step 1.2**.
   - If no, go to **Step 2.1**.
2. Handle the alarm by following the instructions in ALM-14001 HDFS Disk Usage Exceeds the Threshold and check whether the alarm is cleared.
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 3**.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the balance status of DataNodes.

1. Use the client on the cluster node, run the **hdfs dfsadmin -report** command to view the value of **DFS Used%** on the DataNode for which the alarm is generated, and compare the value with those on other DataNodes. Check whether the difference between the values is larger than 10.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 3**.
2. If data skew occurs, use the client on the cluster node and run the **hdfs balancer -threshold 10** command.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Contact the O&M engineers and send the collected logs.

9.11.493 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the number of lost blocks every 30 seconds and compares the number of lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost blocks exceeds the threshold.

This alarm is cleared when the number of lost blocks is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14003	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Data stored in HDFS is lost. HDFS may enter the safe mode and cannot provide write services. Lost block data cannot be restored.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

Procedure

Step 1 Check the DataNode instance.

1. On the MRS cluster details page, choose **Components** > **HDFS** > **Instances**.
2. Check whether the status of all DataNode instances is **Good**.
   - If yes, go to **Step 3**.
   - If no, go to **Step 1.3**.
3. Restart the DataNode instance and check whether the restart is successful.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 2.1**.

Step 2 Delete the damaged file.

1. Use the client on the cluster node. Run the **hdfs fsck / -delete** command to delete the lost file. Then rewrite the file and recover the data.
2. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.494 ALM-14004 Number of Damaged HDFS Blocks Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the number of damaged blocks every 30 seconds and compares the number of damaged blocks with the threshold. The damaged blocks indicator has a default threshold. This alarm is generated when the number of damaged blocks exceeds the threshold.

This alarm is cleared when the number of damaged blocks is less than or equal to the threshold. You are advised to run the **hdfs fsck /** command to check whether any file is completely damaged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14004	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Data is damaged and HDFS fails to read files.

Possible Causes

- The DataNode instance is abnormal.
- Data verification information is damaged.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.495 ALM-14006 Number of HDFS Files Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

This alarm is cleared when the number of HDFS files is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14006	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Disk storage space is insufficient, which may result in data import failure. The performance of the HDFS system is affected.

Possible Causes

The number of HDFS files exceeds the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Check whether unnecessary files exist in the system.

1. Use the client on the cluster node and run the **hdfs dfs -ls** *file or directory path* command to check whether the file or directory can be deleted.
   - If yes, go to **Step 1.2**.
   - If no, go to **Step 2.1**.
2. Run the **hdfs dfs -rm -r** *file or directory path* command. Delete unnecessary files, wait 5 minutes, and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the number of files in the system.

1. On MRS Manager, choose **System** > **Threshold Configuration**.
2. In the navigation tree on the left, choose **Services** > **HDFS** > **HDFS File** > **Total Number of Files**.
3. In the right pane, modify the threshold in the rule based on the number of current HDFS files.

   To check the number of HDFS files, choose **Services** > **HDFS**, click **Customize** in the **Real-Time Statistics** area on the right, and select the **HDFS File** monitoring item.
4. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14007	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

Possible Causes

The HDFS NameNode memory is insufficient.

Procedure

Step 1 Delete unnecessary files.

1. Use the client on the cluster node and run the **hdfs dfs -rm -r** *file or directory path* command to delete unnecessary files.
2. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.498 ALM-14009 Number of Faulty DataNodes Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system periodically checks the number of faulty DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of faulty DataNodes has a default threshold. This alarm is generated when the number of faulty DataNodes in the HDFS cluster exceeds the threshold.

This alarm is cleared when the number of faulty DataNodes in the HDFS cluster is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14009	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Faulty DataNodes cannot provide HDFS services.

Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.

Procedure

Step 1 Check whether DataNodes are faulty.

1. Use the client on the cluster node to run the **hdfs dfsadmin -report** command to check whether DataNodes are faulty.
   - If yes, go to **Step 1.2**.
   - If no, go to **Step 2.1**.
2. On the MRS cluster details page, choose **Components** > **HDFS** > **Instances** to check whether the DataNode is stopped.
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 2.1**.
3. Select the DataNode instance, and choose **More** > **Restart Instance** to restart it. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the status of the network between the NameNode and the DataNode.

1. Log in to the service IP address of the node where the faulty DataNode is located, and run the **ping** *IP address of the NameNode* command to check whether the network between the DataNode and the NameNode is abnormal.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 3.1**.
2. Rectify the network fault. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 3.1**.

Step 3 Check whether the DataNode is overloaded.

1. On the MRS cluster details page, click **Alarms** and check whether the alarm ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold exists.
   - If yes, go to **Step 3.2**.
   - If no, go to **Step 4.1**.
2. Follow procedures in **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)** to handle the alarm and check whether the alarm is cleared.
   - If yes, go to **Step 3.3**.
   - If no, go to **Step 4.1**.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4.1**.

Step 4 Check whether the NameNode is overloaded.

1. On the MRS cluster details page, click **Alarms** and check whether the alarm ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold exists.
   - If yes, go to **Step 4.2**.
   - If no, go to **Step 5**.
2. Follow procedures in **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold (For MRS 2.x or Earlier)** to handle the alarm and check whether the alarm is cleared.
   - If yes, go to **Step 4.3**.
   - If no, go to **Step 5**.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.11.499 ALM-14010 NameService Is Abnormal (For MRS 2.*x* or Earlier)

Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This alarm is cleared when the NameService service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14010	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.

Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

Possible Causes

- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

Procedure

Step 1 Check the status of the JournalNode instance.

1. On the MRS Manager home page, click **Components**.
2. Click **HDFS**.
3. Click **Instance**.
4. Check whether the **Health Status** of the JournalNode is **Good**.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.5**.
5. Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 1.6**.
- If no, go to **Step 5**.

6. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the status of the DataNode instance.

1. On the MRS cluster details page, click **Components**.
2. Click **HDFS**.
3. In **Operation and Health Summary**, check whether the **Health Status** of all DataNodes is **Good**.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 2.4**.
4. Click **Instances**. On the DataNode management page, select the faulty DataNode, and choose **More** > **Restart Instance**. Check whether the DataNode successfully restarts.
   - If yes, go to **Step 2.5**.
   - If no, go to **Step 3.1**.
5. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4.1**.

Step 3 Check the disk status.

1. On the MRS cluster details page, click the **Nodes** tab and expand a node group.
2. In the **Disk Usage** column, check whether disk space is insufficient.
   - If yes, go to **Step 3.3**.
   - If no, go to **Step 4.1**.
3. Expand the disk capacity.
4. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4.1**.

Step 4 Check whether NameNode is in the safe mode.

1. Use the client on the cluster node, and run the **hdfs dfsadmin -safemode get** command to check whether **Safe mode is ON** is displayed.

   Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.
   - If yes, go to **Step 4.2**.
   - If no, go to **Step 5**.
2. Use the client on the cluster node and run the **hdfs dfsadmin -safemode leave** command.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.500 ALM-14011 HDFS DataNode Data Directory Is Not Configured Properly (For MRS 2.*x* or Earlier)

Description

The DataNode parameter **dfs.datanode.data.dir** specifies the DataNode data directory. This alarm is generated in any of the following scenarios:

- A configured data directory cannot be created.
- A data directory uses the same disk as other critical directories in the system.
- Multiple directories use the same disk.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode is restarted.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14011	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the DataNode data directory is mounted on critical directories such as the root directory, the disk space of the root directory will be used up after running for a long time. This causes a system fault.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk as critical directories, such as **/** or **/boot**.
- Multiple directories in the DataNode data directory use the same disk.

Procedure

Step 1 Check the alarm cause and information about the DataNode for which the alarm is generated.

1. On the MRS cluster details page, click **Alarms**. In the alarm list, click the alarm.
2. In the **Alarm Details** area, view **Alarm Cause** to obtain the cause of the alarm. In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

Step 2 Delete directories that do not comply with the disk plan from the DataNode data directory.

1. Choose **Components** > **HDFS** > **Instances**. In the instance list, click the DataNode instance on the node for which the alarm is generated.
2. Click **Instance Configuration** and view the value of the DataNode parameter **dfs.datanode.data.dir**.
3. Check whether all DataNode data directories are consistent with the disk plan.
   - If yes, go to **Step 2.4**.
   - If no, go to **Step 2.7**.
4. Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.
5. Choose **Components** > **HDFS** > **Instances** to restart the DataNode instance.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.7**.
7. Log in to the DataNode for which the alarm is generated.
   - If the alarm cause is "The DataNode data directory fails to be created", go to **Step 3.1**.
   - If the alarm cause is "The DataNode data directory uses the same disk as critical directories, such **/** or **/boot**", go to **Step 4.1**.
   - If the alarm cause is "Multiple directories in the DataNode data directory use the same disk", go to **Step 5.1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the DataNode data directory fails to be created.

1. Run the following commands to switch the user:

   sudo su - root

   su - omm

2. Run the **ls** command to check whether the directories exist in the DataNode data directory.
   - If yes, go to **Step 7**.
   - If no, go to **Step 3.3**.
3. Run the **mkdir** *data directory* command to create a directory and check whether the directory is successfully created.
   - If yes, go to **Step 6.1**.
   - If no, go to **Step 3.4**.
4. Click **Alarms** to check whether alarm ALM-12017 Insufficient Disk Capacity exists.
   - If yes, go to **Step 3.5**.
   - If no, go to **Step 3.6**.
5. Adjust the disk capacity and check whether alarm ALM-12017 Insufficient Disk Capacity is cleared. For details, see **ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier)**.
   - If yes, go to **ALM-12017 Insufficient Disk Capacity (For MRS 2.x or Earlier)**.
   - If no, go to **Step 7**.
6. Check whether user **omm** has the **rwx** or **x** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **x** permission for directory **tmp** and the **rwx** permission for directory **abc**.)
   - If yes, go to **Step 6.1**.
   - If no, go to **Step 3.7**.
7. Run the **chmod u+rwx** *path* or **chmod u+x** *path* command as the **root** user to add the **rwx** or **x** permission to the paths. Then, go to **Step 3.3**.

Step 4 Check whether the DataNode data directory uses the same disk as other critical directories in the system.

1. Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.
2. Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.
   - If yes, go to **Step 4.3**.
   - If no, go to **Step 6.1**.
3. Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.
4. Go to **Step 6.1**.

Step 5 Check whether multiple directories in the DataNode data directory use the same disk.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.
2. Modify the DataNode node parameter **dfs.datanode.data.dir** to reserve one of the directories mounted on the same disk directory.
3. Go to **Step 6.1**.

Step 6 Restart the DataNode and check whether the alarm is cleared.

1. Choose **Components** > **HDFS** > **Instances** to restart the DataNode instance.
2. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 7**.

Step 7 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.501 ALM-14012 HDFS Journalnode Data Is Not Synchronized (For MRS 2.*x* or Earlier)

Description

On the active NameNode, the system checks data synchronization on all JournalNodes in the cluster every 5 minutes. This alarm is generated when data on a JournalNode is not synchronized with that on other JournalNodes.

This alarm is cleared in 5 minutes after data on JournalNodes is synchronized.

Attribute

Alarm ID	Alarm Severity	Auto Clear
14012	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
IP	Specifies the service IP address of the JournalNode instance for which the alarm is generated.

Impact on the System

When a JournalNode is working incorrectly, data on the node is not synchronized with that on other JournalNodes. If data on more than half of JournalNodes is not synchronized, the NameNode cannot work correctly, making the HDFS service unavailable.

Possible Causes

- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

Procedure

Step 1 Check whether the JournalNode instance has been started.

1. On the MRS cluster details page, click **Alarms**. In the alarm list, click the alarm.
2. In the **Alarm Details** area, check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.
3. Choose **Components** > **HDFS** > **Instances**. In the instance list, click the JournalNode for which the alarm is generated and check whether **Operating Status** of the node is **Started**.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.4**.
4. Select the JournalNode instance and choose **More** > **Start Instance** to start it.
5. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 2 Check whether the JournalNode instance is working correctly.

1. Check whether **Health Status** of the JournalNode instance is **Good**.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 2.2**.
2. Select the JournalNode instance and choose **More** > **Restart Instance** to restart it.
3. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Check whether the network of the JournalNode is reachable.

1. On the MRS cluster details page, choose **Components** > **HDFS** > **Instances** to check the service IP address of the active NameNode.
2. Log in to the active NameNode.
3. Run the **ping** command to check whether a timeout occurs or the network between the active NameNode and the JournalNode is unreachable.

   ping *service IP address of the JournalNode*

   - If yes, go to **Step 3.4**.
   - If no, go to **Step 4**.
4. Contact O&M personnel to rectify the network fault. Wait 5 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.502 ALM-16000 Percentage of Sessions Connected to the HiveServer to the Maximum Number Allowed Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the percentage of sessions connected to the HiveServer to the maximum number allowed every 30 seconds. This indicator can be viewed on the Hive service monitoring page. This alarm is generated when the the percentage of sessions connected to the HiveServer to the maximum number allowed exceeds the specified threshold (90% by default).

This alarm can be automatically cleared when the percentage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16000	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

If a connection alarm is generated, too many sessions are connected to the HiveServer and new connections cannot be created.

Possible Causes

Too many clients are connected to the HiveServer.

Procedure

Step 1 Increase the maximum number of connections to Hive.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Hive** > **Service Configuration** and switch **Basic** to **All**.
3. Increase the value of the **hive.server.session.control.maxconnections** configuration item. Suppose the value of the configuration item is A, the threshold is B, and sessions connected to the HiveServer is C. Adjust the value of the configuration item according to A x B > C. Sessions connected to the HiveServer can be viewed on the Hive monitoring page.
4. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.503 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the Hive warehouse space usage every 30 seconds. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page. This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default).

This alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. You can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16001	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

The system fails to write data, which causes data loss.

Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The system disk space is insufficient.
- Some data nodes break down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Expand the system configuration.

1. Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

   Go to the MRS cluster details page, choose **Components** > **Hive** > **Service Configuration**, set **Type** to **All**, search for **hive.metastore.warehouse.size.percent**, and increase the value of this parameter. Suppose that the value of the configuration item is A, total HDFS storage space is B, the threshold is C, and HDFS space used by Hive is D. Adjust the value of the configuration item according to A x B x C > D. The total HDFS storage space can be viewed on the HDFS monitoring page, and HDFS space used by Hive can be viewed on the Hive monitoring page.

2. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Expand the system.

1. Add nodes.
2. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3.1**.

Step 3 Check whether the data node is normal.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12006 Node Fault, ALM-12007 Process Fault, or ALM-14002 DataNode Disk Usage Exceeds the Threshold exists.
   - If yes, go to **Step 3.3**.
   - If no, go to **Step 4**.
3. Handle the alarm by following the steps provided in **ALM-12006 Node Fault (For MRS 2.x or Earlier)**, **ALM-12007 Process Fault (For MRS 2.x or Earlier)**, and **ALM-14002 DataNode Disk Usage Exceeds the Threshold (For MRS 2.x or Earlier)**.
4. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.504 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the percentage of the HiveQL statements that are executed successfully every 30 seconds. Percentage of HiveQL statements that are executed successfully = Number of HiveQL statements that are executed successfully by Hive in a specified period/Total number of HiveQL statements that are executed by Hive. This indicator can be viewed on the Hive service monitoring page. This alarm is generated when the percentage of the HiveQL statements that are executed successfully exceeds the specified threshold (90% by default). The name of the host for which the alarm is generated can be obtained from the location information of the alarm. The host IP address is the IP address of the HiveServer node.

This alarm is cleared when the percentage of the HiveQL statements that are executed successfully in a test period is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16002	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

The system configuration and performance cannot meet service processing requirements.

Possible Causes

- A syntax error occurs in HiveQL commands.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The HBase service is abnormal when a Hive on HBase task is being performed.
- Basic services that are depended on are abnormal, such as HDFS, Yarn, and ZooKeeper.

Procedure

Step 1 Check whether the HiveQL commands comply with syntax.

1. Use the Hive client to log in to the HiveServer node for which the alarm is generated. Query the HiveQL syntax standard provided by Apache, and check whether the HiveQL commands are correct.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.2**.

   NOTE

   To view the user who runs an incorrect statement, download HiveServerAudit logs of the HiveServer node for which this alarm is generated. Set **Start time** and **End time** to 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.
2. Enter correct HiveQL statements, and check whether the command can be properly executed.
   - If yes, go to **Step 4.5**.
   - If no, go to **Step 2.1**.

Step 2 Check whether the HBase service is abnormal.

1. Check whether a Hive on HBase task is performed.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 3.1**.
2. Check whether the HBase service is normal in the service list.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 2.3**.
3. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
4. Enter correct HiveQL statements, and check whether the command can be properly executed.
   - If yes, go to **Step 4.5**.
   - If no, go to **Step 3.1**.

Step 3 Check whether the Spark service is abnormal.

1. Check whether the Spark service is normal in the service list.
   - If yes, go to **Step 4.1**.
   - If no, go to **Step 3.2**.
2. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Enter correct HiveQL statements, and check whether the command can be properly executed.
   - If yes, go to **Step 4.5**.
   - If no, go to **Step 4.1**.

Step 4 Check whether HDFS, Yarn, and ZooKeeper are normal.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.
   - If yes, go to **Step 4.5**.
   - If no, go to **Step 4.3**.
3. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
4. Enter correct HiveQL statements, and check whether the command can be properly executed.
   - If yes, go to **Step 4.5**.
   - If no, go to **Step 5**.
5. Wait one minute and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.505 ALM-16004 Hive Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Hive service status every 30 seconds. This alarm is generated when the Hive service is unavailable.

This alarm is cleared when the Hive service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16004	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- Basic services, such as ZooKeeper, HDFS, Yarn, and DBService work incorrectly, or the Hive process is faulty.
  - ZooKeeper is abnormal.
  - HDFS is abnormal.
  - Yarn is abnormal.
  - DBService is abnormal.
  - The Hive service process is faulty. If the alarm is caused by a Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive service and basic services is interrupted.

Procedure

Step 1 Check the HiveServer/MetaStore process status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Hive** > **Instances**. In the Hive instance list, check whether the status of all HiveServer and MetaStore instances is **Unknown**.
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 2**.
3. Above the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Check the ZooKeeper status.

1. Go to the MRS cluster details page and choose **Alarms**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. On MRS Manager, check whether the ALM-12007 Process Fault alarm is reported.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
3. In the **Alarm Details** area of ALM-12007 Process Fault, check whether **ServiceName** is **ZooKeeper**.
   - If yes, go to **Step 2.4**.
   - If no, go to **Step 3**.
4. Rectify the fault by following steps provided in **ALM-12007 Process Fault (For MRS 2.x or Earlier)**.
5. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the alarm list, check whether the alarm ALM-14000 HDFS Service Unavailable exists.
   - If yes, go to **Step 3.3**.
   - If no, go to **Step 4**.
3. Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier)**.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Check the Yarn status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether the alarm ALM-18000 Yarn Service Unavailable is generated.
   - If yes, go to **Step 4.3**.
   - If no, go to **Step 4**.
3. Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable (For MRS 2.x or Earlier)**.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 5 Check the DBService status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether ALM-27001 DBService Unavailable is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 5.3**.
- If no, go to **Step 6**.

3. Rectify the fault by following the handling procedure in **ALM-27001 DBService Unavailable (For MRS 2.x or Earlier)**.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 6**.

Step 6 Check the network connection between Hive and ZooKeeper, HDFS, Yarn, and DBService.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Hive**.
3. Click **Instances**.

   The HiveServer instance list is displayed.
4. Click **Host Name** in the row of **HiveServer**.

   The HiveServer host status page is displayed.
5. Record the IP address under **Summary**.
6. Use the IP address obtained in **Step 6.5** to log in to the host where HiveServer is located.
7. Run the **ping** command to check whether the network connection between the host that runs HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. Methods of obtaining IP addresses of the hosts that run ZooKeeper, HDFS, Yarn, and DBService services as well as the HiveServer IP address are the same.
   - If yes, go to **Step 7**.
   - If no, go to **Step 6.8**.
8. Contact the O&M personnel to restore the network.
9. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 7**.

Step 7 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.506 ALM-16005 Number of Failed Hive SQL Executions in the Last Period Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks whether the number of Hive SQL statements that fail to be executed has exceeded the threshold in the last 10-minute period. This alarm is generated when the number of failed Hive SQL executions in the last 10 minutes exceeds the threshold. In the next 10 minutes, if the number of failed Hive SQL statement executions is less than the threshold, the alarm is automatically cleared.

Attribute

Alarm ID	Alarm Severity	Auto Clear
16005	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

None

Possible Causes

The Hive SQL syntax is incorrect. As a result, the Hive SQL statements fail to be executed.

Procedure

Check the Hive SQL statements that fail to be executed, correct the syntax, and execute the SQL statements again.

9.11.507 ALM-18000 Yarn Service Unavailable (For MRS 2.*x* or Earlier)

Description

The alarm module checks the Yarn service status every 30 seconds. This alarm is generated when the Yarn service is unavailable.

This alarm is cleared when the Yarn service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18000	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Yarn service. Users cannot run new applications. Submitted applications cannot be run.

Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- There is no active ResourceManager node in the Yarn cluster.
- All NodeManager nodes in the Yarn cluster are abnormal.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether the alarm ALM-13000 ZooKeeper Service Unavailable exists.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 1.3**.
- If no, go to **Step 2.2**.

3. Rectify the fault by following the handling procedure in **ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier)**. Then, check whether this alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.2**.

Step 2 Check the HDFS status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether an HDFS alarm is generated.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3.2**.
3. Click **Alarms**, and handle HDFS alarms according to **Alarm Help**. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3.2**.

Step 3 Check the ResorceManager status in the Yarn cluster.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Yarn**.
3. In **Yarn Summary**, check whether there is an active ResourceManager node in the Yarn cluster.
   - If yes, go to **Step 4.2**.
   - If no, go to **Step 5**.

Step 4 Check the NodeManager node status in the Yarn cluster.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Yarn** > **Instances**.
3. Check **Health Status** of NodeManager, and check whether there are unhealthy nodes.
   - If yes, go to **Step 4.4**.
   - If no, go to **Step 5**.
4. Rectify the fault by following the procedure provided in **ALM-18002 NodeManager Heartbeat Lost (For MRS 2.x or Earlier)** or **ALM-18003 NodeManager Unhealthy (For MRS 2.x or Earlier)**. Then, check whether this alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.508 ALM-18002 NodeManager Heartbeat Lost (For MRS 2.*x* or Earlier)

Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number of lost nodes with the threshold. The **Lost Nodes** indicator has a default threshold. This alarm is generated when the value of the **Lost Nodes** indicator exceeds the threshold.

This alarm is cleared when the value of **Lost Nodes** is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18002	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- NodeManager is forcibly deleted without decommission.
- All NodeManager instances are stopped or the NodeManager process is faulty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Reference

None

9.11.509 ALM-18003 NodeManager Unhealthy (For MRS 2.*x* or Earlier)

Description

The system checks the number of abnormal NodeManager nodes every 30 seconds, and compares the number of abnormal nodes with the threshold. The **Unhealthy Nodes** indicator has a default threshold. This alarm is generated when the value of the **Unhealthy Nodes** indicator exceeds the threshold.

This alarm is cleared when the value of **Unhealthy Nodes** is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18003	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

Possible Causes

- The disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.510 ALM-18004 NodeManager Disk Usability Ratio Is Lower Than the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the available disk space of each NodeManager node every 30 seconds and compares the disk availability rate with the threshold. A default threshold range is provided for the **NodeManager Disk Usability Ratio**. This alarm is generated when the system detects that the actual **NodeManager Disk Usability Ratio** is lower than the threshold.

This alarm is automatically cleared when the value of **NodeManager Disk Usability Ratio** is greater than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18004	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

Impact on the System

- The NodeManager node whose disk availability rate is lower than the threshold may fail to provide the Yarn service.
- The number of containers decreases, so the cluster performance may deteriorate.

Possible Causes

- The disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

Procedure

Step 1 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.511 ALM-18006 MapReduce Job Execution Timeout (For MRS 2.*x* or Earlier)

Description

The alarm module checks the MapReduce job execution every 30 seconds. This alarm is generated when the execution of a submitted MapReduce job times out.

This alarm must be manually cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18006	Major	No

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Execution of the submitted MapReduce job times out, so no execution result can be obtained. Execute the job again after rectifying the fault.

Possible Causes

It takes a long time to execute a MapReduce job. However, the specified time is less than the required execution time.

Procedure

Step 1 Check whether time is improperly set.

Set **-Dapplication.timeout.interval** to a larger value, or do not set the parameter. Check whether the MapReduce job can be executed.

- If yes, go to **Step 2.5**.
- If no, go to **Step 2.2**.

Step 2 Check the Yarn status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether the alarm ALM-18000 Yarn Service Unavailable is generated.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Rectify the fault by following the handling procedure in **ALM-18000 Yarn Service Unavailable (For MRS 2.x or Earlier)**.
4. Run the MapReduce job command again to check whether the MapReduce job can be executed.
   - If yes, go to **Step 2.5**.
   - If no, go to **Step 4**.
5. In the alarm list, click  in the **Operation** column of the alarm to manually clear the alarm. No further action is required.

Step 3 Adjust the timeout threshold.

On MRS Manager, choose **System** > **Threshold Configuration** > **Services** > **Yarn** > **Timed out Applications**, and increase the maximum number of timeout tasks allowed by the current threshold rule. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.512 ALM-18008 Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (80% of the maximum memory by default).

To change the threshold, choose **System** > **Threshold Configuration** > **Service** > **Yarn**. The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18008	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. What is more, a memory overflow occurs so that the Yarn service is unavailable.

Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Step 1 Check the heap memory usage.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **18008** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Yarn** > **Instances** > **ResourceManager** (IP address of the instance for which the alarm is generated) > **Customize** > **Percentage of Used Heap Memory of the ResourceManager**. Check the heap memory usage.
4. Check whether the heap memory usage of ResourceManager has reached the threshold (80% of the maximum memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Yarn** > **Service Configuration**. Set **Type** to **All** and choose **ResourceManager** > **System**. Change the values of **-Xmx** and **-Xms** in the **GC_OPTS** parameter based on the site requirements to ensure that the value of **-Xms** is less than that of **-Xmx**. Click **Save Configuration** and select **Restart Role Instance**. Click **OK**.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.513 ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of MapReduce JobHistoryServer exceeds the threshold (80% of the maximum memory by default).

To change the threshold, choose **System** > **Threshold Configuration** > **Service** > **MapReduce**. The alarm is cleared when the heap memory usage is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18009	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

When the heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce log archiving is affected. What is more, a memory overflow occurs so that the Yarn service is unavailable.

Possible Causes

The heap memory of the MapReduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

Procedure

Step 1 Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **18009** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **MapReduce** > **Instance** > **JobHistoryServer** (IP address of the instance for which the alarm is generated) > **Customize** > **JobHistoryServer Heap Memory Usage Statistics**. Check the heap memory usage.
4. Check whether the heap memory usage of JobHistoryServer has reached the threshold (80% of the maximum heap memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **MapReduce** > **Service Configuration**. Set **Type** to **All** and choose **JobHistoryServer** > **System**. Increase the value of **-Xmx** in the **GC_OPTS** parameter as required, click **Save Configuration**, and select **Restart the affected services or instances.** Click **OK**.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.514 ALM-18010 Number of Pending Yarn Tasks Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the number of pending Yarn tasks every 30 seconds and compares the number of tasks with the threshold. This alarm is generated when the number of pending tasks exceeds the threshold.

You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Yarn** > **Queue Root Pending Applications** > **Queue Root Pending Applications** on MRS Manager.

This alarm is cleared when the number of pending tasks is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18010	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Tasks may be stacked and cannot be processed in a timely manner.

Possible Causes

The computing capability of the cluster is lower than the task submission rate. As a result, the task cannot be processed in a timely manner after being submitted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Check the usage of memory and vCores on the Yarn page.

Check whether the values of **Memory Used|Memory Total** and **VCores Used|VCores Total** on the native Yarn page reach or approach the maximum values.

- If yes, go to **Step 2**.
- If no, go to **Step 5**.

Step 2 Check the number of submitted tasks.

Check whether the running tasks are submitted at a normal frequency.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Scale out the cluster.

The scale-out is based on the site requirements. For details, see .

Step 4 After the scale-out is completed, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.515 ALM-18011 Memory of Pending Yarn Tasks Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the memory of pending Yarn tasks every 30 seconds and compares the memory with the threshold. This alarm is generated when the memory of pending tasks exceeds the threshold.

You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Yarn** > **Queue Root Pending Memory** > **Queue Root Pending Memory** on MRS Manager.

This alarm is cleared when the memory of pending tasks is less than or equal to the threshold.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18011	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

Impact on the System

Tasks may be stacked and cannot be processed in a timely manner.

Possible Causes

The computing capability of the cluster is lower than the task submission rate. As a result, the task cannot be processed in a timely manner after being submitted.

Procedure

Step 1 Check the usage of memory and vCores on the Yarn page.

Check whether the values of **Memory Used|Memory Total** and **VCores Used|VCores Total** on the native Yarn page reach or approach the maximum values.

- If yes, go to **Step 2**.
- If no, go to **Step 5**.

Step 2 Check the number of submitted tasks.

Check whether the running tasks are submitted at a normal frequency.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

Step 3 Scale out the cluster.

The scale-out is based on the site requirements. For details, see .

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 After the scale-out is completed, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Step 5 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.516 ALM-18012 Number of Terminated Yarn Tasks in the Last Period Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the number of terminated Yarn tasks every 10 minutes. This alarm is generated when the number of terminated Yarn tasks in the last 10 minutes is greater than the threshold. This alarm is automatically cleared when the number of terminated Yarn tasks is less than the threshold in the next 10 minutes.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18012	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

None

Possible Causes

A user manually stops a running Yarn task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Check the task termination operator in the Yarn logs and audit logs, and determine the cause of the task termination.

Reference

None

9.11.517 ALM-18013 Number of Failed Yarn Tasks in the Last Period Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the number of failed Yarn tasks every 10 minutes. This alarm is generated when the number of failed Yarn tasks in the last 10 minutes is greater than the threshold. This alarm is automatically cleared when the number of failed Yarn tasks is less than the threshold in the next 10 minutes.

Attribute

Alarm ID	Alarm Severity	Auto Clear
18013	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

None

Possible Causes

The submitted Yarn job program is incorrect. For example, the parameter for Spark to submit a job is incorrect.

Procedure

Check the log of the failed job, locate the failure cause, modify the job, and submit the job again.

9.11.518 ALM-19000 HBase Service Unavailable (For MRS 2.*x* or Earlier)

Description

The alarm module checks the HBase service status every 30 seconds. This alarm is generated when the HBase service is unavailable.

This alarm is cleared when the HBase service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19000	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Operations cannot be performed, such as reading or writing data and creating tables.

Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- HBase is abnormal.
- The network is abnormal.

Procedure

Step 1 Check the ZooKeeper status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list, check whether the health status of ZooKeeper is **Good**.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.3**.
3. In the alarm list, check whether the alarm ALM-13000 ZooKeeper Service Unavailable exists.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2.1**.
4. Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier)**.
5. Wait several minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the HDFS status.

1. On MRS Manager, check whether the ALM-14000 HDFS Service Unavailable alarm is reported.
   - If yes, go to **Step 2.2**.
   - If no, go to **Step 3**.
2. Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier)**.
3. Wait several minutes and check whether the alarm is cleared.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

9.11.519 ALM-19006 HBase Replication Sync Failed (For MRS 2.*x* or Earlier)

Description

This alarm is generated when disaster recovery (DR) data fails to be synchronized to a standby cluster.

This alarm is cleared when DR data synchronization succeeds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19006	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

HBase data in a cluster fails to be synchronized to the standby cluster, causing data inconsistency between active and standby clusters.

Possible Causes

- The HBase service on the standby cluster is abnormal.
- The network is abnormal.

Procedure

Step 1 Observe whether the system automatically clears the alarm.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm to obtain alarm generation time from **Generated Time** in **Alarm Details**. Check whether the alarm has existed for over 5 minutes.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.3**.
3. Wait 5 minutes and check whether the alarm is automatically cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the HBase service status of the standby cluster.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm and obtain **HostName** from **Location** in **Alarm Details**.
3. Log in to the node where the HBase client of the active cluster is located. Run the following commands to switch the user:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sudo su - root

su - omm

4. Run the **status 'replication', 'source'** command to check the synchronization status of the faulty node.

   The synchronization status of a node is as follows.

   ```
   10-10-10-153:
    SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320,
   LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
   TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0,
   TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
   FailedReplicationAttempts=0
    SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
   LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
   TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
   TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
   FailedReplicationAttempts=5
   ```

5. Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

   In the preceding step, data on the faulty node **10-10-10-153** fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

6. Run the **list_peers** command to find the cluster and the HBase instance corresponding to **PeerID**.

   ```
   PEER_ID CLUSTER_KEY STATE TABLE_CFS
    abc1 10.10.10.110,10.10.10.119,10.10.10.133:24002:/hbase2 ENABLED
    abc 10.10.10.110,10.10.10.119,10.10.10.133:24002:/hbase ENABLED
   ```

   In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

7. In the service list of the standby cluster, check whether the health status of the HBase instance obtained in **Step 2.6** is **Good**.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 2.8**.
8. In the alarm list, check whether the alarm ALM-19000 HBase Service Unavailable exists.
   - If yes, go to **Step 2.9**.
   - If no, go to **Step 3.1**.
9. Rectify the fault by following the steps provided in **ALM-19000 HBase Service Unavailable (For MRS 2.x or Earlier)**.
10. Wait several minutes and check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to **Step 3.1**.

Step 3 Check the network connection between RegionServers on active and standby clusters.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm and obtain **HostName** from **Location** in **Alarm Details**.
3. Log in to the faulty RegionServer node.
4. Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 4**.
- If no, go to **Step 3.5**.

5. Contact the O&M personnel to restore the network.
6. After the network recovers, check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.520 ALM-19007 HBase Merge Queue Exceeds the Threshold (for 2.x and Earlier Versions)

Description

The system checks the HBase compaction queue size every 30 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default) for three consecutive times. This alarm is cleared when the compaction queue size is less than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
19007	Minor	Yes

Parameters

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Host Name	Specifies the host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

The cluster performance may deteriorate, affecting data read and write.

Possible Causes

- The number of HBase RegionServers is too small.
- There are too many regions on a RegionServer of HBase.
- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

Procedure

Step 1 Check whether related HBase parameters are properly configured.

1. Log in to the MRS cluster details page, choose **Components** > **HBase** > **Service Configuration**, switch **Basic Configuration** to **All Configurations**, and search for **hbase.hstore.compaction.min** and **hbase.hstore.compaction.max**, and increase the values of **hbase.regionserver.thread.compaction.small** and **hbase.regionserver.thread.compaction.throttle**.

   NOTE

   If you did not synchronize IAM users, perform synchronization first. (In the **Dashboard** tab, click **Synchronize** next to **IAM User Sync**.)

2. Save the configuration, and restart the HBase service during off-peak hours or perform a rolling restart to make the configuration take effect.
3. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

Related Information

None

9.11.521 ALM-20002 Hue Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Hue service status every 60 seconds. This alarm is generated if the Hue service is unavailable.

This alarm is cleared when the Hue service is normal.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
20002	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The system cannot provide data loading, query, and extraction services.

Possible Causes

- The KrbServer service on which Hue depends is abnormal.
- The DBService service on which Hue depends is abnormal.
- The network connection to DBService is abnormal.

Procedure

Check whether the KrbServer service is normal.

Step 1 Go to the MRS cluster details page and click **Components**.

Step 2 In the service list, check whether **Health Status** of **KrbServer** is **Good**.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Click **Restart** in the **Operation** column of the KrbServer service to restart the service.

Step 4 Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

Check whether DBService is normal.

Step 5 Go to the MRS cluster details page and click **Components**.

Step 6 In the service list, check whether **Health Status** of **DBService** is **Good**.

- If yes, go to **Step 9**.
- If no, go to **Step 7**.

Step 7 Click **Restart** in the **Operation** column of the DBService service to restart the service.

NOTE

To restart the service, you need to enter the password of the MRS Manager administrator and select **Start or restart related services** .

Step 8 Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

Check whether the network connected to DBService is normal.

Step 9 Choose **Components** > **Hue** > **Instance** and record the IP address of the active Hue node.

Step 10 Use PuTTY to log in to the active Hue.

Step 11 Run the **ping** command to check whether the network connection between the host where the active Hue is located and the host where DBService is located is normal. (The method of obtaining the DBService service IP address is the same as that of obtaining the active Hue IP address.)

- If yes, go to **Step 17**.
- If no, go to **Step 12**.

Step 12 Contact the network administrator to repair the network.

Step 13 Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to **Step 17**.

Collect fault information.

Step 14 On MRS Manager, choose **System** > **Export Log**.

Step 15 Select the following nodes from the **Services** drop-down list and click **OK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Hue
- Controller

Step 16 Set **Start Time** and **End Time** for log collection to 10 minutes before and after the alarm is generated, select an export type, and click **OK** to collect the corresponding fault log information.

Restart Hue.

Step 17 Choose **Components** > **Hue**.

Step 18 Choose **More** > **Restart Service** and click **OK**.

Step 19 Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 20**.

Step 20 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.522 ALM-23001 Loader Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Loader service availability every 60 seconds. This alarm is generated if the Loader service is unavailable and is cleared after the Loader service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
23001	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Data loading, import, and conversion are unavailable.

Possible Causes

- The services that Loader depends on are abnormal.
  - ZooKeeper is abnormal.
  - HDFS is abnormal.
  - DBService is abnormal.
  - Yarn is abnormal.
  - MapReduce is abnormal.
- The network is faulty. Loader cannot communicate with its dependent services.
- Loader is running improperly.

Procedure

Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **ZooKeeper** and check whether the health status of ZooKeeper is normal.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 1.3**.
3. Choose **More > Restart Service** to restart ZooKeeper. After ZooKeeper starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 1.4**.
4. On MRS Manager, check whether the ALM-12007 Process Fault alarm is reported.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2.1**.
5. In **Alarm Details** of the "ALM-12007 Process Fault" alarm, check whether **ServiceName** is **ZooKeeper**.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 2.1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

6. Rectify the fault by following steps provided in **ALM-12007 Process Fault (For MRS 2.x or Earlier)**.
7. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. On MRS Manager, check whether the "ALM-14000 HDFS Service Unavailable alarm" is reported.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3.1**.
3. Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier)**.
4. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3.1**.

Step 3 Check the DBService status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **DBService** to check whether the health status of DBService is normal.
   - If yes, go to **Step 4.1**.
   - If no, go to **Step 3.3**.
3. Choose **More > Restart Service** to restart DBService. After DBService starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4.1**.

Step 4 Check the MapReduce status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **MapReduce** and check whether the health status of MapReduce is normal.
   - If yes, go to **Step 5.1**.
   - If no, go to **Step 4.3**.
3. Choose **More > Restart Service** to restart MapReduce. After MapReduce starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5.1**.

Step 5 Check the Yarn status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Yarn** and check whether the health status of Yarn is normal.
   - If yes, go to **Step 5.4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 5.3**.

3. Choose **More > Restart Service** to restart Yarn. After Yarn starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 5.4**.
4. On MRS Manager, check whether the "ALM-18000 Yarn Service Unavailable" alarm is reported.
   - If yes, go to **Step 5.5**.
   - If no, go to **Step 6.1**.
5. Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable (For MRS 2.x or Earlier)**.
6. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 6.1**.

Step 6 Check the network connections between Loader and its dependent components.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Loader**.
3. Click **Instance**. The Sqoop instance list is displayed.
4. Record the management IP addresses of all Sqoop instances.
5. Log in to the hosts using the IP addresses obtained in **Step 6.4**. Run the following commands to switch the user:

   sudo su - root

   su - omm
6. Run the **ping** command to check whether the network connection between the hosts where the Sqoop instances reside and the dependent components is normal. (The dependent components include ZooKeeper, DBService, HDFS, MapReduce, and Yarn. The method to obtain the IP addresses of the dependent components is the same as that used to obtain the IP addresses of the Sqoop instances.)
   - If yes, go to **Step 7**.
   - If no, go to **Step 6.7**.
7. Contact the network administrator to repair the network.
8. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 7**.

Step 7 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.523 ALM-24000 Flume Service Unavailable (For MRS 2.*x* or Earlier)

Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is cleared after the Flume service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24000	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Flume cannot work and data transmission is interrupted.

