kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
resources	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.APIResource</a> objects	resources contains the name of the resources and if they are namespaced.

**Table 5-3938** io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

Parameter	Type	Description
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

### 5.15.11 Querying an APIGroup (/apis/crd.yangtse.cni)

#### Function

This API is used to query an APIGroup (/apis/crd.yangtse.cni).

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /apis/crd.yangtse.cni

## Request Parameters

**Table 5-3939** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-3940** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	name is the name of the group.

Parameter	Type	Description
preferredVersion	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> object	preferredVersion is the version preferred by the API server, which probably is the storage version.
serverAddressByClientCIDRs	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR</a> objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.
versions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> objects	versions are the versions supported in this group.

**Table 5-3941** io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

Parameter	Type	Description
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

**Table 5-3942** io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

Parameter	Type	Description
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.

Parameter	Type	Description
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

## 5.15.16 Querying All APIs of metrics.k8s.io/v1beta1

### Function

get available resources

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/metrics.k8s.io/v1beta1

### Request Parameters

Table 5-3957 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

### Response Parameters

Status code: 200

Table 5-3958 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
groupVersion	String	groupVersion is the group and version this APIResourceList is for.

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
resources	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.APIResource</a> objects	resources contains the name of the resources and if they are namespaced.

**Table 5-3959** io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

Parameter	Type	Description
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.

Parameter	Type	Description
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

### 5.15.17 Querying an APIGroup (/apis/networking.cci.io)

#### Function

This API is used to query an APIGroup (/apis/networking.cci.io).

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /apis/networking.cci.io

## Request Parameters

**Table 5-3960** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3961** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	name is the name of the group.
preferredVersion	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> object	preferredVersion is the version preferred by the API server, which probably is the storage version.

Parameter	Type	Description
serverAddressByClientCIDRs	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR</a> objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-IP header or request.RemoteAddr (in that order) to get the client IP.
versions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> objects	versions are the versions supported in this group.

**Table 5-3962** io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

Parameter	Type	Description
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

**Table 5-3963** io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

Parameter	Type	Description
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

## 5.15.18 Querying All APIs of networking.cci.io/v1beta1

### Function

get available resources

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/networking.cci.io/v1beta1

### Request Parameters

Table 5-3964 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

### Response Parameters

Status code: 200

Table 5-3965 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
groupVersion	String	groupVersion is the group and version this APIResourceList is for.

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
resources	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.APIResource</a> objects	resources contains the name of the resources and if they are namespaced.

**Table 5-3966** io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

Parameter	Type	Description
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.

Parameter	Type	Description
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

## 5.16 Event

### 5.16.1 Querying Events in a Namespace

#### Function

This API is used to query the details about all events in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api/v1/namespaces/{namespace}/events

**Table 5-3974** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3975** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3976** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3977** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.core.v1.Event</a> objects	List of events
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3978** io.k8s.api.core.v1.Event

Parameter	Type	Description
action	String	What action was taken/failed regarding to the Regarding object.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
count	Integer	The number of times this event has occurred.
eventTime	String	Time when this Event was first observed.
firstTimestamp	String	The time at which the event was first recorded. (Time of server receipt is in TypeMeta.)
involvedObject	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	The object that this event is about.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
lastTimestamp	String	The time at which the most recent occurrence of this event was recorded.
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
reason	String	This should be a short, machine understandable string that gives the reason for the transition into the object's current status.
related	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Optional secondary object for more complex actions.

Parameter	Type	Description
reportingComponent	String	Name of the controller that emitted this Event, e.g. <i>kubernetes.io/kubelet</i> .
reportingInstance	String	ID of the controller instance, e.g. <i>kubelet-xyzf</i> .
series	<a href="#">io.k8s.api.core.v1.EventSeries</a> object	Data about the Event series this event represents or nil if it's a singleton Event.
source	<a href="#">io.k8s.api.core.v1.EventSource</a> object	The component reporting this event. Should be a short machine understandable string.
type	String	Type of this event (Normal, Warning), new types could be added in the future

**Table 5-3979** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3980** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3981** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3982** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3983** io.k8s.api.core.v1.EventSeries

Parameter	Type	Description
count	Integer	Number of occurrences in this series up to the last heartbeat time
lastObservedTime	String	Time of the last occurrence observed

**Table 5-3984** io.k8s.api.core.v1.EventSource

Parameter	Type	Description
component	String	Component from which the event is generated.
host	String	Node name on which the event is generated.

**Table 5-3985** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.16.2 Deleting an Event

### Function

This API is used to delete a specified event.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /api/v1/namespaces/{namespace}/events/{name}

**Table 5-3986** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Event
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3987** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Mandatory	Type	Description
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3988** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3989** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3990** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

**Status code: 200**

**Table 5-3991** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3992** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3993** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3994** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Status code: 202

Table 5-3995 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3996** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>

Parameter	Type	Description
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3997** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3998** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

```
{
  "apiVersion": "v1",
  "gracePeriodSeconds": 0,
  "kind": "DeleteOptions"
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",
  "details": {
    "kind": "events",
    "name": "cci-deployment-cml002.15c0dbdd5715a8da",
  }
}
```

```
"uid" : "68db3125-ce19-11e9-8d71-d0efc1b3bb6b"  
},  
"kind" : "Status",  
"metadata" : { },  
"status" : "Success"  
}
```

## Status Codes

Status Code	Description
200	OK
202	Accepted
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable

504	ServerTimeout

### 5.16.3 Querying an Event

#### Function

This API is used query the details about a specified event.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api/v1/namespaces/{namespace}/events/{name}

**Table 5-3999** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Event
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4000** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4001** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-4002** Response body parameters

Parameter	Type	Description
action	String	What action was taken/failed regarding to the Regarding object.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
count	Integer	The number of times this event has occurred.
eventTime	String	Time when this Event was first observed.
firstTimestamp	String	The time at which the event was first recorded. (Time of server receipt is in TypeMeta.)
involvedObject	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	The object that this event is about.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
lastTimestamp	String	The time at which the most recent occurrence of this event was recorded.
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
reason	String	This should be a short, machine understandable string that gives the reason for the transition into the object's current status.
related	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Optional secondary object for more complex actions.

Parameter	Type	Description
reportingComponent	String	Name of the controller that emitted this Event, e.g. <i>kubernetes.io/kubelet</i> .
reportingInstance	String	ID of the controller instance, e.g. <i>kubelet-xyzf</i> .
series	<a href="#">io.k8s.api.core.v1.EventSeries</a> object	Data about the Event series this event represents or nil if it's a singleton Event.
source	<a href="#">io.k8s.api.core.v1.EventSource</a> object	The component reporting this event. Should be a short machine understandable string.
type	String	Type of this event (Normal, Warning), new types could be added in the future

**Table 5-4003** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4004** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4005** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4006** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-4007** io.k8s.api.core.v1.EventSeries

Parameter	Type	Description
count	Integer	Number of occurrences in this series up to the last heartbeat time
lastObservedTime	String	Time of the last occurrence observed

**Table 5-4008** io.k8s.api.core.v1.EventSource

Parameter	Type	Description
component	String	Component from which the event is generated.
host	String	Node name on which the event is generated.

## 5.17 PersistentVolumeClaim

### 5.17.1 Querying PVCs in a Namespace

#### Function

This API is used to query all PersistentVolumeClaims (PVCs) in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api/v1/namespaces/{namespace}/persistentvolumeclaims

**Table 5-4009** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4010** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-4011 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-4012 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	A list of persistent volume claims. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-4013** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4014** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4015** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4016** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4017** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4018** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4019** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4020** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4021** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4022** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4023** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-4024** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.17.2 Creating a PVC

### Function

This API is used to dynamically create a PVC. If no storage resources are available, a storage resource is automatically created when there is a request for creating a PVC.

EVS and SFS volumes are supported. The **spec.storageClassName** parameter specifies the volume type. It has the following values:

- **sata**: common I/O EVS volumes

- **sas**: high I/O EVS volumes
- **ssd**: ultra-high I/O EVS volumes
- **csi-disk-gpssd**: General-Purpose SSD EVS volumes
- **csi-disk-gpssd2**: General-Purpose SSD V2 EVS volumes
- **nfs-rw**: Network File System (NFS) volumes
- **csi-sfs**: SFS 3.0 Capacity-Oriented volumes
- **csi-sfsturbo-hpc**: SFS Turbo HPC volumes

If **spec.storageClassName** is not specified, you can specify **volume.beta.kubernetes.io/storage-class** in **metadata.annotations**. The two parameters have the same values. Specify either of the two parameters.

To create an encrypted EVS volume, add the **paas.storage.io/cryptKeyId** field to **metadata.annotations**. To create an encrypted SFS volume, add the **paas.storage.io/cryptKeyId**, **paas.storage.io/cryptAlias**, and **paas.storage.io/cryptDomainId** fields to **metadata.annotations**.

To create a General-Purpose SSD V2 EVS volume, add the **everest.io/disk-iops** and **everest.io/disk-throughput** fields to **metadata.annotations**. For details about the IOPS and throughput, see the EVS documentation.

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /api/v1/namespaces/{namespace}/persistentvolumeclaims

**Table 5-4025** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4026** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4027** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4028** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4029** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Mandatory	Type	Description
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4030** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4031** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4032** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4033** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-4034** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4035** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4036** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4037** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	No	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4038** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Mandatory	Type	Description
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
reason	No	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	Yes	String	status is the status of the condition.
type	Yes	String	type is the type of the condition.

