apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-2604** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-2605** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2606** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-2607** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-2608** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-2609** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-2610** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-2611** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-2612** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-2613** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-2614** io.k8s.api.apps.v1.DeploymentStatus

Parameter	Type	Description
availableReplicas	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
collisionCount	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	Array of <a href="#">io.k8s.api.apps.v1.DeploymentCondition</a> objects	Represents the latest available observations of a deployment's current state.
observedGeneration	Long	The generation observed by the deployment controller.
readyReplicas	Integer	Total number of ready pods targeted by this deployment.
replicas	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	Integer	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.

Parameter	Type	Description
updatedReplicas	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

**Table 5-2615** io.k8s.api.apps.v1.DeploymentCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
lastUpdateTime	String	The last time this condition was updated.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of deployment condition.

## Example Requests

Updating the **labels** value for a Deployment

```
{
  "metadata": {
    "labels": {
      "app": "deployment-test2"
    }
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "apps/v1",
  "kind": "Deployment",
  "metadata": {
    "annotations": {
      "deployment.kubernetes.io/revision": "2"
    },
    "creationTimestamp": "2018-09-06T03:39:32Z",
    "generation": 2,
    "labels": {
      "app": "deployment-test2"
    },
    "name": "deployment-test",
```

```

## 5.5.8 Replacing a Deployment

### Function

This API is used to replace a specified Deployment.

The following fields can be updated:

- **metadata.labels**
- **metadata.generateName**
- **metadata.annotations**
- **spec.template**

- `spec.replicas`
- `spec.revisionHistoryLimit`
- `spec.progressDeadlineSeconds`

## Calling Method

For details, see [Calling APIs](#).

## URI

PUT `/apis/apps/v1/namespaces/{namespace}/deployments/{name}`

**Table 5-2616** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Deployment
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-2617** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-2618** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-2619** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata.

Parameter	Mandatory	Type	Description
spec	No	<a href="#">io.k8s.api.apps.v1.DeploymentSpec</a> object	Specification of the desired behavior of the Deployment.
status	No	<a href="#">io.k8s.api.apps.v1.DeploymentStatus</a> object	Most recently observed status of the Deployment.

**Table 5-2620** io.k8s.api.apps.v1.DeploymentSpec

Parameter	Mandatory	Type	Description
minReadySeconds	No	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
paused	No	Boolean	Indicates that the deployment is paused.
progressDeadlineSeconds	No	Integer	The maximum time in seconds for a deployment to make progress before it is considered to be failed. The deployment controller will continue to process failed deployments and a condition with a ProgressDeadlineExceeded reason will be surfaced in the deployment status. Note that progress will not be estimated during the time a deployment is paused. Defaults to 600s.
replicas	No	Integer	Number of desired pods. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.
revisionHistoryLimit	No	Integer	The number of old ReplicaSets to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 10.

Parameter	Mandatory	Type	Description
selector	Yes	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	Label selector for pods. Existing ReplicaSets whose pods are selected by this will be the ones affected by this deployment. It must match the pod template's labels.
strategy	No	<a href="#">io.k8s.api.apps.v1.DeploymentStrategy</a> object	The deployment strategy to use to replace existing pods with new ones.
template	Yes	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	Template describes the pods that will be created.

**Table 5-2621** io.k8s.api.apps.v1.DeploymentStrategy

Parameter	Mandatory	Type	Description
rollingUpdate	No	<a href="#">io.k8s.api.apps.v1.RollingUpdateDeployment</a> object	Rolling update config params. Present only if DeploymentStrategyType = RollingUpdate.
type	No	String	Type of deployment. Can be "Recreate" or "RollingUpdate". Default is RollingUpdate.

**Table 5-2622** io.k8s.api.apps.v1.RollingUpdateDeployment

Parameter	Mandatory	Type	Description
maxSurge	No	String	The maximum number of pods that can be scheduled above the desired number of pods. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This can not be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up. Defaults to 25%. Example: when this is set to 30%, the new ReplicaSet can be scaled up immediately when the rolling update starts, such that the total number of old and new pods do not exceed 130% of desired pods. Once old pods have been killed, new ReplicaSet can be scaled up further, ensuring that total number of pods running at any time during the update is at most 130% of desired pods.
maxUnavailable	No	String	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding down. This can not be 0 if MaxSurge is 0. Defaults to 25%. Example: when this is set to 30%, the old ReplicaSet can be scaled down to 70% of desired pods immediately when the rolling update starts. Once new pods are ready, old ReplicaSet can be scaled down further, followed by scaling up the new ReplicaSet, ensuring that the total number of pods available at all times during the update is at least 70% of desired pods.

**Table 5-2623** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-2624** io.k8s.api.core.v1.PodSpec

Parameter	Mandatory	Type	Description
activeDeadlineSeconds	No	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	No	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	No	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Yes	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	No	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.

Parameter	Mandatory	Type	Description
dnsPolicy	No	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	No	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	No	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	No	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	No	Boolean	Use the host's ipc namespace. Optional: Default to false.

Parameter	Mandatory	Type	Description
hostNetwork	No	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	No	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	No	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	No	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Mandatory	Type	Description
initContainers	No	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	No	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	No	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Mandatory	Type	Description
overhead	No	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	No	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.

Parameter	Mandatory	Type	Description
priority	No	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	No	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	No	Array of <a href="https://kubernetes.io/api-references/api-groups/generated/k8s.io">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	No	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>