Possible Causes

- HDFS is unavailable.
- LdapServer is unavailable.

Procedure

Step 1 Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Check whether the ALM-14000 HDFS Service Unavailable alarm is generated.
   - If yes, clear the alarm according to the handling suggestions of **ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier)**.
   - If no, go to **Step 2**.

Step 2 Check the LdapServer status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Check whether the ALM-25000 LdapServer Service Unavailable alarm is generated.

- If yes, clear the alarm according to the handling suggestions of **ALM-25000 LdapServer Service Unavailable (For MRS 2.x or Earlier)**.
- If no, go to **Step 3.2**.

Step 3 Check whether the HDFS and LdapServer services are stopped.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list on MRS Manager, check whether the HDFS and LdapServer services are stopped.
   - If yes, start the HDFS and LdapServer services and go to **Step 3.3**.
   - If no, go to **Step 4**.
3. Check whether the "ALM-24000 Flume Service Unavailable" alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.524 ALM-24001 Flume Agent Is Abnormal (For MRS 2.*x* or Earlier)

Description

This alarm is generated if the Flume agent monitoring module detects that the Flume agent process is abnormal.

This alarm is cleared after the Flume agent process recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24001	Minor	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Functions of the alarmed Flume agent instance are abnormal. Data transmission tasks of the instance are suspended. In real-time data transmission, data will be lost.

Possible Causes

- The **JAVA_HOME** directory does not exist or the Java permission is incorrect.
- The permission of the Flume agent directory is incorrect.

Procedure

Step 1 Check the Flume agent's configuration file.

1. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:

   sudo su - root

2. Run the **cd** *Flume installation directory*/**fusioninsight-flume-1.6.0/conf/** command to go to Flume's configuration directory.
3. Run the **cat ENV_VARS** command. Check whether the **JAVA_HOME** directory exists and whether the Flume agent user has execute permission of Java.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.4**.
4. Specify the correct JAVA_HOME directory and grant the Flume agent user with the execute permission of Java. Then go to **Step 2.4**.

Step 2 Check the permission of the Flume agent directory.

1. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:

   sudo su - root

2. Run the following command to access the installation directory of the Flume agent:

   cd *Flume agent installation directory*

3. Run the **ls -al * -R** command. Check whether the owner of all files is the Flume agent user.
   - If yes, go to **Step 3**.
   - If no, run the **chown** command and change the owner of the files to the Flume agent user. Then go to **Step 2.4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.525 ALM-24003 Flume Client Connection Interrupted (For MRS 2.*x* or Earlier)

Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in 3 consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24003	Major	Yes

Parameters

Parameter	Description
ClientIP	Specifies the IP address of the Flume client.
ServerIP	Specifies the IP address of the Flume server.
ServerPort	Specifies the port on the Flume server.

Impact on the System

The communication between the Flume client and server fails. The Flume client cannot send data to the Flume server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The network between the Flume client and server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

Procedure

Step 1 Check the network between the Flume client and server.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:

   sudo su - root

2. Run the **ping** *Flume server IP address* command to check whether the network between the Flume client and server is normal.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 4**.

Step 2 Check whether the Flume client's process is normal.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:

   sudo su - root

2. Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 4**.

Step 3 Check the Flume client configuration.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:

   sudo su - root

2. Run the **cd** *Flume installation directory*/**fusioninsight-flume-1.6.0/conf/** command to go to Flume's configuration directory.
3. Run the **cat properties.properties** command to query the current configuration file of the Flume client.
4. Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.
   - If yes, go to **Step 3.5**.
   - If no, go to **Step 4**.
5. Modify the **properties.properties** configuration file.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Contact the O&M engineers and send the collected logs.

----End

9.11.526 ALM-24004 Flume Fails to Read Data (For MRS 2.*x* or Earlier)

Description

The alarm module monitors the Flume source status. This alarm is generated if the duration that Flume source fails to read data exceeds the threshold.

Users can modify the threshold as required.

This alarm is cleared if the source reads data successfully.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24004	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
ComponentType	Specifies the component type for which the alarm is generated.
ComponentName	Specifies the component name for which the alarm is generated.

Impact on the System

Data collection is stopped.

Possible Causes

- The Flume source is faulty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The network is faulty.

Procedure

Step 1 Check whether the Flume source is normal.

1. Check whether the Flume source is the spoolDir type.
   - If yes, go to **Step 1.2**.
   - If no, go to **Step 1.3**.
2. Query the **spoolDir** directory and check whether all files have been sent.
   - If yes, no further action is required.
   - If no, go to **Step 1.5**.
3. Check whether the Flume source is the Kafka type.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 1.5**.
4. Log in to the Kafka client and run the following commands to check whether all topic data configured for the Kafka source has been consumed.

   cd /opt/client/Kafka/kafka/bin

   ./kafka-consumer-groups.sh --bootstrap-server *Kafka cluster IP address*:**21007 --new-consumer --describe --group example-group1 --command-config**

   ../config/consumer.properties
   - If yes, no further action is required.
   - If no, go to **Step 1.5**.
5. Go to the cluster details page and click **Components**.
6. Choose **Flume** > **Instances**.
7. Click the Flume instance of the faulty node and check whether the value of the **Source Speed Metrics** is 0.
   - If yes, go to **Step 2.1**.
   - If no, no further action is required.

Step 2 Check the status of the network between the Flume source and faulty node.

1. Check whether the Flume source is the avro type.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
2. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:

   sudo su - root
3. Run the **ping** *Flume source IP address* command to check whether the Flume source can be pinged.
   - If yes, go to **Step 3**.
   - If no, go to **Step 2.4**.
4. Contact the network administrator to repair the network.
5. Wait for a while and check whether the alarm is cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, no further action is required.
- If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

Related Information

N/A

9.11.527 ALM-24005 Data Transmission by Flume Is Abnormal (For MRS 2.*x* or Earlier)

Description

The alarm module monitors the capacity of Flume channels. This alarm is generated if the duration that a channel is full or the number of times that a source fails to send data to the channel exceeds the threshold.

Users can set the threshold as required by modifying the **channelfullcount** parameter.

This alarm is cleared after the Flume channel space is released.

Attribute

Alarm ID	Alarm Severity	Auto Clear
24005	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
ComponentType	Specifies the component type for which the alarm is generated.
ComponentName	Specifies the component name for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the usage of the Flume channel continues to grow, the data transmission time increases. When the usage reaches 100%, the Flume agent process is suspended.

Possible Causes

- The Flume sink is faulty.
- The network is faulty.

Procedure

Step 1 Check whether the Flume sink is normal.

1. Check whether the Flume sink is the HDFS type.
   - If yes, go to **Step 1.2**.
   - If no, go to **Step 1.3**.
2. On MRS Manager, check whether the ALM-14000 HDFS Service Unavailable alarm is reported and whether the HDFS service is stopped.
   - If the alarm is reported, clear it according to the handling suggestions of **ALM-14000 HDFS Service Unavailable (For MRS 2.x or Earlier)**; if the HDFS service is stopped, start it. Then go to **Step 1.7**.
   - If no, go to **Step 1.7**.
3. Check whether the Flume sink is the HBase type.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 1.7**.
4. On MRS Manager, check whether the ALM-19000 HBase Service Unavailable alarm is reported and whether the HBase service is stopped.
   - If the alarm is reported, clear it according to the handling suggestions of **ALM-19000 HBase Service Unavailable (For MRS 2.x or Earlier)**; if the HBase service is stopped, start it. Then go to **Step 1.7**.
   - If no, go to **Step 1.7**.
5. Check whether the Flume sink is the Kafka type.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 1.7**.
6. On MRS Manager, check whether the ALM-38000 Kafka Service Unavailable alarm is reported and whether the Kafka service is stopped.
   - If the alarm is reported, clear it according to the handling suggestions of **ALM-38000 Kafka Service Unavailable (For MRS 2.x or Earlier)**; if the Kafka service is stopped, start it. Then go to **Step 1.7**.
   - If no, go to **Step 1.7**.
7. Go to the MRS cluster details page and click **Components**.
8. Choose **Flume** > **Instances**.
9. Click the Flume instance of the faulty node and check whether the value of the **Sink Speed Metrics** is 0.
   - If yes, go to **Step 2.1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, no further action is required.

Step 2 Check the status of the network between the Flume sink and faulty node.

1. Check whether the Flume sink is the Avro type.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
2. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:

   sudo su - root
3. Run the **ping** *Flume sink IP address* command to check whether the Flume sink can be pinged.
   - If yes, go to **Step 3**.
   - If no, go to **Step 2.4**.
4. Contact the network administrator to repair the network.
5. Wait for a while and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

Related Information

N/A

9.11.528 ALM-25000 LdapServer Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the active and standby LdapServer services are abnormal.

This alarm is cleared when either of the LdapServer services restores.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25000	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer users and LdapServer users in the cluster. For example, users, user groups, or roles cannot be added, deleted, or modified, and user passwords cannot be changed on MRS Manager. The authentication for existing users in the cluster is not affected.

Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

Procedure

Step 1 Check whether the nodes where the two SlapdServer instances of the LdapServer service locate are faulty.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **LdapServer** > **Instances**. Go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances reside.
3. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12006 Node Fault is generated.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2.1**.
4. Check whether the host name in the alarm information is the same as the actual host name in **Step 1.2**.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2.1**.
5. Rectify the fault by following steps provided in ALM-12006 Node Fault.
6. In the alarm list, check whether the alarm ALM-25000 LdapServer Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 2 Check whether the LdapServer process is in normal state.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12007 Process Fault is generated.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
3. Check whether the service name and host name in the alarm are consistent with the LdapServer service and host names.
   - If yes, go to **Step 2.4**.
   - If no, go to **Step 3**.
4. Rectify the fault by following steps provided in ALM-12007 Process Fault.
5. In the alarm list, check whether the alarm ALM-25000 LdapServer Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.529 ALM-25004 Abnormal LdapServer Data Synchronization (For MRS 2.*x* or Earlier)

Description

This alarm is generated when LdapServer data on Manager is inconsistent. This alarm is cleared when the data becomes consistent.

This alarm is generated when LdapServer data in the cluster is inconsistent with LdapServer data on Manager. This alarm is cleared when the data becomes consistent.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25004	Critical	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

LdapServer data inconsistency occurs because LdapServer data on Manager or in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.

Procedure

Step 1 Check whether the network where the LdapServer nodes reside is faulty.

1. Go to the cluster details page and choose **Alarms**.
2. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).
3. Contact O&M personnel and use PuTTY to log in to the node corresponding to **IP1**. Run the **ping** command on the node to check whether the IP address of the management plane of the active OMS node can be pinged.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2.1**.
4. Contact O&M personnel to recover the network and check whether the alarm **ALM-25004 Abnormal LdapServer Data Synchronization** is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check whether the LdapServer process is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12004 OLdap Resource Is Abnormal is generated for LdapServer.
   - If yes, go to **Step 2.3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If no, go to **Step 2.5**.

3. Rectify the fault by following steps provided in **ALM-12004 OLdap Resource Abnormal (For MRS 2.x or Earlier)**.
4. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.5**.
5. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12007 Process Fault of LdapServer is generated.
   - If yes, go to **Step 2.6**.
   - If no, go to **Step 3.1**.
6. Rectify the fault by following steps provided in **ALM-12007 Process Fault (For MRS 2.x or Earlier)**.
7. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3.1**.

Step 3 Check whether the OS restart damages data on LdapServer.

1. Go to the cluster details page and choose **Alarms**.
2. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively). Choose **Services** > **LdapServer** > **Service Configuration** and record the LdapServer port number as **PORT**. (If the IP address in the alarm location information is the IP address of the standby OMS node, the default port number is 21750.)
3. Log in to node **IP1** as user **omm** and run the **ldapsearch -H ldaps://IP1:PORT -x -LLL -b dc=hadoop,dc=com** command (if the IP address is the IP address of the standby OMS node, run the **ldapsearch -H ldaps://IP1:PORT -x -LLL -b dc=hadoop,dc=com** command before running this command). Check whether error information is displayed in the command output.
   - If yes, go to **Step 3.4**.
   - If no, go to **Step 4**.
4. Use the backup package generated before the alarm generation date to restore the LdapServer and OMS.

   NOTE

   Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.
5. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

9.11.530 ALM-25500 KrbServer Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the KrbServer service is abnormal.

This alarm is cleared when the KrbServer service is in normal state.

Attribute

Alarm ID	Alarm Severity	Auto Clear
25500	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer component in the cluster. The authentication of KrbServer in other components will be affected. The health status of components that depend on KrbServer in the cluster is **Bad**.

Possible Causes

- The node where the KrbServer service locates is faulty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The OLdap service is unavailable.

Procedure

Step 1 Check whether the node where the KrbServer service locates is faulty.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **KrbServer** > **Instances**. Go to the KrbServer instance page and view the host name of the node where the KrbServer service is deployed.
3. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12006 Node Fault is generated.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2.1**.
4. Check whether the host name in the alarm information is the same as the actual host name in **Step 1.2**.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2.1**.
5. Rectify the fault by following steps provided in ALM-12006 Node Fault.
6. In the alarm list, check whether the alarm ALM-25500 KrbServer Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 2 Check whether the OLdap service is unavailable.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12004 OLdap Resource Is Abnormal is generated.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 3**.
3. Rectify the fault by following steps provided in ALM-12004 OLdap Resource Is Abnormal.
4. In the alarm list, check whether the alarm ALM-25500 KrbServer Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 3**.

Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.531 ALM-26051 Storm Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Storm service availability every 30 seconds. This alarm is generated if the Storm service becomes unavailable after all Nimbus nodes in a cluster become abnormal.

This alarm is cleared after the Storm service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
26051	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

- The cluster cannot provide the Storm service.
- Users cannot run new Storm tasks.

Possible Causes

- The Kerberos component is faulty.
- ZooKeeper is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal.

Procedure

Step 1 Check the Kerberos component status. For clusters without Kerberos authentication, skip this step and go to **Step 2**.

1. Go to the MRS cluster details page and click **Components**.
2. Check whether the health status of the Kerberos service is **Good**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 2.1**.
- If no, go to **Step 1.3**.

3. Rectify the fault by following instructions in **ALM-25500 KrbServer Service Unavailable (For MRS 2.x or Earlier)**.
4. Perform **Step 1.2** again.

Step 2 Check the ZooKeeper component status.

1. Check whether the health status of the ZooKeeper service is **Good**.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 2.2**.
2. If the ZooKeeper service is stopped, start it. For other problems, follow the instructions in **ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier)**.
3. Perform **Step 2.1** again.

Step 3 Check the status of the active and standby Nimbus nodes.

1. Choose **Components** > **Storm** > **Nimbus**.
2. In **Role**, check whether only one active Nimbus node exists.
   - If yes, go to **Step 4**.
   - If no, go to **Step 3.3**.
3. Select the two Nimbus instances and choose **More** > **Restart Instance**. Check whether the restart is successful.
   - If yes, go to **Step 3.4**.
   - If no, go to **Step 4**.
4. Log in to MRS Manager again and choose **Components** > **Storm** > **Nimbus**. Check whether the health status of Nimbus is **Good**.
   - If yes, go to **Step 3.5**.
   - If no, go to **Step 4**.
5. Wait 30 seconds and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.532 ALM-26052 Number of Available Supervisors in Storm Is Lower Than the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the number of supervisors every 60 seconds and compares it with the threshold. This alarm is generated if the number of supervisors is lower than the threshold.

To modify the threshold, users can choose **System** > **Threshold Configuration** on MRS Manager.

This alarm is cleared if the number of supervisors is greater than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
26052	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

- Existing tasks in the cluster cannot be executed.
- The cluster can receive new Storm tasks but cannot execute them.

Possible Causes

Supervisors are abnormal in the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Check the supervisor status.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm** > **Supervisor**.
3. In **Role**, check whether the cluster has supervisor instances that are in the **Faulty** or **Recovering** state.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2**.
4. Select the supervisor instances that are in the **Faulty** or **Recovering** state and choose **More** > **Restart Instance**.
   - If yes, go to **Step 1.5**.
   - If the restart fails, go to **Step 2**.
5. Wait 30 seconds and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.533 ALM-26053 Slot Usage of Storm Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the slot usage of Storm every 60 seconds and compares it with the threshold. This alarm is generated if the slot usage exceeds the threshold.

To modify the threshold, users can choose **System** > **Threshold Configuration** on MRS Manager.

This alarm is cleared if the slot usage is lower than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
26053	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Users cannot run new Storm tasks.

Possible Causes

- Supervisors are abnormal in the cluster.
- Supervisors are normal but have poor processing capability.

Procedure

Step 1 Check the supervisor status.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm** > **Supervisor**.
3. In **Role**, check whether the cluster has supervisor instances that are in the **Faulty** or **Recovering** state.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2.1** or **Step 3.1**.
4. Select the supervisor instances that are in the **Faulty** or **Recovering** state and choose **More** > **Restart Instance**.
   - If yes, go to **Step 1.5**.
   - If the restart fails, go to **Step 4**.
5. Wait a moment and then check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2.1** or **Step 3.1**.

Step 2 Increase the number of slots for the supervisors.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm** > **Supervisor** > **Service Configuration**, and set **Type** to **All**.
3. Increase the value of **supervisor.slots.ports** to increase the number of slots for each supervisor. Then restart the instances.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Wait a moment and then check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 3 Expand the capacity of the supervisors.

1. Add nodes.
2. Wait a moment and then check whether the alarm is cleared.
   - If yes, no further action is required.
   - If the restart fails, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.534 ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares it with the threshold. This alarm is generated if the heap memory usage exceeds the threshold (80% by default).

To modify the threshold, users can choose **System** > **Threshold Configuration** > **Service** > **Storm** on MRS Manager.

This alarm is cleared if the heap memory usage is lower than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
26054	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Frequent memory garbage collection or memory overflow may occur, affecting submission of Storm services.

Possible Causes

The heap memory usage is high or the heap memory is improperly allocated.

Procedure

Step 1 Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Choose **ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold > Location**. Query the **HostName** of the alarmed instance.
3. Choose **Components > Storm > Instances > Nimbus (corresponding to the HostName of the alarmed instance) > Customize > Heap Memory Usage of Nimbus**.
4. Check whether the heap memory usage of Nimbus has reached the threshold (80%).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Adjust the heap memory.

   Choose **Components > Storm > Service Configuration**, and set **Type** to **All**. Choose **Nimbus** > **System**. Increase the value of **-Xmx** in **NIMBUS_GC_OPTS**. Click **Save Configuration**. Select **Restart the affected services or instances** and click **OK**.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.535 ALM-27001 DBService Unavailable (For MRS 2.*x* or Earlier)

Description

The alarm module checks the DBService status every 30 seconds. This alarm is generated when the system detects that DBService is unavailable.

This alarm is cleared when DBService recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27001	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in service exceptions.

Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

Procedure

Step 1 Check whether the floating IP address exists in the cluster environment.

1. Go to the MRS cluster details page and click **Components**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Choose **DBService** > **Instances**.
3. Check whether the active instance exists.
   - If yes, go to **Step 1.4**.
   - If no, go to **Step 2.1**.
4. Select the active DBServer instance and record the IP address.
5. Log in to the host with the preceding IP address and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 2.1**.
6. Run the **ping** *floating IP address* command to check whether the DBService floating IP address can be pinged.
   - If yes, go to **Step 1.7**.
   - If no, go to **Step 2.1**.
7. Log in to the host where the DBService floating IP address is located and run the **ifconfig** *interface* **down** command to delete the floating IP address.
8. Choose **Components** > **DBService** > **More** > **Restart Service** to restart DBService and check whether DBService is started successfully.
   - If yes, go to **Step 1.9**.
   - If no, go to **Step 2.1**.
9. Wait about 2 minutes and check whether the alarm is cleared in the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 13**.

Step 2 Check the status of the active DBServer instance.

1. Select the DBServer instance whose role status is abnormal and record the IP address.
2. On the **Alarms** page, check whether ALM-12007 Process Fault occurs in the DBServer instance on the host that corresponds to the IP address.
   - If yes, go to **Step 2.3**.
   - If no, go to **Step 4**.
3. Rectify the fault by following steps provided in ALM-12007 Process Fault.
4. Wait about 5 minutes and check whether the alarm is cleared in the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 3 Check the status of the active and standby DBServers.

1. Log in to the host where the DBService floating IP address is located, run the **sudo su - root** and **su - omm** commands to switch to user **omm**, and run the **cd ${BIGDATA_HOME}/FusionInsight/dbservice/** command to go to the DBService installation directory.
2. Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If yes, go to **Step 3.3**.
- If no, go to **Step 4**.

3. Check whether the active and standby HA processes are abnormal.
   - If yes, go to **Step 3.4**.
   - If no, go to **Step 4**.
4. Choose **Components** > **DBService** > **More** > **Restart Service** to restart DBService and check whether DBService is started successfully.
   - If yes, go to **Step 3.5**.
   - If no, go to **Step 4**.
5. Wait about 2 minutes and check whether the alarm is cleared in the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.536 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node.

This alarm is cleared when the heartbeat recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27003	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.

Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

Possible Causes

The link between the active and standby DBService nodes is abnormal.

Procedure

Step 1 Check whether the network between the active and standby DBService servers is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, locate the row that contains the alarm and view the IP address of the standby DBService server in the alarm details.
3. Log in to the active DBService server.
4. Run the **ping** *heartbeat IP address of the standby DBService* command to check whether the standby DBService server is reachable.
   - If yes, go to **Step 2**.
   - If no, go to **Step 1.5**.
5. Contact the network administrator to check whether the network is faulty.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 2**.
6. Rectify the network fault and check whether the alarm is cleared from the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.537 ALM-27004 Data Inconsistency Between Active and Standby DBServices (For MRS 2.*x* or Earlier)

Description

The system checks the data synchronization status between the active and standby DBServices every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization is in normal state.

Attribute

Alarm ID	Alarm Severity	Auto Clear
27004	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.
SYNC_PERSENT	Synchronization percentage.

Impact on the System

When data is not synchronized between the active and standby DBServices, the data may be lost or abnormal if the active instance becomes abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The disk space of the standby node is full.

Procedure

Step 1 Check whether the network between the active and standby nodes is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, locate the row that contains the alarm and view the IP address of the standby DBService node in the alarm details.
3. Log in to the active DBService node.
4. Run the **ping** *heartbeat IP address of the standby DBService* command to check whether the standby DBService node is reachable.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.5**.
5. Contact the O&M personnel to check whether the network is faulty.
   - If yes, go to **Step 1.6**.
   - If no, go to **Step 2.1**.
6. Rectify the network fault and check whether the alarm is cleared from the alarm list.
   - If yes, no further action is required.
   - If no, go to **Step 2.1**.

Step 2 Check whether the standby DBService is in normal state.

1. Log in to the standby DBService node.
2. Run the following commands to switch the user:

   sudo su - root

   su - omm
3. Go to the **${DBSERVER_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is in normal state. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

   Example:

   ```
   10_10_10_231 gaussDB Standby_normal Normal Active_standby
   ```
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 4**.

Step 3 Check whether the disk space of the standby node is insufficient.

1. Log in to the standby DBService node.
2. Run the following commands to switch the user:

   sudo su - root

   su - omm

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Go to the **${DBSERVER_HOME}** directory, and run the following commands to obtain the DBService data directory:

   cd ${DBSERVER_HOME}

   source .dbservice_profile

   echo ${DBSERVICE_DATA_DIR}
4. Run the **df -h** command to check the system disk partition usage.
5. Check whether the DBService data directory space is full.
   - If yes, go to **Step 3.6**.
   - If no, go to **Step 4**.
6. Perform upgrade and expand capacity.
7. After capacity expansion, wait 2 minutes and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.538 ALM-28001 Spark Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Spark service status every 30 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
28001	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.

Procedure

Step 1 Check whether service unavailability alarms exist in services that Spark depends on.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Check whether the following alarms exist in the alarm list:
   a. ALM-25500 KrbServer Service Unavailable
   b. ALM-25000 LdapServer Service Unavailable
   c. ALM-13000 ZooKeeper Service Unavailable
   d. ALM-14000 HDFS Service Unavailable
   e. ALM-18000 Yarn Service Unavailable
   f. ALM-16004 Hive Service Unavailable
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 2**.
3. Handle the alarms based on the troubleshooting methods provided in the alarm help.

   After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Contact the O&M engineers and send the collected logs.

9.11.539 ALM-38000 Kafka Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Kafka service availability every 30 seconds. This alarm is generated if the Kafka service becomes unavailable.

This alarm is cleared after the Kafka service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
38000	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The cluster cannot provide the Kafka service and users cannot run new Kafka tasks.

Possible Causes

- The KrbServer component is faulty.
- The ZooKeeper component is faulty or fails to respond.
- The Broker node in the Kafka cluster is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Check the KrbServer component status. For clusters without Kerberos authentication, skip this step and go to **Step 2**.

1. Go to the MRS cluster details page and click **Components**.
2. Check whether the health status of the KrbServer service is **Good**.
   - If yes, go to **Step 2.1**.
   - If no, go to **Step 1.3**.
3. Rectify the fault by following instructions in **ALM-25500 KrbServer Service Unavailable (For MRS 2.x or Earlier)**.
4. Perform **Step 1.2** again.

Step 2 Check the ZooKeeper component status.

1. Check whether the health status of the ZooKeeper service is **Good**.
   - If yes, go to **Step 3.1**.
   - If no, go to **Step 2.2**.
2. If the ZooKeeper service is stopped, start it. For other problems, follow the instructions in **ALM-13000 ZooKeeper Service Unavailable (For MRS 2.x or Earlier)**.
3. Perform **Step 2.1** again.

Step 3 Check the Broker status.

1. Choose **Components** > **Kafka** > **Broker**.
2. In **Role**, check whether all instances are normal.
   - If yes, go to **Step 3.4**.
   - If no, go to **Step 3.3**.
3. Select all instances of Broker and choose **More** > **Restart Instance**.
   - If the restart is successful, go to **Step 3.4**.
   - If the restart fails, go to **Step 4**.
4. Choose **Components > Kafka**. Check whether the health status of Kafka is **Good**.
   - If yes, go to **Step 3.5**.
   - If no, go to **Step 4**.
5. Wait 30 seconds and check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 4**.

Step 4 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.540 ALM-38001 Insufficient Kafka Disk Capacity (For MRS 2.*x* or Earlier)

Description

The system checks the Kafka disk usage every 60 seconds and compares it with the threshold. This alarm is generated if the disk usage exceeds the threshold.

To modify the threshold, users can choose **System** > **Threshold Configuration** on MRS Manager.

This alarm is cleared if the Kafka disk usage is lower than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
38001	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Kafka fails to write data to the disks.

Possible Causes

- The Kafka disk configurations (such as disk count and disk size) are insufficient for the data volume.
- The data retention period is long and historical data occupies large space.
- Services are improperly planned. As a result, data is unevenly distributed and some disks are full.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Step 1 Go to the MRS cluster details page and choose **Alarms**.

Step 2 In the alarm list, click the alarm and view the **HostName** and **PartitionName** of the alarm in **Location** of **Alarm Details**.

Step 3 On the **Hosts** page, click the host name obtained in **Step 2**.

Step 4 Check whether the **Disk** area contains the **PartitionName** of the alarm.

- If yes, go to **Step 5**.
- If no, manually clear the alarm and no further action is required.

Step 5 In the **Disk** area, check whether the usage of the alarmed partition has reached 100%.

- If yes, go to **Step 6**.
- If no, go to **Step 8**.

Step 6 In **Instance**, choose **Broker > Instance Configuration**. On the **Instance Configuration** page that is displayed, set **Type** to **All** and query the data directory parameter **log.dirs**.

Step 7 Choose **Components > Kafka > Instances**. On the **Kafka Instance** page that is displayed, stop the Broker instance corresponding to **Step 2**. Then log in to the alarmed node and manually delete the data directory in **Step 6**. After all subsequent operations are complete, start the Broker instance.

Step 8 Choose **Components > Kafka > Service Configuration**. The **Kafka Configuration** page is displayed.

Step 9 Check whether **disk.adapter.enable** is **true**.

- If yes, go to **Step 11**.
- If no, change the value to **true** and go to **Step 10**.

Step 10 Check whether the **adapter.topic.min.retention.hours** parameter, indicating the minimum data retention period, is properly configured.

- If yes, go to **Step 12**.
- If no, set it to a proper value and go to **Step 12**.

NOTE

If the retention period cannot be adjusted for certain topics, the topics can be added to **disk.adapter.topic.blacklist**.

Step 11 Wait 10 minutes and check whether the disk usage is reduced.

- If yes, wait until the alarm is cleared.
- If no, go to **Step 12**.

Step 12 Go to the **Kafka Topic Monitor** page and query the data retention period configured for Kafka. Determine whether the retention period needs to be shortened based on service requirements and data volume.

- If yes, go to **Step 13**.
- If no, go to **Step 14**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 13 Find the topics with great data volumes based on the disk partition obtained in **Step 2**. Log in to the Kafka client and manually shorten the data retention period for these topics using the following command:

kafka-topics.sh --zookeeper *ZooKeeper address:24002/kafka* **--alter --topic** *Topic name* **--config retention.ms=***Retention period*

Step 14 Check whether partitions are properly configured for topics. For example, if the number of partitions for a topic with a large data volume is smaller than the number of disks, data may be unevenly distributed to the disks and the usage of some disks will reach the upper limit.

NOTE

To identify topics with large data volumes, log in to the relevant nodes obtained in **Step 2**, go to the data directory (the configured directory before **log.dirs** in **Step 6** is modified), and check the disk space used by each topic's partitions.

- If the partitions are improperly configured, go to **Step 15**.
- If the partitions are properly configured, go to **Step 16**.

Step 15 On the Kafka client, add partitions to the topics.

kafka-topics.sh --zookeeper *ZooKeeper address:24002/kafka* **--alter --topic** *Topic name* **--partitions=***Number of new partitions*

NOTE

It is advised to set the number of new partitions to a multiple of the number of Kafka disks.

This operation may not quickly clear the alarm. Data will be gradually balanced among the disks.

Step 16 Check whether the cluster capacity needs to be expanded.

- If yes, add nodes to the cluster and go to **Step 17**.
- If no, go to **Step 17**.

Step 17 Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 18**.

Step 18 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.541 ALM-38002 Heap Memory Usage of Kafka Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the heap memory usage of Kafka every 30 seconds. This alarm is generated if the heap memory usage of Kafka exceeds the threshold (80%).

This alarm is cleared if the heap memory usage is lower than the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
38002	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

Impact on the System

Memory overflow may occur, causing service crashes.

Possible Causes

The heap memory usage is high or the heap memory is improperly allocated.

Procedure

Step 1 Check the heap memory usage.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Choose **ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold** > **Location**. Query the IP address of the alarmed instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Choose **Components > Kafka > Instance > Broker (corresponding to the IP address of the alarmed instance) > Customize > Kafka Heap Memory Resource Percentage** to check the heap memory usage.
4. Check whether the heap memory usage of Kafka has reached the threshold (80%).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Kafka** > **Service Configuration** > **All** > **Broker** > **Environment Variables**. Increase the value of **KAFKA_HEAP_OPTS** as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.542 ALM-43001 Spark Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Spark service status every 60 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43001	Critical	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

The Spark tasks submitted by users fail to be executed.

Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.

Procedure

Step 1 Check whether service unavailability alarms exist in services that Spark depends on.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether the following alarms exist in the alarm list:
   a. ALM-25500 KrbServer Service Unavailable
   b. ALM-25000 LdapServer Service Unavailable
   c. ALM-13000 ZooKeeper Service Unavailable
   d. ALM-14000 HDFS Service Unavailable
   e. ALM-18000 Yarn Service Unavailable
   f. ALM-16004 Hive Service Unavailable
   - If yes, go to **Step 1.3**.
   - If no, go to **Step 2**.
3. Handle the alarm according to the alarm help.
   After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.

9.11.543 ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the heap memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43006	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the available JobHistory process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JobHistory process is overused or the heap memory is inappropriately allocated.

Procedure

Step 1 Check the heap memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43006** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JobHistory** (IP address of the instance for which the alarm is generated) > **Customize** > **Heap Memory Statistics of the JobHistory Process**. Click **OK** to view the heap memory usage.
4. Check whether the used heap memory of JobHistory reaches 90% of the maximum heap memory specified for JobHistory.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JobHistory** > **Default**. Increase the value of **SPARK_DAEMON_MEMORY** as required.
6. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.
7. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.544 ALM-43007 Non-Heap Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the non-heap memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43007	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the available JobHistory process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JobHistory process is overused or the non-heap memory is inappropriately allocated.

Procedure

Step 1 Check non-heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43007** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JobHistory** (IP address of the instance for which the alarm is generated) > **Customize** > **Non-Heap Memory Statistics of the JobHistory Process**. Click **OK** to view the non-heap memory usage.
4. Check whether the non-heap memory usage of JobHistory has reached the threshold (90% of the maximum memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JobHistory** > **Default**. Increase the value of **-XX:MaxMetaspaceSize** in **SPARK_DAEMON_JAVA_OPTS** as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.545 ALM-43008 Direct Memory Usage of the JobHistory Process Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the direct memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43008	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the available JobHistory process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JobHistory process is overused or the direct memory is inappropriately allocated.

Procedure

Step 1 Check the direct memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43008** and view the IP address and role name of the instance in **Location**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Choose **Components** > **Spark** > **Instance** > **JobHistory** (IP address of the instance for which the alarm is generated) > **Customize** > **Direct Memory Statistics of the JobHistory Process**. Click **OK** to view the direct memory usage.
4. Check whether the direct memory usage of the JobHistory process has reached the threshold (90% of the maximum direct memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JobHistory** > **Default**. Increase the value of **-XX:MaxDirectMemorySize** in **SPARK_DAEMON_JAVA_OPTS** as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

9.11.546 ALM-43009 JobHistory GC Time Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the GC time of the JobHistory process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. You can change the threshold by choosing **System** > **Threshold Configuration** > **Service** > **Spark** > **JobHistory GC Time** > **Total JobHistory GC Time**. This alarm is cleared when the JobHistory GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43009	Major	Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, JobHistory may run in low performance.

Possible Causes

The heap memory of the JobHistory process is overused or inappropriately allocated, causing frequent GC.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43009** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JobHistory** (IP address of the instance for which the alarm is generated) > **Customize** > **GC Time of the JobHistory Process**. Click **OK** to view the GC time.
4. Check whether the GC time of the JobHistory process is longer than 12 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JobHistory** > **Default**. Increase the value of the **SPARK_DAEMON_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.547 ALM-43010 Heap Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the heap memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43010	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the available JDBCServer process heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The heap memory of the JDBCServer process is overused or the heap memory is inappropriately allocated.

Procedure

Step 1 Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43010** and view the IP address and role name of the instance in **Location**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Choose **Components** > **Spark** > **Instance** > **JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize** > **Heap Memory Statistics of the JDBCServer Process**. Click **OK** to view the heap memory usage.
4. Check whether the heap memory usage of JDBCServer has reached the threshold (90% of the maximum heap memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JDBCServer** > **Tuning**. Increase the value of the **SPARK_DRIVER_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.

9.11.548 ALM-43011 Non-Heap Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the non-heap memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43011	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the available JDBCServer process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The non-heap memory of the JDBCServer process is overused or the non-heap memory is inappropriately allocated.

Procedure

Step 1 Check non-heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43011** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize** > **Non-heap Memory Statistics of the JDBCServer Process**. Click **OK** to view the non-heap memory usage.
4. Check whether the non-heap memory usage of JDBCServer has reached the threshold (90% of the maximum non-heap memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JDBCServer** > **Tuning**. Increase the value of **-XX:MaxMetaspaceSize** in **spark.driver.extraJavaOptions** as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

9.11.549 ALM-43012 Direct Memory Usage of the JDBCServer Process Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the direct memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43012	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the available JDBCServer process direct memory is insufficient, a memory overflow occurs and the service breaks down.

Possible Causes

The direct memory of the JDBCServer process is overused or the direct memory is inappropriately allocated.

Procedure

Step 1 Check the direct memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43012** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize** > **Direct Memory Statistics of the JDBCServer Process**. Click **OK** to view the direct memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Check whether the direct memory usage of the JDBCServer process has reached the threshold (90% of the maximum direct memory).
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JDBCServer** > **Tuning**. Increase the value of **-XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.550 ALM-43013 JDBCServer GC Time Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system checks the GC time of the JDBCServer process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. You can change the threshold by choosing **System** > **Threshold Configuration** > **Service** > **Spark** > **JDBCServer GC Time** > **Total JDBCServer GC Time**. This alarm is cleared when the JDBCServer GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43013	Major	Yes

Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.

Impact on the System

If the GC time exceeds the threshold, JDBCServer may run in low performance.

Possible Causes

The heap memory of the JDBCServer process is overused or inappropriately allocated, causing frequent GC.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43013** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize** > **GC Time of the JDBCServer Process**. Click **OK** to view the GC time.
4. Check whether the GC time of the JDBCServer process is longer than 12 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JDBCServer** > **Tuning**. Increase the value of the **SPARK_DRIVER_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

----End

9.11.551 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold (For MRS 2.*x* or Earlier)

Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to configure a resource group. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to configure the threshold of each resource group.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44004	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

Procedure

Step 1 Choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to adjust the resource group configuration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to modify the threshold of each resource group.

Step 3 Collect fault information.

1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks on the Presto client based on **Resource Group** in the additional information.
2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
3. Contact O&M engineers and send the collected logs.

9.11.552 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** > **Configure Alarm Threshold** > **Service** > **Presto** > **Coordinator** > **Presto Process Garbage Collection Time** > **Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44005	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44005** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Presto** > **Instances** > **Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**. Choose **Presto** > **Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact O&M engineers and send the collected logs.

----End

9.11.553 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold (For MRS 2.*x* or Earlier)

Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System** >

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configure Alarm Threshold > **Service** > **Presto** > **Worker** > **Presto Garbage Collection Time** > **Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

Attribute

Alarm ID	Alarm Severity	Auto Clear
44006	Major	Yes

Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

Procedure

Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44006**. Then check the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Presto** > **Instances** > **Worker** (business IP address of the instance for which the alarm is generated) > **Customize** > **Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
   - If yes, go to **Step 1.5**.
   - If no, go to **Step 2**.
5. Choose **Components** > **Presto** > **Service Configuration**, and switch **Basic** to **All**, and choose **Presto** > **Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA_OPTS** parameter based on the site requirements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

6. Check whether the alarm is cleared.
   - If yes, no further action is required.
   - If no, go to **Step 2**.

Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M engineers and send the collected logs.

9.11.554 ALM-45325 Presto Service Unavailable (For MRS 2.*x* or Earlier)

Description

The system checks the Presto service status every 60 seconds. This alarm is generated when the system detects that Presto is unavailable.

This alarm is cleared when the Presto service recovers.

Attribute

Alarm ID	Alarm Severity	Auto Clear
45325	Critical	Yes

Parameters

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Impact on the System

Presto cannot run SQL queries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Possible Causes

- The Presto coordinator or worker process is faulty.
- The network communication between Presto coordinator and worker instances is interrupted.

Procedure

Step 1 Check the status of the coordinator and worker processes.

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Presto**. On the page that is displayed, click the **Instance** tab. In the Presto instance list, check whether the status of all coordinator or worker instances is **Unknown**.
   - If yes, go to **2**.
   - If no, go to **1**.
2. In the upper part of the Presto instance list, choose **More** > **Restart Service** to restart the coordinator and worker processes.
3. In the alarm list, check whether ALM-45325 Presto Service Unavailable is cleared.
   - If yes, no further action is required.
   - If no, go to **1** in **Step 2**.

Step 2 Collect fault information.

1. On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
2. Select **Presto** for **Service**.
3. Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
4. Contact the O&M engineers and send the collected logs.

----End

Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

9.12 Configuring Remote O&M for an MRS Cluster

If you encounter any issues while using a cluster and require assistance from support personnel, you can first contact them. Then, you can authorize them to access your machine through the O&M authorization function to locate the fault. Alternatively, you can provide support personnel with logs from a specific time period using the log sharing function to help them locate the fault.

Enabling Remote Node O&M Authorization for an MRS Cluster

This authorization will allow O&M personnel to temporarily access your cluster nodes before the expiration time. You can also manually cancel the authorization in advance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 1 Log in to the MRS console.

Step 2 In the navigation pane of the MRS console, choose **Active Clusters**, locate a running cluster, and click its name to switch to the cluster details page.