## Response Parameters

Status code: 200

**Table 5-4039** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4040** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4041** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4042** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4043** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4044** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4045** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4046** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4047** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4048** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4049** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Status code: 201**

**Table 5-4050** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4051** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4052** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4053** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4054** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4055** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4056** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4057** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4058** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4059** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4060** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Status code: 202**

**Table 5-4061** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4062** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4063** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4064** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4065** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4066** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4067** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4068** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4069** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4070** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4071** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

## Example Requests

- Creating a 10-GB encrypted common I/O EVS volume

```
{
  "apiVersion": "v1",
  "kind": "PersistentVolumeClaim",
  "metadata": {
    "annotations": {
      "paas.storage.io/cryptKeyId": "ee9b610c-e356-11e9-aadc-d0efc1b3bb6b",
      "volume.beta.kubernetes.io/storage-class": "sata"
    },
    "name": "pvc-test",
    "namespace": "test-namespace"
  },
  "spec": {
    "accessModes": [ "ReadWriteMany" ],
    "resources": {
      "requests": {
        "storage": "10Gi"
      }
    }
  }
}
```

- Creating a 10-GB encrypted SFS volume

```
{
  "apiVersion": "v1",
  "kind": "PersistentVolumeClaim",
  "metadata": {
    "annotations": {
      "paas.storage.io/cryptAlias": "sfs/default",
      "paas.storage.io/cryptDomainId": "d6912480-c3d6-4e9e-8c70-38afeea434c3",
      "paas.storage.io/cryptKeyId": "ee9b610c-e356-11e9-aadc-d0efc1b3bb6b",
      "volume.beta.kubernetes.io/storage-class": "nfs-rw"
    },
    "name": "pvc-test",
    "namespace": "test-namespace"
  },
  "spec": {
    "accessModes": [ "ReadWriteMany" ],
    "resources": {
      "requests": {
        "storage": "10Gi"
      }
    }
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",
  "kind": "PersistentVolumeClaim",

### 5.17.3 Deleting a PVC

#### Function

This API is used to delete a PVC.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

DELETE /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}

**Table 5-4072** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the PersistentVolumeClaim
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4073** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Mandatory	Type	Description
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4074** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4075** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-4076** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-4077** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4078** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4079** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4080** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4081** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4082** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4083** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4084** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4085** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4086** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4087** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Status code: 202**

**Table 5-4088** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4089** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4090** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4091** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4092** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4093** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4094** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4095** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4096** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4097** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4098** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

## Example Requests

```
{
  "apiVersion": "v1",
  "gracePeriodSeconds": 0,
  "kind": "DeleteOptions"
}
```

## Example Responses

**Status code: 200**

OK

```

## 5.17.4 Querying a PVC

### Function

This API is used to query a specified PVC.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}

**Table 5-4099** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the PersistentVolumeClaim

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4100** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4101** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-4102** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4103** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4104** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4105** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4106** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4107** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4108** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4109** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4110** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4111** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4112** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

## 5.17.5 Replacing PVCs

### Function

This API is used to replacing a specified PVC.

The following fields can be updated:

- **metadata.labels**
- **metadata.annotations**
- **metadata.generateName** Other fields cannot be updated.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /api/v1/namespaces/{namespace}/persistentvolumeclaims/{name}

**Table 5-4113** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the PersistentVolumeClaim
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4114** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4115** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4116** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

Parameter	Mandatory	Type	Description
status	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4117** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4118** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4119** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4120** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4121** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-4122** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4123** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4124** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4125** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	No	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4126** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Mandatory	Type	Description
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
reason	No	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	Yes	String	status is the status of the condition.
type	Yes	String	type is the type of the condition.

## Response Parameters

Status code: 200

Table 5-4127 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4128** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.  If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).  Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4129** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4130** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4131** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4132** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4133** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4134** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4135** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4136** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4137** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Status code: 201**

**Table 5-4138** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4139** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4140** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4141** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4142** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4143** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4144** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4145** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4146** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4147** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4148** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

## Example Requests

Updating `metadata.labels` for PVCs

```
{
  "apiVersion": "v1",
  "kind": "PersistentVolumeClaim",
  "metadata": {
    "annotations": {
      "everest.io/disk-volume-type": "SATA",
      "pv.kubernetes.io/bind-completed": "yes",
      "pv.kubernetes.io/bound-by-controller": "yes",
      "volume.beta.kubernetes.io/storage-provisioner": "everest-csi-provisioner"
    },
    "creationTimestamp": "2023-06-25T02:59:26Z",
    "finalizers": [ "kubernetes.io/pvc-protection" ],
    "labels": {
      "failure-domain.beta.kubernetes.io/region": "cn-north-7",
      "failure-domain.beta.kubernetes.io/zone": "cn-north-7a"
    },
    "name": "pvc-test",
    "namespace": "test-namespace",
    "resourceVersion": "343613181",
    "selfLink": "/api/v1/namespaces/test-namespace/persistentvolumeclaims/pvc-test",
    "uid": "bb99f33d-a5da-46b4-90a4-b0c6b3eedabf"
  },
  "spec": {
    "accessModes": [ "ReadWriteMany" ],
    "resources": {
      "requests": {
        "storage": "10Gi"
      }
    },
    "storageClassName": "sata",
    "volumeMode": "Filesystem",
    "volumeName": "pvc-bb99f33d-a5da-46b4-90a4-b0c6b3eedabf"
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",

503	ServiceUnavailable
504	ServerTimeout

## 5.18 RoleBinding

### 5.18.1 Listing RoleBindings in a Specified Namespace

#### Function

This API is used to list or watch objects of kind RoleBinding

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings

**Table 5-4149** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4150** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4151** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-4152** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.rbac.v1.RoleBinding</a> objects	Items is a list of RoleBindings
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard object's metadata.

**Table 5-4153** io.k8s.api.rbac.v1.RoleBinding

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4154** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4155** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4156** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4157** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4158** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

**Table 5-4159** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.18.2 Creating a RoleBinding

### Function

This API is used to create a RoleBinding

## Calling Method

For details, see [Calling APIs](#).

## URI

POST /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings

**Table 5-4160** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4161** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4162** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4163** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.

Parameter	Mandatory	Type	Description
roleRef	Yes	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	No	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4164** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	<p>CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.</p> <p>Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>
deletionGracePeriodSeconds	No	Long	<p>Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.</p>

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4165** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4166** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4167** io.k8s.api.rbac.v1.RoleRef

Parameter	Mandatory	Type	Description
apiGroup	Yes	String	APIGroup is the group for the resource being referenced
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-4168** io.k8s.api.rbac.v1.Subject

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	Yes	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	Yes	String	Name of the object being referenced.
namespace	No	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## Response Parameters

Status code: 200

**Table 5-4169** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4170** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.  If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).  Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4171** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4172** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4173** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4174** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

**Status code: 201**

**Table 5-4175** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4176** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4177** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4178** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4179** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4180** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

**Status code: 202**

**Table 5-4181** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4182** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4183** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4184** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4185** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4186** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## Example Requests

Creating a RoleBinding to bind the user group in namespace **rbac-test** to ClusterRole **view**

```
{
  "apiVersion": "rbac.authorization.k8s.io/v1",
  "kind": "RoleBinding",
  "metadata": {
    "name": "clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "namespace": "rbac-test"
  },
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  } ]
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "rbac.authorization.k8s.io/v1",
  "kind": "RoleBinding",
  "metadata": {
    "creationTimestamp": "2020-04-07T08:25:46Z",
    "name": "clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "namespace": "rbac-test",
    "resourceVersion": "230511279",
    "selfLink": "/apis/rbac.authorization.k8s.io/v1/namespaces/rbac-test/rolebindings/clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "uid": "6163c216-78a9-11ea-bcc5-340a9837e2a7"
  },
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  } ]
}
```

## Status Codes

Status Code	Description
200	OK
201	Created
202	Accepted
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	AlreadyExists
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.18.3 Deleting a RoleBinding

### Function

This API is used to delete a RoleBinding

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

**Table 5-4187** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the RoleBinding
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4188** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-4189 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4190** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-4191** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-4192** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4193** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4194** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-4195** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

**Status code: 202**

**Table 5-4196** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4197** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

Parameter	Type	Description
kind	String	The kind attribute of the resource associated with the status <code>StatusReason</code> . On some operations may differ from the requested resource <code>Kind</code> . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status <code>StatusReason</code> (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4198** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-4199** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.18.4 Querying a RoleBinding

### Function

This API is used to read the specified RoleBinding

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

**Table 5-4200** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the RoleBinding
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4201** Query Parameters

Parameter	Mandatory	Type	Description
pretty	No	String	If 'true', then the output is pretty printed.

### Request Parameters

**Table 5-4202** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

### Response Parameters

**Status code: 200**

**Table 5-4203** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4204** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4205** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4206** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4207** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4208** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## 5.18.5 Updating a RoleBinding

### Function

This API is used to partially update the specified RoleBinding

### Calling Method

For details, see [Calling APIs](#).

### URI

```
PATCH /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/  
{name}
```

**Table 5-4209** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the RoleBinding
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4210** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	No	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-4211 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-4212** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-4213** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4214** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4215** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4216** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4217** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4218** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## Example Requests

### Updating a RoleBinding

```
{
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  }, {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "Group",
    "name": "07b8387fd080d2963f92c00bb9a7341e"
  } ]
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "rbac.authorization.k8s.io/v1",
```

```

"kind" : "RoleBinding",
"metadata" : {
  "creationTimestamp" : "2020-04-07T08:25:46Z",
  "name" : "clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
  "namespace" : "rbac-test",
  "resourceVersion" : "230608015",
  "selfLink" : "/apis/rbac.authorization.k8s.io/v1/namespaces/rbac-test/rolebindings/clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
  "uid" : "6163c216-78a9-11ea-bcc5-340a9837e2a7"
},
"roleRef" : {
  "apiGroup" : "rbac.authorization.k8s.io",
  "kind" : "ClusterRole",
  "name" : "view"
},
"subjects" : [ {
  "apiGroup" : "rbac.authorization.k8s.io",
  "kind" : "User",
  "name" : "07b82a44a680d5661f01c00b448f8f50"
}, {
  "apiGroup" : "rbac.authorization.k8s.io",
  "kind" : "Group",
  "name" : "07b8387fd080d2963f92c00bb9a7341e"
} ]
}

```

## Status Codes

Status Code	Description
200	OK
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.18.6 Replacing a RoleBinding

### Function

This API is used to replace the specified RoleBinding

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /apis/rbac.authorization.k8s.io/v1/namespaces/{namespace}/rolebindings/{name}

**Table 5-4219** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the RoleBinding
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4220** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4221** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4222** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.

Parameter	Mandatory	Type	Description
roleRef	Yes	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	No	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4223** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4224** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4225** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4226** io.k8s.api.rbac.v1.RoleRef

Parameter	Mandatory	Type	Description
apiGroup	Yes	String	APIGroup is the group for the resource being referenced
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-4227** io.k8s.api.rbac.v1.Subject

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	Yes	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognize the kind value, the Authorizer should report an error.
name	Yes	String	Name of the object being referenced.
namespace	No	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## Response Parameters

Status code: 200

**Table 5-4228** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4229** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.</p> <p>Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4230** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4231** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4232** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4233** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

**Status code: 201**

**Table 5-4234** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4235** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4236** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4237** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4238** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4239** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

## Example Requests

### Replacing a RoleBinding