Step 3 In the upper right corner of the page, click **O&M**, choose **Authorize for Cluster Nodes**, and select the deadline for the support engineers to access the local host. Before the deadline, the support personnel have the temporary permission to access the local host.

Step 4 Select the check box to confirm authorization and click **OK**.

Step 5 After the fault is rectified, click **O&M** in the upper right corner of the page and choose **Deauthorize for Cluster Nodes** to retrieve the access permission granted to the support engineers.

----End

Configuring Remote O&M Log Sharing for an MRS Cluster

Step 1 Log in to the MRS console.

Step 2 In the navigation pane of the MRS console, choose **Active Clusters**, locate a running cluster, and click its name to switch to the cluster details page.

Step 3 In the upper right corner of the displayed page, choose **O&M** > **Share Log**.

Step 4 In the displayed dialog box, select the start time and end time in **Time Range**.

- Select **Time Range** based on the suggestions of support personnel.
- **End Date** must be later than **Start Date**. Otherwise, logs cannot be filtered by time.

----End

Configuring Remote O&M Metric Sharing for an MRS Cluster

Step 1 Log in to the MRS console.

Step 2 In the navigation pane of the MRS console, choose **Active Clusters**, locate a running cluster, and click its name to switch to the cluster details page.

Step 3 In the upper right corner of the page, click **O&M** and select **Share Metric** to enable metric sharing.

Step 4 After the fault is rectified, click **O&M** in the upper right corner of the page and select **Disable Metric Sharing** to cancel the access permission for the support personnel.

----End

9.13 Common Ports for MRS Cluster Services

This section describes the common ports of each component in an MRS cluster. If the cluster version type is **LTS** during cluster creation in custom config mode as described in **Creating a Custom MRS Cluster**, you can determine whether to keep

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the default ports of the components consistent with those of the open-source components.

- If **Component Port** is set to **Open source** or **Version Type** is set to **Normal**, find the default component ports in the **Default Open Source Port** column of the following table.
- If **Component Port** is set to **Custom**, find the default component ports in the **Default Custom Port** column of the following table.
- If there is only the **Default Port** column, the open-source ports of the component are the same as the default custom ports.
- The value range of each component port is a recommended value, defined by the product. However, the system does not enforce strict limitations on port ranges.

Common HBase Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
hbase.master.port	16000	21300	HMaster RPC port, which is used to connect the HBase client to HMaster. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.master.info.port	16010	21301	HMaster HTTPS port, which is used by the remote web client to connect to the HMaster UI. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.regionserver.port	16020	21302	RegionServer (RS) RPC port, which is used to connect the HBase client to RegionServer. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
hbase.regionserver.info.port	16030	21303	RegionServer HTTPS port, which is used by the remote web client to connect to the RegionServer UI. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.thrift.info.port	9095	21304	Thrift server listening port of ThriftServer. This port is used by client connections. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.regionserver.thrift.port	9090	21305	Thrift server listening port of RegionServer. This port is used by clients to connect to RegionServer. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
hbase.rest.info.port	8085	21308	Port of the native web UI of RegionServer RESTServer.
-	21309	21309	REST port of RegionServer RESTServer.

Common HDFS Ports

The protocol type of all ports in the table is TCP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.namenode.rpc.port	• 9820 (versions earlier than MRS 3.*x*) • 8020 (MRS 3.*x* or later)	25000	NameNode RPC port, which is used for communication between the HDFS client and NameNode and connections between different DataNodes. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
dfs.namenode.http.port	9870	25002	HTTP access port of NameNode. This port is used for the point-to-point NameNode checkpoint operations and for the remote web client to connect to the NameNode UI. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
dfs.namenode.https.port	9871	25003	HTTPS access port of NameNode. This port is used for the point-to-point NameNode checkpoint operations and for the remote web client to connect to the NameNode UI. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
dfs.datanode.ipc.port	9867	25008	Port for communication between DataNode processes. This port is used by clients to connect to DataNodes to perform RPC operations. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.datanode.port	9866	25009	DataNode data transmission port. This port is used by the HDFS client to transfer data from or to DataNode. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.datanode.http.port	9864	25010	DataNode HTTP port, which is used to remotely connect to the DataNode UI through a web client in secure mode. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.datanode.https.port	9865	25011	DataNode HTTPS port, which is used to remotely connect to the DataNode UI through a web client in secure mode. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.JournalNode.rpc.port	8485	25012	JournalNode RPC port, which is used for client communication. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
dfs.journalnode.http.port	8480	25013	JournalNode HTTP port, which is used to remotely connect to JournalNode through a web client in secure mode. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
dfs.journalnode.https.port	8481	25014	JournalNode HTTPS port, which is used to remotely connect to JournalNode through a web client in secure mode. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
httpfs.http.port	14000	25018	HttpFS HTTP server listening port, which is used to remotely connect to HttpFS through a REST API. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common HetuEngine Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
server.port (HSBroker)	29860	29860	Specifies the port number that HSBroker listens to.
server.port (HSConsole)	29880	29880	Specifies the port number that HSConsole listens to.
server.port (HSFabric)	29900	29900	Specifies the port number that HSFabric listens to, which is used for cross-domain connections.
gateway.port	29902	29902	Specifies the port number that HSFabric listens to, which is used for JDBC connections.

Common Hive Ports

The protocol type of all ports in the table is TCP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
templeton.port	9111	21055	Port used for WebHCat to provide the REST service. This port is used for the communication between the WebHCat server and the WebHCat client. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hive.server2.thrift.port	10000	21066	Port for HiveServer to provide Thrift services. This port is used for the communication between the HiveServer server and the HiveServer client. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hive.metastore.port	9083	21088	Port for MetaStore to provide Thrift services. This port is used for communication between the Metastore client and Metastore, that is, communication between HiveServer and Metastore. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
hive.server2.webui.port	10002	-	Hive Web UI port, which is used to communicate with the Hive UI server using HTTPS/HTTP.

Common Hue Ports

The protocol type of all ports in the table is TCP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
HTTP_PORT	8888	21200	Port for Hue to provide HTTPS services This port is used to provide web services over HTTPS, which can be changed. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common Kafka Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
port	9092	21005	Port for a broker to receive data and obtain services
ssl.port	9093	21008	SSL port used by a broker to receive data and obtain services
sasl.port	21007	21007	SASL security authentication port provided by a broker, which provides the secure Kafka service
sasl-ssl.port	21009	21009	Port used by a broker to provide encrypted service based on the SASL and SSL protocols

Common Loader Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
LOADER_HTTPS_PORT	21351	This port is used to provide REST APIs for configuration and running of Loader jobs. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Common Manager Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
-	8080	Port provided by WebService for user access This port is used to access the web UI over HTTP. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
-	28443	Port provided by WebService for user access This port is used to access the web UI over HTTPS. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
-	-	CAS port This port is used for user login authentication. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
-	-	Control port provided by the backup and restoration plug-in process. This port is used by the controller to send backup and restoration control commands.
-	-	Port registered by the client with the OM server
-	-	OMS database service port This port is used to provide database services. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Port	Port Description
-	-	DBService database service port This port is used to provide database services. • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes
-	-	Port used to receive operation or query requests from the management plane and to forward the requests to the executor or manager for execution.

Common MapReduce Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
mapreduce.jobhistory.webapp.port	19888	26012	Web HTTP port of the JobHistory server This port is used to view the web page of the JobHistory server.
mapreduce.jobhistory.port	10020	26013	Port of the JobHistory server This port is used for: 1. Task data restoration in the MapReduce client 2. Obtaining task report in the Job client
mapreduce.jobhistory.webapp.https.port	19890	26014	Web HTTPS port of the JobHistory server This port is used to view the web page of the JobHistory server.

Common Spark Ports

The protocol type of all ports in the table is TCP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
hive.server2.thrift.port	22550	22550	JDBC thrift port This port is used for socket communication between the Spark 2.1.0 CLI/JDBC client and server. If **hive.server2.thrift.port** is used, an exception indicating that the port is occupied is reported. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
spark.ui.port	4040	22950	Web UI port of JDBC This port is used for HTTPS/HTTP communication between Web requests and the JDBC Server Web UI server. The system obtains the port based on the parameter settings and checks its validity. If the port is invalid, the system increases the port number by 1 each time for a maximum of 16 times until a valid port is obtained (the retry times can be configured using **spark.port.maxRetries**). ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
spark.history.ui.port	18080	22500	JobHistory Web UI port This port is used for HTTPS/HTTP communication between web requests and the Spark 2.1.0 History Server. The system obtains the port based on the parameter settings and checks its validity. If the port is invalid, the system increases the port number by 1 each time for a maximum of 16 times until a valid port is obtained (the retry times can be configured using **spark.port.maxRetries**). • Is the port enabled by default during the installation: Yes • Is the port enabled after security hardening: Yes

Common Storm Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
nimbus.thrift.port	6627	29200	Port for Nimbus to provide thrift services
supervisor.slots.ports	6700/6701/6702/6703	29200–29499	Port for receiving service requests that are forwarded from other servers
logviewer.https.port	29248	29248	Port for LogViewer to provide HTTPS services
ui.https.port	29243	29243	Port for the Storm UI to provide HTTPS services

Common YARN Ports

The protocol type of all ports in the table is TCP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
yarn.resourcemanager.webapp.port	8088	26000	Web HTTP port of the ResourceManager service
yarn.resourcemanager.webapp.https.port	8090	26001	Web HTTPS port of the ResourceManager service This port is used to access the Resource Manager web applications in security mode. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes
yarn.nodemanager.webapp.port	8042	26006	NodeManager Web HTTP port
yarn.nodemanager.webapp.https.port	8044	26010	NodeManager Web HTTPS port This port is used to access the NodeManager web applications in security mode. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

Common ZooKeeper Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
clientPort	2181	24002	ZooKeeper client port This port is used for communication between the ZooKeeper client and ZooKeeper server. ● Is the port enabled by default during the installation: Yes ● Is the port enabled after security hardening: Yes

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Common Kerberos Ports

The protocol type of all ports in the table is TCP and UDP.

Parameter	Default Port	Port Description
kdc_ports	21732	Kerberos server port. This port is used by components for Kerberos authentication. This port may be used when you configure mutual trust between clusters.

Common OpenTSDB Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
tsd.network.port	4242	Web UI port of OpenTSDB This port is used for HTTPS/HTTP communication between web requests and the OpenTSDB UI server.

Common Tez Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
tez.ui.port	28888	Web UI port of Tez

Common KafkaManager Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
kafka_manager_port	9099	Web UI port of KafkaManager

Common Presto Ports

The protocol type of all ports in the table is TCP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Port	Port Description
http-server.http.port	7520	HTTP port for Presto coordinator to provide services to external systems
http-server.https.port	7521	HTTPS port for Presto coordinator to provide services to external systems
http-server.http.port	7530	HTTP port for Presto worker to provide services to external systems
http-server.https.port	7531	HTTPS port for Presto worker to provide services to external systems

Common Flink Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Port	Port Description
jobmanager.web.port	32261~32325	Web UI port of Flink This port is used for HTTP/HTTPS communication between the client web requests and Flink server.

Common ClickHouse Ports

The protocol type of the port in the table is TCP and HTTP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
interserver_http_port	9009	9009	HTTP port for the communication between ClickHouse servers.
interserver_https_port	9010	9010	HTTPS port for the communication between ClickHouse servers.
http_port	8123	8123	Port for connecting to the ClickHouse server through HTTP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
https_port	8443	8443	Port for connecting to the ClickHouse server through HTTPS.
tcp_port	9000	9000	Port for connecting the client to the ClickHouse server through TCP.
tcp_port_secure	9440	9440	Port for connecting the client to the ClickHouse server through TCP SSL.
lb_tcp_port	21424	21424	TCP communication port number for ClickHouseBalancer.
lb_http_port	21425	21425	HTTP communication port number for ClickHouseBalancer.
lb_https_port	21426	21426	HTTPS communication port number for ClickHouseBalancer.
lb_tcp_secure_port	21428	21428	TCP SSL communication port number for ClickHouseBalancer.

Common Impala Ports

The protocol type of all ports in the table is TCP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
--beeswax_port	21000	21970	Port for impala-shell communication
--hs2_port	21050	21971	Port for Impala application communication
--hs2_http_port	28000	21981	Port used by Impala to provide the HiveServer2 protocol for external systems

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Common Doris Ports

The protocol type of the port in the table is TCP and HTTP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
http_port	8030	29980	HTTP port of the FE service
https_port	8050	29991	HTTPS port of the FE service
query_port	9030	29982	Port used by the Doris FE to query connections through the MySQL protocol
rpc_port	9020	29981	Thrift Server port of the FE service
be_port	9060	29984	Thrift Server Port on BE for receiving requests from FE
brpc_port	8060	29987	BRPC port on BE, which is used for communications between BE instances.
heartbeat_service_port	9050	29985	Thrift heartbeat service port on BE, which is used to receive heartbeat messages from FE
webserver_port	8040	29986	HTTP server port on BE
broker_ipc_port	8000	29990	Thrift Server communication port on Broker, which is used to receive requests.
single_replica_load_brpc_port	9070	29988	RPC port used for the communication between the master and slave replicas to import single-replica data
single_replica_load_download_port	8050	29989	Port used by the slave replica to download data files from the master replica through HTTP for single-copy data import

Common Guardian Ports

The protocol type of the port in the table is TCP and HTTP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Default Open Source Port	Default Custom Port	Port Description
ranger.obs.service.rpc.address.port	26901	26901	The RPC listening port for the Guardian OBS client service.
token.server.http-server.port	26900	26900	HTTP listening port of the Guardian service.
token.server.rpc.address.port	26902	26902	The RPC listening port of the Guardian service.

Common Kudu Ports

The protocol type of the port in the table is TCP and HTTP.

Parameter	Default Open Source Port	Default Custom Port	Port Description
rpc_bind_addresses	7051	7051	Default RPC port of the Kudu Master. All requests from Tablet Server and clients (such as Impala and Spark) interact with the Master through this port.
webserver_port	8051	8051	Web UI port of the Kudu Master. You can access **http://<*master_host*>:8051** using a browser to view the Master status and monitoring information.
rpc_bind_addresses	7050	7050	Default RPC port of the Kudu Tablet Server. This port is used for receiving client requests, coordinating with the Master, and communication between Tablet Servers.
webserver_port	8050	8050	Web UI port of the Kudu Tablet Server. You can access **http://<*tserver_host*>:8050** using a browser to view the Tablet Server status and monitoring information.

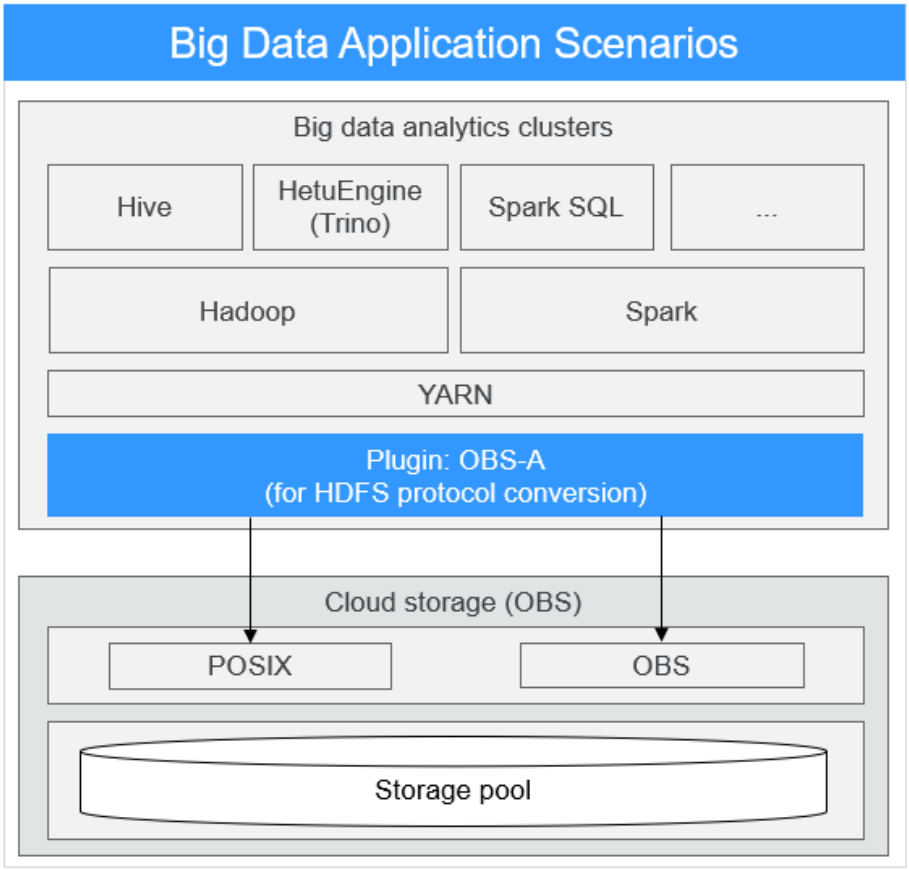
10 Configuring Storage-Compute Decoupling for an MRS Cluster

10.1 MRS Storage-Compute Decoupling Overview

MRS allows you to store data in OBS and use MRS clusters for data computing only. This decoupled storage-compute mode enables you to flexibly scale resources on demand and provides a low-cost solution for massive data analysis.

- MRS 3.3.0- LTS and later versions support only OBS interconnection through the Guardian component, which provides temporary authentication credentials for services such as HDFS, Hive, Spark, Loader, and HetuEngine to access OBS.
  - Configure the Guardian service to disable Ranger OBS path authentication. For details, see **Disabling Ranger OBS Path Authentication for Guardian**.
  - Configure the Guardian service to enable Ranger OBS path authentication and cascading authorization. For details, see **Enabling Ranger OBS Path Authentication for Guardian**.
- For versions earlier than MRS 3.3.0- LTS, OBS interconnection is supported only through the IAM agency mode. For details, see **Interconnecting an MRS Cluster with OBS Using an IAM Agency**.

MRS Storage-Compute Decoupling Solution



In an MRS cluster, data is stored on local disks or HDFS by default. Data required for real-time computing, stream and batch processing, and interactive analysis is accessed directly from the cluster's local storage and is written back locally after processing. This solution integrates compute and storage.

However, as services grow rapidly and data volumes increase, this solution faces several challenges. These include the high cost of local disk resources, inflexible and unbalanced allocation of compute and storage resources across the cluster, and low disk utilization resulting from Hadoop's default three- replica storage mechanism. MRS provides a storage–compute decoupling solution based on OBS. In scenarios with large data volumes and elastic compute requirements, data can be stored in OBS distributed parallel file system while MRS clusters are used only

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

for computing. This allows resources to be scaled on demand and supports a cost- effective approach to massive data analytics.

Figure 10-1 MRS storage-compute decoupling solution

Based on the large capacity and high bandwidth of OBS, the MRS storage-compute decoupling solution is compatible with multiple computing engines such as Hive and Spark in the Hadoop ecosystem. Compared with traditional on-premises IDC deployment of big data services, the MRS storage-compute decoupling solution features high convergence efficiency, high resource utilization, and low costs.

Notes and Constraints

- In storage-compute decoupling scenarios, make sure to use an OBS parallel file system. Using a regular object bucket can significantly impact the performance of the cluster.
- To delete a component or cluster connected to OBS (including storage-compute decoupling and cold-hot data separation scenarios), you must also delete the service data on OBS.
- After storage-compute decoupling is configured for the MRS cluster, components can access the OBS file system and the HDFS in the cluster. For details, see **Interconnecting an MRS Cluster with OBS Using an IAM Agency** or **Interconnecting an MRS Cluster with OBS Through Guardian**.
- On the Guardian-based storage and compute decoupling management plane, job submission depends on the JobGateway instead of the Executor.

Configuring Storage and Compute Decoupling Using Guardian

NOTICE

- If you need to configure permission policies for OBS paths of components using Ranger, that is, enable Ranger OBS path authentication for Guardian, see **Enabling Ranger OBS Path Authentication for Guardian**. For details about OBS permission configuration, see **Granting OBS Permissions**.
- If you only need to configure Guardian to connect to OBS, but do not need to use Ranger to configure permission policies for OBS paths, see **Disabling Ranger OBS Path Authentication for Guardian**.

1. Create an MRS cluster.

   The MRS cluster must contain basic components such as Guardian, Ranger, and Hadoop.

   Only MRS 3.3.0-LTS or later supports interconnection with OBS using Guardian.

2. Create an OBS agency.

   Create an agency with OBS access permissions, which allows Guardian to connect to OBS.

3. Enable the interconnection between Guardian and OBS and configure parameters.

   Modify Guardian service parameters and configure IAM agency authentication information to provide temporary authentication credentials and fine-grained permission control for other components to access OBS.

4. Configure the policy for clearing component data in the recycle bin directory.

   In the storage-compute decoupling scenario, the prevention against accidental deletion is enabled by default for components connected to OBS. When you delete data, the deleted object is moved to the corresponding recycle bin directory. You need to configure a lifecycle rule for the corresponding directory in the OBS file system to prevent the storage space from being used up.

5. Interconnect components with OBS.

6. Components in the MRS cluster can directly access the corresponding path after being granted required permissions for accessing OBS buckets. You can use the component client to directly access resources in the OBS file system in absolute path mode.

Configuring Storage-Compute Decoupling Using IAM Agencies

1. Create an ECS agency with OBS access permissions.

   You need to create an ECS agency with OBS access permissions. The ECS agency is used to automatically obtain temporary AK/SK to access OBS.

2. Create an MRS cluster with decoupled storage and compute.

   - Creating a cluster with decoupled storage and compute

     Create an MRS cluster and bind an ECS agency to it. Add components as required. Components that can be connected to OBS through an IAM

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

agency include Hadoop, Hive, Spark, Presto, Flink, Flume, Hudi and Sqoop.

- Configuring storage-compute decoupling for an existing cluster

  Bind an ECS agency to an existing cluster to implement decoupled storage and compute.

3. Create an OBS file system.

   You need to create an OBS parallel file system for storing cluster data.

4. Configure the policy for clearing component data in the recycle bin directory.

   In the storage-compute decoupling scenario, the prevention against accidental deletion is enabled by default for components connected to OBS. When you delete data, the deleted object is moved to the corresponding recycle bin directory. You need to configure a lifecycle rule for the corresponding directory in the OBS file system to prevent the storage space from being used up.

5. Interconnect components with OBS.
6. Components in the MRS cluster can directly access the corresponding path after being granted required permissions for accessing OBS buckets. You can directly access resources in the OBS file system via the component client using an absolute path.

Granting OBS Permissions

Enabling storage-compute decoupling and Ranger authentication for an MRS cluster that connects to OBS using Guardian allows Ranger administrators to grant cluster users permissions to read and write OBS directories and files.

In addition, with the Guardian-based storage-compute decoupling architecture and the Hive cascading authorization function, you just need to be granted permissions on the service table through Ranger. Then the system will grant you the permissions on the data storage source, for example, the storage directory on OBS, in a fine-grained manner. You do not need to query the storage path of the table and perform secondary authorization.

- Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.
- On Ranger, only users in custom user groups in MRS Manager can be granted OBS permissions. Each user group name must contain 1 to 52 characters and can include only letters, digits, underscores (_), and number signs (#). Otherwise, the policy cannot be added.
- For clusters with Kerberos authentication enabled, permissions need to be granted based on Ranger. For clusters with Kerberos authentication disabled, OBS permissions are granted by default, and no additional configuration is required.

10.2 Interconnecting an MRS Cluster with OBS Through Guardian

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.2.1 Disabling Ranger OBS Path Authentication for Guardian

Scenarios

This section describes how to enable storage–compute decoupling for the Guardian component when Kerberos authentication is disabled for the cluster (in normal mode). In this scenario, the Ranger component cannot be used to configure permission policies for OBS paths—that is, the AccessLabel function used by Guardian to interconnect with OBS is disabled, and you do not need to consider whether AccessLabel is enabled on OBS. Once enabled, Guardian can provide temporary authentication credentials for components such as HDFS, Hive, Spark, Loader, and HetuEngine to access OBS in storage-compute decoupling scenarios.

To interconnect Guardian with OBS, do as follows:

1. **Creating an OBS Parallel File System**
2. **Creating a Cloud Service Agency and Binding It to a Cluster**
3. **Granting Guardian the Permission to Access OBS**
4. **Configuring a Recycle Bin Cleanup Policy**

Prerequisites

- Components such as Guardian, Ranger, and Hadoop have been installed in the cluster.
- If components such as Hadoop, HetuEngine, Hive, and Spark have been installed in an environment before installing Guardian, you need to download these component clients again and refresh the default clients for job submission on the MRS console.

Impact on the System

Once you finish the configuration, you will need to either refresh the original client's configuration or reinstall the client.

Creating an OBS Parallel File System

1. Log in to the OBS console.
2. Choose **Parallel File Systems** > **Create Parallel File System**.
3. Enter a file system name, for example, **guardian-obs**.

   Use the enterprise project selected during MRS cluster creation and set other parameters as needed.
4. Click **Create Now**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Creating a Cloud Service Agency and Binding It to a Cluster

NOTE

- MRS presets **MRS_ECS_DEFAULT_AGENCY** in the IAM agency list by default, allowing you to choose this agency when creating a cluster. This agency has **OBS OperateAccess** permission and, for users with fine-grained policies enabled, **CES FullAccess**, **CES Administrator**, and **KMS Administrator** permissions in the region where the cluster is located. Do not modify **MRS_ECS_DEFAULT_AGENCY** on IAM.
- If you want to use the preset agency, skip the step for creating an agency. If you want to use a custom agency, perform the following steps to create an agency. (To create or modify an agency, you must have the **Security Administrator** permission.) If you need to have more fine-grained control over the permissions of a specific path in the OBS file system, you can refer to **Configuring Fine- Grained OBS Access Permissions for MRS Cluster Users** to create a custom role policy.

1. Log in to the management console.
2. In the service list, choose **Management & Governance** > **Identity and Access Management**.
3. Choose **Agencies**. On the displayed page, click **Create Agency**.
4. On the **Create Agency** page, set the following parameters and click **Done**:
   - **Agency Name**: Enter an agency name, for example, **mrs_ecs_obs**.
   - **Agency Type**: Select **Cloud service**.
   - **Cloud Service**: Select **Elastic Cloud Server (ECS) and Bare Metal Server (BMS)**.
   - **Validity Period**: Select **Unlimited**.
5. In the displayed dialog box, click **Authorize**. On the displayed page, click **Create Policy**.

   On the **Create Policy** page, set the following parameters and click **Next**:
   - **Policy Name**: Enter a policy name, for example, **guardian-policy**.
   - **Policy View**: Select **JSON**.
   - **Policy Content**: Configure the parameter as follows:

```
{
   "Version": "1.1",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
         "obs:bucket:GetBucketLocation",
         "obs:bucket:ListBucketMultipartUploads",
         "obs:object:GetObject",
         "obs:object:ModifyObjectMetaData",
         "obs:object:DeleteObject",
         "obs:object:ListMultipartUploadParts",
         "obs:bucket:HeadBucket",
         "obs:object:AbortMultipartUpload",
         "obs:bucket:ListBucket",
         "obs:object:PutObject",
            "obs:bucket:ListAllMyBuckets"
         ],
         "Resource": [
            "OBS:*:*:bucket:guardian-obs",
            "OBS:*:*:bucket:guardian-obs2",
            "OBS:*:*:object:*"
         ]
      }
   ]
}
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In the preceding configuration, **Resource** indicates all resources that can access the configured parallel file system. *guardian-obs* indicates the name of the OBS parallel file system created in **Creating an OBS Parallel File System**.

6. Click **Next**. On the **Select Policy/Role** page, select the policy created in **5**.
7. Click **Next**, select **All resources**, click **Show More**, select **Global resources**, and click **OK**.
8. In the displayed dialog box, click **OK** to start authorization. After the message "Authorization successful." is displayed, click **Finish**. The agency is successfully created.
9. Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.
10. Click the name of the target cluster to access its details page.
11. On the **Dashboard** page, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.
12. On the **Dashboard** tab, click **Select Agency** next to **Agency**. In the displayed dialog box, select the agency you created, for example, **mrs_ecs_obs**, and click **OK**.

Granting Guardian the Permission to Access OBS

1. Log in to MRS Manager by referring to **Accessing MRS Manager**. Choose **Cluster** > **Services** > **Guardian**, click **Configurations** and then **All Configurations**, search for and configure the following parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
fs.obs.guardian.accesslabel.enabled	Whether to enable AccessLabel on OBS, which allows Guardian to connect to OBS. • **true**: indicates that after OBS is connected, you can use Ranger to configure the permission policies of OBS paths. Ensure that the AccessLabel function has been enabled for OBS. If the function is not enabled, manually enable it. For details, contact OBS O&M personnel. • **false**: indicates After OBS is interconnected, the permission policies of OBS paths cannot be configured using Ranger. You do not need to check whether the AccessLabel function is enabled for OBS. Set this parameter to **false**.	false
fs.obs.guardian.enabled	Whether to enable Guardian. • **true**: enables the Guardian. • **false**: (default value) disables the Guardian.	true
fs.obs.delegation.token.providers	Delegation token generator. When **fs.obs.guardian.enabled** is set to **true**, **com..mrs.dt.MRSDelegationTokenProvider** and **com..mrs.dt.GuardianDTProvider** must be configured.	**com..mrs.dt.MRSDelegationTokenProvider** and **com..mrs.dt.GuardianDTProvider**

2. Click **Save** to save the service configuration. On the FusionInsight Manager, choose **More** > **Restart Configuration-Expired Instances** and restart all service instances with expired configurations as prompted.
3. To submit jobs on the MRS console, log in to the active OMS node as user **omm** and run the following command to refresh the built-in client configuration:

```
sh /opt/executor/bin/refresh-client-config.sh
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. (Optional) If you need to update the client configurations of other installed cluster components, see **Updating Client Configurations**.

Configuring a Recycle Bin Cleanup Policy

1. Log in to the OBS console.
2. In the navigation pane on the left, choose **Resources** > **Parallel File Systems**. On the displayed page, click the name of the file system created in **Creating an OBS Parallel File System**.
3. Choose **Data Management** > **Lifecycle Rules**. On the displayed page, click **Create** to create a lifecycle rule for the **/user/.Trash** directory.

> **CAUTION**
>
> **After the decoupled storage-compute solution is used, you must configure lifecycle rules for related directories. Otherwise, there is a risk of running out of storage space and incurring additional storage costs.**

Table 10-1 Parameters for creating a lifecycle rule

Parameter	Description	Example Value
Status	Whether to enable the lifecycle rule.	Enabled
Rule Name	Rule name, used to identify different lifecycle configurations.	rule-test
Prefix	Prefix of the objects to which the lifecycle rule applies. Typically, the recycle bin directory of MRS components is prefixed with **/user/.Trash**.	user/.Trash
Transition to Infrequent Access After (Days)	Number of days after the last update of an object that it will be transitioned to infrequent access storage based on the rule. The minimum value is **30**.	30
Transition to Archive After (Days)	Number of days after the last update of an object that it will be transitioned to archive based on the rule. If you are setting both this parameter and **Transition to Infrequent Access After (Days)**, make sure this parameter value is at least 30 days greater than the value of **Transition to Infrequent Access After (Days)**. If you are only setting this parameter, assign any value to it as needed.	31

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Delete Files After (Days)	Number of days after the last update of an object that it will expire and be automatically deleted by OBS based on the rule. The value of this parameter must be greater than the values of the parameters **Transition to Infrequent Access After (Days)** and **Transition to Archive After (Days)**.	32
Delete Fragments Upon Expiration	Number of days of a fragment that it will expire and be automatically deleted by OBS based on the rule.	30

4. Click **OK**.

   To modify the lifecycle configuration, locate the target lifecycle rule, click **Edit** or **Disable** on the right. To enable a lifecycle rule, click **Enable**.

10.2.2 Enabling Ranger OBS Path Authentication for Guardian

Scenarios

This section describes how to configure permission policies for OBS paths through Ranger after the storage-compute decoupling function is enabled and Guardian is connected to OBS. Ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel. Once enabled, Guardian can provide temporary authentication credentials for components such as HDFS, Hive, Spark, Loader, and HetuEngine to access OBS in storage-compute decoupling scenarios.

To interconnect Guardian with OBS, do as follows:

1. **Creating an OBS Parallel File System**
2. **Creating an Agency for a Regular Account**
3. **Creating a Cloud Service Agency and Binding It to a Cluster**
4. **Granting Guardian Permissions to Access OBS**
5. **Enabling Cascading Authorization for Hive Tables**
6. **Configuring a Recycle Bin Cleanup Policy**

Prerequisites

- Components such as Guardian, Ranger, and Hadoop have been installed in the cluster.
- If components such as Hadoop, HetuEngine, Hive, and Spark have been installed in an environment before installing Guardian, you need to download these component clients again and refresh the default clients for job submission on the MRS console.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If Kerberos authentication is disabled for the cluster (in normal mode), choose **Cluster** > **Services** > *Service name* on MRS Manager. On the displayed **Dashboard** page, click **More** and select **Enable Ranger** in the upper right corner to enable Ranger authentication for the service.

Impact on the System

- Once you finish the configuration, you will need to either refresh the original client's configuration or reinstall the client.
- To submit a job on console, log in to the active OMS node as user **omm** and run the following command to refresh the cluster's built-in clients.
  ```
  sh /opt/executor/bin/refresh-client-config.sh
  ```

Creating an OBS Parallel File System

1. Log in to the OBS console.
2. Choose **Parallel File Systems** > **Create Parallel File System**.
3. Enter a file system name, for example, **guardian-obs**.

   Use the enterprise project selected during MRS cluster creation and set other parameters as needed.
4. Click **Create Now**.

Creating an Agency for a Regular Account

1. Log in to the management console.
2. In the service list, choose **Management & Governance** > **Identity and Access Management**.
3. Choose **Agencies**. On the displayed page, click **Create Agency**.
4. On the **Create Agency** page, set the following parameters and click **Done**:
   - **Agency Name**: Enter an agency name, for example, **agency-MRS-to-OBS**.
   - **Agency Type**: Select **Account**.
   - **Delegated Account**: Enter your cloud account that you signed up for with your mobile number. It cannot be a federated user or an IAM user created using your cloud account.
   - **Validity Period**: Select **Unlimited**.
5. In the displayed dialog box, click **Authorize**. On the displayed page, click **Create Policy**.

   On the **Create Policy** page, set the following parameters and click **Next**:
   - **Policy Name**: Enter a policy name, for example, **guardian-policy**.
   - **Policy View**: Select **JSON**.
   - **Policy Content**: Configure the parameter as follows:
     ```
     {
        "Version": "1.1",
        "Statement": [
           {
              "Effect": "Allow",
              "Action": [
              "obs:bucket:GetBucketLocation",
              "obs:bucket:ListBucketMultipartUploads",
              "obs:object:GetObject",
     ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
            "obs:object:ModifyObjectMetaData",
            "obs:object:DeleteObject",
            "obs:object:ListMultipartUploadParts",
            "obs:bucket:HeadBucket",
            "obs:object:AbortMultipartUpload",
            "obs:bucket:ListBucket",
            "obs:object:PutObject",
            "obs:object:GetAccessLabel",
            "obs:object:DeleteAccessLabel",
            "obs:object:PutAccessLabel",
                "obs:bucket:ListAllMyBuckets"
            ],
            "Resource": [
                "OBS:*:*:bucket:guardian-obs",
                "OBS:*:*:object:*"
            ]
        }
    ]
}
```

In the preceding configuration, **Resource** indicates all resources that can access the configured parallel file system. *guardian-obs* indicates the name of the OBS parallel file system created in **Creating an OBS Parallel File System**.

6. Click **Next**. On the **Select Policy/Role** page, select the policy created in **5**.
7. Click **Next**, select **All resources**, click **Show More**, select **Global resources**, and click **OK**.
8. View and record the agency ID.

Creating a Cloud Service Agency and Binding It to a Cluster

1. Log in to the management console.
2. In the service list, choose **Management & Governance** > **Identity and Access Management**.
3. Choose **Agencies**. On the displayed page, click **Create Agency**.
4. Set **Agency Name**. For example, enter **mrs_ecs_obs**.
5. Set **Agency Type** to **Cloud service** and select **Elastic Cloud Server (ECS) and Bare Metal Server (BMS)** to authorize ECS or BMS to access OBS.
6. Set **Validity Period** to **Unlimited** and click **Done**.
7. In the displayed dialog box, click **Authorize**. On the displayed page, click **Create Policy**.

   On the **Create Policy** page, set the following parameters and click **Next**:

   - **Policy Name**: Enter a policy name, for example, **guardian-assume-policy**.
   - **Policy View**: Select **JSON**.
   - **Policy Content**: Enter the following content. *{Agency ID}* indicates the ID recorded in **8**.

```
{
    "Version": "1.1",
    "Statement": [
        {
            "Action": [
                "iam:agencies:assume"
            ],
            "Resource": {
                "uri": [
                    "/iam/agencies/{Agency ID}"
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
            ]
        },
        "Effect": "Allow"
    }
  ]
}
```

8. Click **Next**. On the **Select Policy/Role** page, select the policy created in 7.
9. Click **Next**, click **Show More**, select **Global services**, and click **OK**.
10. In the displayed dialog box, click **OK** to start authorization. Click **Finish** after the message "Authorization successful." is displayed.
11. Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.
12. Click the name of the target cluster to access its details page.
13. On the **Dashboard** tab, click **Synchronize** next to **IAM User Sync** to synchronize IAM users.
14. On the **Dashboard** tab, click **Manage Agency** next to **Agency**. In the displayed dialog box, select the agency you created, for example, **mrs_ecs_obs**, and click **OK**.

Granting Guardian Permissions to Access OBS

1. Log in to MRS Manager by referring to **Accessing MRS Manager**. Choose **Cluster** > **Services** > **Guardian**, click **Configurations** and then **All Configurations**, search for and configure the following parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
fs.obs.guardian.accesslabel.enabled	Whether to enable AccessLabel on OBS, which allows Guardian to connect to OBS. • **true**: indicates that after OBS is connected, you can use Ranger to configure the permission policies of OBS paths. Ensure that the AccessLabel function has been enabled for OBS. If the function is not enabled, manually enable it. For details, contact OBS O&M personnel. • **false**: indicates After OBS is interconnected, the permission policies of OBS paths cannot be configured using Ranger. You do not need to check whether the AccessLabel function is enabled for OBS. Set this parameter to **true**.	true
fs.obs.guardian.enabled	Whether to enable Guardian. • **true**: enables the Guardian. • **false**: (default value) disables the Guardian.	true
fs.obs.delegation.token.providers	Delegation token generator. When **fs.obs.guardian.enabled** is set to **true**, **com..mrs.dt.MRSDelegationTokenProvider** and **com..mrs.dt.GuardianDTProvider** must be configured.	**com..mrs.dt.MRSDelegationTokenProvider** and **com..mrs.dt.GuardianDTProvider**
token.server.access.label.agency.name	Name of the specified IAM agency, which is the one created in **Creating an Agency for a Regular Account**.	agency-MRS-to-OBS

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Save the service configuration, choose **More** > **Restart Configuration-Expired Instances** on the FusionInsight Manager home page, and restart all service instances whose configurations have expired as prompted.
3. To submit jobs on the MRS console, log in to the active OMS node as user **omm** and run the following command to refresh the built-in client configuration:
```
sh /opt/executor/bin/refresh-client-config.sh
```
4. (Optional) If you need to update the client configurations of other installed cluster components, see **Updating Client Configurations**.

Enabling Cascading Authorization for Hive Tables

In versions earlier than MRS 3.5.0, only clusters with Kerberos authentication enabled support OBS cascading authorization.

1. Log in to FusionInsight Manager by referring to **Accessing MRS Manager**. Choose **Cluster** > **Services** > **Ranger** > **Configurations**.
2. Search for **ranger.ext.authorization.cascade.enable** in the search box and set its value to **true** to enable the cascading authorization.
3. Click **Save**.
4. Click **Instance** and select all RangerAdmin instances. Click **More** and select **Restart Instance**. Enter the password and click **OK** to restart all RangerAdmin instances.

Configuring a Recycle Bin Cleanup Policy

1. Log in to the OBS console.
2. In the navigation pane on the left, choose **Resources** > **Parallel File Systems**. On the displayed page, click the name of the file system created in **Creating an OBS Parallel File System**.
3. Choose **Data Management** > **Lifecycle Rules**. On the displayed page, click **Create** to create a lifecycle rule for the **/user/.Trash** directory.

CAUTION

After the decoupled storage-compute solution is used, you must configure lifecycle rules for related directories. Otherwise, there is a risk of running out of storage space and incurring additional storage costs.

Table 10-2 Parameters for creating a lifecycle rule

Parameter	Description	Example Value
Status	Whether to enable the lifecycle rule.	Enabled
Rule Name	Enter a rule name, which is used to identify different lifecycle configurations.	rule-test

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Prefix	Prefix of the objects to which the lifecycle rule applies. Typically, the prefix of the recycle bin directory of MRS components is **/user/.Trash**.	user/.Trash
Transition to Infrequent Access After (Days)	Number of days after the last update of an object that it will be transitioned to infrequent access storage based on the rule. The minimum value is **30**.	30 days
Transition to Archive After (Days)	Number of days after the last update of an object that it will be transitioned to archive based on the rule. If you are setting both this parameter and **Transition to Infrequent Access After (Days)**, make sure this parameter value is at least 30 days greater than the value of **Transition to Infrequent Access After (Days)**. If you are only setting this parameter, assign any value to it as needed.	31 days
Delete Files After (Days)	Number of days after the last update of an object that it will expire and be automatically deleted by OBS based on the rule. The value of this parameter must be greater than the values of the two transition parameters.	32 days
Delete Fragments Upon Expiration	Number of days of a fragment that it will expire and be automatically deleted by OBS based on the rule.	30 days

4. Click **OK**.

   To modify, disable, or enable a lifecycle rule, locate the rule and click **Edit**, **Disable**, or **Enable** in the **Operation** column, respectively.

10.2.3 Example for Interconnecting an MRS Cluster with OBS

10.2.3.1 Accessing OBS Using Flink Through Guardian

After Guardian is interconnected with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you can access the OBS parallel file system and run jobs in a Flink job. This section describes how to submit a Flink WordCount job.

Prerequisites

- Before interconnecting Flink with OBS, ensure that YARN is connected to OBS as Flink jobs run on YARN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The provided OBS parallel file system name/file name must include the full directory hierarchy.
- If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Ranger Permission Configuration**.

Interconnecting Flink with OBS

Step 1 Log in to the Flink client installation node as the client installation user.

Step 2 Run the following command to initialize environment variables:

```
source Client installation directory/bigdata_env
```

Step 3 Configure the Flink client.

Step 4 Start the session.

- Normal cluster (Kerberos authentication disabled)

  ```
  yarn-session.sh -nm "session-name" -d
  ```

- Security cluster (Kerberos authentication enabled)
  - If the paths of the **flink.keystore** and **flink.truststore** files are relative ones:

    Run the following command in the directory at the same level as the **ssl** directory to start the session. **ssl/** is a relative path.

    Switch to the **conf** directory.

    ```
    cd Client installation directory/Flink/flink/conf
    ```

    Start a session.

    ```
    yarn-session.sh -t ssl/ -nm "session-name" -d
    ```

    The session starts successfully.

    ```
    ...
    Cluster started: Yarn cluster with application id application_1624937999496_0017
    JobManager Web Interface: http://192.168.1.150:32261
    ```

  - If the paths of the **flink.keystore** and **flink.truststore** files are absolute ones, run the following commands to start a session:

    Switch to the **conf** directory.

    ```
    cd Client installation directory/Flink/flink/conf
    ```

    Start a session.

    ```
    yarn-session.sh -nm "session-name" -d
    ```

Step 5 If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. Skip this step if Kerberos authentication is disabled.

```
kinit Username
```

Step 6 Add the target OBS file system to the Flink CLI and execute the analysis program.

1. Create the **test** file in the **/tmp/test** directory.

   ```
   echo -e 'test' >/tmp/test
   ```

2. Create a directory for storing the **test** file in the OBS parallel file system.

   ```
   hdfs dfs -mkdir -p obs://Parallel file system name/tmp/flinkjob
   ```

3. Upload the **test** file to the OBS parallel file system.

   ```
   hdfs dfs -put /tmp/test/ obs://Parallel file system name/tmp/flinkjob/
   ```

4. Run **WordCount.jar**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
flink run Client installation directory/Flink/flink/examples/batch/WordCount.jar -input obs://Parallel file system name/tmp/flinkjob/test -output obs://Parallel file system name/tmp/flinkjob/output
```

Step 7 Log in to the OBS console and check the execution result of **WordCount.jar** in the output path specified in **Step 6.4**.

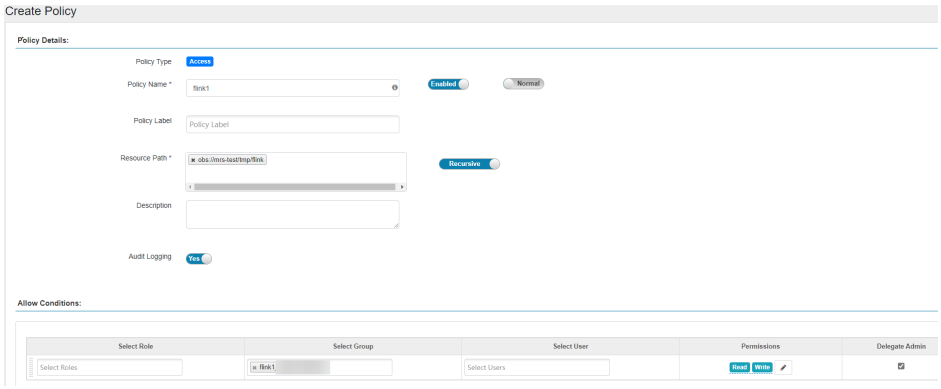
----End

Ranger Permission Configuration

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group**.



Step 3 Create a user group without a role, for example, **obs_flink**, and bind the user group to the corresponding user.

Step 4 Log in to the Ranger management page as user **rangeradmin**.

Step 5 On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

Step 6 Click **Add New Policy** to add the **Read** and **Write** permissions on OBS paths to the user group created in **3**. If there are no OBS paths, create one in advance. The OBS path cannot contain wildcard characters (*).

Figure 10-2 Granting the Flink user group permissions for reading and writing OBS paths

Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

----End

10.2.3.2 Accessing OBS Using HDFS Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Authentication for Guardian, you can view and create OBS file directories on the HDFS client.

Prerequisites

If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Configuring Ranger Permissions**.

Interconnecting HDFS with OBS

Step 1 Log in to the node on which the HDFS client is installed as a client installation user.

Step 2 Run the following command to switch to the client installation directory:

```
cd Client installation directory
```

Step 3 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 4 If Kerberos authentication is enabled for the cluster, run the following command to perform user authentication. The user must have the read and write permissions on the OBS directory. User authentication is not required for clusters with Kerberos authentication disabled.

```
kinit User performing HDFS operations
```

Step 5 Access the OBS file system using the HDFS CLI.

The following commands are examples.

- Access the OBS file system.
  ```
  hdfs dfs -ls obs://OBS parallel file system name/path
  ```
- Create a directory in the OBS file system.
  ```
  hdfs dfs -mkdir obs://OBS parallel file system name/hadoop
  ```
- Upload the **/opt/test.txt** file on the client node to the **obs://***OBS parallel file system name***/hadoop** directory.
  ```
  hdfs dfs -put /opt/test.txt obs://OBS parallel file system name/hadoop
  ```
  View the uploaded file in the corresponding OBS file system path.

----End

Changing the Log Level of OBS Client

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

1. Go to the **hadoop** directory.
   ```
   cd Client installation directory/HDFS/hadoop/etc/hadoop
   ```
2. Edit the file **log4j.properties**.
   ```
   vi log4j.properties
   ```
   Add the following OBS log level configuration to the file and save it.
   ```
   log4j.logger.org.apache.hadoop.fs.obs=WARN
   log4j.logger.com.obs=WARN
   ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Run the following command:
   ```
   tail -4 log4j.properties
   ```
   If the command output shown in **Figure 10-3** is displayed, the log level has been changed.

   Figure 10-3 Adding an OBS log level

   ```
   [root@node-master1AuKK hadoop]# tail -4 log4j.properties
   log4j.logger.org.apache.commons.beanutils=WARN

   log4j.logger.org.apache.hadoop.fs.obs=WARN
   log4j.logger.com.obs=WARN
   [root@node-master1AuKK hadoop]#
   ```

Configuring Ranger Permissions

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group** to create a user group without any roles, for example, **obs_hadoop**.

Step 3 Back to FusionInsight Manager and choose **System** > **Permission** > **User**. On the displayed page, click **Create User** to create a user that is associated only with the **obs_hadoop** user group, for example, **hadoopuser**.

Step 4 Log in to the Ranger management page as the **rangeradmin** user.

Step 5 On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

Step 6 Click **Add New Policy** and add the **Read** and **Write** permissions on the desired OBS paths to the created user group.

The following figure shows the configurations needed for adding the **Read** and **Write** permissions on **obs://***OBS parallel file system name***/hadoop** to user group **obs_hadoop**.

Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

----End

10.2.3.3 Accessing OBS Using HetuEngine Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you can create a table with a specified location as the OBS file system path on the HetuEngine client. Additionally, you can interconnect Guardian with OBS using Hive MetaStore.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Prerequisites

If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Configuring Ranger Permissions**.

Interconnecting HetuEngine with OBS

In an MRS cluster, **Location** can be set to an OBS file system path during HetuEngine table creation and HetuEngine can connect to OBS through Hive Metastore.

- Setting **Location** to the OBS file system path when creating a table
  a. If a HetuEngine compute instance is running, restart it.

     Log in to FusionInsight Manager as a user who has permission to access the HetuEngine web UI. Choose **Cluster** > **Services** > **HetuEngine**. In the **Basic Information** area in the Dashboard tab, click the link next to **HSConsole WebUI**. On the displayed HSConsole page, click **Compute Instance**. In the instance list, click **Restart** in the **Operation** column and operate as prompted.

  b. Log in to the node where the HetuEngine service client is located as the client installation user and run the following command:
     ```
     source Client installation directory/bigdata_env
     ```

  c. Log in to the HetuEngine client.

     - If the cluster has enabled Kerberos authentication (security mode), run the following command to complete user authentication and log in to the HetuEngine client:

       Authenticate the user.

       ```
       kinit User performing HetuEngine operations
       ```

       Log in to the HetuEngine client.

       ```
       hetu-cli --catalog hive --tenant default --schema default
       ```

     - Kerberos authentication is not enabled for the cluster (normal mode): Run the following command to log in to the HetuEngine client:
       ```
       hetu-cli --catalog hive --tenant default --schema default --user User performing HetuEngine operations
       ```

  d. Set **Location** to the OBS file system path when creating a table.
     ```
     create table test(name string) with (location = 'obs://OBS parallel file system name/user/hive/warehouse/test');
     ```

- Interconnecting with OBS through Hive Metastore
  a. Complete the configurations by referring to **Interconnecting Hive with OBS using MetaStore**.

  b. Log in to FusionInsight Manager, choose **Cluster** > **Services** > **HetuEngine**. On the displayed page, choose **More** > **Synchronize Configuration**. After the synchronization is complete, choose **More** > **Synchronize Configuration** again and then restart the HetuEngine service as prompted.

     If a HetuEngine compute instance is running, stop it before restarting the service. After the service is restarted, start this compute instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

c. No location needs to be specified when you log in to the HetuEngine client to create a schema or table. The schema or table is stored on OBS by default.

Configuring Ranger Permissions

For HetuEngine clusters with Kerberos authentication enabled (security mode), the methods to grant Ranger permission are the same for both storage-compute decoupled architecture and storage-compute coupled architecture.

Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

10.2.3.4 Accessing OBS Using Hive Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you can create tables stored in the OBS parallel file system on the Hive client.

Prerequisites

If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Configuring Ranger Permissions**.

Interconnecting Hive with OBS

MRS clusters allow Hive to connect to OBS through Metastore.

Interconnecting Hive with OBS through Metastore

Step 1 You have configured storage and compute decoupling by referring to **Enabling Ranger OBS Path Authentication for Guardian**.

Step 2 Log in to FusionInsight Manager of the MRS cluster.

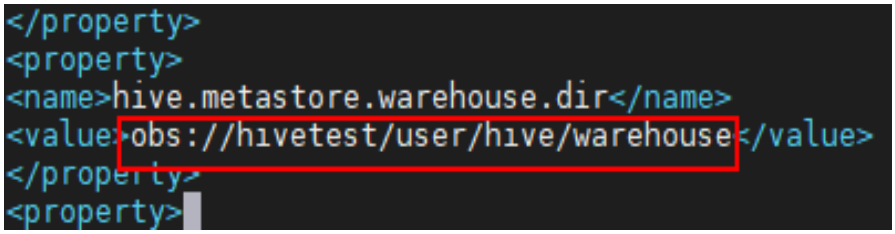
For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 3 Choose **Cluster** > **Services** > **Hive** and click **Configurations**.

Step 4 Search for **hive.metastore.warehouse.dir** and set its value to an OBS path, for example, **obs://hivetest/user/hive/warehouse/**. **hivetest** indicates the OBS file system name.

Step 5 Click **Save** to save the configuration, choose **Cluster** > **Services**, and restart the Hive service in the service list.

Step 6 Update the client configuration file.



1. Log in to the node where the Hive client is located and run the following command to modify **hivemetastore-site.xml** in the Hive client configuration file directory:

```
vi Client installation directory/Hive/config/hivemetastore-site.xml
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Change the value of **hive.metastore.warehouse.dir** to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**.

   Figure 10-4 Configuring the OBS path

3. Change the value of **hive.metastore.warehouse.dir** of **hivemetastore-site.xml** in the HCatalog client configuration file directory to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**.

   ```
   vi Client installation directory/Hive/HCatalog/conf/hivemetastore-site.xml
   ```

Step 7 Go to the Hive Beeline CLI, create a database, and ensure that the location is an OBS path.

1. Go to the client installation directory.

   ```
   cd Client installation directory
   ```

2. Load the environment variables.

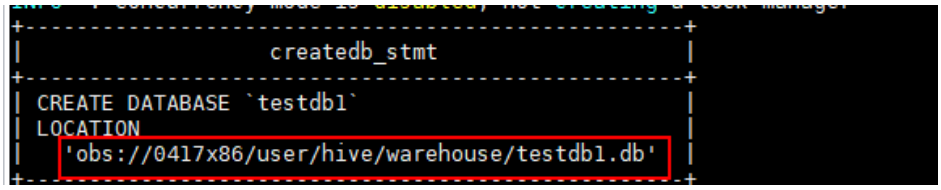
   ```
   source bigdata_env
   ```

3. Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.

   ```
   kinit User performing Hive operations
   ```

4. Log in to the Hive client.

   ```
   beeline
   ```



5. Create a database.

   ```
   create database testdb1;
   ```

6. Check the location of the database.

   ```
   show create database testdb1;
   ```

   Figure 10-5 Viewing the location of the newly created Hive database

----End

Configuring Ranger Permissions

- Granting the read and write permissions on OBS paths to the **hive** user group

  a. Log in to the Ranger web UI as the Ranger administrator. On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area, and assign the **Read** and **Write** permissions on the OBS storage path to the **hive** user group. If this operation is successful, all users in the **hive** group can access the Hive data warehouse path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For example, assign the **Read** and **Write** permissions on the **obs://hivetest/user/hive/warehouse/** directory to the **hive** user group.

b. Choose **Settings** > **Roles**, click **Add New Role**, and create a role whose **Role Name** is **hive**.

- Granting the read and write permissions on OBS paths to a custom user group

  a. Log in to FusionInsight Manager and choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group**.

  b. Create a user group without a role, for example, **hiveobs1**, and bind the user group to the corresponding user.

  c. Log in to the Ranger management page as user **rangeradmin**.

  d. On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

  e. Grant the **Read** and **Write** permissions on the OBS storage path to the **hiveobs1** user group. In this case, all users bound to the **hiveobs1** user group can access the Hive data warehouse path.

- Creating a database, table, or partition in a custom location and granting read and write permissions on OBS paths

  a. Log in to the Ranger web UI as the Ranger administrator.

  b. On the home page, click the component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area, and assign the **Read** and **Write** permissions on OBS storage paths to the user group of the corresponding user.

  For example, assign the **Read** and **Write** permissions on the **obs://obs-test/test/** directory to the **hgroup1** user group, as shown in the following figure.

  c. On the home page, click the component plug-in name **Hive** in the **HADOOP SQL** area, and add a URL policy that grants the **Read** and **Write** permissions on the OBS path to the user group of the corresponding user.

  For example, create the **hive_url_policy URL** policy for the **hgroup1** user group and assign the **Read** and **Write** permissions on the **obs://obs-test/test/** directory to the user group.

  d. Log in to the beeline client and set **Location** to the OBS file system path when creating a table.

  Go to the client installation directory.

  ```
  cd Client installation directory
  ```

  Load the environment variables.

  ```
  source bigdata_env
  ```

  Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.

  ```
  kinit User performing Hive operations
  ```

  Log in to the Hive client.

  ```
  beeline
  ```

  For example, to create a table named **test** whose **Location** is **obs://obs-test/test/***Database name*/*Table name*, run the following command:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
create external table test(name string) location " obs://obs-test/test/ Database name/Table name";
```

NOTE

- To authorize a view chart, you need to grant the view chart permission and the physical table path permission corresponding to the view chart.
- Cascading authorization can be performed only on databases and tables, and cannot be on partitions. If a partition path is not in the table path, you need to manually authorize the partition path.
- Cascading authorization for **Deny Conditions** in the Hive Ranger policy is not supported. That is, the Deny Conditions permission only restricts the table permission and cannot generate the permission of the HDFS/OBS storage source.
- The permission of the HDFS Ranger policy is prior to that of the HDFS/OBS storage source generated by cascading authorization. If the HDFS Ranger permission has been set for the HDFS storage source of the table, the cascading permission does not take effect.
- **alter** operations cannot be performed on tables whose storage source is OBS after cascading authorization. To perform the **alter** operation, you need to grant the **Read** and **Write** permissions of the parent directory of the OBS table path to the corresponding user group.
- Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

10.2.3.5 Accessing OBS Using Hudi Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you can create a Hudi COW table in spark-shell and store it to OBS.

Prerequisites

If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Configuring Ranger Permissions**.

Interconnecting Hudi with OBS

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following commands to configure environment variables:

Load the environment variables.

```
source Client installation directory/bigdata_env
```

Load the component environment variables.

```
source Client installation directory/Hudi/component_env
```

Step 3 Modify the configuration file.

```
vim Client installation directory/Hudi/hudi/conf/hdfs-site.xml
```

Modify the following content, where the **dfs.namenode.acls.enabled** parameter specifies whether to enable the HDFS ACL function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>false</value>
</property>
```

Step 4 If Kerberos authentication has been enabled (security mode) for the cluster, run the following command to perform authentication as a user who has the Read and Write permissions on the corresponding OBS path. If Kerberos authentication has not been enabled (normal mode) for the cluster, you do not need to run this command.

```
kinit Username
```

Step 5 Start **spark-shell** and run the following commands to create a COW table and store it to OBS:

```
spark-shell --master yarn
import org.apache.hudi.QuickstartUtils._
import scala.collection.JavaConversions._
import org.apache.spark.sql.SaveMode._
import org.apache.hudi.DataSourceReadOptions._
import org.apache.hudi.DataSourceWriteOptions._
import org.apache.hudi.config.HoodieWriteConfig._
val tableName = "hudi_cow_table"
val basePath = "obs://testhudi/cow_table/"
val dataGen = new DataGenerator
val inserts = convertToStringList(dataGen.generateInserts(10))
val df = spark.read.json(spark.sparkContext.parallelize(inserts, 2))
df.write.format("org.apache.hudi").
options(getQuickstartWriteConfigs).
option(PRECOMBINE_FIELD_OPT_KEY, "ts").
option(RECORDKEY_FIELD_OPT_KEY, "uuid").
option(PARTITIONPATH_FIELD_OPT_KEY, "partitionpath").
option(TABLE_NAME, tableName).
mode(Overwrite).
save(basePath);
```

In the preceding command, **obs://testhudi/cow_table/** indicates the OBS path, and **testhudi** indicates the OBS parallel system file name. Change them as required.

Step 6 Use DataSource to check whether the table is created and whether the data is normal.

```
val roViewDF = spark.
read.
format("org.apache.hudi").
load(basePath + "/*/*/*/*")
roViewDF.createOrReplaceTempView("hudi_ro_table")
spark.sql("select * from  hudi_ro_table").show()
```

Step 7 Exit the **spark-shell** CLI.

```
:q
```

----End

Configuring Ranger Permissions

Step 1 Log in to FusionInsight Manager and choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group**.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Create a user group without a role, for example, **obs_hudi**, and bind the user group to the corresponding user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Log in to the Ranger management page as the **rangeradmin** user.

Step 4 On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

Step 5 Click **Add New Policy** to add the **Read** and **Write** permissions on OBS paths to the user group created in **Step 2**. If there are no OBS paths, create one in advance (wildcard character * is not allowed).

Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

----End

10.2.3.6 Accessing OBS Using MapReduce Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you need to add custom configurations for the MapReduce component.

Interconnecting MapReduce with OBS

Step 1 Log in to the MRS management console. In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the displayed page, click the name of the cluster you created to access its details page.

Step 2 Choose **Components** > **MapReduce**.On the displayed page, click **Configurations** then **All Configurations**. In the navigation pane on the left, choose **MapReduce** > **Customization**. In the custom configuration items, add the configuration item **mapreduce.jobhistory.always-scan-user-dir** to **core-site.xml** file.

This parameter specifies whether the JobHistory service always scans log files in the user directory when scanning job logs. The value can be **true** or **false**.

- **true**: The JobHistory service forcibly scans the specified directory even if the directory has been scanned. This ensures that all related log files are correctly collected and processed each time a job is executed.
- **false** (default value): The JobHistory service does not scan the user directories that have been scanned. This reduces unnecessary disk I/O operations.

Set this parameter to **true**.

Step 3 Click **Save Configuration**.

Step 4 Click the **Service Status** tab and choose **More** > **Restart Service** to restart the MapReduce service.

Step 5 If the OBS job is submitted and executed, MapReduce is successfully connected to OBS. For example, create a Hive table and set its **Location** to an OBS path.

1. Log in to the node where the Hive client is installed and run the following commands. The authenticated user must have the read and write permissions to create Hive tables and access OBS paths.

   Go to the client installation directory.

   ```
   cd Client installation directory
   ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Load the environment variables.

```
source bigdata_env
```

Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.

```
kinit Service user
```

2. Log in to the Hive client.

```
beeline
```

3. Create a Hive table and insert data into the table.

   a. Create a table.

   ```
   create table test(name string) location "obs://OBS parallel file system name/user/hive/warehouse/Database name/Table name";
   ```

   b. Check the **Location** of the table.

   ```
   desc formatted test;
   ```

   It is found that the **Location** of the table is the OBS path.

   Figure 10-6 Checking the table location

   ```
   +-------------------------------+-----------------------------------------------------+-----------------------+
   |           col_name            |                      data_type                      |        comment        |
   +-------------------------------+-----------------------------------------------------+-----------------------+
   | # col_name                    | data_type                                           | comment               |
   | name                          | string                                              |                       |
   |                               | NULL                                                | NULL                  |
   | # Detailed Table Information  | NULL                                                | NULL                  |
   | Database:                     | default                                             | NULL                  |
   | OwnerType:                    | USER                                                | NULL                  |
   | Owner:                        | root                                                | NULL                  |
   | CreateTime:                   | Fri May 16 18:04:09 CST 2025                        | NULL                  |
   | LastAccessTime:               | UNKNOWN                                             | NULL                  |
   | Retention:                    | 0                                                   | NULL                  |
   | Location:                     | obs://                                              | NULL                  |
   | Table Type:                   | MANAGED_TABLE                                       | NULL                  |
   | Table Parameters:             | NULL                                                | NULL                  |
   |                               | bucketing_version                                   | 2                     |
   |                               | transient_lastDdlTime                               | 1747389049            |
   |                               | NULL                                                | NULL                  |
   | # Storage Information         | NULL                                                | NULL                  |
   | SerDe Library:                | org.apache.hadoop.hive.serde2.columnar.ColumnarSerDe | NULL                  |
   | InputFormat:                  | org.apache.hadoop.hive.ql.io.RCFileInputFormat      | NULL                  |
   | OutputFormat:                 | org.apache.hadoop.hive.ql.io.RCFileOutputFormat     | NULL                  |
   | Compressed:                   | No                                                  | NULL                  |
   | Num Buckets:                  | -1                                                  | NULL                  |
   | Bucket Columns:               | []                                                  | NULL                  |
   | Sort Columns:                 | []                                                  | NULL                  |
   | Storage Desc Params:          | NULL                                                | NULL                  |
   |                               | serialization.format                                | 1                     |
   +-------------------------------+-----------------------------------------------------+-----------------------+
   ```

   c. Insert data.

   ```
   insert into table test values("A");
   ```

   d. Query table data.

   ```
   select * from test;
   ```

4. Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**, and click the hyperlink next to **ResourceManager WebUI** to go to the YARN web UI. On the **All Applications** page, click the application ID of the target Hive task to view the job running information. If **Application Type** is **MAPREDUCE**, the job submitted to OBS is a MapReduce job.
5. Click **Logs** in the **Logs** column at the bottom of the page to view job logs.

----End

10.2.3.7 Accessing OBS Using Spark Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you can create a table whose location is an OBS path on the Spark client.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Prerequisites

If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Configuring Ranger Permissions**.

Interconnecting Spark with OBS

In an MRS cluster, **Location** can be set to an OBS file system path during Spark table creation and Spark can connect to OBS through Hive Metastore.

- Setting the location to an OBS path during table creation:
  a. Log in to the node where the client is installed as the client installation user and access the **spark-sql** client.

     Go to the client installation directory.

     ```
     cd Client installation directory
     ```

     Load the environment variables.

     ```
     source bigdata_env
     ```

     Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.

     ```
     kinit User performing operations on the component
     ```

     Log in to the **spark-sql** client.

     ```
     spark-sql --master yarn
     ```

  b. Set **Location** to the OBS file system path when creating a table.

     For example, to create a table named **test** whose **Location** is **obs://obs-test/test/***Database name***/***Table name*, run the following command:

     ```
     create external table testspark(name string) location " obs://obs-test/test/ Database name/ Table name";
     ```

- Interconnecting Spark with OBS through Hive Metastore:
  a. Complete the configurations by referring to **Interconnecting Hive with OBS using MetaStore**.
  b. Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Spark** and choose **Configurations** > **All Configurations**.
  c. In the navigation pane on the left, choose **SparkResource** > **Customization**. In the custom configuration items, add **spark.sql.warehouse.location.first** to the **custom** parameter and set its value to **true**.
  d. In the navigation pane on the left, choose **JDBCServer** > **Customization**. In the custom configuration items, add **spark.sql.warehouse.location.first** to the **custom** parameter and set its value to **true**.
  e. Click **Save** to save the configuration. Click the **Dashboard** tab choose **More** > **Restart Service**, enter the password, click **OK**, and click **OK** again to restart Spark.
  f. After Spark is restarted, choose **More** > **Download Client** to download and install the Spark client again. Then, go to **g**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If you do not download and install the client again, you can perform the following steps to update the Spark client configuration file (for example, the client directory is **/opt/client**):

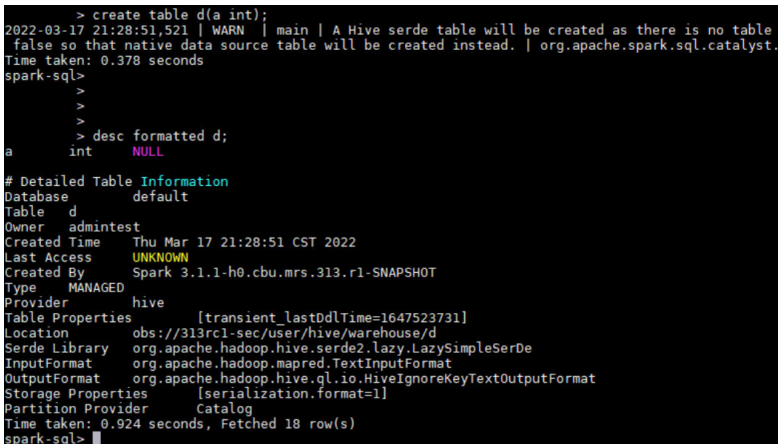
i. Log in to the node where the Spark client is deployed as user **root** and switch to the client installation directory.
```
cd /opt/client
```

ii. Run the following command to modify **hive-site.xml** in the configuration file directory of the Spark client:
```
vi Spark/spark/conf/hive-site.xml
```
Change the value of **hive.metastore.warehouse.dir** to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**.
```
<property>
<name>hive.metastore.warehouse.dir</name>
<value>obs://hivetest/user/hive/warehouse/<value>
</property>
```

iii. Run the following command to modify the **spark-defaults.conf** file in the configuration file directory of the Spark client and set **spark.sql.warehouse.location.first** to **true**:
```
vi Spark/spark/conf/spark-defaults.conf
```

g. For a cluster with Kerberos authentication enabled, configure the OBS directory permission for the user who performs operations on the component. For details, see **Configuring Ranger Permissions**.

h. Go to the SparkSQL CLI and spark-beeline, create a table, and check whether the location of the table is an OBS path.



Load the environment variables.
```
source bigdata_env
```

Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.
```
kinit Service user
```

- Go to the SparkSQL CLI.
```
spark-sql
```
Create a table.
```
create table d(a int);
```
Check the table location.
```
desc formatted d;
```
As shown in the following figure, the location of table **d** is in the specified OBS path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-7 Viewing the location of the d table

- Go to spark-beeline.

  ```
  spark-beeline
  ```

  Create a table.

  ```
  create table e(a int);
  ```

  Check the table location.

  ```
  desc formatted e;
  ```

  As shown in the following figure, the location of table **e** is in the specified OBS path.

Figure 10-8 Viewing the location of the e table

Configuring Ranger Permissions

Step 1 Log in to MRS Manager and choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group**.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Create a user group without a role, for example, **obs_spark**, and bind the user group to the corresponding user.

Step 3 Log in to the Ranger management page as user **rangeradmin**.

Step 4 On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Click **Add New Policy** to add the **Read** and **Write** permissions on OBS paths to the user group created in **Step 2**. If there are no OBS paths, create one in advance (wildcard character * is not allowed).

----End

NOTE

- To authorize a view chart, you need to grant the view chart permission and the physical table path permission corresponding to the view chart.
- Cascading authorization can be performed only on databases and tables, and cannot be on partitions. If a partition path is not in the table path, you need to manually authorize the partition path.
- Cascading authorization for **Deny Conditions** in the Hive Ranger policy is not supported. That is, the Deny Conditions permission only restricts the table permission and cannot generate the permission of the HDFS/OBS storage source.
- The permission of the HDFS Ranger policy is prior to that of the HDFS/OBS storage source generated by cascading authorization. If the HDFS Ranger permission has been set for the HDFS storage source of the table, the cascading permission does not take effect.
- **alter** operations cannot be performed on tables whose storage source is OBS after cascading authorization. To perform the **alter** operation, you need to grant the **Read** and **Write** permissions of the parent directory of the OBS table path to the corresponding user group.
- Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

Configuring Permissions for CDL Service Users

If Kerberos authentication is enabled for a cluster (security mode) and you want to use CDL to import data to OBS in real time after the cluster is connected to OBS, perform the following steps to grant corresponding users **Read** and **Write** permissions on the corresponding OBS path:

Step 1 Log in to MRS Manager and choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group**.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Create a user group with no assigned role, for example, **obs_cdl**, and bind it to the relevant CDL service user, like **cdluser**.

Step 3 Log in to the Ranger management page as user **rangeradmin**.

Step 4 On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

Step 5 Click **Add New Policy** to add the **Read** and **Write** permissions on OBS paths to the created user group. If there are no OBS paths, create one in advance (wildcard character * is not allowed).

The following figure shows the configurations needed for adding the **Read** and **Write** permissions on **obs://***OBS parallel file system name***/cdldata** to user group **obs_cdl**.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.2.3.8 Accessing OBS Using YARN Through Guardian

After interconnecting Guardian with OBS by referring to **Disabling Ranger OBS Path Authentication for Guardian** or **Enabling Ranger OBS Path Authentication for Guardian**, you can execute YARN jobs on the cluster client to access OBS.

Prerequisites

If you interconnected Guardian with OBS by referring to **Enabling Ranger OBS Path Authentication for Guardian**, ensure that you have the read and write permissions on the OBS path in Ranger. For details about how to obtain the permissions, see **Configuring Ranger Permissions**.

Interconnecting YARN with OBS

Step 1 Log in to the node where the YARN client is installed as the client installation user.

Step 2 Run the following command to switch to the client installation directory.

```
cd Client installation directory
```

Step 3 Run the following command to configure environment variables:

```
source bigdata_env
```

Step 4 If Kerberos authentication is enabled for the cluster, run the following command to perform user authentication. The user must have the read and write permissions on the OBS directory. User authentication is not required for clusters with Kerberos authentication disabled.

```
kinit User performing HDFS operations
```

Step 5 Explicitly add the OBS file system to be accessed in the YARN command line.

- Access the OBS file system.
  ```
  hdfs dfs -ls obs://OBS parallel file system name/path
  ```
- Create a directory in the OBS file system.
  ```
  hdfs dfs -mkdir obs://OBS parallel file system name/hadoop1
  ```
- Execute the YARN task to access OBS.
  ```
  yarn jar Client installation directory/HDFS/hadoop/share/hadoop/mapreduce/hadoop-mapreduce-examples-*.jar pi -Dmapreduce.job.hdfs-servers=NAMESERVICE -fs obs://OBS parallel file system name 1 1
  ```

  NAMESERVICE indicates the NameService in HDFS. The default value is **hdfs://hacluster**. If there are multiple NameServices, separate them with commas (**,**).

  Example:

  ```
  yarn jar /opt/hadoopclient/HDFS/hadoop/share/hadoop/mapreduce/hadoop-mapreduce-examples-*.jar pi -Dmapreduce.job.hdfs-servers=hdfs://hacluster -fs obs://bucketname 1 1
  ```
- Run the following command to write data to OBS:
  ```
  yarn jar Client installation directory/HDFS/hadoop/share/hadoop/mapreduce/hadoop-mapreduce-examples-*.jar teragen 100  obs://OBS parallel file system name/hadoop1/teragen1
  ```
- Run the following command to copy data from OBS to HDFS:
  ```
  hadoop distcp obs://OBS parallel file system name/hadoop1/teragen1 /tmp
  ```

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Changing the Log Level of OBS Client

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

1. Go to the **hadoop** directory.
   ```
   cd Client installation directory/HDFS/hadoop/etc/hadoop
   ```
2. Edit the file **log4j.properties**.
   ```
   vi  log4j.properties
   ```
   Add the following OBS log level configuration to the file and save it.
   ```
   log4j.logger.org.apache.hadoop.fs.obs=WARN
   log4j.logger.com.obs=WARN
   ```
3. Run the following command:
   ```
   tail -4 log4j.properties
   ```
   If the command output shown in **Figure 10-3** is displayed, the log level has been changed.

   Figure 10-9 Adding an OBS log level

Configuring Ranger Permissions

Step 1 Log in to FusionInsight Manager and choose **System** > **Permission** > **User Group**. On the displayed page, click **Create User Group** to create a user group without any roles, for example, **obs_hadoop1**.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

Step 2 Back to FusionInsight Manager and choose **System** > **Permission** > **User**. On the displayed page, click **Create User** to create a user that is associated with the **obs_hadoop1** user group and the **default** role, for example, **hadoopuser1**.

Step 3 Log in to the Ranger management page as the **rangeradmin** user.

Step 4 On the home page, click component plug-in name **OBS** in the **EXTERNAL AUTHORIZATION** area.

Step 5 Click **Add New Policy** and add the **Read** and **Write** permissions on the desired OBS paths to the user group created in **Step 1**.

The following figure shows the configurations needed for adding the **Read** and **Write** permissions on **obs://***OBS parallel file system name***/hadoop1** to user group **obs_hadoop1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Before configuring permission policies for OBS paths on Ranger, ensure that the AccessLabel function has been enabled for OBS. For how to enable it, contact OBS O&M personnel.

----End

10.3 Interconnecting an MRS Cluster with OBS Using an IAM Agency

10.3.1 Interconnecting an MRS Cluster with OBS Using an IAM Agency

MRS allows you to store data in OBS and use an MRS cluster for data computing only. In this way, storage and compute are decoupled. You can create an IAM agency, which enables ECS to automatically obtain the temporary AK/SK to access OBS. This prevents the permanent AK/SK from being exposed in the configuration file.

By binding an agency, ECSs or BMSs can manage some of your resources. Determine whether to configure an agency based on the actual service scenario. This feature can be used with Hadoop, Hive, Spark, Presto, Sqoop, Flink, and Flume components in clusters. To interconnect MRS with OBS using an IAM agency, perform the following tasks:

1. **Creating an ECS Agency with OBS Access Permissions**
2. **Creating a Decoupled Storage and Compute Cluster**
3. **Creating an OBS Parallel File System for Storing Service Data**
4. **Creating a Lifecycle Rule**

Creating an ECS Agency with OBS Access Permissions

NOTE

- MRS presets **MRS_ECS_DEFAULT_AGENCY** in the IAM agency list by default, allowing you to choose this agency when creating a cluster. This agency has **OBS OperateAccess** permission and, for users with fine-grained policies enabled, **CES FullAccess**, **CES Administrator**, and **KMS Administrator** permissions in the region where the cluster is located. Do not modify **MRS_ECS_DEFAULT_AGENCY** on IAM.
- If you want to use the preset agency, skip the step for creating an agency. If you want to use a custom agency, perform the following steps to create an agency. (To create or modify an agency, you must have the Security Administrator permission.) If you need to have more fine-grained control over the permissions of a specific path in the OBS file system, you can refer to **Configuring Fine- Grained OBS Access Permissions for MRS Cluster Users** to create a custom role policy.

1. Log in to the management console.
2. In the service list, choose **Management & Governance** > **Identity and Access Management**.
3. Choose **Agencies**. On the displayed page, click **Create Agency**.
4. Set **Agency Name**. For example, enter **mrs_ecs_obs**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

5. Set **Agency Type** to **Cloud service** and select **ECS BMS** to authorize ECS or BMS to invoke OBS.
6. Set **Validity Period** to **Unlimited** and click **Done**.
7. In the displayed dialog box, click **Authorize**. Search for **OBS OperateAccess** and select it.
8. Click **Next**. On the page that is displayed, select the desired scope for the permissions you selected. By default, **All resources** is selected. Click **Show More**, select **Global resources**, and click **OK**.
9. In the dialog box that is displayed, click **OK** to start authorization. After the message "**Authorization successful.**" is displayed, click **Finish**. The agency is successfully created.

Creating a Decoupled Storage and Compute Cluster

You can configure an agency when creating a cluster or bind an agency to an existing cluster to decouple storage and compute. This section uses a cluster with Kerberos authentication enabled as an example.

Configuring an agency when creating a cluster:

1. Log in to the MRS console.
2. Click **Create Cluster**. The page for creating a cluster is displayed.
3. Click the **Custom Config** tab.
4. On the Custom Config page, set cluster parameters based on your service requirements.

Table 10-3 Parameters for a custom MRS cluster

Parameter	Description	Example Value
Region	Region where the resource to be created is located. Resources in different regions cannot communicate with each other over the intranet. To improve access speed and reduce network latency, select the region nearest to you.	-
Cluster Name	MRS cluster name. You can use the default name. However, you are advised to include a project name abbreviation or date in the cluster name for remembering and distinguishing. After a cluster is created, you can change the cluster name in the cluster list.	mrs-test

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Cluster Type	Select a required MRS cluster type based on service requirements. • Analysis cluster: It is well-suited for analyzing and processing large amounts of offline data to obtain results. Recommended components include Hadoop, Spark, Hive, Flink, Oozie, and Tez. • Streaming cluster: It is ideal for streaming data processing and quick analysis of real-time data sources. Recommended components include Kafka and Flume. • Hybrid cluster: It is suitable for both offline data analysis and stream processing. • Custom: A wide range of components are available. You can select supported components as required based on your MRS cluster version.	Custom
Version Type	MRS provides two cluster version types: **LTS** and **Normal**. Different version types provide different components. You can select a version type as required. • **LTS**: employs MRS's own components to provide highly reliable clusters with strong DR capabilities, making long-term support and evolution possible. • **Normal**: integrates MRS's mature and stable features and functions with open-source capabilities, offering high performance and stability.	LTS
Cluster Version	Version of the MRS cluster. Different versions may contain different open-source component versions and functions. You are advised to select the latest version.	MRS 3.2.0-LTS.1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Component	Cluster templates containing preset open-source components you will need for your business. Components that can connect to OBS through IAM agencies include Hadoop, Hive, Spark, Presto, Sqoop, Flink, and Flume. Select the components based on your requirements. **NOTE** Hadoop components include HDFS, YARN, and MapReduce. Components used within a cluster, such as DBService, KrbServer, and LdapServer, are not displayed in the component list during cluster creation.	Hadoop and Hive
Metadata	Whether to use external data sources to store Hive and Ranger metadata of the cluster. • **Local**: Metadata is stored in the local cluster. • **External data connection**: Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled.	Local
AZ	AZ to which resources to be created belong in the current region. An AZ is a physical area where resources use independent power supply and networks.	AZ1
VPC	VPC to which the MRS cluster node belongs. If no VPC is available, click **View VPC** to access the network console and create a VPC.	-
Subnet	Subnet information in the VPC. If no subnet is available, click **View Subnet** to access the network console and create a subnet.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Security Group	A security group is a set of ECS access rules. It provides access policies for ECSs that have the same security protection requirements and are mutually trusted in a VPC. When you create an MRS cluster, a security group is automatically created by default. You can also select an existing security group from the drop-down list.	Auto create
Common Node Configurations	This parameter is available only when **Cluster Type** is set to **Custom**. **Common Node Configurations** can be **Compact**, **Full-size**, or **OMS-separate**.	Compact
Cluster Nodes	Specifications and quantity of nodes in an MRS cluster. For MRS 3.*x* or later, the memory of a Master node must be greater than 64 GB.	Set the number of cluster nodes and node specifications as required.
Kerberos Authentication	Whether to enable Kerberos authentication for each component in the MRS cluster. If Kerberos authentication is enabled, users can access component resources only after being authenticated. This option cannot be changed after you create a cluster.	Kerberos authentication enabled
Username	Default user for logging in to MRS Manager and nodes in the MRS cluster. User **admin** is used to log in to MRS Manager, while user **root** is the OS user used to log in to the nodes in the cluster.	-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Password/ Confirm Password	Password of the MRS Manager administrator **admin**. Keep the password secure. ● Must contain 8 to 26 characters. ● Must contain every type of the following: – Lowercase letters – Uppercase letters – Digits – Special characters: `~!@#$ %^&*()-_=+|[{}];:',<.>/? ● Cannot be the same as the username or the username spelled backwards.	-
Login Mode	Mode for logging in to a node in the MRS cluster. ● Password Use a password to log in to the node as user **root**. You need to set the password of user **root**. ● Key Pair Use a key pair to log in to the node. Select a key pair from the drop-down list. If you have obtained the private key file, select **I acknowledge that I have obtained private key file** *SSHkey-xxx* **and that without this file I will not be able to log in to my ECS.** If no key pair is available, click **View Key Pair** to create or import a key pair, and then obtain the private key file.	Password

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Advanced Configuration	Enable **Advanced Configuration** and set **Agency**. After an agency is bound, the ECS or BMS services will have the permission to manage some resources in the cluster. • Click **Available agencies** and select the agency created in **Creating an ECS Agency with OBS Access Permissions** from the drop-down list. • Select the **MRS_ECS_DEFAULT_AGENCY** agency preset by MRS in IAM.	MRS_ECS_DEFAULT_AGENCY
Enterprise Project	An enterprise project facilitates project-level management and grouping of cloud resources and users. You can select the system-defined enterprise project **default** or create a new one.	default
Secure Communications	To allow the MRS console to access big data components in your VPC, you need to enable relevant security group rules to allow traffic to pass. For details, see **Configuring Secure Communication Authorization for an MRS Cluster**.	Select the check box.

5. Click **Apply Now** and wait until the cluster is created.

Configuring an agency for an existing cluster:

1. Log in to the MRS console. In the navigation pane on the left, choose **Active Clusters**.
2. Click the name of the cluster to enter its details page.
3. On the **Dashboard** page, click **Synchronize** on the right of **IAM User Sync** to synchronize IAM users.
4. On the **Dashboard** tab page, click **Select Agency** on the right side of **Agency** to select an agency and click **OK** to bind it. Alternatively, click **Create New** to go to the IAM console to create an agency and select it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Creating an OBS Parallel File System for Storing Service Data

> **WARNING**
>
> In decoupled storage-compute scenarios, make sure to use an OBS parallel file system. Using an OBS bucket can significantly affect the performance of the cluster.

1. Log in to the OBS console.
2. Choose **Parallel File Systems** > **Create Parallel File System**.
3. Enter the file system name, for example, **mrs-word001**.

   Set other parameters as required.
4. Click **Create Now**.
5. In the parallel file system list on the OBS console, click the file system name to go to the details page.
6. In the navigation pane, choose **Files** and create the **program** and **input** folders.
   - **program**: Upload the program package to this folder.
   - **input**: Upload the input data to this folder.

Creating a Lifecycle Rule

In MRS 3.2.0-LTS.1 and later versions, components prevent mis-deletion by default. That is, file data deleted by component users is not directly deleted but stored in the recycle bin directory in the OBS file system.

To save OBS space, you need to enable periodical deletion of file data from the OBS recycle bin by referring to **Configuring the Policy for Clearing Recycle Bin Directories of MRS Cluster Components**.

Managing MRS Cluster Agencies

In practical scenarios, if the agency currently bound to the cluster cannot meet the requirements, you can switch the agency by performing the following operations:

1. Log in to the MRS console and click the name of the desired MRS cluster in the active cluster list.
2. In the **O&M Management** area, click **Select Agency** on the right of **Agency**.
3. In the displayed **Select Agency** dialog box, select the agency you want to switch to and click **OK**. Alternatively, click **Create New** to open the IAM console, create a new agency, and bind it here.
4. After switching the agency, log in to MRS Manager by referring to **Accessing MRS Manager**.
5. Choose **Cluster** > **Services** > **Meta**. In the upper right corner of the page, click **More** and select **Restart Service**. Enter the password of the current user and click **OK** to restart the meta service for the new agency to take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Due to the IAM agency permission cache mechanism, changes to agency permissions take effect within 24 hours. If you need the permission change to take effect immediately, it is recommended that you create a new agency with the required permissions and bind it to the MRS cluster.

10.3.2 Configuring the Policy for Clearing Recycle Bin Directories of MRS Cluster Components

Scenarios

In MRS 3.2.0-LTS.1 or later, components prevent mis-deletion by default. That is, file data deleted by component users is not directly deleted but stored in the recycle bin directory in the OBS file system. This function is compatible with the native garbage collection mechanism of Hadoop FS, providing additional data protection for OBS-based Hadoop big data systems.

This section describes how to set the lifecycle policy of the recycle bin directory in the OBS file system to automatically clear related data periodically. The recycle bin directory is created for each required user. If a new user is added to the MRS cluster and has the permission to delete component data, you need to configure the policy for clearing the recycle bin directory for the new user.

CAUTION

For clusters that use decoupled storage and compute, configure a lifecycle policy for the related directories by referring to this section. Otherwise, the storage space may be used up and storage fees may increase.

You need to configure lifecycle policies for the recycle bin directories of preset users in the MRS cluster and the recycle bin directories of new users who need accidental deletion prevention. If a low privileged agency is used or only the permission for MRS users to access OBS file system directories is configured by referring to **Configuring Fine- Grained OBS Access Permissions for MRS Cluster Users**, you will need the operation permission for the recycle bin directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-4 Directories for which a lifecycle policy needs to be configured

Cluster Version	Directory Type	Component	Directory	How to Create
Versions earlier than MRS 3.3.0-LTS	Recycle bin directories that must be configured by default for each component in an MRS cluster	Hive	• user/omm/.Trash • user/hive/.Trash	If the **.Trash** folder does not exist, create it on the cluster client as user **omm**. Run the following command: **hdfs dfs -mkdir -p obs://***Name of the OBS parallel file system where the table is stored***/***Folder path*
		Spark	• user/omm/.Trash • user/root/.Trash • user/spark2x/.Trash	
		HetuEngine	• user/omm/.Trash • user/hetuserver/.Trash	
		HBase	• user/hbase/.Trash • user/omm/.Trash	
	Recycle bin directories of users who need accidental deletion prevention	Hive/Spark/HetuEngine	user/*<New service user>*/.Trash	
MRS 3.3.0-LTS or later	Default recycle bin directories configured for each component in an MRS cluster	Hive/Spark/HetuEngine	/user/.Trash	

For example, if a user with the following permissions has been added to the cluster, you need to create a recycle bin directory clearing rule for the user in the parallel file system:

- Permissions to delete the HDFS files
- **DROP**, **INSERT OVERWRITE**, and **TRUNCATE** permissions on Hive tables
- **DROP**, **TRUNCATE**, **DELETE**, **INSERT OVERWRITE**, and **LOAD OVERWRITE** permissions on HetuEngine

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The following table lists the MRS component commands that support data restoration after accidental deletion.

Table 10-5 Commands supporting data restoration after accidental deletion

Component	Commands Supporting Data Restoration After Accidental Deletion
Hive	• Deleting a table: drop table • Clearing table data: truncate table • Deleting a table partition: alter table drop partition • Overwriting a table or partition: insert overwrite table [partition] • Overwriting a directory: insert overwrite directory • Overwriting a table or partition: load data overwrite
Spark	• Deleting a table: drop table • Clearing table data: truncate table • Clearing a table partition: truncate table table_name partition • Deleting a table partition: alter table drop partition • Overwriting a table or partition: insert overwrite table [partition] • Overwriting a directory: insert overwrite directory • Overwriting a table or partition: load data overwrite
HetuEngine	• Deleting a table: drop table • Clearing table data: truncate table delete table • Deleting a table partition: alter table drop partition delete table where [partition] • Overwriting a table or partition: insert overwrite table [partition] • Overwriting a table or partition: load data overwrite

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Component	Commands Supporting Data Restoration After Accidental Deletion

Hudi	• Deleting a table:
	`drop table`
	• Deleting a table partition:
	– SQL:
	`alter table drop partition`
	– API:
	`delete_partition`
	• Deleting row-level data:
	– SQL:
	`delete from`
	– API:
	`delete`
	• Clearing table data:
	`truncate table`
	• Overwriting a table:
	– SQL:
	`insert overwrite`
	`insert overwrite table`
	– API:
	`insert_overwrite`
	`insert_overwrite_table`

Configuring the Lifecycle Rule of an OBS Directory

Step 1 Log in to the OBS console.

Step 2 Click **Parallel File Systems** and click the name of the file system used by the current MRS cluster.

Step 3 In the navigation pane, choose **Data Management** > **Lifecycle Rules**. Click **Create** to create a lifecycle rule for a specified directory.

Table 10-6 Parameters for creating a lifecycle rule

Parameter	Description	Example Value
Status	Whether to enable the lifecycle rule.	Enable
Rule Name	Rule name that identifies different lifecycle configurations.	rule-test

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description	Example Value
Prefix	Prefix of the objects to which the lifecycle rule applies. Objects that have the specified prefix will be managed by the lifecycle rule. The prefix cannot start with a slash (/), have consecutive slashes (/), or contain the following special characters: **\:*?"<>|** If this parameter is not specified, the rule will take effect for the entire file system. **WARNING** To prevent other service data from being deleted by mistake, you are not advised to use the lifecycle rule configured for the entire file system or high-level directories. Generally, the recycle bin directory of MRS components is in the following format. If the folder does not exist, create it. user/*<Username>*/.Trash	user/omm/.Trash
Delete Files After (Days)	The object within the rule configuration scope expires and is automatically deleted by OBS if the number of days since its last update reaches this parameter value. The recommended value is 1 to 7 days.	2 days

Step 4 Click **OK** to complete the lifecycle rule configuration.

You can click **Edit** in the **Operation** column of a lifecycle rule to edit it. You can also click **Disable** or **Enable** to disable or enable it.

Step 5 Repeat the preceding steps to create recycle bin directory clearing rules for all users who have the data deletion permission in the current MRS cluster one by one until all recycle bin directories in the OBS file system are configured.

----End

10.3.3 Example for Interconnecting an MRS Cluster with OBS

10.3.3.1 Interconnecting Flink with OBS Using an IAM Agency

After configuring a cluster with decoupled storage and compute by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can access the OBS parallel file system and run jobs in a Flink task. This section describes how to submit a Flink WordCount job.

Prerequisites

Before interconnecting Flink with OBS, ensure that YARN is connected to OBS as Flink jobs run on YARN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interconnecting Flink with OBS

Step 1 Log in to the Flink client installation node as the client installation user.

Step 2 Initialize environment variables.

```
source Client installation directory/bigdata_env
```

Step 3 Configure the Flink client.

Step 4 Start a session.

- Normal cluster (Kerberos authentication disabled)

  ```
  yarn-session.sh -nm "session-name" -d
  ```

- Security cluster (Kerberos authentication enabled)
  - If the paths of the **flink.keystore** and **flink.truststore** files are relative ones:

    Run the following command in the directory at the same level as **ssl** to start the session. **ssl/** is a relative path.

    Go to the **conf** directory.

    ```
    cd Client installation directory/Flink/flink/conf
    ```

    Start a session.

    ```
    yarn-session.sh -t ssl/ -nm "session-name" -d
    ```

    The session is started successfully.

    ```
    ...
    Cluster started: Yarn cluster with application id application_1624937999496_0017
    JobManager Web Interface: http://192.168.1.150:32261
    ```

  - If the **flink.keystore** and **flink.truststore** files are stored in absolute paths, run the following commands to start a session:

    Go to the **conf** directory.

    ```
    cd Client installation directory/Flink/flink/conf
    ```

    Start a session.

    ```
    yarn-session.sh -nm "session-name" -d
    ```

Step 5 Authenticate the user of the cluster with Kerberos authentication enabled. Skip this step for the user of the cluster with Kerberos authentication disabled.

```
kinit Username
```

Step 6 Add the target OBS file system to the Flink CLI and execute the analysis program.

1. Create the **test** file in the **/tmp/test** directory.

   ```
   echo -e 'test' >/tmp/test
   ```

2. Create a directory for storing the **test** file in the OBS parallel file system.

   ```
   hdfs dfs -mkdir -p obs://OBS parallel file system name/tmp/flinkjob
   ```

3. Upload the **test** file to the OBS parallel file system.

   ```
   hdfs dfs -put /tmp/test/ obs://OBS parallel file system name/tmp/flinkjob/
   ```

4. Run **WordCount.jar**.

   ```
   flink run Client installation directory/Flink/flink/examples/batch/WordCount.jar -input obs://OBS parallel file system name/tmp/flinkjob/test -output obs://OBS parallel file system name/tmp/flinkjob/output
   ```

Step 7 Log in to the OBS console and view the execution result of **WordCount.jar** in the output path specified by **Step 6.4**.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.3.3.2 Interconnecting Flume with OBS Using an IAM Agency

After configuring decoupled storage and compute for a cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can run OBS jobs using Flume. This section describes how to submit a Flume job that reads a **.txt** file from the client node and exports the file to the OBS directory.

Notes and Constraints

This section applies to MRS 3.*x* or later.

Interconnecting Flume with OBS

Step 1 Create an OBS folder for storing data.

1. Log in to the OBS console.
2. In the navigation pane on the left, choose **Resources** > **Parallel File Systems**.
3. On the displayed page, click the name of the parallel file system you created to access its details page.
4. In the navigation pane on the left, choose **Files**. On the displayed page, click **Create Folder** to create the **testFlumeOutput** folder.

Step 2 Log in to the node where the Flume client is installed as user **root**.

Step 3 Create the **/opt/flumeInput** directory and create a customized **.txt** file in it.

Step 4 Add the following content to the *Client installation directory*/**FusionInsight-flume-*/properties.properties** file:

```
# source
server.sources = r1
# channels
server.channels = c1
# sink
server.sinks = obs_sink
# ----- define net source -----
server.sources.r1.type = seq
server.sources.r1.spooldir = /opt/flumeInput
# ---- define OBS sink ----
server.sinks.obs_sink.type = hdfs
server.sinks.obs_sink.hdfs.path = obs://esdk-c-test-pfs1/testFlumeOutput
server.sinks.obs_sink.hdfs.filePrefix = %[localhost]
server.sinks.obs_sink.hdfs.useLocalTimeStamp = true
# set file size to trigger roll
server.sinks.obs_sink.hdfs.rollSize = 0
server.sinks.obs_sink.hdfs.rollCount = 0
server.sinks.obs_sink.hdfs.rollInterval = 5
#server.sinks.obs_sink.hdfs.threadsPoolSize = 30
server.sinks.obs_sink.hdfs.fileType = DataStream
server.sinks.obs_sink.hdfs.writeFormat = Text
server.sinks.obs_sink.hdfs.fileCloseByEndEvent = false

# define channel
server.channels.c1.type = memory
server.channels.c1.capacity = 1000
# transaction size
server.channels.c1.transactionCapacity = 1000
server.channels.c1.byteCapacity = 800000
server.channels.c1.byteCapacityBufferPercentage = 20
server.channels.c1.keep-alive = 60
server.sources.r1.channels = c1
server.sinks.obs_sink.channel = c1
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Set **server.sources.r1.spooldir** to the directory of the **.txt** file created in **Step 3**.
- Set **server.sinks.obs_sink.hdfs.path** to the OBS file system created in **Step 1**.

Step 5 Copy the **hadoop-huaweicloud-*.jar** and **mrs-obs-provider-*.jar** files from *Client installation directory*/**Hive/Beeline/lib** to *Flume client installation directory*/**fusionInsight-flume-*/lib**. Then run the following commands to modify permissions:

1. Go to the **lib** directory.
   cd *Flume client installation directory*/fusionInsight-flume-*/lib
2. Modify the permission on **hadoop-huaweicloud-*.jar**.
   chmod 755 hadoop-huaweicloud-*.jar
3. Modify the permission on **mrs-obs-provider-*.jar**.
   chmod 755 mrs-obs-provider-*.jar

Step 6 Run the following command to restart the Flume client:

Go to the **bin** directory.

cd *Flume client installation directory*/fusionInsight-flume-*/bin

Restart the Flume client.

./flume-manager.sh restart

Step 7 View the result in the OBS system.

1. Log in to the OBS console.
2. In the navigation pane on the left, choose **Resources** > **Parallel File Systems**. Click the name of the parallel file system you created. In the navigation pane on the left, choose **Files**. On the displayed page, click the folder created in **Step 1** to view the result.

----End

10.3.3.3 Interconnecting HDFS with OBS Using an IAM Agency

After configuring decoupled storage and compute for a cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can view and create OBS file directories on the HDFS client.

Interconnecting HDFS with OBS

Step 1 Log in to the node where the HDFS client is installed as the client installation user.

For details about how to download and install the cluster client, see .

Step 2 Run the following command to switch to the client installation directory.
cd *Client installation directory*

Step 3 Run the following command to configure environment variables:
source bigdata_env

Step 4 Authenticate the user of the cluster with Kerberos authentication enabled. Skip this step for clusters with Kerberos authentication disabled.
kinit *Component service user*

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Add the target OBS file system in the HDFS CLI.

For example:

- Run the following command to access the OBS file system:
  ```
  hdfs dfs -ls obs://OBS parallel file system name/path
  ```
  For example, run the following command to access the **mrs-word001** parallel file system. If the file list is returned, OBS is successfully accessed.
  ```
  hadoop fs -ls obs://mrs-word001/
  ```

  Figure 10-10 Returned file list

  ```
  Found 2 items
  drwxrwxrwx   - root root          0 2019-12-21 11:04 obs://mrs-word001/input
  drwxrwxrwx   - root root          0 2019-12-21 11:04 obs://mrs-word001/program
  ```

- Run the following command to upload the **/opt/test.txt** file from the client node to the OBS file system path:
  ```
  hdfs dfs -put /opt/test.txt obs://OBS parallel file system name/path
  ```
  View the uploaded file in the corresponding OBS file system path.

----End

Changing the Log Level of OBS Client

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

1. Go to the **hadoop** directory.
   ```
   cd Client installation directory/HDFS/hadoop/etc/hadoop
   ```
2. Edit the file **log4j.properties**.
   ```
   vi  log4j.properties
   ```
   Add the following OBS log level configuration to the file and save it.
   ```
   log4j.logger.org.apache.hadoop.fs.obs=WARN
   log4j.logger.com.obs=WARN
   ```
3. Run the following command:
   ```
   tail -4 log4j.properties
   ```
   If the command output shown in **Figure 10-11** is displayed, the log level has been changed.

   Figure 10-11 Viewing the log level

   ```
   [root@ecs-          hadoop]# tail -4 log4j.properties
   # Log levels of third-party libraries
   log4j.logger.org.apache.commons.beanutils=WARN
   log4j.logger.org.apache.hadoop.fs.obs=WARN
   log4j.logger.com.obs=WARN
   [root@ecs-          hadoop]#
   ```

10.3.3.4 Interconnecting Hive with OBS Using an IAM Agency

After configuring decoupled storage and compute for a cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can create tables with OBS paths as their location on the Hive client.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting the Location to an OBS Path When Creating a Table

Step 1 Log in to the client installation node as the client installation user.

Step 2 Run the following command to initialize environment variables:

```
source Client installation directory/bigdata_env
```

Step 3 Authenticate the user of the cluster with Kerberos authentication enabled. (The user must have the permission to perform operations on Hive.) Skip this step for the user of the cluster with Kerberos authentication disabled.

```
kinit User performing Hive operations
```

Step 4 Log in to FusionInsight Manager of a cluster earlier than MRS 3.2.0-LTS, choose **Cluster** > **Services** > **Hive**, and click **Configurations** then **All Configurations**.

In the navigation pane on the left, choose **Hive(Service)** > **Customization**. In the custom parameters, add **dfs.namenode.acls.enabled** to **hdfs.site.customized.configs** and set its value to **false** to disable the HDFS ACL function.

Step 5 Click **Save** to save the configuration for versions earlier than MRS 3.2.0-LTS. On the **Dashboard** page, click **More** and select **Restart Service**. Enter the password of the current user, click **OK**, and select **Restart upper-layer services**. Click **OK** to restart Hive.

Step 6 Log in to the beeline client and set **Location** to the OBS file system path when creating a table.

```
beeline
```

For example, run the following command to create the table **test** in **obs://***OBS parallel file system name***/user/hive/warehouse/***Database name***/***Table name*:

```
create table test(name string) location "obs://OBS parallel file system name/user/hive/warehouse/Database name/Table name";
```

Check the table location.

```
desc formatted test;
```

NOTE

You need to attach the component operation user to the URL policy within the Ranger policy. Enter the complete OBS path of the object for **URL** and select **Read** and **Write** permissions. Other permissions are not involved in the URL policy.

----End

Interconnecting Hive with OBS Through MetaStore

Step 1 Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Hive** > **Configurations** > **All Configurations**.

For details about how to log in to MRS Manager, see **Accessing MRS Manager**.

- For versions earlier than MRS 3.2.0-LTS:
  - In the navigation pane on the left, choose **MetaStore(role)** > **Customization**. Add the configuration item **hive.metastore.warehouse.dir** to the custom parameter **hive.metastore.customized.configs** and set the value to an OBS path,

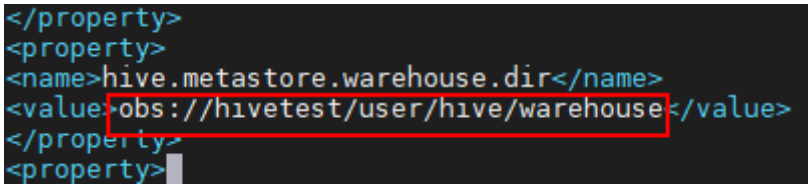
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

for example, **obs://hivetest/user/hive/warehouse/**, where **hivetest** is the name of the OBS parallel file system.

- In the navigation pane on the left, choose **HiveServer(role)** > **Customization**. Add the configuration item **hive.metastore.warehouse.dir** to custom parameters **hive.metastore.customized.configs** and **hive.server.customized.configs** and set the values to an OBS path, for example, **obs://hivetest/user/hive/warehouse/**, where **hivetest** is the name of the OBS parallel file system.

- For MRS 3.2.0-LTS and later versions:

  Search for **hive.metastore.warehouse.dir** in the search box and change its value to an OBS path, for example, **obs://hivetest/user/hive/warehouse/**, where **hivetest** indicates the OBS file system name.



Step 2 Save the change and restart Hive.

Step 3 (Optional) Install the client by referring to **Installing an MRS Cluster Client**. If the client has been installed in the cluster, go to **Step 4**.

Step 4 Update the client configuration file.

1. Run the following command to open **hivemetastore-site.xml** in the Hive configuration file directory on the client:
   ```
   vim Client installation directory/Hive/config/hivemetastore-site.xml
   ```
2. Change the value of **hive.metastore.warehouse.dir** to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**, where **hivetest** is the OBS bucket name.

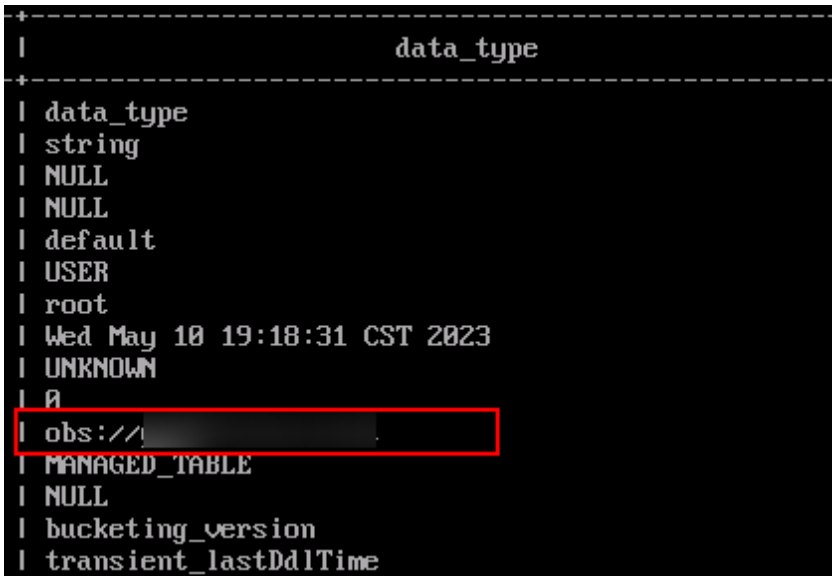
   Figure 10-12 Configuring the OBS Path

3. For MRS 3.2.0-LTS and later versions, change the value of **hive.metastore.warehouse.dir** in **hivemetastore-site.xml** file to the corresponding OBS path, for example, **obs://hivetest/user/hive/warehouse/**. The XML file is stored in the HCatalog client configuration file directory.
   ```
   vi Client installation directory/Hive/HCatalog/conf/hivemetastore-site.xml
   ```

Step 5 Log in to the beeline client, create a table, and check whether the location is the OBS path.

1. Go to the client installation directory.
   ```
   cd Client installation directory
   ```
2. Load the environment variables.
   ```
   source bigdata_env
   ```
3. Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.
   ```
   kinit User performing Hive operations
   ```
4. Log in to the Hive client.
   ```
   beeline
   ```
5. Create the **test** table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



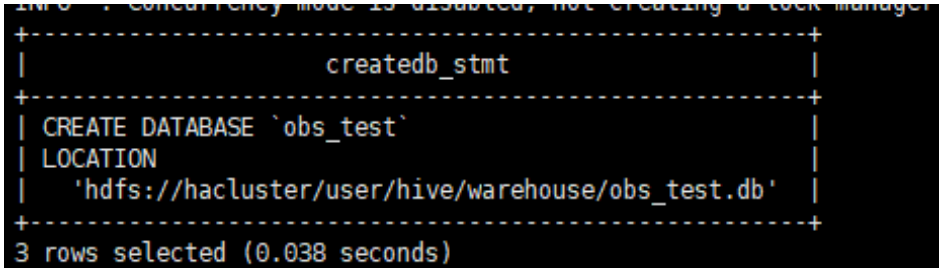
```
create table test(name string);
```

6. Check the table location.

```
desc formatted test;
```

Location of the table is the OBS path.

Figure 10-13 Viewing the location of a Hive table



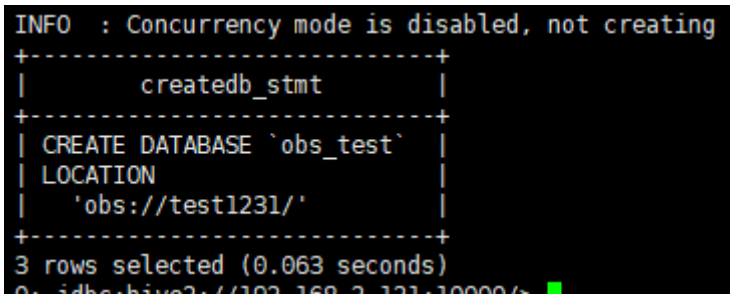
Step 6 If the location of the current database points to HDFS, tables created in the database are located in HDFS by default. You do not need to specify the location. To modify the default table creation policy, update the location of the database to OBS. The procedure is as follows:

1. Query the location of the database.

```
show create database obs_test;
```

Figure 10-14 Viewing the location of a Hive table

2. Change the database location.



```
alter database obs_test set location 'obs://OBS parallel file system name/user/hive/warehouse/Database name';
```

Check whether the database location is changed to an OBS path.

```
show create database obs_test;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-15 Checking the new location of the Hive table

3. Change the table location.

   alter table *user_info* set location 'obs://*OBS parallel file system name/user/hive/warehouse/Database name/Table name*';

   If there is already data in the table, migrate the data to the new location.

----End

10.3.3.5 Interconnecting Hudi with OBS Using an IAM Agency

After configuring decoupled storage and compute for a cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can create Hudi COW tables in spark-shell and store them to OBS.

Interconnecting Hudi with OBS

Step 1 Log in to the client installation node as the client installation user.

Step 2 Run the following commands to configure environment variables:

Load the environment variables.

```
source Client installation directory/bigdata_env
```

Load the component environment variables.

```
source Client installation directory/Hudi/component_env
```

Step 3 Modify the configuration file:

```
vim Client installation directory/Hudi/hudi/conf/hdfs-site.xml
```

Modify the following content, where the **dfs.namenode.acls.enabled** parameter specifies whether to enable the HDFS ACL function.

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>false</value>
</property>
```

Step 4 Authenticate the user of the cluster with Kerberos authentication enabled. Skip this step for the user of the cluster with Kerberos authentication disabled.

```
kinit Username
```

Step 5 Start spark-shell and run the following commands to create a COW table and save it in OBS:

```
import org.apache.hudi.QuickstartUtils._
import scala.collection.JavaConversions._
import org.apache.spark.sql.SaveMode._
import org.apache.hudi.DataSourceReadOptions._
import org.apache.hudi.DataSourceWriteOptions._
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
import org.apache.hudi.config.HoodieWriteConfig._
val tableName = "hudi_cow_table"
val basePath = "obs://testhudi/cow_table/"
val dataGen = new DataGenerator
val inserts = convertToStringList(dataGen.generateInserts(10))
val df = spark.read.json(spark.sparkContext.parallelize(inserts, 2))
df.write.format("org.apache.hudi").
options(getQuickstartWriteConfigs).
option(PRECOMBINE_FIELD_OPT_KEY, "ts").
option(RECORDKEY_FIELD_OPT_KEY, "uuid").
option(PARTITIONPATH_FIELD_OPT_KEY, "partitionpath").
option(TABLE_NAME, tableName).
mode(Overwrite).
save(basePath);
```

In the preceding command, **obs://testhudi/cow_table/** indicates the OBS path, and **testhudi** indicates the name of the parallel file system. Change them as required.

Step 6 Use DataSource to check whether the table is created and whether the data is normal.

```
val roViewDF = spark.
read.
format("org.apache.hudi").
load(basePath + "/*/*/*/*")
roViewDF.createOrReplaceTempView("hudi_ro_table")
spark.sql("select * from  hudi_ro_table").show()
```

Figure 10-16 Viewing table data

Step 7 Exit the **spark-shell** CLI.

```
:q
```

----End

10.3.3.6 Interconnecting MapReduce with OBS Using an IAM Agency

After configuring a storage-compute decoupled cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can add a Mapreduce custom configuration to enable JobHistory to delete log files of the user directory in a timely manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interconnecting MapReduce with OBS

Step 1 Log in to the MRS management console. In the navigation pane on the left, choose **Clusters** > **Active Clusters**. On the displayed page, click the name of the cluster you created to access its details page.

Step 2 Choose **Components** > **MapReduce**.On the displayed page, click **Configurations** then **All Configurations**. In the navigation pane on the left, choose **MapReduce** > **Customization**. In the custom configuration items, add the configuration item **mapreduce.jobhistory.always-scan-user-dir** to **core-site.xml** file.

This parameter specifies whether the JobHistory service always scans log files in the user directory when scanning job logs. The value can be **true** or **false**.

- **true**: The JobHistory service forcibly scans the specified directory even if the directory has been scanned. This ensures that all related log files are correctly collected and processed each time a job is executed.
- **false** (default value): The JobHistory service does not scan the user directories that have been scanned. This reduces unnecessary disk I/O operations.

Set this parameter to **true**.

Step 3 Click **Save Configuration**.

Step 4 Click the **Service Status** tab and choose **More** > **Restart Service** to restart the MapReduce service.

Step 5 If the OBS job is submitted and executed, MapReduce is successfully connected to OBS. For example, create a Hive table and set its **Location** to an OBS path.

1. Log in to the node where the Hive client is installed and run the following commands. The authenticated user must have the permission to create Hive tables.

   Go to the client installation directory.

   ```
   cd Client installation directory
   ```

   Load the environment variables.

   ```
   source bigdata_env
   ```

   Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.

   ```
   kinit Service user
   ```

2. Log in to the Hive client.

   ```
   beeline
   ```

3. Create a Hive table and insert data into the table.

   a. Create a table.

   ```
   create table test(name string) location "obs://OBS parallel file system name/user/hive/warehouse/Database name/Table name";
   ```

   b. Check the table location.

   ```
   desc formatted test;
   ```

   It is found that the **Location** of the table is the OBS path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

c. Insert data.

```
insert into table test values("A");
```

d. Query table data.

```
select * from test;
```

4. Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Yarn**, and click the hyperlink next to **ResourceManager WebUI** to go to the YARN web UI. On the **All Applications** page, click the application ID of the target Hive task to view the job running information. If **Application Type** is **MAPREDUCE**, the job submitted to OBS is a MapReduce job.
5. Click **Logs** in the **Logs** column at the bottom of the page to view job logs.

----End

10.3.3.7 Interconnecting Presto with OBS Using an IAM Agency

After configuring decoupled storage and compute for a cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can use **presto_cli.sh** client to create tables and store them in OBS.

Interconnecting Presto with OBS (Kerberos authentication is disabled for the cluster (in normal mode))

Step 1 Log in to the node where the client is installed as the client installation user.

For details about how to download and install the cluster client, see .

Step 2 Configure environment variables.

Go to the client installation directory.

```
cd Client installation directory
```

Configure environment variables.

```
source bigdata_env
```

Step 3 Connect to the Presto client.

```
presto_cli.sh
```

Step 4 Create a schema and set **location** to an OBS path.

```
CREATE SCHEMA hive.demo WITH (location = 'obs://mrs-word001/presto-demo002/');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 5 Create a table in the schema. The table data is stored in the OBS file system.

```
CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;
```

Figure 10-18 Return result

```
[root@node-master2mdc0 ~]# presto_cli.sh
--server http://192.168.3.66:7520
presto> CREATE SCHEMA hive.demo WITH (location = 'obs://mrs-word001/presto-demo/');
CREATE SCHEMA
presto> CREATE TABLE hive.demo.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;
CREATE TABLE: 150000 rows

Query 20191221_033019_00001_ukfbz, FINISHED, 2 nodes
Splits: 42 total, 42 done (100.00%)
0:09 [150K rows, 0B] [16K rows/s, 0B/s]
```

Step 6 Exit the client.

```
exit
```

----End

Interconnecting Presto with OBS (Kerberos authentication is enabled for the cluster (in security mode))

Step 1 Log in to FusionInsight Manager of the MRS cluster.

For details about how to log in to FusionInsight Manager, see **Accessing MRS Manager**.

Step 2 Create a role with the Hive Admin Privilege permission, for example, **prestorole**. For how to create a role, see **Managing MRS Cluster Roles**.

Step 3 Create a user that belongs to the Presto and Hive groups and bind the role created in **Step 2** to the user, for example, **presto001**. For how to create a user, see **Creating an MRS Cluster User**.

If a human-machine user is created, log in to MRS Manager as the new user and change the initial password.

Step 4 Download the user credential.

- For versions earlier than MRS 3.*x*, log in to MRS Manager, choose **System** > **Manage User**. Locate the row containing the new user, click **More**, and select **Download Authentication Credential**.
- Log in to FusionInsight Manager for MRS 3.*x* or later, choose **System** > **Permission** > **User**. Locate the row containing the new user, click **More**, and select **Download Authentication Credential**.

Step 5 Decompress the downloaded user credential file and save the obtained **krb5.conf** and **user.keytab** files to the client directory, for example, *Client installation directory*/**Presto/**.

For details about how to download and install the cluster client, see .

Step 6 Log in to the node where the client is installed as the client installation user.

Step 7 Obtain the user principal.

```
klist -kt Client installation directory/Presto/user.keytab
```

Step 8 Configure environment variables.

Go to the client installation directory.

```
cd Client installation directory
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configure environment variables.

```
source bigdata_env
```

Step 9 Connect to the Presto server of the cluster.

```
presto_cli.sh --krb5-config-path {krb5.conf file path} --krb5-principal {User principal} --krb5-keytab-path {user.keytab file path} --user {Presto username}
```

Table 10-7 How to obtain parameter values

Parameter Value	How to Obtain
krb5.conf file path	Replace it with the file path set in **Step 5**, for example, *Client installation directory*/**Presto/krb5.conf**.
user.keytab file path	Replace it with the file path set in **Step 5**, for example, *Client installation directory*/**Presto/user.keytab/opt/Bigdata/client/Presto/user.keytab**.
User principal	Replace it with the result returned in **Step 7**.
Presto username	Replace it with the username created in **Step 3**, for example, **presto001**.

Step 10 Create a schema and set **location** to an OBS path.

```
CREATE SCHEMA hive.demo01 WITH (location = 'obs://mrs-word001/presto-demo002/');
```

Step 11 Create a table in the schema. The table data is stored in the OBS file system.

```
CREATE TABLE hive.demo01.demo_table WITH (format = 'ORC') AS SELECT * FROM tpch.sf1.customer;
```

Figure 10-19 Returned result

Step 12 Exit the client.

```
exit
```

----End

10.3.3.8 Interconnecting Spark with OBS Using an IAM Agency

After configuring decoupled storage and compute for a cluster by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can create tables with OBS paths as their location on the Spark client.

Interconnecting with OBS Using Spark Beeline

Step 1 Log in to the MRS Manager and choose **Cluster** > **Services** > **Spark2x** > **Configurations** > **All Configurations**. For how to log in to MRS Manager, see **Accessing MRS Manager**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In the left navigation pane, choose **JDBCServer2x** > **Customization**. Add the configuration item **dfs.namenode.acls.enabled** to the **spark.hdfs-site.customized.configs** parameter and set the value to **false** to disable the HDFS ACL function.

Step 2 Search for the **spark.sql.statistics.fallBackToHdfs** parameter and set its value to **false**.

Step 3 Save the configurations and restart the JDBCServer2x instance.

Step 4 Log in to the client installation node as the client installation user.

For details about how to download and install the cluster client, see .

Step 5 Run the following commands to configure environment variables:

```
source Client installation directory/bigdata_env
```

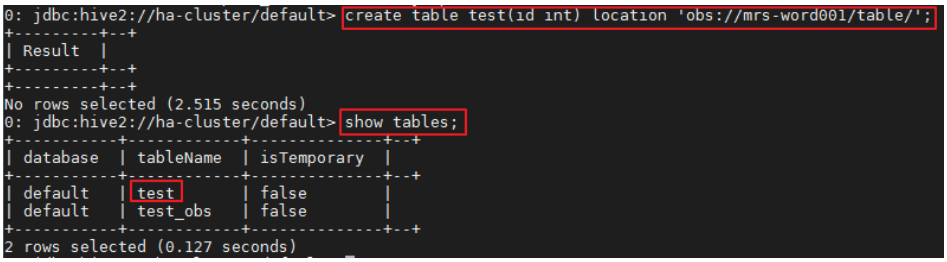
Step 6 Authenticate the user of the cluster with Kerberos authentication enabled. Skip this step for the user of the cluster with Kerberos authentication disabled.

```
kinit Username
```

Step 7 Access OBS using Spark beeline. The following example creates a table named **test** in the **obs://mrs-word001/table/** directory.