```
{
  "apiVersion": "rbac.authorization.k8s.io/v1",
  "kind": "RoleBinding",
  "metadata": {
    "creationTimestamp": "2020-04-07T08:25:46Z",
    "name": "clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "namespace": "rbac-test",
    "resourceVersion": "230608015",
    "selfLink": "/apis/rbac.authorization.k8s.io/v1/namespaces/rbac-test/rolebindings/clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "uid": "6163c216-78a9-11ea-bcc5-340a9837e2a7"
  },
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  } ]
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "rbac.authorization.k8s.io/v1",
  "kind": "RoleBinding",
  "metadata": {
    "creationTimestamp": "2020-04-07T08:25:46Z",
    "name": "clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "namespace": "rbac-test",
    "resourceVersion": "230609819",
    "selfLink": "/apis/rbac.authorization.k8s.io/v1/namespaces/rbac-test/rolebindings/clusterrole_view_User_07b82a44a680d5661f01c00b448f8f50",
    "uid": "6163c216-78a9-11ea-bcc5-340a9837e2a7"
  },
  "roleRef": {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "ClusterRole",
    "name": "view"
  },
  "subjects": [ {
    "apiGroup": "rbac.authorization.k8s.io",
    "kind": "User",
    "name": "07b82a44a680d5661f01c00b448f8f50"
  } ]
}
```

## Status Codes

Status Code	Description
200	OK

503	ServiceUnavailable

Status Code	Description
504	ServerTimeout

## 5.18.7 Listing RoleBindings

### Function

This API is used to list or watch objects of kind RoleBinding

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/rbac.authorization.k8s.io/v1/rolebindings

**Table 5-4240** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	No	String	If 'true', then the output is pretty printed.

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

## Request Parameters

**Table 5-4241** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-4242 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.rbac.v1.RoleBinding</a> objects	Items is a list of RoleBindings
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard object's metadata.

Table 5-4243 io.k8s.api.rbac.v1.RoleBinding

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
roleRef	<a href="#">io.k8s.api.rbac.v1.RoleRef</a> object	RoleRef can reference a Role in the current namespace or a ClusterRole in the global namespace. If the RoleRef cannot be resolved, the Authorizer must return an error.
subjects	Array of <a href="#">io.k8s.api.rbac.v1.Subject</a> objects	Subjects holds references to the objects the role applies to.

**Table 5-4244** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4245** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4246** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4247** io.k8s.api.rbac.v1.RoleRef

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced
kind	String	Kind is the type of resource being referenced

Parameter	Type	Description
name	String	Name is the name of resource being referenced

**Table 5-4248** io.k8s.api.rbac.v1.Subject

Parameter	Type	Description
apiGroup	String	APIGroup holds the API group of the referenced subject. Defaults to "" for ServiceAccount subjects. Defaults to "rbac.authorization.k8s.io" for User and Group subjects.
kind	String	Kind of object being referenced. Values defined by this API group are "User", "Group", and "ServiceAccount". If the Authorizer does not recognized the kind value, the Authorizer should report an error.
name	String	Name of the object being referenced.
namespace	String	Namespace of the referenced object. If the object kind is non-namespace, such as "User" or "Group", and this value is not empty the Authorizer should report an error.

**Table 5-4249** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.19 StatefulSet

### 5.19.1 Deleting StatefulSets in a Namespace

#### Function

This API is used to delete all StatefulSets in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets

**Table 5-4250** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4251** Query Parameters

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset

Parameter	Mandatory	Type	Description
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4252** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4253** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-4254** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

**Status code: 200**

**Table 5-4255** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4256** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4257** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-4258** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

- Deleting only the StatefulSets (The pods are not deleted.)

```
{
  "Kind": "DeleteOptions",
  "apiVersion": "v1",
  "propagationPolicy": "Orphan"
}
```

- Deleting the pods and then the StatefulSets

```
{
  "apiVersion": "v1",
  "kind": "DeleteOptions",
  "propagationPolicy": "Foreground"
}
```

- Deleting the StatefulSets and then the pods

```
{
  "apiVersion": "v1",
  "kind": "DeleteOptions",
  "propagationPolicy": "Background"
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "apps/v1",
  "items": null,
  "kind": "StatefulSetList",
  "metadata": {
    "resourceVersion": "5257614",
    "selfLink": "/apis/apps/v1/namespaces/namespace-test/statefulsets"
  }
}
```

## Status Codes

Status Code	Description
200	OK
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.19.2 Querying StatefulSets in a Namespace

### Function

This API is used to query the details about all StatefulSets in a specified namespace.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps/v1/namespaces/{namespace}/statefulsets

**Table 5-4259** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4260** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4261** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-4262** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.apps.v1.StatefulSet</a> objects	StatefulSet represents a set of pods with consistent identities. Identities are defined as: <ul style="list-style-type: none"> <li>• Network: A single stable DNS and hostname.</li> <li>• Storage: As many VolumeClaims as requested. The StatefulSet guarantees that a given network identity will always map to the same storage identity.</li> </ul>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	ListMeta describes metadata that synthetic resources must have, including lists and various status objects. A resource may have only one of {ObjectMeta, ListMeta}.

**Table 5-4263** io.k8s.api.apps.v1.StatefulSet

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4264** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.

Parameter	Type	Description
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4265** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4266** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

Parameter	Type	Description
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAlias</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Type	Description
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/apis/core.v1/#pod-readiness-gate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4267** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4268** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4269** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4270** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4271** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4272** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4273** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4274** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4275** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4276** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4277** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4278** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-4279** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4280** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-4281** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4282** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4283** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4284** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4285** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4286** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4287** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4288** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4289** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-4290** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4291** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4292** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4293** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4294** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-4295** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4296** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4297** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4298** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-4299** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4300** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4301** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '..'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4302** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4303** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4304** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4305** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4306** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-4307** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4308** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-4309** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4310** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4311** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4312** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4313** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4314** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4315** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-4316** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4317** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4318** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4319** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4320** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4321** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4322** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4323** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4324** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4325** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4326** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4327** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4328** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-4329** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4330** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4331** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4332** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p> ::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-4333** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4334** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4335** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-4336** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4337** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4338** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4339** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4340** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4341** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4342** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-4343** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-4344** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4345** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-4346** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-4347** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-4348** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-4349** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-4350** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-4351** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-4352** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-4353** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-4354** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-4355** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4356** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.  If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).  Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4357** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4358** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4359** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4360** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4361** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4362** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4363** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4364** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4365** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-4366** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-4367** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

**Table 5-4368** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.19.3 Creating a StatefulSet

### Function

This API is used to create a StatefulSet.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /apis/apps/v1/namespaces/{namespace}/statefulsets

**Table 5-4369** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4370** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-4371** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4372** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	No	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	No	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4373** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Mandatory	Type	Description
podManagementPolicy	No	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	No	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	No	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	Yes	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Parameter	Mandatory	Type	Description
serviceName	Yes	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	Yes	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	No	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4374** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4375** io.k8s.api.core.v1.PodSpec

Parameter	Mandatory	Type	Description
activeDeadlineSeconds	No	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	No	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	No	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Yes	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	No	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.

Parameter	Mandatory	Type	Description
dnsPolicy	No	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	No	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	No	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	No	Array of <a href="#">io.k8s.api.core.v1.HostAlias</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	No	Boolean	Use the host's ipc namespace. Optional: Default to false.

Parameter	Mandatory	Type	Description
hostNetwork	No	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	No	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	No	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	No	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Mandatory	Type	Description
initContainers	No	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	No	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	No	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Mandatory	Type	Description
overhead	No	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	No	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.

Parameter	Mandatory	Type	Description
priority	No	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	No	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	No	Array of <a href="https://kubernetes.io/api-references/api-groups/generated/kubernetes.io/v1/#podreadinessgate-object">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	No	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>

Parameter	Mandatory	Type	Description
runtimeClassName	No	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	No	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	No	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	No	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	No	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>

Parameter	Mandatory	Type	Description
setHostnameAsFQDN	No	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	No	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	No	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.

Parameter	Mandatory	Type	Description
terminationGracePeriodSeconds	No	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	No	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	No	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	No	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4376** io.k8s.api.core.v1.Affinity

Parameter	Mandatory	Type	Description
nodeAffinity	No	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Mandatory	Type	Description
podAffinity	No	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	No	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4377** io.k8s.api.core.v1.NodeAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Mandatory	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	No	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4378** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Mandatory	Type	Description
preference	Yes	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Yes	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4379** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	No	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4380** io.k8s.api.core.v1.NodeSelector

Parameter	Mandatory	Type	Description
nodeSelectorTerms	Yes	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4381** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	The label key that the selector applies to.
operator	Yes	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
values	No	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4382** io.k8s.api.core.v1.PodAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4383** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4384** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Mandatory	Type	Description
podAffinityTerm	Yes	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Yes	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4385** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Mandatory	Type	Description
labelSelector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	No	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	Yes	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4386** io.k8s.api.core.v1.PodDNSConfig

Parameter	Mandatory	Type	Description
nameservers	No	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	No	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	No	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4387** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Mandatory	Type	Description
name	No	String	Required.
value	No	String	value is the value of the option

**Table 5-4388** io.k8s.api.core.v1.EphemeralContainer

Parameter	Mandatory	Type	Description
args	No	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	No	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	No	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.

Parameter	Mandatory	Type	Description
envFrom	No	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	No	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	No	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	No	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	Yes	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	No	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.

Parameter	Mandatory	Type	Description
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	No	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	No	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Parameter	Mandatory	Type	Description
targetContainerName	No	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	No	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	No	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Mandatory	Type	Description
volumeDevices	No	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	No	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	No	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4389** io.k8s.api.core.v1.HostAlias

Parameter	Mandatory	Type	Description
hostnames	No	Array of strings	Hostnames for the above IP address.
ip	No	String	IP address of the host file entry.

**Table 5-4390** io.k8s.api.core.v1.LocalObjectReference

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4391** io.k8s.api.core.v1.Container

Parameter	Mandatory	Type	Description
args	No	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	No	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	No	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.

Parameter	Mandatory	Type	Description
envFrom	No	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	No	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	No	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	No	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	No	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
securityContext	No	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>

Parameter	Mandatory	Type	Description
startupProbe	No	<a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	No	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Parameter	Mandatory	Type	Description
terminationMessagePath	No	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	No	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	No	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	No	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

Parameter	Mandatory	Type	Description
workingDir	No	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4392** io.k8s.api.core.v1.EnvVar

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	No	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	No	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4393** io.k8s.api.core.v1.EnvVarSource

Parameter	Mandatory	Type	Description
configMapKeyRef	No	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.

Parameter	Mandatory	Type	Description
fieldRef	No	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['&lt;KEY&gt;']</i> , <i>metadata.annotations['&lt;KEY&gt;']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	No	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	No	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4394** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Mandatory	Type	Description
key	Yes	String	The key to select.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4395** io.k8s.api.core.v1.SecretKeySelector

Parameter	Mandatory	Type	Description
key	Yes	String	The key of the secret to select from. Must be a valid secret key.

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4396** io.k8s.api.core.v1.EnvFromSource

Parameter	Mandatory	Type	Description
configMapRef	No	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	No	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	No	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4397** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4398** io.k8s.api.core.v1.SecretEnvSource

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret must be defined

**Table 5-4399** io.k8s.api.core.v1.Lifecycle

Parameter	Mandatory	Type	Description
postStart	No	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

Parameter	Mandatory	Type	Description
preStop	No	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4400** io.k8s.api.core.v1.Handler

Parameter	Mandatory	Type	Description
exec	No	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	No	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
tcpSocket	No	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4401** io.k8s.api.core.v1.ContainerPort

Parameter	Mandatory	Type	Description
containerPort	Yes	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, $0 < x < 65536$ .
hostIP	No	String	What host IP to bind the external port to.
hostPort	No	Integer	Number of port to expose on the host. If specified, this must be a valid port number, $0 < x < 65536$ . If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	No	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	No	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4402** io.k8s.api.core.v1.SecurityContext

Parameter	Mandatory	Type	Description
allowPrivilegeEscalation	No	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

Parameter	Mandatory	Type	Description
capabilities	No	<a href="https://kubernetes.io/api-reference/v1/objects/capabilities">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	No	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	No	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	No	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	No	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

Parameter	Mandatory	Type	Description
runAsUser	No	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	No	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	No	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	No	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4403** io.k8s.api.core.v1.Capabilities

Parameter	Mandatory	Type	Description
add	No	Array of strings	Added capabilities
drop	No	Array of strings	Removed capabilities

**Table 5-4404** io.k8s.api.core.v1.Probe

Parameter	Mandatory	Type	Description
exec	No	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	No	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	No	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	No	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	No	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	No	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	No	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	No	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4405** io.k8s.api.core.v1.ExecAction

Parameter	Mandatory	Type	Description
command	No	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4406** io.k8s.api.core.v1.HTTPGetAction

Parameter	Mandatory	Type	Description
host	No	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	No	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	No	String	Path to access on the HTTP server.
port	Yes	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	No	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4407** io.k8s.api.core.v1.HTTPHeader

Parameter	Mandatory	Type	Description
name	Yes	String	The header field name

Parameter	Mandatory	Type	Description
value	Yes	String	The header field value

**Table 5-4408** io.k8s.api.core.v1.TCPSocketAction

Parameter	Mandatory	Type	Description
host	No	String	Optional: Host name to connect to, defaults to the pod IP.
port	Yes	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4409** io.k8s.api.core.v1.VolumeDevice

Parameter	Mandatory	Type	Description
devicePath	Yes	String	devicePath is the path inside of the container that the device will be mapped to.
name	Yes	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4410** io.k8s.api.core.v1.VolumeMount

Parameter	Mandatory	Type	Description
extendPathMode	No	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	Yes	String	Path within the container at which the volume should be mounted. Must not contain '!'.

Parameter	Mandatory	Type	Description
mountPropagation	No	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	Yes	String	This must match the Name of a Volume.
policy	No	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	No	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	No	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	No	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4411** io.k8s.api.core.v1.Policy

Parameter	Mandatory	Type	Description
logs	No	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4412** io.k8s.api.core.v1.Logs

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations for log.
rotate	Yes	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4413** io.k8s.api.core.v1.PodReadinessGate

Parameter	Mandatory	Type	Description
conditionType	Yes	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4414** io.k8s.api.core.v1.PodSecurityContext

Parameter	Mandatory	Type	Description
fsGroup	No	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

Parameter	Mandatory	Type	Description
fsGroupChangePolicy	No	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	No	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

Parameter	Mandatory	Type	Description
runAsUser	No	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	No	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	No	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	No	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	No	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	No	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4415** io.k8s.api.core.v1.SELinuxOptions

Parameter	Mandatory	Type	Description
level	No	String	Level is SELinux level label that applies to the container.
role	No	String	Role is a SELinux role label that applies to the container.
type	No	String	Type is a SELinux type label that applies to the container.
user	No	String	User is a SELinux user label that applies to the container.

**Table 5-4416** io.k8s.api.core.v1.SeccompProfile

Parameter	Mandatory	Type	Description
localhostProfile	No	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	Yes	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4417** io.k8s.api.core.v1.Sysctl

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a property to set
value	Yes	String	Value of a property to set

**Table 5-4418** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Mandatory	Type	Description
gmsaCredentialSpec	No	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	No	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	No	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4419** io.k8s.api.core.v1.Toleration

Parameter	Mandatory	Type	Description
effect	No	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	No	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

Parameter	Mandatory	Type	Description
operator	No	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	No	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	No	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4420** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Mandatory	Type	Description
labelSelector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Mandatory	Type	Description
maxSkew	Yes	Integer	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3     P   P     - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>
topologyKey	Yes	String	<p>TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each &lt;key, value&gt; as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.</p>

Parameter	Mandatory	Type	Description
whenUnsatisfiable	Yes	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4421** io.k8s.api.core.v1.Volume

Parameter	Mandatory	Type	Description
awsElasticBlockStore	No	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Parameter	Mandatory	Type	Description
azureDisk	No	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	No	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	No	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	No	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	No	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	No	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	No	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	No	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Mandatory	Type	Description
ephemeral	No	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	No	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>
flexVolume	No	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	<p>FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.</p>

Parameter	Mandatory	Type	Description
flocker	No	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	No	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
gitRepo	No	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	No	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	No	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	No	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>

Parameter	Mandatory	Type	Description
localDir	No	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	Yes	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	No	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	No	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	No	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	No	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	No	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime

Parameter	Mandatory	Type	Description
rbd	No	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	No	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	No	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	No	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	No	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4422** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Parameter	Mandatory	Type	Description
partition	No	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	No	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	Yes	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4423** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Mandatory	Type	Description
cachingMode	No	String	Host Caching mode: None, Read Only, Read Write.
diskName	Yes	String	The Name of the data disk in the blob storage
diskURI	Yes	String	The URI the data disk in the blob storage
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

Parameter	Mandatory	Type	Description
kind	No	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4424** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	Yes	String	the name of secret that contains Azure Storage Account Name and Key
shareName	Yes	String	Share Name

**Table 5-4425** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Mandatory	Type	Description
monitors	Yes	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	No	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	No	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a>	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	No	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4426** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

Parameter	Mandatory	Type	Description
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	Yes	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4427** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4428** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Mandatory	Type	Description
driver	Yes	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	No	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	No	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Mandatory	Type	Description
volumeAttributes	No	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4429** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	No	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4430** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Mandatory	Type	Description
medium	No	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	No	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4431** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Mandatory	Type	Description
volumeClaimTemplate	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4432** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	Yes	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4433** io.k8s.api.core.v1.FCVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	No	Integer	Optional: FC target lun number
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	No	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	No	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4434** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Mandatory	Type	Description
driver	Yes	String	Driver is the name of the driver to use for this volume.
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	No	Map<String,String>	Optional: Extra command options if any.
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4435** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Mandatory	Type	Description
datasetName	No	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	No	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4436** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	No	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	Yes	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4437** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Mandatory	Type	Description
directory	No	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	Yes	String	Repository URL
revision	No	String	Commit hash for the specified revision.

**Table 5-4438** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Mandatory	Type	Description
endpoints	Yes	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	Yes	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	No	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4439** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Mandatory	Type	Description
path	Yes	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	No	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4440** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Mandatory	Type	Description
chapAuthDiscovery	No	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	No	Boolean	whether support iSCSI Session CHAP authentication
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	No	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	Yes	String	Target iSCSI Qualified Name.
iscsiInterface	No	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Yes	Integer	iSCSI Target Lun number.

Parameter	Mandatory	Type	Description
portals	No	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	Yes	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4441** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Mandatory	Type	Description
sizeLimit	No	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that:</p> <ol style="list-style-type: none"> <li>No precision is lost b.</li> <li>No fractional digits will be emitted c.</li> <li>The exponent (or</li> </ol>

Parameter	Mandatory	Type	Description
			<p>suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

**Table 5-4442** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Mandatory	Type	Description
path	Yes	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	No	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	Yes	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4443** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Mandatory	Type	Description
claimName	Yes	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	No	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4444** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	Yes	String	ID that identifies Photon Controller persistent disk

**Table 5-4445** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	Yes	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4446** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Yes	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4447** io.k8s.api.core.v1.VolumeProjection

Parameter	Mandatory	Type	Description
configMap	No	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	No	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project
secret	No	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	No	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4448** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '.' path or start with '..'.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4449** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4450** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Mandatory	Type	Description
fieldRef	No	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

Parameter	Mandatory	Type	Description
mode	No	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	Yes	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	No	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4451** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Mandatory	Type	Description
apiVersion	No	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	Yes	String	Path of the field to select in the specified API version.

**Table 5-4452** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Mandatory	Type	Description
containerName	No	String	Container name: required for volumes, optional for env vars

Parameter	Mandatory	Type	Description
divisor	No	String	Specifies the output format of the exposed resources, defaults to "1"
resource	Yes	String	Required: resource to select

**Table 5-4453** io.k8s.api.core.v1.SecretProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4454** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Mandatory	Type	Description
audience	No	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	No	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	Yes	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-4455** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Mandatory	Type	Description
group	No	String	Group to map volume access to Default is no group
readOnly	No	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	Yes	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

Parameter	Mandatory	Type	Description
tenant	No	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	No	String	User to map volume access to Defaults to serviceaccount user
volume	Yes	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-4456** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	Yes	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	No	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Yes	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
pool	No	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	No	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-4457** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	Yes	String	The host address of the ScaleIO API Gateway.
protectionDomain	No	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	Yes	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	No	Boolean	Flag to enable/disable SSL communication with Gateway, default false

Parameter	Mandatory	Type	Description
storageMode	No	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	No	String	The ScaleIO Storage Pool associated with the protection domain.
system	Yes	String	The name of the storage system as configured in ScaleIO.
volumeName	No	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-4458** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

Parameter	Mandatory	Type	Description
items	No	Array of <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	No	Boolean	Specify whether the Secret or its keys must be defined
secretName	No	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-4459** io.k8s.api.core.v1.KeyToPath

Parameter	Mandatory	Type	Description
key	Yes	String	The key to project.
mode	No	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

Parameter	Mandatory	Type	Description
path	Yes	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-4460** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	No	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

Parameter	Mandatory	Type	Description
volumeNamespace	No	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-4461** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	No	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	No	String	Storage Policy Based Management (SPBM) profile name.
volumePath	Yes	String	Path that identifies vSphere volume vmdk

**Table 5-4462** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Mandatory	Type	Description
rollingUpdate	No	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	No	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-4463** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Mandatory	Type	Description
partition	No	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-4464** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4465** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4466** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4467** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4468** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4469** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-4470** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4471** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4472** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4473** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	No	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4474** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Mandatory	Type	Description
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
reason	No	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	Yes	String	status is the status of the condition.
type	Yes	String	type is the type of the condition.

**Table 5-4475** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Mandatory	Type	Description
collisionCount	No	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	No	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	No	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	No	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).

Parameter	Mandatory	Type	Description
observedGeneration	No	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	No	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Yes	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	No	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)
updatedReplicas	No	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-4476** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Mandatory	Type	Description
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
message	No	String	A human readable message indicating details about the transition.
reason	No	String	The reason for the condition's last transition.
status	Yes	String	Status of the condition, one of True, False, Unknown.
type	Yes	String	Type of statefulset condition.

## Response Parameters

Status code: 200

**Table 5-4477** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4478** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.

Parameter	Type	Description
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4479** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4480** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

Parameter	Type	Description
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAlias</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

Parameter	Type	Description
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/objects/PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4481** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4482** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4483** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4484** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4485** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4486** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4487** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4488** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4489** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4490** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4491** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4492** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-4493** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4494** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-4495** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4496** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4497** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4498** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4499** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4500** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4501** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4502** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4503** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-4504** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4505** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4506** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4507** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4508** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-4509** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4510** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4511** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4512** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-4513** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4514** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4515** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '..'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4516** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4517** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4518** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4519** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4520** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-4521** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4522** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-4523** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4524** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4525** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4526** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4527** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4528** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4529** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-4530** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4531** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4532** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4533** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4534** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4535** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4536** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4537** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4538** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4539** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4540** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4541** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4542** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-4543** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4544** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4545** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4546** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-4547** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4548** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4549** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-4550** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4551** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4552** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4553** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4554** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4555** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4556** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-4557** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-4558** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4559** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-4560** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-4561** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-4562** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-4563** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-4564** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-4565** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-4566** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-4567** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-4568** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-4569** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4570** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.  If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).  Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4571** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4572** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4573** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4574** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4575** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4576** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4577** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4578** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4579** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-4580** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-4581** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

**Status code: 201**

**Table 5-4582** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.

Parameter	Type	Description
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4583** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Parameter	Type	Description
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4584** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4585** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.

Parameter	Type	Description
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>

Parameter	Type	Description
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Parameter	Type	Description
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_readiness_gate.go">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_security_context.go">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.

Parameter	Type	Description
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="https://kubernetes.io/api-reference/v1.27/types/#io.k8s.api.core.v1.Toleration">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.

Parameter	Type	Description
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4586** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4587** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4588** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4589** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4590** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4591** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4592** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4593** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4594** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4595** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4596** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Parameter	Type	Description
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4597** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-4598** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Parameter	Type	Description
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4599** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-4600** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4601** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4602** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4603** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4604** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4605** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4606** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4607** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4608** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-4609** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4610** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4611** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4612** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4613** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-4614** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4615** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4616** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4617** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-4618** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4619** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4620** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4621** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4622** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4623** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4624** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4625** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-4626** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4627** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-4628** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4629** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4630** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4631** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4632** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4633** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4634** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-4635** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4636** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4637** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4638** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4639** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4640** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4641** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4642** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4643** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4644** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4645** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4646** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4647** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-4648** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4649** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4650** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4651** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-4652** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4653** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4654** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-4655** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4656** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4657** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4658** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4659** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4660** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4661** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-4662** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-4663** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4664** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-4665** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-4666** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-4667** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-4668** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-4669** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-4670** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-4671** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-4672** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-4673** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-4674** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4675** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-4676** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4677** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4678** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4679** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4680** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4681** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4682** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4683** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4684** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-4685** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-4686** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

**Status code: 202**

**Table 5-4687** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.

Parameter	Type	Description
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4688** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Parameter	Type	Description
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4689** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4690** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.

Parameter	Type	Description
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>

Parameter	Type	Description
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Parameter	Type	Description
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_readiness_gates.go">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_security_context.go">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.

Parameter	Type	Description
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="https://kubernetes.io/api-references/api/v1/#toleration">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.

Parameter	Type	Description
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4691** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4692** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4693** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4694** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4695** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4696** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4697** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4698** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4699** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4700** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4701** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Parameter	Type	Description
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4702** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-4703** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Parameter	Type	Description
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4704** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-4705** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4706** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4707** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4708** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4709** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4710** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4711** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4712** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4713** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-4714** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4715** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4716** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4717** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4718** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-4719** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4720** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4721** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4722** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-4723** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4724** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4725** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4726** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4727** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4728** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4729** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4730** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-4731** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4732** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-4733** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4734** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4735** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4736** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4737** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4738** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4739** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-4740** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4741** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4742** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4743** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4744** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4745** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4746** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4747** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4748** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4749** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4750** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4751** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4752** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-4753** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4754** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4755** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4756** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-4757** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4758** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4759** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-4760** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4761** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4762** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4763** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4764** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4765** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4766** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-4767** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-4768** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4769** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-4770** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-4771** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-4772** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-4773** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-4774** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-4775** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-4776** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-4777** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-4778** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-4779** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4780** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4781** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4782** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4783** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4784** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4785** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4786** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4787** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4788** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4789** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-4790** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-4791** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

## Example Requests

Creating a StatefulSet named **statefulset-test** and using a Redis image to create three pods