Access **spark-beeline**.

```
spark-beeline
```



Create the **test** table.

```
create table test(id int) location 'obs://mrs-word001/table/';
```

Step 8 Run the following command to query all tables. If table **test** is returned, OBS access is successful.

```
show tables;
```

Figure 10-20 Returned table names

Step 9 Press **Ctrl+C** to exit Spark beeline.

----End

Interconnecting with OBS Using Spark SQL

Step 1 Log in to the client installation node as the client installation user.

For details about how to download and install the cluster client, see .

Step 2 Run the following commands to configure environment variables:

```
source Client installation directory/bigdata_env
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 3 Modify the configuration file:

```
vim Client installation directory/Spark2x/spark/conf/hdfs-site.xml
```

Modify the following content, where the **dfs.namenode.acls.enabled** parameter specifies whether to enable the HDFS ACL function.

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>false</value>
</property>
```

Step 4 Authenticate the user of the cluster with Kerberos authentication enabled. Skip this step for the user of the cluster with Kerberos authentication disabled.

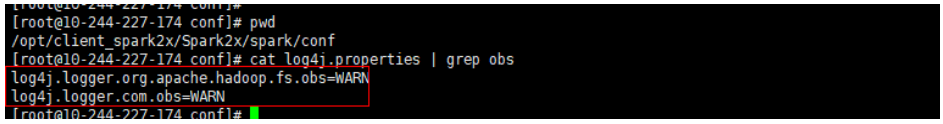
```
kinit Username
```

Step 5 Access OBS using Spark SQL CLI. For example, create a table named **test** in the **obs://mrs-word001/table/** directory.

1. Go to the Spark **bin** directory.
   ```
   cd Client installation directory/Spark2x/spark/bin
   ```
2. Log in to the Spark SQL CLI.
   ```
   ./spark-sql
   ```
3. Run the following command in the Spark SQL CLI to create a table:
   ```
   create table test(id int) location 'obs://mrs-word001/table/';
   ```

Step 6 Check whether the table exists.

```
show tables;
```



Step 7 Run **exit;** to exit the Spark SQL CLI.

NOTE

If a large number of logs are printed in the OBS file system, the read and write performance may be affected. You can adjust the log level of the OBS client as follows:

1. Go to the **conf** directory.
   ```
   cd Client installation directory/Spark2x/spark/conf
   ```
2. Edit the file **log4j.properties**.
   ```
   vi log4j.properties
   ```
3. Add the OBS log level configuration to the file.
   ```
   log4j.logger.org.apache.hadoop.fs.obs=WARN
   log4j.logger.com.obs=WARN
   ```

Figure 10-21 Adding an OBS log level

----End

Using Spark Shell to Read OBS Files

Step 1 Log in to the client installation node as the client installation user.

For details about how to download and install the cluster client, see .

Step 2 Run the following commands to configure environment variables:

```
source Client installation directory/bigdata_env
```

Step 3 Modify the configuration file:

```
vim Client installation directory/Spark2x/spark/conf/hdfs-site.xml
```

Modify the following content, where the **dfs.namenode.acls.enabled** parameter specifies whether to enable the HDFS ACL function.

```
<property>
<name>dfs.namenode.acls.enabled</name>
<value>false</value>
</property>
```

Step 4 Authenticate the user of the cluster with Kerberos authentication enabled. Skip this step for the user of the cluster with Kerberos authentication disabled.

```
kinit Username
```

Step 5 Run the following commands to log in to the Spark SQL CLI:

Go to the **bin** directory.

```
cd Client installation directory/Spark2x/spark/bin
```

Log in to the Spark SQL CLI.

```
./spark-sql
```

Step 6 Create a table in OBS and import data to the table.

1. Create a database.
   ```
   create database test location "obs://Parallel file system path/test";
   ```
2. Switch to the new database.
   ```
   use test;
   ```
3. Create a table.
   ```
   create table test1(a int,b int) using parquet;
   ```
4. Insert data into the table.
   ```
   insert into test1 values(1,2);
   ```
5. View table details.
   ```
   desc formatted test1;
   ```

   The **Location** of the table shown in **Figure 10-22** is an OBS path.

   Figure 10-22 Checking the location of the table

   ```
   spark-sql> desc formatted test11;
   a       int     NULL
   b       int     NULL

   # Detailed Table Information
   Database        test1
   Table   test11
   Owner   root
   Created Time    Tue Nov 21 10:35:40 CST 2023

   Provider        parquet
   Location        obs://        /test11/test11
   Serde Library   org.apache.hadoop.hive.ql.io.parquet.serde.ParquetHiveSerDe
   InputFormat     org.apache.hadoop.hive.ql.io.parquet.MapredParquetInputFormat
   OutputFormat    org.apache.hadoop.hive.ql.io.parquet.MapredParquetOutputFormat
   Time taken: 0.235 seconds, Fetched 16 row(s)
   spark-sql>
   ```

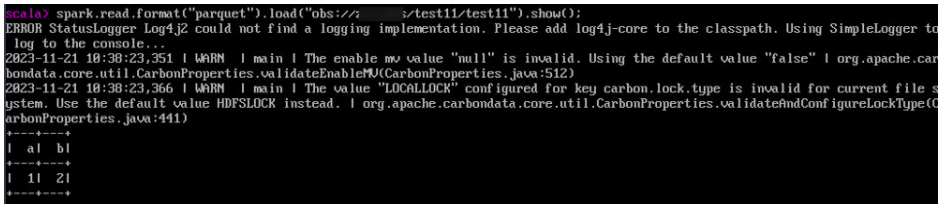
6. Run **exit;** to exit the Spark SQL CLI.

Step 7 Run the following command to go to the Spark **bin** directory:

```
cd Client installation directory/Spark2x/spark/bin
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 8 Log in to the Spark SQL CLI.



```
./spark-shell
```

Step 9 In the Spark Shell CLI, run the following command to query the table created in **Step 5.3**:

```
spark.read.format("parquet").load("obs://Parallel file system path/test1").show();
```

The table data is displayed, as shown below.

Figure 10-23 Viewing table data

Step 10 Run the **:quit** command to exit the Spark Shell CLI.

----End

10.3.3.9 Interconnecting Sqoop with OBS Using an IAM Agency

After connecting the Sqoop client to an OBS file system by referring to **Interconnecting an MRS Cluster with OBS Using an IAM Agency**, you can import tables from a relational database to OBS or export tables from OBS to a relational database on the Sqoop client.

Prerequisites

The RDS for MySQL instance and the MRS cluster where Sqoop is located are in the same VPC.

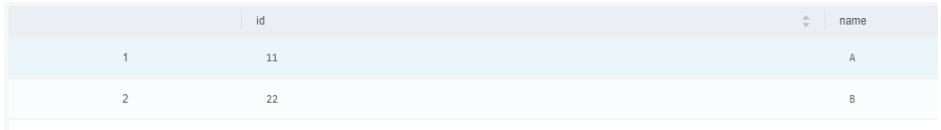
Importing MySQL Data to OBS Using Sqoop

Step 1 Log in to the RDS console, choose **Instances**, locate the row that contains the target RDS for MySQL instance, click **Log In** in the **Operation** column to log in to the instance as user **root**.

Step 2 On the homepage, click **Create Database** to create a database, for example, **test**. In the database list, click the name of the newly created database to go to the database management page. On the **Tables** page, click **Create Table** to create a table, for example, **sourcetable**, which contains the **id** and **name** fields.

Step 3 Click **Query SQL Statements** in the row where the new table is located. On the displayed page, switch to the database where the table is located and run the following SQL command to insert data into the table:

```
INSERT INTO sourcetable (id,name) VALUES (11,"A");
INSERT INTO sourcetable (id,name) VALUES (22,"B");
```



Query table data.

```
select * from `sourcetable`;
```

The queried table data is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

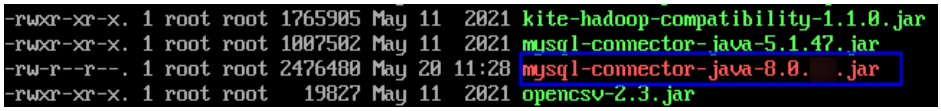


Figure 10-24 Querying table data

	id	name
1	11	A
2	22	B

Step 4 Download the MySQL driver package of the required version from the MySQL official website **https://downloads.mysql.com/archives/c-j/**, decompress the package, and upload it to the *Client installation directory*/**Sqoop/sqoop/lib** directory on the node where the Sqoop client is installed.

Figure 10-25 Uploading the MySQL driver file

Step 5 Log in to the node where the client is installed as the client installation user.

For details about how to download and install the cluster client, see .

Step 6 Configure environment variables and authenticate the user.

Go to the client installation directory.

```
cd Client installation directory
```

Load the environment variables.

```
source bigdata_env
```

Authenticate the user. Skip this step for clusters with Kerberos authentication disabled.

```
kinit Component service user
```

Step 7 Import MySQL table data to OBS using **sqoop import**.

```
sqoop import --connect jdbc:mysql://MySQL IP address:3306/test --username root --password xxx --table sourcetable --target-dir obs://Parallel file system name/xxx --delete-target-dir --fields-terminated-by "," -m 1 --as-textfile
```

Step 8 Log in to OBS console, choose **Parallel File System**, go to the parallel file system path for storing MySQL data configured in **Step 7**, and download and check whether the data file is the same as that inserted into the MySQL table in **Step 3**.

```
11,A
22,B
```

----End

10.3.4 Configuring Fine- Grained OBS Access Permissions for MRS Cluster Users

When fine-grained permission control is enabled, you can configure OBS access permissions to implement access control on directories in OBS file systems.

This function enables you to control MRS users' access to OBS resources. For example, if you allow user group A to only access log files in a specified OBS file system, perform the following operations:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Configure an agency with OBS access permissions for an MRS cluster so that OBS can be accessed using the temporary AK/SK automatically obtained by the ECS.
2. Create a policy on the IAM console to allow access to log files in a specified OBS file system, and create an agency bound to the policy permission.
3. In the MRS cluster, bind the new agency to user group A so that user group A only has the permission to access log files in the specified OBS file system.

In the following scenarios, the username used for submitting jobs is an internal username so that MRS multi-user access to OBS is not supported.

- In a cluster with Kerberos authentication enabled, the built-in username of **spark-beeline** for submitting jobs is **spark**. In a cluster with Kerberos authentication disabled, the built-in username is **omm**.
- In a cluster with Kerberos authentication enabled, the built-in usernames of Presto for submitting jobs is **omm** and **hive**. In a cluster with Kerberos authentication disabled, the built-in username is **omm**. On the cluster details page of the MRS console, choose **Components** > **Presto** > **Service Configuration**, set **Type** to **All**, search for **hive.hdfs.impersonation.enabled**, and change its value to **true**. In this way, multiple MRS users can access OBS with fine-grained permissions.

Notes and Constraints

This section does not apply to MRS 1.9.2.

Prerequisites

Fine-grained permission control has been enabled. For details about permissions management, see **Creating an IAM User and Granting MRS Permissions**.

Configuring an Agency with OBS Access Permissions for a Cluster

Follow instructions in **Interconnecting an MRS Cluster with OBS Using an IAM Agency** to configure an agency with OBS access permissions.

The agency takes effect for all users (including internal users) and user groups in the cluster. To control the permissions of users and user groups in the cluster to access OBS, perform the following operations.

When configuring permissions on an OBS path, if you grant write permissions, you must also configure the corresponding recycle bin path. The default recycle bin path is **/user/***${current.user}***/.Trash/**, where *${current.user}* indicates the current username.

Creating a Policy and an Agency on IAM

Create policies with different access permissions and bind the policies to the agency. For details, see **Reference: Creating a Policy and an Agency on IAM**.

Configuring OBS Permission Control Mapping

Step 1 On the MRS management console, choose **Active Clusters** and click the cluster name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 2 In the **Basic Information** area on the **Dashboard** tab page, click **Manage** next to **OBS Permission Control**.

Step 3 Click **Add Mapping** and set parameters according to **Table 10-8**.

Table 10-8 Adding an OBS permission control mapping

Parameter	Description
IAM Agency	Select the agency created in **Step 2**.
Type	• **User**: User-level mapping • **Group**: User group-level mapping User-level mapping takes priority over user group-level mapping. If you select **Group**, you are advised to enter the primary group name in **MRS User (User Group)**. Do not use the same username (group) in multiple mapping records.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
MRS User (User Group)	Use commas (,) to separate multiple names of users or user groups. • If OBS permission control is not configured for a user and no AK/SK is set, the OBS Operator permission in **MRS_ECS_DEFAULT_AGENCY** will be used to access OBS. It is recommended that you do not bind the internal user of a component to any agency. • If you need to configure an agency for a component's internal user when submitting a job in the following scenarios, observe the following requirements: – To control permissions on spark-beeline operations, configure the username **spark** for clusters with Kerberos authentication enabled and the username **omm** for clusters with Kerberos authentication disabled. – To control permissions on Presto operations, configure usernames **omm**, **hive**, and the one used to log in to the client for clusters with Kerberos authentication enabled, and configure usernames **omm** and the one used to log in to the client for clusters with Kerberos authentication disabled. – If you want to use Hive to create tables in beeline mode, configure the internal user **hive**.

Step 4 Click **OK**.

Step 5 Select **I agree to authorize the trust relationships between MRS Users (Groups) and IAM agencies**, and click **OK**. The mapping between the MRS user and OBS permission is added.

If appears next to **OBS Permission Control** on the **Dashboard** tab page or the mapping table has been updated for OBS permission control, the mapping takes effect. It takes about 1 minute to for the mapping to take effect.

In the **Operation** column of the mapping list, you can edit or delete the added mapping.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If OBS permission control is not configured for a user and no AK/SK is set, OBS access is granted using the permissions of the agency configured for the cluster in the **Object Storage Service (OBS)** project.
- Once AK/SK credentials are configured, OBS access is performed using those credentials, regardless of whether OBS permission control is configured.
- Security Administrator permissions are required to modify, create, or delete a mapping.
- To apply the mapping changes in Spark Beeline, Hive Beeline, and Presto, you must restart Spark, exit and re-enter Beeline, and restart Presto, respectively.

----End

Component Access to OBS When OBS Permission Control Is Enabled

Step 1 Log in to any node in a cluster as user **root** using the password set during cluster creation.

Step 2 Run the following commands to set the environment variables:

cd *Client installation directory*

source *Client installation directory*/**bigdata_env**

Step 3 If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step:

kinit *MRS cluster user*

Example:

kinit admin

Step 4 If Kerberos authentication is disabled for the current cluster, run the following commands to log in as a user who belongs to the **supergroup** group. Replace *XXXX* with the username. For how to create a user, refer to **Creating an MRS Cluster User**.

mkdir /home/*XXXX*

chown *XXXX* **/home/***XXXX*

su - *XXXX*

Step 5 Access OBS. You do not need to configure AK/SK credentials or endpoints. The OBS path format is **obs://***OBS parallel file system name*/*XXX*.

hadoop fs -ls "obs://obs-example/job/hadoop-mapreduce-examples-3.1.2.jar**"**

Note that:

- To delete files from OBS using the **hadoop fs** command, run **hadoop fs -rm -skipTrash**.
- If table creation in Spark SQL or Spark Beeline does not involve data import, OBS access is not triggered. That is, if you create a table in an OBS directory on which you do not have permission, the **CREATE TABLE** operation will still

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

be successful, but the error message "**403 AccessDeniedException**" is displayed when you insert data.

----End

Reference: Creating a Policy and an Agency on IAM

Step 1 Create a policy on IAM.

1. Log in to the IAM console.
2. In the navigation pane on the left, choose **Permissions** > **Policies/Roles**. On the displayed page, click **Create Custom Policy**.
3. Set parameters according to **Table 10-9**.

Table 10-9 Policy parameters

Parameter	Description
Policy Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.
Scope	Select **Global services**, because OBS is a global service.
Policy View	Select **Visual editor**.
Policy Content	– **Allow**: Select **Allow**. – **Select service**: Select **Object Storage Service (OBS)**. – **Select action**: Select **ReadWrite**, **ReadOnly**, and **ListOnly**. – **Resources** under **All**: Select **Specific** and set the following parameters: ▪ **object**: Select **Specify resource path** and click **Add Resource Path** to add a path. The **/tmp** directory is used as an example. For example, enter *obs_bucket_name***/tmp/** and *obs_bucket_name***/tmp/***. ▪ **bucket**: Select **Specify resource path**, click **Add Resource Path**, and enter *obs_bucket_name*. – (Optional) Request condition: not added.
Description	(Optional) Brief description about the policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the data write operation of each component is implemented in **rename** mode, the permission to delete objects must be configured when data is written.

4. Click **OK** to save the policy.

Step 2 Create an agency on IAM.

1. Log in to the IAM console.
2. Choose **Agencies**. On the displayed page, click **Create Agency**.
3. Set parameters according to **Table 10-10**.

Table 10-10 Agency parameters

Parameter	Description
Agency Name	Only letters, digits, spaces, and special characters (-_.,) are allowed.
Agency Type	Select **Common account**.
Delegated Account	Enter your cloud account, that is, the account you register using your mobile phone number. It cannot be a federated user or an IAM user created using your cloud account.
Validity Period	Set this parameter as required.
Description	(Optional) Brief description about the agency.
Permissions	1. In the **Project [Region]** column, locate the row where **OBS** is, click **Attach Policy**. 2. Select the policy created in **Step 1** to display it in **Selected Policies**. 3. Click **OK**.

4. Click **OK** to save the agency.

   If you modify an agency or its bound policies after it has been used to access OBS, the changes take effect within 15 minutes.

----End

10.3.5 How Do I Access OBS Using an MRS Client Installed Outside a Cluster?

Scenarios

In storage-compute decoupling scenarios where data is computed in an MRS cluster and stored in OBS buckets, you can obtain a temporary AK/SK using an agency and then use the AK/SK to access the OBS server. To access OBS from a

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

client on a node outside the cluster, obtain an AK/SK through Guardian. Guardian is a component developed by the MRS team that allows clients outside the cluster to access OBS using temporary AKs/SKs.

Notes and Constraints

This function is available in MRS 3.1.5 or later.

Accessing OBS Through Guardian on a Client Installed Outside the Cluster

Step 1 Install Guardian in the cluster.

- For a new cluster in creation, select **Guardian**.
- For an existing cluster, add the Guardian component in the **Components** tab.
  a. On the cluster details page, choose **Components** and click **Add Service**.
  b. In the service list, select the services to be added and click **Next**.
  c. On the **Topology Adjustment** page, select the node where the service is to be deployed. (You are advised to deploy the Guardian service on the Master node.)
  d. Click **OK**. After the service is added, you can view the added service on the **Components** page.

     The services added on the MRS console are automatically synchronized to MRS Manager.

Step 2 Configure storage and compute decoupling for the cluster by referring to **Configuring a Storage-Compute Decoupled Cluster (Agency)** or **Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS**.

Step 3 Install or update the client.

- For details about how to install the client on a node outside the cluster, see **Installing a Client (MRS 3.x)**.
- For details about how to update an existing client, see **Updating the MRS Cluster Client After the Server Configuration Expires**.

Step 4 Once the installation is successful, you can access OBS. For example, access OBS from the HDFS client of an MRS cluster with Kerberos authentication disabled:

1. Log in to the node where the client is installed as the client installation user.
2. Go to the client installation directory and configure the environment variables:

   cd *Client installation directory*

   source bigdata_env
3. Run the following command on the HDFS client to access OBS:

   hdfs dfs -ls obs://*Directory of the OBS parallel file system*

   If information similar to the following is displayed, the interconnection is successful:

11 FAQs

11.1 MRS Basics

11.1.1 What Is MRS Used For?

Question:

What Can MapReduce Service (MRS) Do?

Answer:

MapReduce Service (MRS) is an enterprise-grade big data platform that allows you to quickly build and operate economical, secure, full-stack, cloud-native big data environments on the cloud. It provides engines such as ClickHouse, Spark, Flink, Kafka, and HBase, and supports convergence of data lake, data warehouse, business intelligence (BI), and artificial intelligence (AI). Fully compatible with open-source components, MRS helps you rapidly innovate and expand service growth.

11.1.2 What Types of Distributed Storage Does MRS Support?

Question:

What Types of Distributed Storage Do MRS Clusters Support? What Versions Are Available?

Answer:

The MRS clusters use the mainstream big data component Hadoop. Currently, Hadoop 3.x is supported and will be updated as the cluster evolves.

MRS allows you to store data in OBS and use an MRS cluster for data computing only. In this way, storage and compute are decoupled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.1.3 What Are Regions and AZs?

A region and an availability zone (AZ) identify the location of a data center. You can create resources in a specific AZ of a region.

- A region is a physical data center. Each region is completely isolated to ensure high fault tolerance and stability. After creating resources in a region, you cannot change the region.
- An AZ is a physical location with independent power supplies and network in a region. A region contains one or more AZs that are physically isolated but interconnected through the internal network. The fault of an AZ will not affect other AZs. The internal network provides economical connection with low latency.

What Are the Considerations for Selecting a Region?

When selecting a region, consider the following factors:

- Location

  You are advised to select a region closest to your target users. This reduces network latency and improves access rate. However, there is no distinct difference between the infrastructure, BGP network quality, and resource operations and configurations in the same region/country. Therefore, you do not need to consider the network latency when selecting a region in a country.
- Resource price

  Resource prices may vary in different regions.

What Are the Considerations for Selecting an AZ?

Consider the requirements for disaster recovery (DR) and network latency when selecting an AZ:

- Deploy resources in different AZs in the same region for DR purposes.
- Deploy resources in the same AZ for minimum latency.

11.1.4 Can I Change the Network Segment of Nodes in an MRS Cluster?

Question:

Can I Change the Network Segment of Nodes in an MRS Cluster?

Answer:

Yes, you can. Perform the following steps to change the network segment of nodes in a cluster:

1. On the **Dashboard** page of the cluster, locate the **Network Information** pane, and click **Change Subnet** on the right of subnet name.
2. Select another subnet in the VPC to which the current cluster belongs to expand the available subnet IP addresses.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Selecting a new subnet will not change the IP addresses and subnets of existing nodes.

11.1.5 Can I Downgrade the Specifications of an MRS Cluster Node?

Question:

Can I Downgrade the Specifications of an MRS Cluster Node?

Answer:

Currently, the configuration specifications of nodes in an MRS cluster cannot be downgraded.

11.1.6 Are Hive Components of Different Versions Compatible with Each Other?

Hive 3.1 is incompatible with Hive 1.2 in the following items:

- Strings cannot be converted to int in Hive 3.1.
- The user-defined functions (UDFs) of the **Date** type are changed to Hive 3.1 built-in UDFs.
- Hive 3.1 does not provide the index function anymore.
- The JDBC drivers in Hive 3.1 and Hive 1.2 are incompatible.
- In Hive 3.1, column names in ORC files are case-sensitive and underscores-sensitive.
- Hive 3.1 does not allow columns named **time**.

11.1.7 What Are the Differences Between OBS and HDFS in Data Storage?

The data processed by MRS is from OBS or HDFS. OBS is an object-based storage service that provides secure, reliable, and cost-effective storage of huge amounts of data. MRS can directly process data in OBS. You can view, manage, and use data by using the OBS console or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

- Data stored in OBS: Data storage is decoupled from compute. The cluster storage cost is low, and storage capacity is not limited. Clusters can be deleted at any time. However, the computing performance depends on the OBS access performance and is lower than that of HDFS. OBS is recommended for applications that do not demand a lot of computation.
- Data stored in HDFS: Data storage is not decoupled from compute. The cluster storage cost is high, and storage capacity is limited. The computing performance is high. You must export data before you delete clusters. HDFS is recommended for computing-intensive scenarios.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.1.8 What Are the Solutions for Processing over 1 Billion Data Records?

Question:

What Are the Solutions for Processing over 1 Billion Data Records?

Answer:

- You are advised to use TaurusDB databases in scenarios where data is updated, online transaction processing (OLTP) is performed, and complex analysis is required.
- Impala and Kudu in MRS also meet this requirement. Impala and Kudu can load all join tables to the memory in the join operation.

11.1.9 What Are the Advantages of ZSTD?

Question:

What are the advantages of ZSTD?

Answer:

Zstandard (ZSTD) is an open-source lossless data compression algorithm. Its compression performance and compression ratio are better than those of other compression formats supported by Hadoop.

For details, see **https://github.com/L-Angel/compress-demo**.

11.2 Cluster Creation

11.2.1 How Do I Create an MRS Cluster Using a Custom Security Group?

Question:

How Do I Create an MRS Cluster Using a Custom Security Group?

Answer:

You can create an MRS cluster using a user-defined security group in either of the following ways:

- If you want to use a security group created by yourself, you need to enable port 9022 when you create a cluster.
- When you create a cluster, set **Security Group** to **Auto create**.

11.2.2 What Should I Do If HDFS, Yarn, and MapReduce Components Are Unavailable When I Create an MRS Cluster?

Question:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

What Should I Do If HDFS, Yarn, and MapReduce Components Are Unavailable When I Create an MRS Cluster?

Answer:

The HDFS, YARN, and MapReduce components are integrated in Hadoop. If the three components are unavailable when are MRS cluster is created, select Hadoop instead. After an MRS cluster is created, HDFS, YARN, and MapReduce are available in the **Components** page.

11.2.3 What Should I Do If the ZooKeeper Component Is Unavailable When I Create an MRS Cluster?

Question:

Why Cannot I Find the ZooKeeper Component When I Create an MRS Cluster?

Answer:

- If you create a cluster of a version earlier than MRS 3.*x*, ZooKeeper is installed by default and is not displayed on the GUI.

  After the cluster is created, the ZooKeeper component is available on the **Components** page.
- If you create a cluster of MRS 3.*x* or later, ZooKeeper is available on the GUI and is selected by default.

11.3 Web Page Access

11.3.1 How Do I Change the Session Timeout Duration for an Open Source Component Web UI?

You can perform the following operations to configure the timeout duration of the MRS Manager web UI and an open-source component web UI.

CAUTION

Set the minimum session duration based on service requirements. Otherwise, there will be security risks.

Changing the Timeout Duration of the MRS Manager Web UI and Authentication Center Page

- **Clusters of MRS 3.*x* (MRS 3.3.0 or later)**:
  a. Log in to MRS Manager and choose **System** > **OMS**.
  b. In the list, locate the row that contains **tomcat** and click **Modify Configuration**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

c. On the displayed page, set **Session Timeout** as required and click **OK**. Verify the user password and wait until the configuration to complete. Once done, the timeout setting will take effect for Manager.

- **Clusters of MRS 3.*x* (Versions earlier than MRS 3.3.0)**:

  a. Log in to the active and standby OMS nodes of the cluster as user **omm** and perform steps 2 to 5.

  b. In the files **/opt/Bigdata/om-server/tomcat/webapps/web/WEB-INF/web.xml** and **/opt/Bigdata/om-server/tomcat/conf/web.xml**, locate the following content, where **20** indicates the session timeout duration, in minutes. You can change the value as required, but it cannot exceed 480.

  ```
  <session-timeout>20</session-timeout>
  ```

  c. In the file **/opt/Bigdata/om-server/tomcat/webapps/cas/WEB-INF/classes/config/application.properties**, add the following information, where **28800** indicates the validity period of the authentication center, in seconds. You can change the value as required, but it cannot exceed 28800.

  ```
  ticket.tgt.timeToKillInSeconds=28800
  ```

  d. In the file **/opt/Bigdata/om-server/tomcat/webapps/cas/WEB-INF/classes/apereo.properties**, add the following content, where **28800** indicates Ticket Granting Ticket (TGT) validity period, in seconds. You can change the value as required, but it cannot exceed 28800.

  ```
  cas.ticket.tgt.maxTimeToLiveInSeconds=28800
  cas.ticket.tgt.timeToKillInSeconds=28800
  ```

  e. In the file **/opt/Bigdata/om-server/tomcat/webapps/cas/WEB-INF/classes/bootstrap.properties**, add the following content, where **28800** indicates Ticket Granting Ticket (TGT) validity period, in seconds. You can change the value as required, but it cannot exceed 28800.

  ```
  cas.ticket.tgt.maxTimeToLiveInSeconds=28800
  cas.ticket.tgt.timeToKillInSeconds=28800
  ```

  f. Run the following command on the active management node as user **omm** to restart the Tomcat node:

  sh ${BIGDATA_HOME}/om-server/tomcat/bin/shutdown.sh;sh ${BIGDATA_HOME}/om-server/tomcat/bin/startup.sh

- **For clusters of versions earlier than MRS 3.*x*:**

  a. Log in to the active and standby OMS nodes of the cluster as user **omm** and perform steps 2 to 4.

  b. In the file **/opt/Bigdata/apache-tomcat-xxx/webapps/cas/WEB-INF/web.xml**, locate the following content, where the value **20** indicates the session timeout duration, in minutes. You can change the value as required, but it cannot exceed 480.

  ```
  <session-timeout>20</session-timeout>
  ```

  c. In the file **/opt/Bigdata/apache-tomcat-xxx/webapps/web/WEB-INF/web.xml**, locate the following content, where the value **20** indicates the session timeout duration, in minutes. You can change the value as required, but it cannot exceed 480.

  ```
  <session-timeout>20</session-timeout>
  ```

  d. In the file **/opt/Bigdata/apache-tomcat-xxx/webapps/cas/WEB-INF/spring-configuration/ticketExpirationPolicies.xml**, add the following content, where the value **1200** indicates the validity period of the authentication center, in seconds. You can change the value as required, but it cannot exceed 28800.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
p:maxTimeToLiveInSeconds="${tgt.maxTimeToLiveInSeconds:1200}"
p:timeToKillInSeconds="${tgt.timeToKillInSeconds:1200}"
```

e. Restart the Tomcat node on the active master node.

i. On the active master node, run the **netstat -anp |grep 28443 |grep LISTEN | awk '{print $7}'** command as user **omm** to query the Tomcat process ID.

ii. Run the **kill -9 {*pid*}** command, where *{pid}* indicates the Tomcat process ID obtained in the previous step.

iii. Wait for the process to restart. You can run the **netstat -anp |grep 28443 |grep LISTEN** command to check whether the process is restarted. If the process can be queried, the process is successfully restarted. If the process cannot be queried, query the process again later.

Changing the Web UI Timeout Duration of a Component

- **For clusters of versions earlier than MRS 3.*x*:**

a. On the cluster details page, choose **Components** > **meta** > **Configurations**.

b. Click **All Configurations** tab and search for **http.server.session.timeout.secs** on the displayed page. If the parameter exists, change its value as required. If not, the version does not support dynamic adjustment of the session duration.

c. Restart the meta component for the modification to take effect.

11.3.2 What Can I Do If the Dynamic Resource Plan Page in MRS Tenant Management Cannot Be Refreshed?

Question:

What Can I Do If the Dynamic Resource Plan Page in MRS Tenant Management Cannot Be Refreshed?

Answer:

Step 1 Log in to the Master1 and Master2 nodes as user **root**.

Step 2 Run the **ps -ef |grep aos** command to check the AOS process ID.

Step 3 Run the **kill -9** *AOS process ID* command to end the AOS process.

Step 4 Wait until the AOS process is automatically restarted. You can run the **ps -ef |grep aos** command to check whether the AOS process exists. If the process exists, the restart is successful. If the process does not exist, retry later.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.3.3 What Do I Do If the Kafka Topic Monitoring Tab Is Not Displayed on Manager?

Question:

What Do I Do If the Kafka Topic Monitoring Tab Is Not Displayed on Manager?

Answer:

Step 1 Log in to the Master nodes of the cluster and switch to user **omm**.

Step 2 Go to the **/opt/Bigdata/apache-tomcat-7.0.78/webapps/web/WEB-INF/lib/components/Kafka/** directory.

cd /opt/Bigdata/apache-tomcat-*7.0.78***/webapps/web/WEB-INF/lib/components/Kafka/**

Step 3 Copy the ZooKeeper package to the directory.

cp /opt/share/zookeeper-3.5.1-mrs-2.0/zookeeper-3.5.1-mrs-2.0.jar ./

Step 4 Restart Tomcat.

sh /opt/Bigdata/apache-tomcat-*7.0.78***/bin/shutdown.sh**

sh /opt/Bigdata/apache-tomcat-*7.0.78***/bin/startup.sh**

----End

11.3.4 Why Can't I Find the User Management Page on MRS Manager?

Question:

Why can't I find the user management page on MRS Manager?

Answer:

Check whether you have the **Manager_administrator** permission. If you do not have this permission, **Manage User** will not be available on the **System** page of MRS Manager.

Log in to MRS Manager as user **admin** or another user who has the Manager administration permission.

11.3.5 What Should I Do If the Excel File Downloaded by Hue Cannot Be Opened?

NOTE

This section applies only to versions earlier than MRS 3.*x*.

1. Log in to a Master node as user **root** and switch to user **omm**.

   su - omm

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Check whether the current node is the active OMS node.

   sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh

   If **active** is displayed in the command output, the node is the active node. Otherwise, log in to the other Master node.

   Figure 11-1 Active OMS node

3. Go to the **{BIGDATA_HOME}/Apache-httpd-*/conf** directory.

   cd ${BIGDATA_HOME}/Apache-httpd-*/conf

4. Open the **httpd.conf** file.

   vim httpd.conf

5. Search for **21201** in the file and delete the following content from the file. (The values of *proxy_ip* and *proxy_port* are the same as those in the actual environment.)

   ProxyHTMLEnable On
   SetEnv PROXY_PREFIX=https://[proxy_ip]:[proxy_port]
   ProxyHTMLURLMap (https?:\/\/[^:]*:[0-9]*.*) ${PROXY_PREFIX}/proxyRedirect=$1 RV

   Figure 11-2 Content to be deleted

6. Save the modification and exit.
7. Open the **httpd.conf** file again, search for **proxy_hue_port**, and delete the following content:

   ProxyHTMLEnable On
   SetEnv PROXY_PREFIX=https://[proxy_ip]:[proxy_port]
   ProxyHTMLURLMap (https?:\/\/[^:]*:[0-9]*.*) ${PROXY_PREFIX}/proxyRedirect=$1 RV

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 11-3 Content to be deleted

8. Save the modification and exit.
9. Run the following command to restart the **httpd** process:

   sh ${BIGDATA_HOME}/Apache-httpd-*/setup/restarthttpd.sh
10. Check whether the **httpd.conf** file on the standby Master node is modified. If the file is modified, no further action is required. If the file is not modified, modify the **httpd.conf** file on the standby Master node in the same way. You do not need to restart the **httpd** process.
11. Download the Excel file again. You can open the file successfully.

11.4 Authentication and Permission

11.4.1 What Is the User for Logging in to FusionInsight Manager?

Question:

What Is the User for Logging in to FusionInsight Manager?

Answer:

The default account for logging in to Manager is **admin**, and the password is the one you set when you created the cluster.

11.4.2 How Do I Query and Change the Password Validity Period of a User In a Cluster?

Querying the Password Validity Period

Querying the password validity period of a component running user (human-machine user or machine-machine user):

Step 1 Log in to the node where the client is installed as the client installation user.

Step 2 Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

cd /opt/Bigdata/client

Step 3 Run the following command to configure environment variables:

source bigdata_env

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Run the following command and enter the password of user **kadmin/admin** to log in to the kadmin console:

kadmin -p kadmin/admin

NOTE

The default password of user **kadmin/admin** is **Admin@123**. Change the password upon your first login or as prompted and keep the new password secure.

Step 5 Run the following command to view the user information:

getprinc *Internal system username*

Example: **getprinc user1**

```
kadmin:  getprinc user1
......
Expiration date: [never]
Last password change: Sun Oct 09 15:29:54 CST 2022
Password expiration date: [never]
......
```

----End

Querying the password validity period of an OS user:

Step 1 Log in to any master node in the cluster as user **root**.

Step 2 Run the following command to view the password validity period (value of **Password expires**):

chage -l *Username*

For example, to view the password validity period of user **root**, run the **chage -l root** command. The command output is as follows:

```
[root@xxx ~]#chage -l root
Last password change                                    : Sep 12, 2021
Password expires                                        : never
Password inactive                                       : never
Account expires                                         : never
Minimum number of days between password change          : 0
Maximum number of days between password change          : 99999
Number of days of warning before password expires       : 7
```

----End

Changing the Password Validity Period

- The password of a machine-machine user is randomly generated and never expires by default.
- The password validity period of a human-machine user can be changed by modifying the password policy on Manager.

11.4.3 Does an MRS Cluster Support Access Permission Control If Kerberos Authentication Is not Enabled?

For MRS cluster 2.1.0 or earlier, choose **System** > **Configuration** > **Permission** on MRS Manager.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For MRS cluster 3.*x* or later, choose **System** > **Permission** on FusionInsight Manager.

11.4.4 How Do I Add Tenant Management Permission to Users in a Cluster?

You can assign tenant management permission only in analysis or hybrid clusters, but not in streaming clusters.

The operations vary depending on the MRS cluster version:

Procedure for versions earlier than MRS cluster 3.x:

Step 1 Log in to MRS Manager.

Step 2 Choose **System** > **Manage User**. Select the new user, and click **Modify** in the **Operation** column.

Step 3 In **Assign Rights by Role**, click **Select and Add Role**.

- If you bind the **Manager_tenant** role to the account, the account will have permission to view tenant management information.
- If you bind the **Manager_administrator** role to the account, the account will have permission to view and perform tenant management.

Step 4 Click **OK**.

----End

Procedure for MRS cluster 3.x and later versions:

Step 1 Log in to FusionInsight Manager and choose **System** > **Permission** > **User**.

Step 2 Locate the user and click **Modify**.

Modify the parameters based on service requirements.

If you bind the **Manager_tenant** role to the account, the account will have permission to view tenant management information. If you bind the **Manager_administrator** role to the account, the account will have permission to view and perform tenant management.

NOTE

It takes about three minutes for the settings to take effect after user group or role permission are modified.

Step 3 Click **OK**.

----End

11.4.5 Can I Configure Account Permissions on the Hue Web UI?

Question:

Can I configure account permissions on the Hue web UI in an MRS cluster?

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Answer:

Account permissions cannot be configured on the Hue web UI.

You can configure cluster user roles and user groups on FusionInsight Manager to manage user permissions.

11.4.6 How Do I View the Hive Table Created by Another User?

Versions earlier than MRS 3.*x*:

1. Log in to MRS Manager and choose **System** > **Permission** > **Manage Role**.
2. Click **Create Role**, and set **Role Name** and **Description**.
3. In the **Permission** table, choose **Hive** > **Hive Read Write Privileges**.
4. In the database list, click the name of the database where the table created by user B is stored. The table is displayed.
5. In the **Permission** column of the table created by user B, select **SELECT**.
6. Click **OK**, and return to the **Role** page.
7. Choose **System** > **Manage User**. Locate the row containing user A, click **Modify** to bind the new role to user A, and click **OK**. After about 5 minutes, user A can access the table created by user B.

MRS 3.*x* or later:

1. Log in to FusionInsight Manager and choose **Cluster** > **Services**. On the page that is displayed, choose **Hive**. On the displayed page, choose **More**, and check whether **Enable Ranger** is grayed out.
   - If yes, go to **9**.
   - If no, perform **2** to **8**.
2. Log in to FusionInsight Manager and choose **System** > **Permission** > **Role**.
3. Click **Create Role**, and set **Role Name** and **Description**.
4. In the **Configure Resource Permission** table, choose *Name of the desired cluster* > **Hive** > **Hive Read Write Privileges**.
5. In the database list, click the name of the database where the table created by user B is stored. The table is displayed.
6. In the **Permission** column of the table created by user B, select **Select**.
7. Click **OK**, and return to the **Role** page.
8. Choose **Permission** > **User**. On the **Local User** page that is displayed, locate the row containing user A, click **Modify** in the **Operation** column to bind the new role to user A, and click **OK**. After about 5 minutes, user A can access the table created by user B.
9. Perform the following steps to add the Ranger access permission policy of Hive:
   a. Log in to FusionInsight Manager as a Hive administrator and choose **Cluster** > **Services**. On the page that is displayed, choose **Ranger**. On the displayed page, click the URL next to **Ranger WebUI** to go to the Ranger management page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

b. On the home page, click the component plug-in name in the **HADOOP SQL** area, for example, **Hive**.
c. On the **Access** tab page, click **Add New Policy** to add a Hive permission control policy.
d. In the **Create Policy** dialog box that is displayed, set the following parameters:
   - **Policy Name**: Enter a policy name, for example, **table_test_hive**.
   - **database**: Enter or select the database where the table created by user B is stored, for example, **default**.
   - **table**: Enter or select the table created by user B, for example, **test**.
   - **column**: Enter and select a column, for example, *****.
   - In the **Allow Conditions** area, click **Select User**, select user A, click **Add Permissions**, and select **select**.
   - Click **Add**.