```
{
  "apiVersion": "apps/v1",
  "kind": "StatefulSet",
  "metadata": {
    "name": "statefulset-test"
  },
  "spec": {
    "replicas": 3,
    "selector": {
      "matchLabels": {
        "app": "statefulset-test"
      }
    },
    "serviceName": "statefulset-test",
    "template": {
      "metadata": {
        "labels": {
          "app": "statefulset-test"
        }
      },
      "spec": {
        "containers": [ {
          "image": "redis",
          "name": "container-0",
          "resources": {
            "limits": {
              "cpu": "500m",
              "memory": "1024Mi"
            }
          }
        }
      ]
    }
  }
}
```

```
    "requests": {
      "cpu": "500m",
      "memory": "1024Mi"
    }
  },

## 5.19.4 Deleting a StatefulSet

### Function

This API is used to delete a specified StatefulSet.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}

**Table 5-4792** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the StatefulSet
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4793** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-4794 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-4795** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-4796** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-4797** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4798** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4799** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-4800** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

**Status code: 202**

**Table 5-4801** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4802** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

Parameter	Type	Description
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4803** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-4804** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

- Deleting only the StatefulSet (The pods are not deleted.)

```
{
  "Kind" : "DeleteOptions",
  "apiVersion" : "v1",
  "propagationPolicy" : "Orphan"
}
```

- Deleting the pods and then the StatefulSet

```
{
  "apiVersion" : "v1",
  "kind" : "DeleteOptions",
  "propagationPolicy" : "Foreground"
}
```

- Deleting the StatefulSet and then the pods

```
{
  "apiVersion" : "v1",
  "kind" : "DeleteOptions",
  "propagationPolicy" : "Background"
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion" : "v1",
  "code" : 200,
  "details" : {
    "group" : "apps",
    "kind" : "statefulsets",
    "name" : "statefulset-test",
    "uid" : "5eb82b50-b028-11e8-9d5d-c88d83be759f"
  },
  "kind" : "Status",
  "metadata" : { },
  "status" : "Success"
}
```

## Status Codes

Status Code	Description
200	OK
202	Accepted
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable

Status Code	Description
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.19.5 Querying a StatefulSet

### Function

This API is used to query the details about a specified StatefulSet.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}

**Table 5-4805** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the StatefulSet
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4806** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.

Parameter	Mandatory	Type	Description
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-4807 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-4808 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4809** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Parameter	Type	Description
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4810** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4811** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.

Parameter	Type	Description
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>

Parameter	Type	Description
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Parameter	Type	Description
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_readiness_gates.go">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_security_context.go">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.

Parameter	Type	Description
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="https://kubernetes.io/api-references/api/v1/#toleration">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.

Parameter	Type	Description
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4812** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4813** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4814** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4815** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4816** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4817** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4818** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4819** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4820** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4821** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4822** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Parameter	Type	Description
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4823** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-4824** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Parameter	Type	Description
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4825** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-4826** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4827** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4828** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4829** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4830** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4831** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4832** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4833** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4834** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-4835** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4836** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4837** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4838** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4839** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-4840** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4841** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4842** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4843** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-4844** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4845** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4846** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4847** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4848** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4849** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4850** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4851** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-4852** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4853** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-4854** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4855** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4856** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4857** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4858** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4859** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4860** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-4861** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4862** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4863** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4864** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4865** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4866** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4867** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4868** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4869** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4870** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4871** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4872** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4873** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-4874** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4875** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4876** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4877** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-4878** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4879** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4880** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-4881** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4882** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4883** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4884** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4885** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4886** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4887** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-4888** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-4889** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4890** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-4891** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-4892** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-4893** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-4894** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-4895** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-4896** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-4897** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-4898** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-4899** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-4900** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-4901** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4902** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-4903** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-4904** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-4905** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-4906** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-4907** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-4908** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-4909** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-4910** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-4911** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-4912** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

## 5.19.6 Updating a StatefulSet

### Function

This API is used to update a specified StatefulSet.

The following fields can be updated:

- **metadata.labels**
- **metadata.annotations**
- **spec.replicas**
- **spec.template**
- **spec.restartPolicy**
- **spec.revisionHistoryLimit**
- **spec.progressDeadlineSeconds** Other fields cannot be updated.

### Calling Method

For details, see [Calling APIs](#).

### URI

PATCH /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}

**Table 5-4913** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the StatefulSet
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-4914** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	No	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-4915 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-4916** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-4917** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-4918** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.

Parameter	Type	Description
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-4919** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-4920** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

Parameter	Type	Description
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

Parameter	Type	Description
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/objects/PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-4921** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-4922** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-4923** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-4924** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-4925** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-4926** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-4927** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4928** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-4929** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-4930** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-4931** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-4932** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-4933** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4934** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-4935** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-4936** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-4937** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-4938** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-4939** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-4940** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4941** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-4942** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-4943** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-4944** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-4945** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-4946** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-4947** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4948** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-4949** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-4950** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-4951** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-4952** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-4953** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-4954** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-4955** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'. Must not contain '..'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-4956** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-4957** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-4958** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-4959** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4960** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-4961** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-4962** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-4963** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-4964** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-4965** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-4966** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-4967** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-4968** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-4969** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-4970** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-4971** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-4972** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4973** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-4974** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-4975** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-4976** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-4977** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-4978** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-4979** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-4980** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-4981** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-4982** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-4983** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-4984** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-4985** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-4986** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-4987** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-4988** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-4989** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-4990** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-4991** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-4992** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-4993** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-4994** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-4995** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-4996** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-4997** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-4998** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-4999** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-5000** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-5001** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-5002** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-5003** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-5004** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-5005** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-5006** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-5007** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-5008** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-5009** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-5010** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-5011** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-5012** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-5013** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-5014** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-5015** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-5016** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-5017** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-5018** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-5019** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-5020** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-5021** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