10. Perform the following steps to add the Ranger access permission policy of HDFS:
    a. Log in to FusionInsight Manager as user **rangeradmin** and choose **Cluster** > **Services**. On the page that is displayed, choose **Ranger**. On the displayed page, click the URL next to **Ranger WebUI** to go to the Ranger management page.
    b. On the home page, click the component plug-in name in the **HDFS** area, for example, **hacluster**.
    c. Click **Add New Policy** to add an HDFS permission control policy.
    d. In the **Create Policy** dialog box that is displayed, set the following parameters:
       - **Policy Name**: Enter a policy name, for example, **tablehdfs_test**.
       - **Resource Path**: Set this parameter to the HDFS path where the table created by user B is stored, for example, **/user/hive/warehouse/***Database name*/*Table name*.
       - In the **Allow Conditions** area, select user A for **Select User**, click **Add Permissions** in the **Permissions** column, and select **Read** and **Execute**.
       - Click **Add**.
11. View basic information about the policy in the policy list. After the policy takes effect, user A can view the table created by user B.

11.4.7 How Do I Prevent Kerberos Authentication Expiration?

- Java applications:

  Before connecting to HBase, HDFS, or other big data components, call loginUserFromKeytab() to create a UGI. Then, start a scheduled thread to periodically check whether the Kerberos Authentication expires. Log in to the system again before the Kerberos Authentication expires.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
private static void startCheckKeytabTgtAndReloginJob() {
    //The credential is checked every 10 minutes, and updated before the expiration time.
    ThreadPool.updateConfigThread.scheduleWithFixedDelay(() -> {
        try {
            UserGroupInformation.getLoginUser().checkTGTAndReloginFromKeytab();
            logger.warn("get tgt:{}", UserGroupInformation.getLoginUser().getTGT());
            logger.warn("Check Kerberos Tgt And Relogin From Keytab Finish.");
        } catch (IOException e) {
            logger.error("Check Kerberos Tgt And Relogin From Keytab Error", e);
        }
    }, 0, 10, TimeUnit.MINUTES);
    logger.warn("Start Check Keytab TGT And Relogin Job Success.");
}
```

- Tasks executed in shell client:
  a. Run the **kinit** command to authenticate the user.
  b. Create a scheduled task of the operating system or any other scheduled task to run the **kinit** command to authenticate the user periodically.
  c. Submit jobs to execute big data tasks.
- Spark jobs:

  If you submit jobs using **spark-shell**, **spark-submit**, or **spark-sql**, you can specify **Keytab** and **Principal** in the command to perform authentication and periodically update the login credential and authorization tokens to prevent authentication expiration.

  The following is an example:

  spark-shell --principal spark2x/hadoop.<*System domain name*>@<*System domain name*> **--keytab** *${BIGDATA_HOME}/FusionInsight_Spark2x_XXX/install/FusionInsight-Spark2x-2.4.5/keytab/spark2x/SparkResource/spark2x.keytab* **--master yarn**

11.4.8 How Do I Enable or Disable Kerberos Authentication for an Existing MRS Cluster?

Question:

How do I enable or disable Kerberos authentication for an existing MRS cluster?

Answer:

You cannot enable or disable the Kerberos service after the MRS cluster is created. You need to create an MRS cluster, enable or disable the Kerberos service, and migrate data from the original one.

11.4.9 What Are the Ports of the Kerberos Authentication Service?

Question:

What Are the Ports of the Kerberos Authentication Service?

Answer:

The Kerberos authentication service uses ports 21730 (TCP), 21731 (TCP/UDP), and 21732 (TCP/UDP).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.5 Client Usage

11.5.1 How Do I Disable SASL Authentication for ZooKeeper?

Question:

How Do I Disable ZooKeeper SASL Authentication?

Answer:

1. Log in to FusionInsight Manager.
2. Choose Cluster > Service > ZooKeeper > Configuration > All Configurations.
3. In the navigation tree on the left, choose quorumpeer > Customization and add zookeeper.sasl.disable = false.

   Save the configuration and restart the ZooKeeper service.

11.5.2 What Can I Do If the Error Message "Permission denied" Is Displayed When kinit Is Executed on a Client Outside the MRS Cluster?

Symptom

After the client is installed on a node outside an MRS cluster and the **kinit** command is executed, the following error information is displayed:

```
-bash kinit Permission denied
```

The following error information is displayed when the **java** command is executed:

```
-bash: /xxx/java: Permission denied
```

After running the **ll /***Java installation path***/JDK/jdk/bin/java** command, it is found that the file execution permission is correct.

Fault Locating

Run the **mount | column -t** command to check the status of the mounted partition. It is found that the partition status of the mount point where the Java execution file is located is **noexec**. In the current environment, the data disk where the MRS client is installed is set to **noexec**, that is, binary file execution is prohibited. As a result, Java commands cannot be executed.

Solution

1. Log in to the node where the MRS client is located as user **root**.
2. Remove the configuration item **noexec** of the data disk where the MRS client is located from the **/etc/fstab** file.
3. Run the **umount** command to detach the data disk, and then run the **mount -a** command to remount the data disk.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.5.3 What Should I Do If an Alarm Is Reported Indicating that the Memory Is Insufficient When I Execute a SQL Statement on the ClickHouse Client?

Symptom

The ClickHouse client restricts the memory used by GROUP BY statements. When a SQL statement is executed on the ClickHouse client, the following error information is displayed:

```
Progress: 1.83 billion rows, 85.31 GB (68.80 million rows/s., 3.21 GB/s.)  6%Received exception from server:
Code: 241. DB::Exception: Received from localhost:9000, 127.0.0.1.
DB::Exception: Memory limit (for query) exceeded: would use 9.31 GiB (attempt to allocate chunk of 1048576 bytes), maximum: 9.31 GiB:
(while reading column hits):
```

Solution

- Run the following command before executing an SQL statement on condition that the cluster has sufficient memory:
  ```
  SET max_memory_usage = 128000000000; #128G
  ```
- If no sufficient memory is available, ClickHouse enables you to overflow data to disk to free up the memory: You are advised to set the value of **max_memory_usage** to twice the size of **max_bytes_before_external_group_by**.
  ```
  set max_bytes_before_external_group_by=20000000000; #20G
  set max_memory_usage=40000000000; #40G
  ```
- If the customer has a large amount of data and the entire table is queried, you are advised to query the data by partition or upgrade the specifications of the core node in the cluster.

11.5.4 How Do I Connect to Spark Shell from MRS?

1. Log in to the Master node in the cluster as user **root**.
2. Run the following command to configure environment variables:

   source *Client installation directory*/**bigdata_env**
3. If Kerberos authentication is enabled for the cluster, authenticate the user. If Kerberos authentication is disabled, skip this step.

   Run the **kinit** *MRS cluster user* command.

   Examples:

   - For a machine-machine user, run the **kinit -kt** *user.keytab sparkuser* command.
   - For a human-machine user, run the **kinit** *sparkuser* command.
4. Run the following command to connect to Spark shell:

   spark-shell

11.5.5 How Do I Connect to Spark Beeline from MRS?

1. Log in to the master node in the cluster as user **root**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. Run the following command to configure environment variables:

   source *Client installation directory*/**bigdata_env**

3. If Kerberos authentication is enabled for the cluster, authenticate the user. If Kerberos authentication is disabled, skip this step.

   Run the **kinit** *MRS cluster user* command.

   Examples:

   - For a machine-machine user, run the **kinit -kt** *user.keytab sparkuser* command.
   - For a human-machine user, run the **kinit** *sparkuser* command.

4. Run the following command to connect to Spark Beeline:

   spark-beeline

5. Run commands on Spark Beeline. For example, create the table **test** in the **obs://mrs-word001/table/** directory.

   create table test(id int) location 'obs://mrs-word001/table/';

6. Query all tables.

   show tables;

   If the table **test** is displayed in the command output, OBS is successfully accessed.

   Figure 11-4 Returned table name

7. Press **Ctrl+C** to exit the Spark Beeline.

11.5.6 What Should I Do If the Connection to the ClickHouse Server Fails and Error Code 516 Is Reported?

Symptom

When the **clickhouse client** command is executed to connect to the ClickHouse server, the following error is reported:

```
ClickHouse exception, code: 516, host: 192.168.0.198, port: 8443; Code: 516, e.displayText() = DB::Exception: clickDevelopuser: Authentication failed: password is incorrect or there is no user with such name
```

Fault Locating

The username or password used for connecting the ClickHouse server is incorrect.

Procedure

Enter the correct username or password .

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.6 Component Configurations

11.6.1 Does MRS Support Running Hive on Kudu?

Question:

Does MRS Support Running Hive on Kudu?

Answer:

MRS does not support Hive on Kudu.

Currently, MRS supports only the following two methods to access Kudu:

- Access Kudu through Impala tables.
- Access and operate Kudu tables using the client application.

11.6.2 Does an MRS Cluster Support Hive on Spark?

Question:

Does an MRS Cluster Support Hive on Spark?

Answer:

- Clusters of MRS 1.9.*x* support Hive on Spark.
- Clusters of MRS 3.*x* or later support Hive on Spark.
- You can use Hive on Tez for the clusters of other versions.

11.6.3 Can I Change the IP address of DBService?

Question:

Can I Change the IP address of DBService?

Answer:

The IP address of DBService cannot be changed in the MRS cluster.

11.6.4 What Access Protocols Does Kafka Support?

Question:

What Access Protocols Does Kafka Support?

Answer:

Kafka supports the following access protocols: PLAINTEXT, SSL, SASL_PLAINTEXT, and SASL_SSL.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.6.5 What Python Versions Are Supported by Spark Tasks in an MRS Cluster?

Question:

Which Python Versions Are Supported by Spark Tasks in MRS 3.1.0 Clusters?

Answer:

For MRS 3.1.0 clusters, Python 2.7 or 3.x is recommended for Spark tasks.

11.6.6 What Are the Restrictions on the Storm Log Size in an MRS 2.1.0 Cluster?

Question:

What Are the Restrictions on the Storm Log Size in an MRS 2.1.0 Cluster?

Answer:

In MRS 2.1.0, the size of Storm logs cannot exceed 20 GB. If the size of Storm logs exceeds 20 GB, the logs will be deleted cyclically.

Logs are stored on the system disk, and the space is limited. If you want to store logs for a long time, mount them to a data disk.

11.6.7 How Do I Modify the HDFS fs.defaultFS of an Existing Cluster?

Question:

How do I modify the HDFS NameSpace (fs.defaultFS) of an existing cluster?

Answer:

You can modify or add the HDFS NameSpace (fs.defaultFS) of the cluster by modifying the parameters in the **core-site.xml** and **hdfs-site.xml** files on the client. However, you are not advised to perform this operation on the server.

11.6.8 Can MRS Run Multiple Flume Tasks at a Time?

The Flume client supports multiple independent data flows. You can configure and link multiple sources, channels, and sinks in the **properties.properties** configuration file.

These components can be linked to form multiple data flows.

The following is an example of configuring two data flows in a configuration file:

```
server.sources = source1 source2
server.sinks = sink1 sink2
server.channels = channel1 channel2

#dataflow1
server.sources.source1.channels = channel1
server.sinks.sink1.channel = channel1
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
#dataflow2
server.sources.source2.channels = channel2
server.sinks.sink2.channel = channel2
```

11.6.9 How Do I Change FlumeClient Logs to Standard Logs?

1. Log in to the node where the Flume client is installed.
2. Go to the Flume client installation directory, for example, **/opt/FlumeClient**. Run the following command:

   cd /opt/FlumeClient/fusioninsight-flume-1.9.0/bin
3. Run the **./flume-manage.sh stop force** command to stop FlumeClient.
4. Run the **vi ../conf/log4j.properties** command to open the **log4j.properties** file and change the **flume.root.logger** value to **${flume.log.level},console**.
5. Run the **./flume-manage.sh start force** command to restart FlumeClient.
6. After the modification, check whether the Docker configuration is correct.

11.6.10 Where Are the JAR Files and Environment Variables of Hadoop Stored?

- **hadoopstreaming.jar**: **/opt/share/hadoop-streaming-*** (***** indicates the Hadoop version.)
- The JDK environment variables are stored in **/opt/client/JDK/component_env**.
- The Hadoop environment variables are stored in **/opt/client/HDFS/component_env**.
- The Hadoop client path is **/opt/client/HDFS/hadoop**.

11.6.11 How Do I View HBase Logs?

1. Log in to the Master node in the cluster as user **root**.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /var/log/Bigdata/hbase/** command to go to the **/var/log/Bigdata/hbase/** directory and view HBase logs.

11.6.12 How Do I Set the TTL for an HBase Table?

- Set the time to live (TTL) when creating a table:

  Create the **t_task_log** table, set the column family to **f**, and set the TTL to **86400** seconds.

  ```
  create 't_task_log',{NAME => 'f', TTL=>'86400'}
  ```
- Set the TTL for an existing table:

  ```
  alter "t_task_log",NAME=>'data',TTL=>'86400' # Set the TTL value for the column family data.
  ```

11.6.13 How Do I Change the Number of HDFS Replicas?

1. Go to the HDFS service configuration page.
   - For MRS 1.8.10 or earlier clusters

     Log in to MRS Manager (see), choose **Services** > **HDFS** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - For MRS 1.8.10 or later and MRS 2.*x*, click the cluster name. On the cluster details page that is displayed, choose **Components** > **HDFS** > **Service Configuration**, and select **All** from the **Basic** drop-down list.

    NOTE

    If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

  - For MRS cluster version 3.*x* or later:

    Log in to FusionInsight Manager, and choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**.

2. Search for **dfs.replication**, change the value (value range: 1 to 16), and restart the HDFS instance.

11.6.14 How Do I Modify the HDFS Active/Standby Switchover Class?

If the **org.apache.hadoop.hdfs.server.namenode.ha.AdaptiveFailoverProxyProvider** class is unavailable when an MRS 3.*x* cluster connects to NameNodes using HDFS, the cause is that the HDFS active/standby switchover class of the cluster is configured improperly. To solve the problem, perform the following operations:

- Method 1: Add the **hadoop-plugins-*xxx*.jar** package to the **classpath** or **lib** directory of your program.

  The **hadoop-plugins-*xxx*.jar** package is stored in the HDFS client directory, for example, **$HADOOP_HOME/share/hadoop/common/lib/hadoop-plugins-*xxx*.jar**.

- Method 2: Change the following HDFS configuration item to the corresponding open source class:

  dfs.client.failover.proxy.provider.hacluster=org.apache.hadoop.hdfs.server.namenode.ha.ConfiguredFailoverProxyProvider

11.6.15 What Data Type in Hive Tables Is Recommended for the Number Type of DynamoDB?

Question:

What is the best type for the number in DynamoDB in Hive tables?

Answer:

smallint is recommended.

11.6.16 Can I Export the Query Result of Hive Data?

Question:

Can I export the query result of Hive data in an MRS cluster?

Answer:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Run the following statement to export the query result of Hive data:

```
insert overwrite local directory "/tmp/out/" row format delimited fields terminated by "\t" select * from table;
```

11.6.17 What Should I Do If an Error Occurs When Hive Runs the beeline -e Command to Execute Multiple Statements?

When Hive uses Beeline to run the **beeline -e "use default;show tables;"** command on an MRS 3.x cluster, the following error is reported:

```
Error while compiling statement: FAILED: ParseException line 1:11 missing EOF at ';' near 'default' (state=42000,code=40000)
```

Solutions:

- Method 1: Replace the **beeline -e " use default;show tables;"** command with **beeline --entirelineascommand=false -e "use default;show tables;"**.
- Method 2:
  a. In the **/opt/Bigdata/client/Hive** directory on the Hive client, change **export CLIENT_HIVE_ENTIRELINEASCOMMAND=true** in the **component_env** file to **export CLIENT_HIVE_ENTIRELINEASCOMMAND=false**.

     Figure 11-5 Changing the **component_env** file

  b. Run the following command to verify the configuration:

     source /opt/Bigdata/client/bigdata_env

     beeline -e "use default;show tables;"

11.6.18 What Do I Do If "over max user connections" Is Displayed When Hue Connects to HiveServer?

Applicable versions: MRS 3.1.0 and earlier

1. Modify the following configuration files on all Hue nodes:

   /opt/Bigdata/FusionInsight_Porter_8.*/install/FusionInsight-Hue-*/hue/apps/beeswax/src/beeswax/models.py

2. Change the configurations in lines 396 and 404.

   ```
   q = self.filter(owner=user, application=application).exclude(guid='').exclude(secret='')
   ```

   Modify the content as follows:

   ```
   q = self.filter(owner=user, application=application).exclude(guid=None).exclude(secret=None)
   ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 11-6 Modifying the Hue configuration file

11.6.19 How Do I View MRS Hive Metadata?

- Hive metadata is stored in the GaussDB database of the MRS cluster. You can perform the following steps to view the metadata:
  a. Log in to the DBServer active node as user **root**.
  b. Log in to the Hive database:
     su - omm
     source $DBSERVER_HOME/.dbservice_profile
     gsql -p 20051 -U *USER* **-W** *PASSWD* **-d hivemeta**
  c. View all metadata tables in the Hive metadata database:
     \d+
  d. Run **q** to exit the page for viewing the metadata table.
  e. View data in the metadata table:
     select * from *Table name*;

  NOTE

  To query the IP address of the active DBServer node, log in to FusionInsight Manager, choose **Cluster** > **Services** > **DBService**, and click the **Instances** tab.
- If Hive metadata is stored in an external relational database, perform the following steps:
  a. On the cluster **Dashboard** page, click **Manage** on the right of **Data Connection**.
  b. On the displayed page, obtain the value of **Data Connection ID**.
  c. On the MRS console, click **Data Connections**.
  d. In the data connection list, locate the data connection based on the data connection ID.
  e. Click **Edit** in the **Operation** column of the data connection.
     The **RDS Instance** and **Database** indicate the relational database in which the Hive metadata is stored.

11.6.20 How Do I Reset Kafka Data?

You can reset Kafka data by deleting Kafka topics.

- Delete a topic: **kafka-topics.sh --delete --zookeeper** *ZooKeeper Cluster service IP address*:**2181/kafka --topic** ***topicname***
- Query all topics: **kafka-topics.sh --zookeeper** *ZooKeeper cluster service IP address*:**2181/kafka --list**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

After the deletion command is executed, empty topics will be deleted immediately. If a topic has data, the topic will be marked for deletion and will be deleted by Kafka later.

11.6.21 What Should I Do If the Error Message "Not Authorized to access group XXX" Is Displayed When Kafka Topics Are Consumed?

This issue is caused by the conflict between the Ranger authentication and ACL authentication of a cluster. If a Kafka cluster uses ACL for permission access control and Ranger authentication is enabled for the Kafka component, all authentications of the component are managed by Ranger. The permissions set by the original authentication plug-in are invalid. As a result, ACL authorization does not take effect. You can disable Ranger authentication of Kafka and restart the Kafka service to rectify the fault. The procedure is as follows:

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Kafka**.
2. In the upper right corner of the **Dashboard** page, click **More** and choose **Disable Ranger**. In the displayed dialog box, enter the password and click **OK**. After the operation is successful, click **Finish**.
3. In the upper right corner of the **Dashboard** page, click **More** and choose **Restart Service** to restart the Kafka service.

11.6.22 What Compression Algorithms Does Kudu Support?

Question:

What compression algorithms does Kudu support?

Answer:

It supports **Snappy**, **LZ4**, and **zlib**. **LZ4** is used by default.

11.6.23 How Do I View Kudu Logs?

1. Log in to the Master node in the cluster.
2. Run the **su - omm** command to switch to user **omm**.
3. Run the **cd /var/log/Bigdata/kudu/** command to go to the **/var/log/Bigdata/kudu/** directory and view Kudu logs.

11.6.24 How Do I Handle the Kudu Service Exceptions Generated During Cluster Creation?

Viewing the Kudu Service Exception Logs

1. Log in to the MRS console.
2. Click the name of the cluster.
3. On the page displayed, choose **Components** > **Kudu** > **Instances** and locate the IP address of the abnormal instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

4. Log in to the node where the abnormal instance resides, and view the Kudu log.

```
cd /var/log/Bigdata/Kudu
[root@node-master1AERu kudu]# ls
healthchecklog  runninglog  startlog
```

You can find the Kudu health check logs in the **healthchecklog** directory, the startup logs in the **startlog** directory, and the Kudu process run logs in the **runninglog** directory.

```
[root@node-master1AERu logs]# pwd
/var/log/Bigdata/kudu/runninglog/master/logs
[root@node-master1AERu logs]# ls -al
kudu-master.ERROR   kudu-master.INFO   kudu-master.WARNING
```

Run logs are classified into three types: ERROR, INFO, and WARNING. Each type of run logs is recorded in the corresponding file. You can run the **cat** command to view run logs of each type.

Handling Kudu Service Exceptions

The **/var/log/Bigdata/kudu/runninglog/master/logs/kudu-master.INFO** file contains the following error information:

```
"Unable to init master catalog manager: not found: Unable to initialize catalog manager: Failed to initialize sys tables async: Unable to load consensus metadata for tablet 00000000000000000000: xxx"
```

If this exception occurs when the Kudu service is installed for the first time, the KuduMaster service is not started. Data inconsistency causes the startup failure. To solve the problem, perform the following steps to clear the data directories and restart the Kudu service. If the Kudu service is not installed for the first time, clearing the data directories will cause data loss. In this case, migrate data and clear the data directory.

1. Search for the data directories **fs_data_dir**, **fs_wal_dir**, and **fs_meta_dir**.

   find /opt -name master.gflagfile

   cat /opt/Bigdata/FusionInsight_Kudu_*/*_KuduMaster/etc/master.gflagfile | grep fs_

2. On the cluster details page, choose **Components** > **Kudu** and click **Stop Service**.
3. Clear the Kudu data directories on all KuduMaster and KuduTserver nodes. The following command uses two data disks as an example.

   rm -Rvf /srv/Bigdata/data1/kudu, rm -Rvf /srv/Bigdata/data2/kudu

4. On the cluster details page, choose **Components** > **Kudu** and choose **More** > **Restart Service**.
5. Check the Kudu service status and logs.

11.6.25 How Do I Configure Other Data Sources on Presto?

This topic uses the MySQL data source as an example.

- For MRS 1.*x* and 3.*x* clusters, do the following:

  a. Log in to the MRS management console.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

b. Click the name of the cluster to go to its details page.

c. Click the **Components** tab and then **Presto** in the component list. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.

d. On the Presto configuration page that is displayed, find **connector-customize**.

e. Set **Name** and **Value** as follows:

Name: **mysql.connector.name**

Value: **mysql**

f. Click the plus sign (+) to add three more fields and set **Name** and **Value** according to the table below. Then click **Save**.

Table 11-1 Parameter description

Name	Value	Description
mysql.connection-url	jdbc:mysql://xxx.xxx.xxx.xxx:3306	Database connection pool
mysql.connection-user	xxxx	Database username
mysql.connection-password	xxxx	Database password

g. Restart the Presto service.

h. Run the following command to connect to the Presto Server of the cluster:

presto_cli.sh --*krb5-config-path* {krb5.conf path} *--krb5-principal* {User principal} *--krb5-keytab-path* {user.keytab path} *--user* {presto username}

i. Log in to Presto and run the **show catalogs** command to check whether the data source list of Presto can be queried.

```
[root@node-master2uoHG bin]# ./presto_cli.sh
--server http://15[redacted]20
        show catalogs;
 Catalog
---------
 hive
 jmx
 mysql
 system
 tpcds
 tpch
(6 rows)

Query 20220422_121338_00002_ra2vb, FINISHED, 3 nodes
Splits: 53 total, 53 done (100.00%)
0:00 [0 rows, 0B] [0 rows/s, 0B/s]
```

Run the **show schemas from mysql** command to query the MySQL database.

- For MRS 2.*x* clusters, do the following:

a. Create the **mysql.properties** configuration file containing the following content:

```
connector.name=mysql
connection-url=jdbc:mysql://IP address of MySQL:3306
connection-user=Username
connection-password=Password
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The IP Address of MySQL is that of the MySQL instance, which must be able to communicate with the MRS cluster.
- The username and password are those used to log in to the MySQL database.
- Configuration files containing authentication passwords pose security risks. Delete such files after configuration or store them securely.

b. Upload the configuration file to the **/opt/Bigdata/MRS_Current/1_14_Coordinator/etc/catalog/** directory on the Master node (where the Coordinator instance resides) and the **/opt/Bigdata/MRS_Current/1_14_Worker/etc/catalog/** directory on the Core node (depending on the actual directory in the cluster), and change the file owner group to **omm:wheel**.

c. Restart the Presto service.

11.6.26 How Do I Specify a Log Path When Submitting a Task in an MRS Storm Cluster?

Question:

How do I specify a log path when submitting a task in an MRS storm cluster?

Answer:

You can open the **/opt/Bigdata/MRS_*XXX*/1_*XX*_Supervisor/etc/worker.xml** file on the streaming Core node of MRS, set the value of **filename** in the file to the path, and restart the corresponding instance on Manager.

NOTE

You are advised not to modify the default log configuration of MRS. Otherwise, the log system may be abnormal.

11.6.27 How Do I Check the ResourceManager Configuration of Yarn?

This section applies only to versions earlier than MRS 3.*x*.

Step 1 Log in to MRS Manager and choose **Services** > **Yarn** > **Instance**.

Step 2 Click the names of the two ResourceManager nodes, choose **More** > **Synchronize Configuration**, and deselect **Restart services or instances whose configurations have expired**. .

Step 3 Click **Yes** to synchronize the configuration.

Step 4 Log in to the Master nodes as user **root**.

Step 5 Run the **cd /opt/Bigdata/MRS_Current/*_*_ResourceManager/etc_UPDATED/** command to go to the **etc_UPDATED** directory.

Step 6 Run the **grep '\.queues' capacity-scheduler.xml -A2** command to display all configured queues and check whether the queues are consistent with those displayed on Manager.

root-default is hidden on the Manager page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$ grep '\.queues' capacity-scheduler.xml  -A2
<name>yarn.scheduler.capacity.root.queues</name>
<value>default,root-default,launcher-job,test1,test2,test3,test4</value>
</property>
[omm@node-master1IlZA etc]$
[omm@node-master1IlZA etc]$
```

Step 7 Run the **grep '\.capacity</name>' capacity-scheduler.xml -A2** command to display the value of each queue and check whether the value of each queue is the same as that displayed on Manager. Check whether the sum of the values configured for all queues is **100**.

- If the sum is **100**, the configuration is correct.
- If the sum is not **100**, the configuration is incorrect. Perform the following steps to rectify the fault.

Step 8 Log in to MRS Manager, and select **Hosts**.

Step 9 Determine the active Master node. The host name of the active Master node starts with a solid pentagon.

Step 10 Log in to the active Master node as user **root**.

Step 11 Run the **su - omm** command to switch to user **omm**.

Step 12 Run the **sh /opt/Bigdata/om-0.0.1/sbin/restart-controller.sh** command to restart the controller when no operation is being performed on Manager.

Restarting the controller will not affect the big data component services.

Step 13 Repeat **Step 1** to **Step 7** to synchronize ResourceManager configurations and check whether the configurations are correct.

If the latest configuration has not been loaded after the configuration synchronization is complete, a message will be displayed on the Manager page indicating that the configuration has expired. However, this will not affect services. The latest configuration will be automatically loaded when the component restarts.

----End

11.6.28 How Do I Modify the allow_drop_detached Parameter of ClickHouse?

Step 1 Log in to the node where the ClickHouse client is located as user **root**.

Step 2 Run the following commands to go to the client installation directory and set the environment variables:

cd /opt/*Client installation directory*

source bigdata_env

Step 3 If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

kinit *MRS cluster user*

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> The user must have the ClickHouse administrator permissions.

Step 4 Run the **clickhouse client --host** *192.168.42.90* **--secure -m** command, in which *192.168.42.90* indicates the IP address of the ClickHouseServer instance node. The command output is as follows:

```
[root@server-2110082001-0017 hadoopclient]# clickhouse client --host 192.168.42.90 --secure -m
ClickHouse client version 21.3.4.25.
Connecting to 192.168.42.90:21427.
Connected to ClickHouse server version 21.3.4 revision 54447.
```

Step 5 Run the following command to set the value of the **allow_drop_detached** parameter, for example, **1**:

set allow_drop_detached=1;

Step 6 Run the following command to query the value of the **allow_drop_detached** parameter:

SELECT * FROM system.settings WHERE name = 'allow_drop_detached';

Step 7 Run the **q;** command to exit the ClickHouse client.

----End

11.6.29 How Do I Add a Policy for Periodically Deleting Large ClickHouse System Table Logs?

Symptom

ClickHouse logs generated in the system table is too large. Deleting logs at a time takes a long time.

Handling Procedure

- For MRS 3.3.0 and later versions, on FusionInsight Manager, choose **Cluster** > **Services** > **ClickHouse** > **Configurations** > **All Configurations**. You can set **query_log.ttl** and **trace_log.ttl** to configure the data clearing period, the default value is 90 days.
- In versions earlier than MRS 3.3.0, run the following statement on the ClickHouse client to modify the TTL of a table in ClickHouse:

  alter table *system.Table name* **modify** *TTL event_date* **+ INTERVAL** *Number of days for storing data* **day;**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

CAUTION

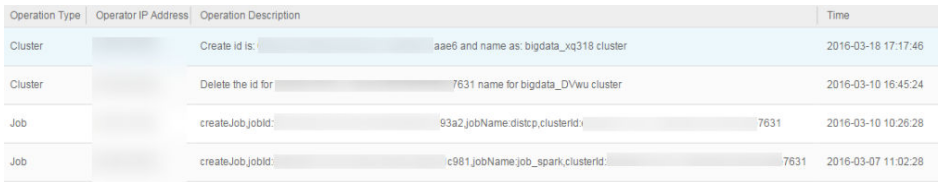
- This statement is used only on a SQL node to configure the TTL of the system table. If the TTL needs to be configured on all nodes, run this statement on each node. Do not run the statement with **on cluster** on each node. Otherwise the ClickHouse will keep running.
- Run the preceding statement during off-peak hours. This operation may take a long time if there is a large amount of data.

11.7 Cluster Management

11.7.1 How Do I View All Clusters?

All MRS clusters are displayed on the **Clusters** page of the MRS management console. You can view clusters in different status.

- **Active Clusters**: all clusters except clusters in **Failed** and **Terminated** states.
- **Cluster History**: clusters in the **Deleted** state. Only the clusters deleted within the last six months are displayed. If you want to view clusters deleted more than six months ago, contact technical support engineers.
- **Failed Tasks**: tasks in **Failed** state. The failed tasks include the following:
  - Tasks failed to create clusters
  - Tasks failed to terminate clusters
  - Tasks failed to scale out clusters
  - Tasks failed to scale in clusters



11.7.2 How Do I View MRS Operation Logs?

You can view operation logs of clusters and jobs on the **Operation Logs** page. The MRS operation logs record the following operations:

- Cluster operations
  - Create, terminate, and scale out or in clusters
  - Create directories and delete directories or files
- Job operations: Create, stop, and delete jobs
- Data operations: IAM user tasks, add users, and add user groups

Figure 11-7 shows the operation logs.

Figure 11-7 Log information

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.7.3 How Do I View MRS Cluster Configuration Information?

- After a cluster is created, click the cluster name. On the page displayed, you can view basic configuration information about the cluster.
- The instance specifications and node capacity determine the data analysis and processing capability of the cluster.
- Higher instance specifications and larger capacity enable faster data processing at a higher cost.
- On the **Dashboard** page, click **Access Manager**.
- On displayed MRS Manager, you can view and handle alarms, and modify cluster configurations.

11.7.4 How Do I Add Components to an MRS Cluster?

Question: How do I add services to an existing MRS cluster?

Answer:

You cannot install new components for a created cluster whose version is MRS 3.1.0 or earlier. If you want to use a component that is not installed in your cluster, you need to create a cluster and select the required component.

You can add components to MRS 3.1.2-LTS.3 or later custom clusters.

11.7.5 How Do I Cancel Message Notifications for MRS Cluster Alarms?

1. Log in to the MRS console.
2. Click the name of the cluster.
3. On the page displayed, choose **Alarms** > **Notification Rules**.
4. Locate the row that contains the rule you want to modify, click **Edit** in the **Operation** column, and deselect the alarm or event severity levels.
5. Click **OK**.

11.7.6 Why Is the Resource Pool Memory Displayed in the MRS Cluster Smaller Than the Actual Cluster Memory?

Question:

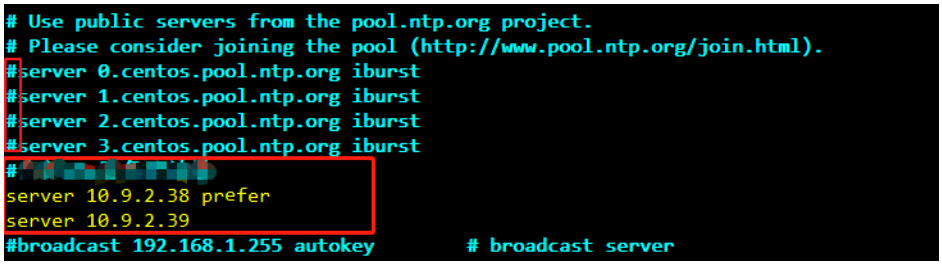
Why is the resource pool memory displayed in the MRS cluster smaller than the actual cluster memory?

Answer:

In an MRS cluster, MRS allocates 50% of the cluster memory to YARN by default. You manage YARN nodes logically by resource pool. Therefore, the total memory of the resource pool displayed in the cluster is only 50% of the total memory of the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.7.7 What Is the Python Version Installed for an MRS Cluster?



Log in to a Master node as user **root** and run the **Python3** command to query the Python version.

11.7.8 What Can I Do If the Time Information of an MRS Cluster Node Is Incorrect?

- If the time on a node inside the cluster is incorrect, log in to the node and rectify the fault from 2.
- If the time on a node inside the cluster is different from that on a node outside the cluster, log in to the node and rectify the fault from 1.

1. Run the **vi /etc/ntp.conf** command to edit the NTP client configuration file, add the IP addresses of the master node in the MRS cluster, and comment out the IP address of other servers.
   server *master1_ip* prefer
   server *master2_ip*

   Figure 11-8 Adding the master node IP addresses

2. Run the **service ntpd stop** command to stop the NTP service.
3. Run the **/usr/sbin/ntpdate** *IP address of the active master node* command to manually synchronize time.
4. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
5. Run the **ntpstat** command to check the time synchronization result:

11.7.9 What Are the Differences and Relationships Between the MRS Management Console and MRS Manager?

Question:

What Are the Differences and Relationships Between the MRS Management Console and MRS Manager?

Answer:

You can access Manager from the MRS management console.

Manager is classified as MRS Manager and FusionInsight Manager.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- MRS Manager is the manager page of MRS 2.*x* or earlier clusters.
- FusionInsight Manager is the manager page of MRS 3.*x* or later clusters.

The following table lists the differences and relationships between the management console and FusionInsight Manager.

Common Operation	MRS Console	FusionInsight Manager
Changing subnets, adding security group rules, controlling OBS permissions, managing agencies, and synchronizing IAM users	Supported	Not supported
Adding node groups, scaling out, scaling in, and upgrading specifications	Supported	Not supported
Isolating hosts, starting all roles, and stopping all roles	Supported	Supported
Downloading the client, starting services, stopping services, and perform rolling restart of services	Supported	Supported
Viewing the instance status of services, configuring parameters, and synchronizing configurations	Supported	Supported
Viewing cleared alarms and events	Supported	Supported
Viewing the alarm help	Supported	Supported
Setting thresholds for threshold alarms	Not supported	Supported
Adding message subscription specifications	Supported	Not supported
Managing files	Supported	Not supported
Managing jobs	Supported	Not supported
Managing tenants	Supported	Supported
Managing tags	Supported	Not supported

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Common Operation	MRS Console	FusionInsight Manager
Setting permissions (adding and deleting users, user groups, and roles)	Not supported	Supported
Backing up component data and restoring data	Not supported	Supported
Logging metadata operation audit	Not supported	Supported
Monitoring resources	Supported	Supported

11.7.10 How Do I Disable the Firewall Service on Nodes in an MRS Cluster?

Question:

How do I disable the firewall service on nodes in an MRS cluster?

Answer:

Step 1 Log in to each node of a cluster as user **root**.

Step 2 Check whether the firewall service is started.

For example, to check the firewall status on EulerOS, run the **systemctl status firewalld.service** command.

Step 3 Stop the firewall service.

For example, to stop the firewall service on EulerOS, run the **systemctl stop firewalld.service** command.

----End

11.7.11 How Do I Switch the Login Mode of a Node in an MRS Cluster?

Question:

How do I switch the login mode (password or key pair) of a node in an MRS cluster?

Answer:

Login mode cannot be changed. You can select the login mode when creating the cluster, but cannot change the login mode after you create the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.7.12 How Do I Access an MRS Cluster from a Node Outside the Cluster?

Creating a Linux ECS Outside the Cluster to Access the MRS Cluster

Step 1 Create an ECS outside the cluster.

Set **AZ**, **VPC**, and **Security Group** of the ECS to the same values as those of the cluster to be accessed.

Step 2 On the VPC management console, apply for an EIP and bind it to the ECS.

Step 3 Configure security group rules for the cluster.

1. On the **Dashboard** tab page, click **Add Security Group Rule**. In the **Add Security Group Rule** dialog box that is displayed, click **Manage Security Group Rule**.
2. Click the **Inbound Rules** tab, and click **Add Rule**. In the **Add Inbound Rule** dialog box, configure the IP address of the ECS and enable all ports.
3. After the security group rule is added, you can download and install the client on the ECS..
4. Use the client.

   Log in to the client node as the client installation user and run the following command to switch to the client directory:

   cd /opt/hadoopclient

   Run the following command to load environment variables:

   source bigdata_env

   If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, authentication is not required.

   kinit *MRS cluster user*

   Example:

   kinit admin

   Run the client command of a component.

   Example:

   Run the following command to view files in the HDFS root directory:

   hdfs dfs -ls /

   ```
   Found 15 items
   drwxrwx--x   - hive       hive             0 2021-10-26 16:30 /apps
   drwxr-xr-x   - hdfs       hadoop           0 2021-10-18 20:54 /datasets
   drwxr-xr-x   - hdfs       hadoop           0 2021-10-18 20:54 /datastore
   drwxrwx---+  - flink      hadoop           0 2021-10-18 21:10 /flink
   drwxr-x---   - flume      hadoop           0 2021-10-18 20:54 /flume
   drwxrwx--x   - hbase      hadoop           0 2021-10-30 07:31 /hbase
   ...
   ```

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.7.13 Does Kafka Topic Monitoring in MRS Clusters Support Alarm Reporting?

Question:

Can Kafka topic monitoring in MRS streaming clusters send alarms?

Answer:

The Kafka topic monitoring cannot send notifications by email or SMS message. Currently, you can view alarm information on Manager.

11.7.14 How Do I View Running Resource Queues When an Alarm Indicating Insufficient YARN Queue Resources Is Generated?

Question:

Where can I view the running resource queues when ALM-18022 Insufficient Yarn Queue Resources is generated?

Answer:

Log in to FusionInsight Manager and choose **Cluster** > **Services** > **Yarn**. In the navigation pane on the left, choose **ResourceManager(Active)** and log in to the native Yarn page.

For details, see the online help.

11.7.15 How Do I Understand the Multi-Level Chart Statistics in the HBase Operation Requests Metric?

Question:

How Do I Understand the Multi-Level Chart Statistics in the HBase Operation Requests Metric?