## Example Requests

Changing the **labels** value of an existing StatefulSet to **"app": "statefulset-test2"**

```
{
  "metadata": {
    "labels": {
      "app": "statefulset-test2"
    }
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "apps/v1",
  "kind": "StatefulSet",
  "metadata": {
    "creationTimestamp": "2018-09-04T07:13:00Z",
    "generation": 2,
    "labels": {
      "app": "statefulset-test2"
    },
    "name": "statefulset-test",
    "namespace": "namespace-test",
    "resourceVersion": "5231369",
    "selfLink": "/apis/apps/v1/namespaces/namespace-test/statefulsets/statefulset-test",
    "uid": "f4a35f35-b011-11e8-b6ef-f898ef6c78b4"
  },
}
```

```

500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.19.7 Replacing a StatefulSet

### Function

This API is used to replace a specified StatefulSet.

The following fields can be updated:

- **metadata.labels**
- **metadata.annotations**
- **spec.template**
- **spec.replicas**
- **spec.revisionHistoryLimit**
- **spec.progressDeadlineSeconds** Other fields cannot be updated.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}

**Table 5-5022** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the StatefulSet
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-5023** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-5024** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-5025** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	No	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	No	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-5026** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Mandatory	Type	Description
podManagementPolicy	No	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	No	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	No	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	Yes	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Parameter	Mandatory	Type	Description
serviceName	Yes	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	Yes	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	No	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-5027** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-5028** io.k8s.api.core.v1.PodSpec

Parameter	Mandatory	Type	Description
activeDeadlineSeconds	No	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	No	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	No	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Yes	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	No	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.

Parameter	Mandatory	Type	Description
dnsPolicy	No	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	No	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	No	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	No	Array of <a href="#">io.k8s.api.core.v1.HostAlias</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	No	Boolean	Use the host's ipc namespace. Optional: Default to false.

Parameter	Mandatory	Type	Description
hostNetwork	No	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	No	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	No	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	No	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Mandatory	Type	Description
initContainers	No	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	No	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	No	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Mandatory	Type	Description
overhead	No	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	No	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.

Parameter	Mandatory	Type	Description
priority	No	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	No	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	No	Array of <a href="https://kubernetes.io/api-references/api-groups/versioned/#io.k8s.api.core.v1.PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	No	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>

Parameter	Mandatory	Type	Description
runtimeClassName	No	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	No	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	No	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	No	String	DeprecatedServiceAccount is a depreciated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	No	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>

Parameter	Mandatory	Type	Description
setHostnameAsFQDN	No	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	No	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	No	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.

Parameter	Mandatory	Type	Description
terminationGracePeriodSeconds	No	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	No	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	No	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	No	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-5029** io.k8s.api.core.v1.Affinity

Parameter	Mandatory	Type	Description
nodeAffinity	No	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Mandatory	Type	Description
podAffinity	No	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	No	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-5030** io.k8s.api.core.v1.NodeAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Mandatory	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	No	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-5031** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Mandatory	Type	Description
preference	Yes	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Yes	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-5032** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	No	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-5033** io.k8s.api.core.v1.NodeSelector

Parameter	Mandatory	Type	Description
nodeSelectorTerms	Yes	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-5034** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	The label key that the selector applies to.
operator	Yes	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
values	No	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-5035** io.k8s.api.core.v1.PodAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5036** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5037** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Mandatory	Type	Description
podAffinityTerm	Yes	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Yes	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-5038** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Mandatory	Type	Description
labelSelector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	No	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	Yes	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-5039** io.k8s.api.core.v1.PodDNSConfig

Parameter	Mandatory	Type	Description
nameservers	No	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	No	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	No	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-5040** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Mandatory	Type	Description
name	No	String	Required.
value	No	String	value is the value of the option

**Table 5-5041** io.k8s.api.core.v1.EphemeralContainer

Parameter	Mandatory	Type	Description
args	No	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	No	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	No	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.

Parameter	Mandatory	Type	Description
envFrom	No	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	No	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	No	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	No	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	Yes	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	No	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.

Parameter	Mandatory	Type	Description
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	No	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	No	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Parameter	Mandatory	Type	Description
targetContainerName	No	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	No	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	No	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Mandatory	Type	Description
volumeDevices	No	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	No	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	No	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5042** io.k8s.api.core.v1.HostAlias

Parameter	Mandatory	Type	Description
hostnames	No	Array of strings	Hostnames for the above IP address.
ip	No	String	IP address of the host file entry.

**Table 5-5043** io.k8s.api.core.v1.LocalObjectReference

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-5044** io.k8s.api.core.v1.Container

Parameter	Mandatory	Type	Description
args	No	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	No	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	No	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.

Parameter	Mandatory	Type	Description
envFrom	No	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	No	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	No	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	No	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	No	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
securityContext	No	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>

Parameter	Mandatory	Type	Description
startupProbe	No	<a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	No	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Parameter	Mandatory	Type	Description
terminationMessagePath	No	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	No	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	No	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	No	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

Parameter	Mandatory	Type	Description
workingDir	No	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5045** io.k8s.api.core.v1.EnvVar

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	No	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	No	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-5046** io.k8s.api.core.v1.EnvVarSource

Parameter	Mandatory	Type	Description
configMapKeyRef	No	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.

Parameter	Mandatory	Type	Description
fieldRef	No	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['&lt;KEY&gt;']</i> , <i>metadata.annotations['&lt;KEY&gt;']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	No	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	No	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-5047** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Mandatory	Type	Description
key	Yes	String	The key to select.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-5048** io.k8s.api.core.v1.SecretKeySelector

Parameter	Mandatory	Type	Description
key	Yes	String	The key of the secret to select from. Must be a valid secret key.

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5049** io.k8s.api.core.v1.EnvFromSource

Parameter	Mandatory	Type	Description
configMapRef	No	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	No	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	No	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-5050** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap must be defined

**Table 5-5051** io.k8s.api.core.v1.SecretEnvSource

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret must be defined

**Table 5-5052** io.k8s.api.core.v1.Lifecycle

Parameter	Mandatory	Type	Description
postStart	No	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

Parameter	Mandatory	Type	Description
preStop	No	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-5053** io.k8s.api.core.v1.Handler

Parameter	Mandatory	Type	Description
exec	No	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	No	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
tcpSocket	No	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-5054** io.k8s.api.core.v1.ContainerPort

Parameter	Mandatory	Type	Description
containerPort	Yes	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	No	String	What host IP to bind the external port to.
hostPort	No	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	No	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	No	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-5055** io.k8s.api.core.v1.SecurityContext

Parameter	Mandatory	Type	Description
allowPrivilegeEscalation	No	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

Parameter	Mandatory	Type	Description
capabilities	No	<a href="https://kubernetes.io/docs/reference/generated/kubernetes-api/v1.27/#capabilities-object">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	No	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	No	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	No	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	No	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

Parameter	Mandatory	Type	Description
runAsUser	No	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	No	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	No	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	No	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5056** io.k8s.api.core.v1.Capabilities

Parameter	Mandatory	Type	Description
add	No	Array of strings	Added capabilities
drop	No	Array of strings	Removed capabilities

**Table 5-5057** io.k8s.api.core.v1.Probe

Parameter	Mandatory	Type	Description
exec	No	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	No	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	No	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	No	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	No	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	No	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	No	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	No	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-5058** io.k8s.api.core.v1.ExecAction

Parameter	Mandatory	Type	Description
command	No	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-5059** io.k8s.api.core.v1.HTTPGetAction

Parameter	Mandatory	Type	Description
host	No	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	No	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	No	String	Path to access on the HTTP server.
port	Yes	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	No	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-5060** io.k8s.api.core.v1.HTTPHeader

Parameter	Mandatory	Type	Description
name	Yes	String	The header field name

Parameter	Mandatory	Type	Description
value	Yes	String	The header field value

**Table 5-5061** io.k8s.api.core.v1.TCPSocketAction

Parameter	Mandatory	Type	Description
host	No	String	Optional: Host name to connect to, defaults to the pod IP.
port	Yes	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-5062** io.k8s.api.core.v1.VolumeDevice

Parameter	Mandatory	Type	Description
devicePath	Yes	String	devicePath is the path inside of the container that the device will be mapped to.
name	Yes	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-5063** io.k8s.api.core.v1.VolumeMount

Parameter	Mandatory	Type	Description
extendPathMode	No	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	Yes	String	Path within the container at which the volume should be mounted. Must not contain '!'.

Parameter	Mandatory	Type	Description
mountPropagation	No	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	Yes	String	This must match the Name of a Volume.
policy	No	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	No	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	No	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	No	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-5064** io.k8s.api.core.v1.Policy

Parameter	Mandatory	Type	Description
logs	No	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-5065** io.k8s.api.core.v1.Logs

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations for log.
rotate	Yes	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-5066** io.k8s.api.core.v1.PodReadinessGate

Parameter	Mandatory	Type	Description
conditionType	Yes	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-5067** io.k8s.api.core.v1.PodSecurityContext

Parameter	Mandatory	Type	Description
fsGroup	No	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

Parameter	Mandatory	Type	Description
fsGroupChangePolicy	No	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	No	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

Parameter	Mandatory	Type	Description
runAsUser	No	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	No	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	No	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	No	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	No	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	No	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5068** io.k8s.api.core.v1.SELinuxOptions

Parameter	Mandatory	Type	Description
level	No	String	Level is SELinux level label that applies to the container.
role	No	String	Role is a SELinux role label that applies to the container.
type	No	String	Type is a SELinux type label that applies to the container.
user	No	String	User is a SELinux user label that applies to the container.

**Table 5-5069** io.k8s.api.core.v1.SeccompProfile

Parameter	Mandatory	Type	Description
localhostProfile	No	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	Yes	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-5070** io.k8s.api.core.v1.Sysctl

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a property to set
value	Yes	String	Value of a property to set

**Table 5-5071** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Mandatory	Type	Description
gmsaCredentialSpec	No	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	No	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	No	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5072** io.k8s.api.core.v1.Toleration

Parameter	Mandatory	Type	Description
effect	No	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	No	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

Parameter	Mandatory	Type	Description
operator	No	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	No	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	No	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-5073** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Mandatory	Type	Description
labelSelector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Mandatory	Type	Description
maxSkew	Yes	Integer	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3     P   P     - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>
topologyKey	Yes	String	<p>TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each &lt;key, value&gt; as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.</p>

Parameter	Mandatory	Type	Description
whenUnsatisfiable	Yes	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-5074** io.k8s.api.core.v1.Volume

Parameter	Mandatory	Type	Description
awsElasticBlockStore	No	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Parameter	Mandatory	Type	Description
azureDisk	No	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	No	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	No	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	No	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	No	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	No	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	No	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	No	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Mandatory	Type	Description
ephemeral	No	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	No	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>
flexVolume	No	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	<p>FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.</p>

Parameter	Mandatory	Type	Description
flocker	No	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	No	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
gitRepo	No	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	No	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	No	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	No	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>

Parameter	Mandatory	Type	Description
localDir	No	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	Yes	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	No	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	No	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	No	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	No	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	No	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime

Parameter	Mandatory	Type	Description
rbd	No	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	No	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	No	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	No	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	No	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-5075** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Parameter	Mandatory	Type	Description
partition	No	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	No	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	Yes	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-5076** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Mandatory	Type	Description
cachingMode	No	String	Host Caching mode: None, Read Only, Read Write.
diskName	Yes	String	The Name of the data disk in the blob storage
diskURI	Yes	String	The URI the data disk in the blob storage
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

Parameter	Mandatory	Type	Description
kind	No	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-5077** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	Yes	String	the name of secret that contains Azure Storage Account Name and Key
shareName	Yes	String	Share Name

**Table 5-5078** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Mandatory	Type	Description
monitors	Yes	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	No	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	No	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a>	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	No	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-5079** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

Parameter	Mandatory	Type	Description
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	Yes	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-5080** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-5081** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Mandatory	Type	Description
driver	Yes	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	No	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	No	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Mandatory	Type	Description
volumeAttributes	No	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-5082** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	No	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-5083** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Mandatory	Type	Description
medium	No	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	No	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-5084** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Mandatory	Type	Description
volumeClaimTemplate	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-5085** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	Yes	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-5086** io.k8s.api.core.v1.FCVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	No	Integer	Optional: FC target lun number
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	No	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	No	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-5087** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Mandatory	Type	Description
driver	Yes	String	Driver is the name of the driver to use for this volume.
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	No	Map<String,String>	Optional: Extra command options if any.
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-5088** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Mandatory	Type	Description
datasetName	No	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	No	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-5089** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	No	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	Yes	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-5090** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Mandatory	Type	Description
directory	No	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	Yes	String	Repository URL
revision	No	String	Commit hash for the specified revision.

**Table 5-5091** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Mandatory	Type	Description
endpoints	Yes	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	Yes	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	No	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-5092** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Mandatory	Type	Description
path	Yes	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	No	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-5093** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Mandatory	Type	Description
chapAuthDiscovery	No	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	No	Boolean	whether support iSCSI Session CHAP authentication
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	No	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	Yes	String	Target iSCSI Qualified Name.
iscsiInterface	No	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Yes	Integer	iSCSI Target Lun number.

Parameter	Mandatory	Type	Description
portals	No	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	Yes	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-5094** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Mandatory	Type	Description
sizeLimit	No	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or</p>

Parameter	Mandatory	Type	Description
			<p>suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

**Table 5-5095** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Mandatory	Type	Description
path	Yes	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	No	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	Yes	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-5096** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Mandatory	Type	Description
claimName	Yes	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	No	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-5097** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	Yes	String	ID that identifies Photon Controller persistent disk

**Table 5-5098** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	Yes	String	VolumeID uniquely identifies a Portworx volume

**Table 5-5099** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Yes	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-5100** io.k8s.api.core.v1.VolumeProjection

Parameter	Mandatory	Type	Description
configMap	No	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	No	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project
secret	No	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	No	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-5101** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-5102** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-5103** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Mandatory	Type	Description
fieldRef	No	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

Parameter	Mandatory	Type	Description
mode	No	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	Yes	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	No	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-5104** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Mandatory	Type	Description
apiVersion	No	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	Yes	String	Path of the field to select in the specified API version.

**Table 5-5105** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Mandatory	Type	Description
containerName	No	String	Container name: required for volumes, optional for env vars

Parameter	Mandatory	Type	Description
divisor	No	String	Specifies the output format of the exposed resources, defaults to "1"
resource	Yes	String	Required: resource to select

**Table 5-5106** io.k8s.api.core.v1.SecretProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5107** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Mandatory	Type	Description
audience	No	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	No	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	Yes	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-5108** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Mandatory	Type	Description
group	No	String	Group to map volume access to Default is no group
readOnly	No	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	Yes	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

Parameter	Mandatory	Type	Description
tenant	No	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	No	String	User to map volume access to Defaults to serviceaccount user
volume	Yes	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-5109** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	Yes	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	No	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Yes	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
pool	No	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	No	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-5110** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	Yes	String	The host address of the ScaleIO API Gateway.
protectionDomain	No	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	Yes	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	No	Boolean	Flag to enable/disable SSL communication with Gateway, default false

Parameter	Mandatory	Type	Description
storageMode	No	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	No	String	The ScaleIO Storage Pool associated with the protection domain.
system	Yes	String	The name of the storage system as configured in ScaleIO.
volumeName	No	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-5111** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

Parameter	Mandatory	Type	Description
items	No	Array of <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	No	Boolean	Specify whether the Secret or its keys must be defined
secretName	No	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-5112** io.k8s.api.core.v1.KeyToPath

Parameter	Mandatory	Type	Description
key	Yes	String	The key to project.
mode	No	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

Parameter	Mandatory	Type	Description
path	Yes	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-5113** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	No	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

Parameter	Mandatory	Type	Description
volumeNamespace	No	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-5114** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	No	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	No	String	Storage Policy Based Management (SPBM) profile name.
volumePath	Yes	String	Path that identifies vSphere volume vmdk

**Table 5-5115** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Mandatory	Type	Description
rollingUpdate	No	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	No	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-5116** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Mandatory	Type	Description
partition	No	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-5117** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-5118** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-5119** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-5120** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-5121** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-5122** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-5123** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-5124** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-5125** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-5126** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	No	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-5127** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Mandatory	Type	Description
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
reason	No	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	Yes	String	status is the status of the condition.
type	Yes	String	type is the type of the condition.

**Table 5-5128** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Mandatory	Type	Description
collisionCount	No	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	No	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	No	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	No	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).

Parameter	Mandatory	Type	Description
observedGeneration	No	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	No	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Yes	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	No	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)
updatedReplicas	No	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-5129** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Mandatory	Type	Description
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
message	No	String	A human readable message indicating details about the transition.
reason	No	String	The reason for the condition's last transition.
status	Yes	String	Status of the condition, one of True, False, Unknown.
type	Yes	String	Type of statefulset condition.

## Response Parameters

Status code: 200

**Table 5-5130** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-5131** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.

Parameter	Type	Description
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-5132** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-5133** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

Parameter	Type	Description
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

Parameter	Type	Description
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/apis/core/v1/#pod-readiness-gate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-5134** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-5135** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-5136** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-5137** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-5138** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-5139** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-5140** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5141** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5142** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-5143** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-5144** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-5145** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-5146** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5147** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-5148** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-5149** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5150** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-5151** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-5152** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-5153** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5154** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-5155** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-5156** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-5157** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-5158** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-5159** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-5160** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5161** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-5162** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-5163** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-5164** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-5165** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-5166** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-5167** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-5168** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-5169** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-5170** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-5171** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-5172** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5173** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-5174** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-5175** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-5176** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5177** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-5178** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-5179** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-5180** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-5181** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-5182** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-5183** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-5184** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-5185** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-5186** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-5187** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-5188** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-5189** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-5190** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-5191** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-5192** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-5193** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-5194** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-5195** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-5196** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-5197** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-5198** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-5199** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-5200** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-5201** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-5202** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-5203** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-5204** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-5205** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-5206** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-5207** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-5208** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-5209** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-5210** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-5211** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5212** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-5213** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-5214** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-5215** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-5216** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-5217** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-5218** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-5219** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-5220** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-5221** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-5222** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-5223** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-5224** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-5225** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-5226** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-5227** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-5228** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-5229** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-5230** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-5231** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-5232** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-5233** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-5234** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

**Status code: 201**

**Table 5-5235** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.

Parameter	Type	Description
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-5236** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>

Parameter	Type	Description
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-5237** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-5238** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.

Parameter	Type	Description
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>

Parameter	Type	Description
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Parameter	Type	Description
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_readiness_gates.go">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_security_context.go">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.

Parameter	Type	Description
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="https://kubernetes.io/docs/reference/generated/kubernetes-api/v1.27/#toleration-v1-core">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.

Parameter	Type	Description
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-5239** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-5240** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-5241** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-5242** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-5243** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-5244** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-5245** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5246** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringSchedulingIgnoredDuringExecution anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5247** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-5248** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-5249** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Parameter	Type	Description
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-5250** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-5251** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Parameter	Type	Description
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5252** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-5253** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-5254** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5255** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-5256** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-5257** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-5258** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5259** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-5260** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-5261** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-5262** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-5263** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-5264** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-5265** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5266** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-5267** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-5268** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-5269** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-5270** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-5271** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-5272** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-5273** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-5274** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-5275** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-5276** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-5277** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5278** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-5279** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-5280** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-5281** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5282** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-5283** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-5284** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-5285** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-5286** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-5287** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-5288** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-5289** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-5290** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-5291** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-5292** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-5293** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-5294** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-5295** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-5296** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-5297** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-5298** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-5299** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-5300** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-5301** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-5302** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-5303** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-5304** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-5305** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-5306** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-5307** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-5308** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-5309** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-5310** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-5311** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-5312** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-5313** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-5314** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-5315** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-5316** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5317** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-5318** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-5319** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-5320** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-5321** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-5322** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-5323** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-5324** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-5325** io.k8s.api.apps.v1.StatefulSetUpdateStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy</a> object	RollingUpdate is used to communicate parameters when Type is RollingUpdateStatefulSetStrategyType.
type	String	Type indicates the type of the StatefulSetUpdateStrategy. Default is RollingUpdate.

**Table 5-5326** io.k8s.api.apps.v1.RollingUpdateStatefulSetStrategy

Parameter	Type	Description
partition	Integer	Partition indicates the ordinal at which the StatefulSet should be partitioned. Default value is 0.

**Table 5-5327** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-5328** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-5329** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-5330** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-5331** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-5332** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-5333** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-5334** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-5335** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-5336** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-5337** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-5338** io.k8s.api.apps.v1.StatefulSetStatus

Parameter	Type	Description
collisionCount	Integer	collisionCount is the count of hash collisions for the StatefulSet. The StatefulSet controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ControllerRevision.
conditions	Array of <a href="#">io.k8s.api.apps.v1.StatefulSetCondition</a> objects	Represents the latest available observations of a statefulset's current state.
currentReplicas	Integer	currentReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by currentRevision.
currentRevision	String	currentRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [0,currentReplicas).
observedGeneration	Long	observedGeneration is the most recent generation observed for this StatefulSet. It corresponds to the StatefulSet's generation, which is updated on mutation by the API Server.
readyReplicas	Integer	readyReplicas is the number of Pods created by the StatefulSet controller that have a Ready Condition.
replicas	Integer	replicas is the number of Pods created by the StatefulSet controller.
updateRevision	String	updateRevision, if not empty, indicates the version of the StatefulSet used to generate Pods in the sequence [replicas-updatedReplicas,replicas)

Parameter	Type	Description
updatedReplicas	Integer	updatedReplicas is the number of Pods created by the StatefulSet controller from the StatefulSet version indicated by updateRevision.

**Table 5-5339** io.k8s.api.apps.v1.StatefulSetCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of statefulset condition.

## Example Requests

Changing the **replicas** value of an existing StatefulSet to 2