Answer:

The following uses the **Operation Requests on RegionServers** monitoring item as an example:

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HBase** > **Resource**. On the displayed page, you can view the **Operation Requests on RegionServers** chart. If you click **all**, the top 10 RegionServers ranked by the total number of operation requests in the current cluster are displayed, the statistics interval is 5 minutes.
2. Click a point in the chart. A level-2 chart is displayed, showing the number of operation requests of all RegionServers in the past 5 minutes.
3. Click an operation statistics bar chart. A level-3 chart is displayed, showing the distribution of operations in each region within the period.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Click a region name. The distribution chart of operations performed every 5 minutes in the last 12 hours is displayed. You can view the number of operations performed in the period.

11.8 Node Management

11.8.1 Can I Change MRS Cluster Nodes on the MRS Console?

You cannot change MRS cluster nodes on the MRS console. You are also advised not to change MRS cluster nodes on the ECS console.

Manually stopping or deleting an ECS, modifying or reinstalling the ECS OS, or modifying ECS specifications for a cluster node on the ECS console will affect the cluster stability.

If an ECS is deleted, the ECS OS is modified or reinstalled, or the ECS specifications are modified on the ECS console, MRS will automatically identify and delete the node.

You can log in to the MRS console and restore the deleted node through scale-out. Do not perform operations on the nodes that are being scaled out.

11.8.2 How Do I Query the Startup Time of an MRS Node?

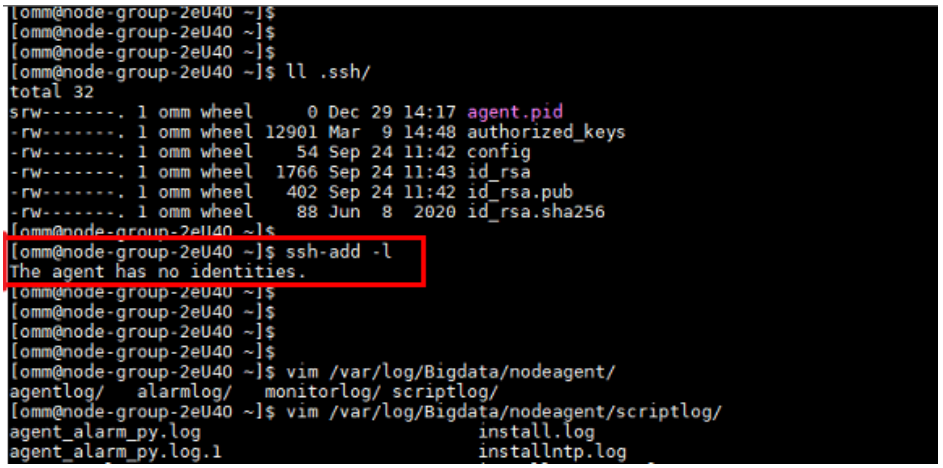
Step 1 Log in to the MRS console, click a cluster name to go to its details page.

Step 2 Click the **Nodes** tab and view the IP address of the node.

Step 3 Log in to the target node and run the following command to query the startup time:

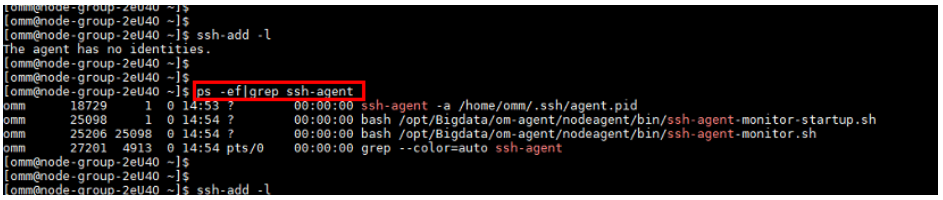
date -d "$(awk -F. '{print $1}' /proc/uptime) second ago" +"%Y-%m-%d %H:%M:%S"

```
[root@server-2110082001-0018 ~]#date -d "$(awk -F. '{print $1}' /proc/uptime) second ago" +"%Y-%m-%d %H:%M:%S"
2021-12-13 15:56:23
```



----End

11.8.3 What Do I Do If Trust Relationships Between Nodes Are Abnormal?



If "ALM-12066 Inter-Node Mutual Trust Fails" is reported on Manager or there is no SSH trust relationship between nodes, rectify the fault by performing the following operations:

1. Run the **ssh-add -l** command on both nodes of the trusted cluster to check whether there are identities.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the ssh-agent process, kill the process, and wait for the process to automatically restart.

3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.

4. If identities exist, check whether the **authorized_keys** file in the **/home/omm/.ssh** directory contains the information in the **id_rsa.pub** file in the **/home/omm/.ssh** of the peer node. If no, manually add the information about the peer node.
5. Check whether the permissions on the files in **/home/omm/.ssh** directory are correct.
6. Check the **/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log** file.
7. If the **omm** user directory has been deleted, contact MRS support personnel.

11.8.4 Can Sudo Logs of Nodes in an MRS Cluster Be Cleared?

Question:

Can Sudo Logs of Nodes in an MRS Cluster Be Cleared?

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Answer:

The sudo log file on the nodes in the MRS cluster records the operations performed by user **omm** to facilitate fault locating. You can clear the file as you need.

You can delete the logs in earlier days to release storage space.

1. If the log file is large, add the log file directory to **/etc/logrotate.d/syslog** to enable periodical deletion.

   Run **sed -i '3 a/var/log/sudo/sudo.log' /etc/logrotate.d/syslog**.

2. Set the maximum number and size of logs in **/etc/logrotate.d/syslog**. If the threshold is exceeded, the logs will be automatically deleted. By default, logs are aged based on the size and number of archived logs. You can use **size** and **rotate** to limit the size and number of archived logs, respectively. If required, you can also add **daily**/**weekly**/**monthly** to specify how often the logs are cleared.

11.8.5 Does an MRS Cluster Support System Reinstallation?

Question:

Does an MRS cluster support system reinstallation?

Answer:

The nodes in the MRS cluster use initial ECS images as their OSs, which cannot be reinstalled.

11.8.6 Can I Change the OS of an MRS Cluster?

Question:

Can I change the OS of an MRS cluster?

Answer:

The node OS in the MRS cluster is based on the initial ECS image and cannot be changed.

11.9 Component Management

11.9.1 Can I Delete Components Installed in an MRS Cluster?

Question:

Can I delete components from an existing MRS cluster?

Answer:

You cannot delete any component from a cluster in MRS 3.1.0 and earlier versions. If a component is not required, log in to MRS Manager and stop the component on the **Services** page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.9.2 How Do I View the Configuration File Directory of Each Component?

The configuration file paths of commonly used components are as follows:

Component	Configuration File Directory
ClickHouse	*Client installation directory*/**ClickHouse/clickhouse/config**
Flink	*Client installation directory*/**Flink/flink/conf**
Flume	*Client installation directory/***fusioninsight-flume-***xxx*/**conf**
HBase	*Client installation directory*/**HBase/hbase/conf**
HDFS	*Client installation directory*/**HDFS/hadoop/etc/hadoop**
Hive	*Client installation directory*/**Hive/config**
Hudi	*Client installation directory*/**Hudi/hudi/conf**
Kafka	*Client installation directory*/**Kafka/kafka/config**
Loader	• *Client installation directory*/**Loader/loader-tools-xxx/loader-tool/conf** • *Client installation directory*/**Loader/loader-tools-xxx/schedule-tool/conf** • *Client installation directory*/**Loader/loader-tools-xxx/shell-client/conf** • *Client installation directory*/**Loader/loader-tools-xxx/sqoop-shell/conf**
Oozie	*Client installation directory*/**Oozie/oozie-client-***xxx*/**conf**
Spark2x	*Client installation directory/Spark2x/spark/conf*
Yarn	*Client installation directory/Yarn/config*
ZooKeeper	*Client installation directory/Zookeeper/zookeeper/conf*

11.9.3 Will Upper-Layer Services Be Affected If the Hive Service Status Is Partially Healthy?

Question

Will Upper-Layer Services Be Affected If the Hive Service Status Is Partially Healthy?

Answer:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the cluster service status is **Subhealthy**, some enhancements of the service cannot work properly.

Log in to FusionInsight Manager to check the status of other services in the cluster. In this example, the HBase service is stopped. If HBase is installed but is abnormal, Hive, Spark, and Loader are in the **Subhealthy** state.

In this case, upper-layer services depending on the Hive service are not affected. After you restart HBase, the Hive service recovers.

11.9.4 How Do I Obtain the IP Address and Port Number of a ZooKeeper Instance in the MRS Cluster?

You can obtain the IP address and port number of a ZooKeeper instance through the MRS console or FusionInsight Manager.

Method 1: Obtaining the IP address and port number of a ZooKeeper through the MRS console

1. On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.
2. Click the **Components** tab and choose **ZooKeeper**. On the displayed page, click **Instances** to view the business IP address of a ZooKeeper instance.
3. Click the **Service Configuration** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

Method 2: Obtaining the IP address and port number of a ZooKeeper through FusionInsight Manager

1. Log in to FusionInsight Manager.
2. Perform the following operations to obtain the IP address and port number of a ZooKeeper instance.
   - For clusters of MRS 3.*x* or earlier
     i. Choose **Services** > **ZooKeeper**. On the displayed page, click the **Instance** tab to view the business IP address of a ZooKeeper instance.
     ii. Click the **Service Configuration** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.
   - For clusters of MRS 3.*x* or later
     i. Choose **Cluster** > **Services** > **ZooKeeper**. On the displayed page, click the **Instance** tab to view the business IP address of a ZooKeeper instance.
     ii. Click the **Configurations** tab. On the displayed page, search for the **clientPort** parameter to view the port number of the ZooKeeper instance.

11.10 Job Management

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.10.1 What Types of Spark Jobs Can Be Submitted in a Cluster?

Question:

What Types of Spark Jobs Can Be Submitted in a Cluster?

Answer:

MRS clusters support Spark jobs submitted in Spark, Spark Script, or Spark SQL mode.

11.10.2 How Do I Enable Different Service Programs to Use Different Yarn Queues?

Question:

How Do I Enable Different Service Programs to Use Different Yarn Queues?

Answer:

Create a tenant on FusionInsight Manager and bind different cluster service users to different tenants.

Procedure

Step 1 Log in to FusionInsight Manager and choose **Tenant Resources**.

Step 2 In the tenant list on the left, select a parent tenant and click . On the page for adding a sub-tenant, set properties for the sub-tenant according to **Table 11-2**.

Table 11-2 Sub-tenant parameters

Parameter	Description
Cluster	Cluster to which the parent tenant belongs.
Parent Tenant	Name of the parent tenant.
Name	• Name of the current tenant. The value consists of 3 to 50 characters, including digits, letters, and underscores (_). • Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Tenant Type	Whether the tenant is a leaf tenant. • When **Leaf Tenant** is selected, the current tenant is a leaf tenant and no sub-tenant can be added. • When **Non-leaf Tenant** is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.
Computing Resource	Dynamic compute resources for the current tenant. • When **Yarn** is selected, the system automatically creates a queue in YARN and the queue is named the same as the sub-tenant name. – A leaf tenant can directly submit jobs to the queue. – A non-leaf tenant cannot directly submit jobs to the queue. However, YARN adds an extra queue (hidden) named **default** for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual jobs do not run in this queue. • If **Yarn** is not selected, the system does not automatically create a queue.
Default Resource Pool Capacity (%)	Percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max Capacity (%)	Maximum percentage of computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Storage resources for the current tenant. • When **HDFS** is selected, the system automatically creates a folder named after the sub-tenant in the HDFS parent tenant directory. • When **HDFS** is not selected, the system does not automatically allocate storage resources.
Quota	Quota for files and directories.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
Space Quota	Quota for the HDFS storage space used by the current tenant. • If the unit is set to **MB**, the value ranges from **1** to **8796093022208**. If the unit is set to **GB**, the value ranges from **1** to **8589934592**. • This parameter indicates the maximum HDFS storage space that can be used by the tenant, but not the actual space used. • If its value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk. • If this quota is greater than the quota of the parent tenant, the actual storage space does not exceed the quota of the parent tenant.
Storage Path	HDFS storage directory for the tenant. • The system automatically creates a folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is **ta1s** and the parent directory is **/tenant/ta1**, the storage path for the sub-tenant is then **/tenant/ta1/ta1s**. • The storage path is customizable in the parent directory.
Description	Description of the current tenant.

NOTE

Roles, computing resources, and storage resources are automatically created when tenants are created.

- The new role has permissions on the computing and storage resources. This role and its permissions are automatically controlled by the system and cannot be manually managed by choosing **System** > **Permission** > **Role**. The role name is in the format of *Tenant name_Cluster ID*. The ID of the first cluster is not displayed by default.
- When using this tenant, create a system user and bind the user to the role of the tenant.
- The sub-tenant can further allocate the resources of its parent tenant. The sum of the resource percentages of direct sub-tenants under a parent tenant at each level cannot exceed 100%. The sum of the computing resource percentages of all level-1 tenants cannot exceed 100%.

Step 3 Check whether the current tenant needs to be associated with resources of other services.

- If yes, go to **Step 4**.
- If no, go to **Step 5**.

Step 4 Click **Associate Service** to configure other service resources used by the current tenant.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Set **Services** to **HBase**.
2. Set **Association Type** as follows:
   - **Exclusive** indicates that the service resources are used by the tenant exclusively and cannot be associated with other tenants.
   - **Shared** indicates that the service resources can be shared with other tenants.

NOTE

- Only HBase can be associated with a new tenant. However, HDFS, HBase, and Yarn can be associated with existing tenants.
- To associate an existing tenant with service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Associate Service** to configure resources to be associated with the tenant.
- To disassociate an existing tenant from service resources, click the target tenant in the tenant list, switch to the **Service Associations** page, and click **Delete** in the **Operation** column. In the displayed dialog box, select **I have read the information and understand the impact** and click **OK**.

3. Click **OK**.

Step 5 Click **OK**. Wait until the system displays a message indicating that the tenant is successfully created.

----End

11.10.3 What Should I Do If a Job Fails to Be Submitted and the Error Is Related to OBS?

Question:

Why Does a Job Fail to Be Submitted and the Error Is Related to OBS?

Answer:

OBS errors are generally related to read and write. You can perform the following steps to locate the fault:

Step 1 View the failed job details on the **Jobs** page and check the actual job ID. If the job ID is empty, go to **Step 4**.

Step 2 Log in to FusionInsight Manager, choose **Cluster** > **Services** > **Yarn** > **Overview** > **ResourceManager Web UI**, and search for **logs** by the job ID.

Step 3 Check whether the following error information is displayed in the job log: If the following error message is displayed, bind an OBS agency to the cluster and submit the job again.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 View the logs of to the Launcher job. On the **Jobs** page, view the logs to check whether the **stdout** or **stderr** log of the Launcher job contains error information. Locate the fault based on the error logs.

----End

11.10.4 Can I Run Multiple Spark Tasks at the Same Time After the Minimum Tenant Resources of an MRS Cluster Is Changed to 0?

Question:

Can I run multiple Spark tasks at the same time after the minimum tenant resources of an MRS cluster is changed to **0**?

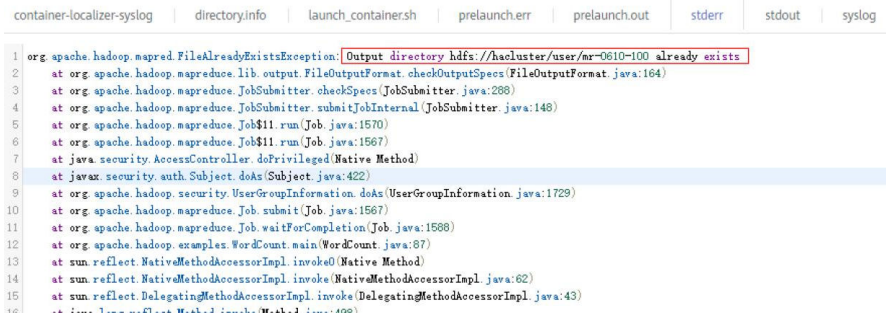
Answer:

You can run only one Spark task at a time after the minimum tenant resources of an MRS cluster is changed to 0.

11.10.5 What Are the Differences Between the Client Mode and Cluster Mode of Spark Jobs?

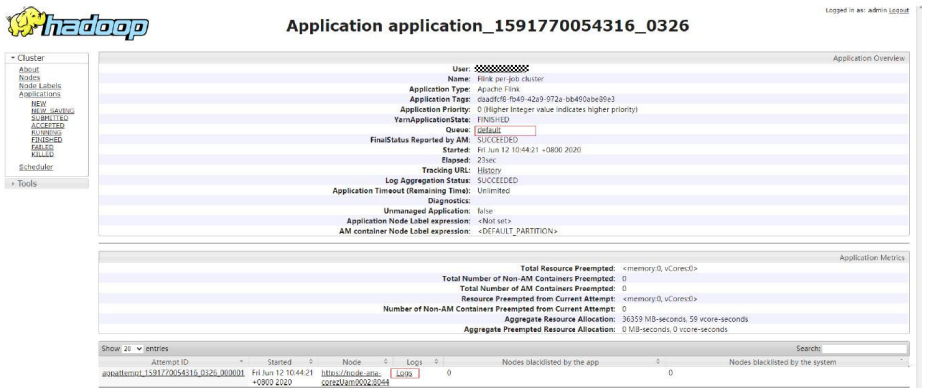
You need to understand the concept ApplicationMaster before understanding the essential differences between Yarn-client and Yarn-cluster.

In Yarn, each application instance has an ApplicationMaster process, which is the first container started by the application. It interacts with ResourceManager and requests resources. After obtaining resources, it instructs NodeManager to start containers. The essential difference between the Yarn-cluster and Yarn-client modes lies in the ApplicationMaster process.



In Yarn-cluster mode, Driver runs in ApplicationMaster, which requests resources from Yarn and monitors the running status of a job. After a user submits a job, the client can be stopped and the job continues running on Yarn. Therefore, the Yarn-cluster mode is not suitable for running interactive jobs.

In Yarn-client mode, ApplicationMaster requests only Executor from Yarn. The client communicates with the requested containers to schedule tasks. Therefore, the client cannot be stopped.



11.10.6 How Do I View MRS Job Logs?

Step 1 On the **Jobs** page of the MRS console, you can view logs of each job, including launcherJob and realJob logs.

- Generally, error logs are printed in **stderr** and **stdout** for launcherJob jobs, as shown in the following figure:

- You can view realJob logs on the ResourceManager web UI provided by the Yarn service on MRS Manager.

Step 2 Log in to the Master node of the cluster to obtain the job log files in **Step 1**. The HDFS path is **/tmp/logs/***{submit_user}*/**logs/***{application_id}*.

Step 3 After the job is submitted, if the job application ID cannot be found on the Yarn web UI, the job fails to be submitted. You can log in to the active Master node of the cluster and view the job submission process log **/var/log/executor/logs/exe.log**.

----End

11.10.7 What Can I Do If the System Displays a Message Indicating that the Current User Does Not Exist on Manager When I Submit a Job?

Question:

If IAM synchronization is not performed when a job is submitted to a cluster in security mode, the error message "The current user does not exist on MRS Manager. Grant the user sufficient permissions on IAM and then perform IAM user synchronization on the Dashboard tab page." is displayed.

Answer:

Before you submit the job, go to the **Dashboard** page, and click **Synchronize** on the right side of **IAM User Sync**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.10.8 What Can I Do If LauncherJob Fails to Be Executed and the Error Message "jobPropertiesMap is null" Is Displayed?

Question:

What should I do if the Launcher job fails because the user who submits the job does not have the write permission on the **hdfs /mrs/job-properties** directory?

Answer:

This problem has been fixed in the MRS 2.1.0.6. Additionally, you can also grant the write permission on the **//mrs/job-properties** directory to the synchronized user who submits the job on MRS Manager.

11.10.9 What Should I Do If the Flink Job Status on the MRS Console Is Inconsistent with That on YARN?

Question:

What should I do if the Flink job status on the MRS Console is inconsistent with that on YARN?

Answer:

To save storage space, you can modify the YARN configuration item **yarn.resourcemanager.max-completed-applications** to reduce the number of historical job records stored on YARN. Flink jobs are long-term jobs. The realJob is still running on Yarn, but the launcherJob has been deleted. As a result, the launcherJob cannot be found on Yarn, and the job status fails to be updated.

Stop the jobs where launcherJob cannot be found. The statuses of jobs submitted later will be updated.

11.10.10 What Should I Do If Error Code 403 Is Reported When a Spark Streaming Job Is Running?

Question:

What can I do if a Spark Streaming job fails after running for dozens of hours and error 403 is reported for OBS access?

Answer:

When a user submits a job that needs to read and write OBS, the job submission program adds the temporary access key (AK) and secret key (SK) for accessing OBS by default. However, the temporary AK and SK may expire.

If you want to run long-term jobs such as Flink and SparkStreaming jobs, you can enter the AK and SK in **Service Parameter** to prevent jobs execution failure due to key expiration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.10.11 What Should I Do If Error Message "java.io.IOException: Connection reset by peer" Is Displayed During the Execution of a Spark Job?

Question:

The execution of a Spark job cannot finish and error message "java.io.IOException: Connection reset by peer" is displayed.

Answer:

Add the **executor.memoryOverhead** parameter to the job submission parameters.

11.10.12 What Should I Do If the Error Message "requestId=XXX" Is Displayed When a Spark Job Accesses OBS?

Question:

What do I do if the following error message is displayed when a Spark job accesses OBS?

```
xxx requestId=4971883851071737250 xxx
```

Answer:

1. Log in to the node where the Spark client is located, go to the **conf** directory, and change the value of the **fs.obs.metrics.switch** parameter in the **core-site.xml** configuration file to **false**.
2. Start the job again.

11.10.13 What Should I Do If the Error Message "UnknownScannerExeception" Is Displayed for Spark Jobs?

Symptom

Spark jobs run slowly. Warning information is printed in run logs, and the error cause is **UnknownScannerExeception**.

Solution

Before running a Spark job, adjust the value of **hbase.client.scanner.timeout.period** (for example, from 60 seconds to 120 seconds).

Log in to FusionInsight Manager and choose **Cluster** > **Services** > **HBase**. Click **Configurations** then **All Configurations**, search for **hbase.client.scanner.timeout.period**, and change its value to **120000** (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.10.14 What Can I Do If DataArts Studio Occasionally Fails to Schedule Spark Jobs?

Symptom

DataArtsStudio occasionally fails to schedule Spark jobs and the rescheduling also fails. The following error information is displayed:

```
Caused by: org.apache.spark.SparkException: Application application_1619511926396_2586346 finished with failed status
```

Solution

Log in to the node where the Spark client is located as user **root** and increase the value of the **spark.driver.memory** parameter in the **spark-defaults.conf** file.

11.10.15 What Should I Do If a Flink Job Fails to Execute and the Error Message "java.lang.NoSuchFieldError: SECURITY_SSL_ENCRYPT_ENABLED" Is Displayed?

Question:

A Flink job fails to be executed and the following error message is displayed:

```
Caused by: java.lang.NoSuchFieldError: SECURITY_SSL_ENCRYPT_ENABLED
```

Answer:

The third-party dependency package in the customer code conflicts with the cluster package. As a result, the job fails to be submitted to the MRS cluster.

You need to modify the dependency package, set the scope of the open source Hadoop package and Flink package in the POM file to **provide**, and pack and execute the job again.

11.10.16 What Should I Do If Submitted Yarn Jobs Cannot Be Viewed on the Web UI?

Question:

Why can't I view a created Yarn job when I log in to Manager as the **admin** user?

Answer:

- The **admin** user is a user on the cluster management page. Check whether the user has the **supergroup** permission. Generally, only the user with the **supergroup** permission can view jobs.
- Log in to Yarn as the user who submits the job. Do not use the **admin** user to view the job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.10.17 What Can I Do If launcher-job Is Terminated by Yarn When a Flink Task Is Submitted?

Symptom

Launcher-job is terminated by Yarn due to insufficient heap size when a Flink task is submitted on the management plane.

Solution

Increase the heap size of the launcher-job queue.

1. Log in to the active OMS node as user **omm**.
2. Change the value of **job.launcher.resource.memory.mb** in **/opt/executor/webapps/executor/WEB-INF/classes/servicebroker.xml** to **2048**.
3. Run the **sh /opt/executor/bin/restart-executor.sh** command to restart the executor process.

11.10.18 What Should I Do If the Error Message "slot request timeout" Is Displayed When I Submit a Flink Job?

Symptom

When a Flink job is submitted, JobManager is started successfully. However, TaskManager remains in the starting state until timeout. The following error information is displayed:

```
org.apache.flink.runtime.jobmanager.scheduler.NoResourceAvailableException: Could not allocate the required slot within slot request timeout. Please make sure that the cluster has enough resources
```

Possible Causes

- The resources in the YARN queue are insufficient. As a result, TaskManager fails to start.
- Your JAR files conflict with those in the environment. You can execute the WordCount program to determine whether the issue occurs.
- If the cluster is in security mode, the SSL certificate of Flink may be incorrectly configured or has expired.

Solution

1. Add resources to the YARN queue.
2. Exclude the Flink and Hadoop dependencies in your JAR files so that Flink and Hadoop can depend only on the JAR files in the environment.
3. Reconfigure the SSL certificate of Flink..

11.10.19 FAQs About Importing and Exporting Data Using DistCP Jobs

- **Question**: Does a DistCP job check data consistency during data import and export?

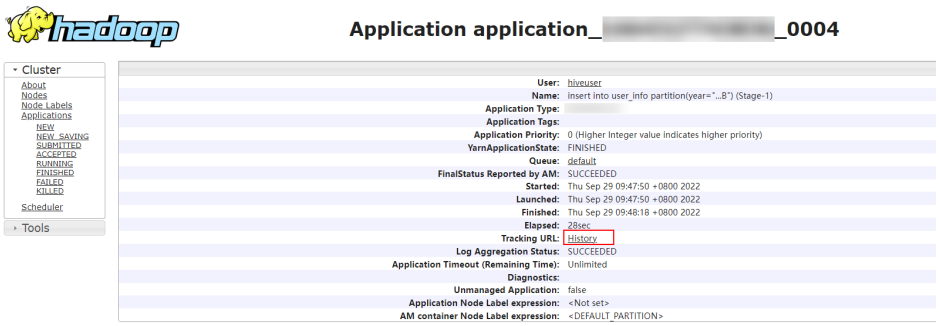
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Answer: No. DistCP jobs only copy data but do not modify it.

- **Question**: When data is exported from a DistCP job, if some files already exist in OBS, how will the job process the files?

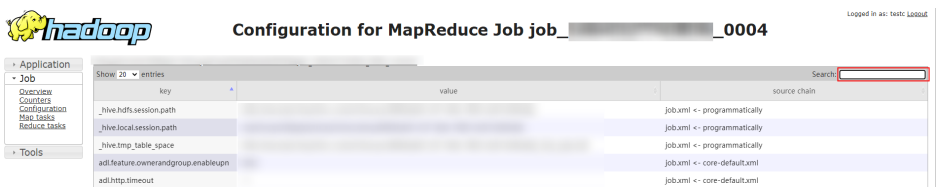
  Answer: DistCP jobs will overwrite the files in OBS.

11.10.20 How Do I View SQL Statements of Hive Jobs on the Yarn Web UI?



Step 1 Log in to FusionInsight Manager as a service user.

Step 2 Choose **Cluster** > **Services** > **Yarn**. Click **ResourceManager(xxx,Active)** next to **ResourceManager WebUI**.



Step 3 On the YARN web UI, click the ID of the job to be viewed.

Step 4 Click **ApplicationMaster** or **History** next to **Tracking URL**.

Step 5 Choose **Configuration** in the left navigation pane and search for the **hive.query.string** parameter in the upper right corner to query the corresponding HiveSQL.

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.10.21 How Do I View Logs of a Specified Yarn Task?

Step 1 Log in to the active Master node as user **root**.

Step 2 Run the following command to initialize environment variables:

source *Client installation directory*/**bigdata_env**

Step 3 If Kerberos authentication is enabled for the cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

kinit *MRS cluster user*

Step 4 Run the following command to obtain the logs of a specified task:

yarn logs -applicationId *application_ID of the job you want to view*

----End

11.10.22 What Should I Do If a HiveSQL/HiveScript Job Fails to be Submitted After Hive Is Added?

This issue occurs because the **MRS CommonOperations** permission bound to the user group to which the user who submits the job belongs does not include the Hive permission after being synchronized to Manager. To solve this issue, perform the following operations:

1. Add the Hive service.
2. Log in to the IAM console and create a user group. The policy bound to the user group is the same as that of the user group to which the user who submits the job belongs.
3. Add the user who submits the job to the new user group.
4. Refresh the cluster details page on the MRS console. The status of IAM user synchronization is **Not synchronized**.
5. Click **Synchronize** on the right of **IAM User Sync**. Go back to the previous page. In the navigation pane on the left, choose **Operation Logs** and check whether the user is changed.
   - If yes, submit the Hive job again.
   - If no, check whether all the preceding operations are complete.
     - If yes, contact an O&M engineer.
     - If no, submit the Hive job after the preceding operations are complete.

11.10.23 Where Are the Execution Logs of Spark Jobs Stored?

Question:

Where Are the Execution Logs of Spark Jobs Stored?

Answer:

- Logs of unfinished Spark jobs are stored in the **/srv/BigData/hadoop/data1/nm/containerlogs/** directory on the Core node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Logs of finished Spark jobs are stored in the **/tmp/logs/***Username***/logs** directory of the HDFS.

11.10.24 What Should I Do If an Alarm Indicating Insufficient Memory Is Reported During Spark Task Execution?

Symptom

When a Spark task is executed, an alarm indicating insufficient memory is reported. The alarm ID is 18022. As a result, no available memory can be used.

Procedure

Set the executor parameters in the SQL script to limit the number of cores and memory of an executor.

For example, the configuration is as follows:

```
set hive.execution.engine=spark;
set spark.executor.cores=2;
set spark.executor.memory=4G;
set spark.executor.instances=10;
```

Change the values of the parameters as required.

11.10.25 What Should I Do If It Takes a Long Time for Spark SQL to Access Hive Partitioned Tables Before a Job Starts?

Symptom

When Spark SQL is used to access Hive partitioned tables stored in OBS, the access speed is slow and a large number of OBS query APIs are called.

Example SQL:

```
select a,b,c from test where b=xxx
```

Fault Locating

According to the configuration, the task should scan only the partition whose b is *xxx*. However, the task logs show that the task scans all partitions and then calculates the data whose b is *xxx*. As a result, the task calculation is slow. In addition, a large number of OBS requests are sent because all files need to be scanned.

By default, the execution plan optimization based on partition statistics is enabled on MRS, which is equivalent to automatic execution of Analyze Table. (The default configuration method is to set **spark.sql.statistics.fallBackToHdfs** to **true**. You can set this parameter to **false**.) After this function is enabled, table partition statistics are scanned during SQL execution and used as cost estimation in the execution plan. For example, small tables identified during cost evaluation are broadcast to each node in the memory for join operations, significantly reducing shuffle time. This function greatly optimizes performance in join scenarios, but increases the number of OBS calls.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Procedure

Set the following parameter in Spark SQL and then run the SQL statement:

```
set spark.sql.statistics.fallBackToHdfs=false;
```

Alternatively, run the **--conf** command to set this parameter to **false** before startup.

```
--conf spark.sql.statistics.fallBackToHdfs=false
```

11.10.26 How Does the System Select the Queue When an MRS Cluster User Is Associated to Multiple Queues?

Question

Users A and B share the same user group and permissions in the MRS cluster. They are associated to both queue A and queue B.

Why are tasks of user A always submitted to queue A and tasks of user B always submitted to queue B?

Answer:

- If a user in the MRS cluster is associated to multiple queues, the system randomly selects a queue for tasks submitted by the user. You can set the queue permission of the user.and associate a user to only one queue.
- If you have to associate multiple queues, configure a global user policy to specify the default submission queue for a user.
  a. Take the MRS 3.x cluster as an example. Log in to Manager and click **Tenant Resources**.
  b. Choose **Dynamic Resource Plan** > **Global User Policy** > **Create Global User Policy**.

     Username: indicates the user for whom resource scheduling needs to be controlled. Enter an existing username in the current cluster.

     Default Queue: indicates the queue of the user. Enter the name of an existing queue in the current cluster.

11.11 Performance Tuning

11.11.1 How Do I Obtain the Hadoop Pressure Test Tool?

Question:

How Do I Obtain the Hadoop Pressure Test Tool?

Answer:

Obtain the Hadoop pressure test tool from the community at **https://github.com/Intel-bigdata/HiBench**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.11.2 How Do I Improve the Resource Utilization of Core Nodes in a Cluster?

1. Go to the Yarn service configuration page.
   - For versions earlier than MRS 1.8.10, log in to MRS Manager, choose **Services** > **Yarn** > **Service Configuration**, and select **All** from the **Basic** drop-down list.
   - For MRS 1.8.10 or later and MRS 2.*x*, click the cluster name. On the cluster details page that is displayed, click the **Components** tab and choose **Yarn**. Click the **Service Configuration** and select **All** from the **Basic** drop-down list.

     NOTE

     If the **Components** tab is unavailable, complete IAM user synchronization first. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
   - For MRS cluster version 3.*x* or later:

     Log in to FusionInsight Manager. Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations**.
2. Search for **yarn.nodemanager.resource.memory-mb**, and increase the value based on the actual memory of the cluster nodes.
3. Save the change and restart the affected services or instances.

11.11.3 How Do I Configure the Knox Memory for an MRS Cluster?

Step 1 Log in to a Master node of the cluster as user **root**.

Step 2 Run the following command on the Master node to open the **gateway.sh** file:

su omm

vim /opt/knox/bin/gateway.sh

Step 3 Change **APP_MEM_OPTS=""** to **APP_MEM_OPTS="-Xms256m -Xmx768m"**, save the file, and exit.

Step 4 Run the following command on the Master node to restart the knox process:

sh /opt/knox/bin/gateway.sh stop

sh /opt/knox/bin/gateway.sh start

Step 5 Repeat the preceding steps on each Master node.

Step 6 Run the **ps -ef |grep knox** command to check the configured memory.

Figure 11-9 knox memory

----End

11.11.4 How Do I Adjust the Memory Size of the manager-executor Process?

Symptom

The **manager-executor** process runs either on the Master1 or Master2 node in the MRS cluster in active/standby mode. This process is used to encapsulate the MRS management and control plane's operations on the MRS cluster, such as job submission, heartbeat reporting, certain alarm reporting, as well as cluster creation, scale-out, and scale-in. When you submit jobs on the MRS management and control plane, the Executor memory may become insufficient as the tasks increase or the number of concurrent tasks increases. As a result, the CPU usage is high and the Executor process experiences out-of-memory (OOM) errors.

Procedure

1. Log in to either the Master1 or Master2 node as user **root** and run the following command to switch to user **omm**:

   su - omm

2. Run the following command to modify the **catalina.sh** script. Specifically, search for **JAVA_OPTS** in the script, find the configuration items similar to **JAVA_OPTS="-Xms1024m -Xmx4096m**, and change the values of the items to desired ones, and save the modification.

   vim /opt/executor/bin/catalina.sh

3. The **manager-executor** process only runs on either the Master1 or Master2 node in active/standby mode. Check whether it exists on the node before restarting it.

   a. Log in to the Master1 and Master2 nodes and run the following command to check whether the process exists. If any command output is displayed, the process exists.

      ps -ef | grep "/opt/executor" | grep -v grep

   b. Run the following command to restart the process:

      sh /opt/executor/bin/shutdown.sh

      sh /opt/executor/bin/startup.sh

11.11.5 What Should I Do If the spark.yarn.executor.memoryOverhead Setting Does Not Take Effect?

Symptom

The overhead memory of the executor needs to be adjusted for Spark tasks. The **spark.yarn.executor.memoryOverhead** parameter is set to **4096**. However, the default value **1024** is used to apply for resources during actual computation.

Fault Locating

In Spark 2.3 and later versions, use the new parameter **spark.executor.memoryOverhead** to set the overhead memory of the executor. If

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

both old and new parameters are set, the value of **spark.yarn.executor.memoryOverhead** does not take effect, and the value of **spark.executor.memoryOverhead** is used.

Same thing happens if you use **spark.driver.memoryOverhead** to set the overhead memory of driver.

Procedure

Use the new parameter:

```
spark.executor.memoryOverhead=4096
```

11.12 Application Development

11.12.1 How Do I Get My Data into OBS or HDFS?

MRS can process data in OBS and HDFS. You can get your data into OBS or HDFS as follows:

1. Upload local data to OBS.
   a. Log in to the OBS console.
   b. Create a parallel file system named **userdata** on OBS and create the **program**, **input**, **output**, and **log** folders in the file system.
      i. Choose **Parallel File System** > **Create Parallel File System**, and create a file system named **userdata**.
      ii. In the OBS file system list, click the file system name **userdata**, choose **Files** > **Create Folder**, and create the **program**, **input**, **output**, and **log** folders.
   c. Upload data to the **userdata** file system.
      i. Go to the **program** folder and click **Upload File**.
      ii. Click **add file** and select a user program.
      iii. Click **Upload**.
      iv. Upload the user data file to the **input** directory using the same method.
2. Import OBS data to HDFS.

   You can import OBS data to HDFS only when **Kerberos Authentication** is disabled and the cluster is running.
   a. Log in to the MRS console.
   b. Click the name of the cluster.
   c. On the page displayed, select the **Files** tab page and click **HDFS File List**.
   d. Select a data directory, for example, **bd_app1**.

      The **bd_app1** directory is only an example. You can use any directory on the page or create a new one.
   e. Click **Import Data** and click **Browse** to select an OBS path and an HDFS path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

f. Click **OK**.

You can view the file upload progress on the **File Operation Records** tab page.

11.12.2 Can MRS Write Data to HBase Through an HBase External Table of Hive?

Question:

Can MRS write data to HBase through an HBase external table of Hive?

Answer:

This operation is not supported.

Hive on HBase supports only data query.

11.12.3 Does OpenTSDB Support Python APIs?

Question:

Does OpenTSDB support Python APIs?

Answer:

OpenTSDB supports Python APIs. OpenTSDB provides HTTP-based RESTful APIs that are language-independent. Any language that supports HTTP requests can interconnect to OpenTSDB.

11.12.4 How Do I Configure the node_id Parameter When Calling the API for Adjusting Cluster Nodes?

Question:

How Do I Configure the Request Parameter node_id When Calling the API for Adjusting Cluster Nodes (/v1.1/{project_id}/cluster_infos/{cluster_id})?

Answer:

When the API is called, the value of the request parameter **node_id** is fixed to **node_orderadd**.

11.12.5 How Do I Manage and Use Third-Party JAR Packages for MRS Cluster Components?

Some components within an MRS cluster support the use of custom third-party JAR packages to meet specific customization needs. When a user application invokes a third-party JAR package while using a component, it can be stored in a designated directory on each node. Upon restarting the component, the JAR package in that directory will be automatically loaded by the corresponding component program.

The directory is as follows: *<Cluster installation directory>***/third_lib/***<Component name>* of the component installation node.

Here are two examples of saving JAR files to their respective directories:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Save the JAR package file used by the HBase service to the **${BIGDATA_HOME}/third_lib/HBase** directory of the HBase node.
- Save the JAR package file used by the Hive service to the **${BIGDATA_HOME}/third_lib/Hive** directory of each HiveServer instance node.

NOTE

- Currently, custom JAR files are supported on HDFS, YARN, MapReduce, Spark, HBase, and Hive.
- Hive supports only Hive custom JAR files developed by users for UDF implementation. Do not store other open-source JAR files in the directory, including **org.apache.***, **com.google.***, and **javax.***.
- This directory is supported only by MRS 3.x clusters.

11.13 Upgrade and Patching

11.13.1 How Do I Upgrade an MRS Cluster?

- Non-LTS clusters

  An existing non-LTS cluster cannot be upgraded to a later version. You can create a cluster of the new version and migrate data from the old cluster to the new cluster.

- MRS LTS clusters

  MRS LTS clusters can be upgraded to a target LTS version. Contact our O&M engineers to confirm the upgrade path and apply for professional services for cluster upgrade.

11.13.2 Does MRS Support Kernel Version Upgrade of Components in a Cluster?

Question:

Does MRS support kernel version upgrade of components in a cluster?

Answer:

MRS does not support independent upgrade of kernel versions of components in a cluster. To use components of new versions, delete the current cluster and create another cluster.