```
{
  "apiVersion": "apps/v1",
  "kind": "StatefulSet",
  "metadata": {
    "name": "statefulset-test"
  },
  "spec": {
    "replicas": 2,
    "selector": {
      "matchLabels": {

## 5.19.8 Querying the Status of a StatefulSet

### Function

This API is used to query the status of a specified StatefulSet.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps/v1/namespaces/{namespace}/statefulsets/{name}/status

**Table 5-5340** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the StatefulSet
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-5341** Query Parameters

Parameter	Mandatory	Type	Description
pretty	No	String	If 'true', then the output is pretty printed.

### Request Parameters

**Table 5-5342** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

### Response Parameters

**Status code: 200**

**Table 5-5343** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	ObjectMeta is metadata that all persisted resources must have, which includes all objects users must create.
spec	<a href="#">io.k8s.api.apps.v1.StatefulSetSpec</a> object	Spec defines the desired identities of pods in this set.
status	<a href="#">io.k8s.api.apps.v1.StatefulSetStatus</a> object	Status is the current status of Pods in this StatefulSet. This data may be out of date by some window of time.

**Table 5-5344** io.k8s.api.apps.v1.StatefulSetSpec

Parameter	Type	Description
podManagementPolicy	String	podManagementPolicy controls how pods are created during initial scale up, when replacing pods on nodes, or when scaling down. The default policy is <i>OrderedReady</i> , where pods are created in increasing order (pod-0, then pod-1, etc) and the controller will wait until each pod is ready before continuing. When scaling down, the pods are removed in the opposite order. The alternative policy is <i>Parallel</i> which will create pods in parallel to match the desired scale without waiting, and on scale down will delete all pods at once.

Parameter	Type	Description
replicas	Integer	replicas is the desired number of replicas of the given Template. These are replicas in the sense that they are instantiations of the same Template, but individual replicas also have a consistent identity. If unspecified, defaults to 1.
revisionHistoryLimit	Integer	revisionHistoryLimit is the maximum number of revisions that will be maintained in the StatefulSet's revision history. The revision history consists of all revisions not represented by a currently applied StatefulSetSpec version. The default value is 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	selector is a label query over pods that should match the replica count. It must match the pod template's labels. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
serviceName	String	serviceName is the name of the service that governs this StatefulSet. This service must exist before the StatefulSet, and is responsible for the network identity of the set. Pods get DNS/hostnames that follow the pattern: pod-specific-string.serviceName.default.svc.cluster.local where "pod-specific-string" is managed by the StatefulSet controller.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	template is the object that describes the pod that will be created if insufficient replicas are detected. Each pod stamped out by the StatefulSet will fulfill this Template, but have a unique identity from the rest of the StatefulSet.
updateStrategy	<a href="#">io.k8s.api.apps.v1.StatefulSetUpdateStrategy</a> object	updateStrategy indicates the StatefulSetUpdateStrategy that will be employed to update Pods in the StatefulSet when a revision is made to Template.
volumeClaimTemplates	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> objects	volumeClaimTemplates is a list of claims that pods are allowed to reference. The StatefulSet controller is responsible for mapping network identities to claims in a way that maintains the identity of a pod. Every claim in this list must have at least one matching (by name) volumeMount in one container in the template. A claim in this list takes precedence over any volumes in the template, with the same name.

**Table 5-5345** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-5346** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

Parameter	Type	Description
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Type	Description
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/objects/PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-5347** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-5348** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-5349** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-5350** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-5351** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-5352** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-5353** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5354** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-5355** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-5356** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-5357** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-5358** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-5359** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5360** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-5361** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-5362** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-5363** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-5364** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-5365** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-5366** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-5367** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-5368** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-5369** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-5370** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-5371** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-5372** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-5373** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5374** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-5375** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-5376** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-5377** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-5378** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-5379** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-5380** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-5381** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-5382** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-5383** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-5384** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-5385** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5386** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-5387** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-5388** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-5389** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-5390** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-5391** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-5392** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-5393** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-5394** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