Parameter	Mandatory	Type	Description
runtimeClassName	No	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	No	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	No	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	No	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	No	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>

Parameter	Mandatory	Type	Description
setHostnameAsFQDN	No	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	No	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	No	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.

Parameter	Mandatory	Type	Description
terminationGracePeriodSeconds	No	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	No	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	No	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	No	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-2625** io.k8s.api.core.v1.Affinity

Parameter	Mandatory	Type	Description
nodeAffinity	No	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Mandatory	Type	Description
podAffinity	No	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	No	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-2626** io.k8s.api.core.v1.NodeAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Mandatory	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	No	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-2627** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Mandatory	Type	Description
preference	Yes	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Yes	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-2628** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	No	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-2629** io.k8s.api.core.v1.NodeSelector

Parameter	Mandatory	Type	Description
nodeSelectorTerms	Yes	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-2630** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	The label key that the selector applies to.
operator	Yes	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist, Gt, and Lt.
values	No	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-2631** io.k8s.api.core.v1.PodAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2632** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Mandatory	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	No	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2633** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Mandatory	Type	Description
podAffinityTerm	Yes	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Yes	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-2634** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Mandatory	Type	Description
labelSelector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	No	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	Yes	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-2635** io.k8s.api.core.v1.PodDNSConfig

Parameter	Mandatory	Type	Description
nameservers	No	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	No	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	No	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-2636** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Mandatory	Type	Description
name	No	String	Required.
value	No	String	value is the value of the option

**Table 5-2637** io.k8s.api.core.v1.EphemeralContainer

Parameter	Mandatory	Type	Description
args	No	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	No	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	No	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.

Parameter	Mandatory	Type	Description
envFrom	No	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	No	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	No	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	No	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	Yes	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	No	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.

Parameter	Mandatory	Type	Description
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	No	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	No	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Parameter	Mandatory	Type	Description
targetContainerName	No	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	No	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	No	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Mandatory	Type	Description
volumeDevices	No	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	No	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	No	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2638** io.k8s.api.core.v1.HostAlias

Parameter	Mandatory	Type	Description
hostnames	No	Array of strings	Hostnames for the above IP address.
ip	No	String	IP address of the host file entry.

**Table 5-2639** io.k8s.api.core.v1.LocalObjectReference

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-2640** io.k8s.api.core.v1.Container

Parameter	Mandatory	Type	Description
args	No	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	No	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	No	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.

Parameter	Mandatory	Type	Description
envFrom	No	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	No	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	No	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	No	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	No	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	No	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
securityContext	No	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>

Parameter	Mandatory	Type	Description
startupProbe	No	<a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	No	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	No	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false

Parameter	Mandatory	Type	Description
terminationMessagePath	No	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	No	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	No	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	No	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	No	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.

Parameter	Mandatory	Type	Description
workingDir	No	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2641** io.k8s.api.core.v1.EnvVar

Parameter	Mandatory	Type	Description
name	Yes	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	No	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".
valueFrom	No	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-2642** io.k8s.api.core.v1.EnvVarSource

Parameter	Mandatory	Type	Description
configMapKeyRef	No	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.

Parameter	Mandatory	Type	Description
fieldRef	No	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports metadata.name, metadata.namespace, <i>metadata.labels['&lt;KEY&gt;']</i> , <i>metadata.annotations['&lt;KEY&gt;']</i> , spec.nodeName, spec.serviceAccountName, status.hostIP, status.podIP, status.podIPs.
resourceFieldRef	No	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	No	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-2643** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Mandatory	Type	Description
key	Yes	String	The key to select.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-2644** io.k8s.api.core.v1.SecretKeySelector

Parameter	Mandatory	Type	Description
key	Yes	String	The key of the secret to select from. Must be a valid secret key.

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2645** io.k8s.api.core.v1.EnvFromSource

Parameter	Mandatory	Type	Description
configMapRef	No	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	No	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	No	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-2646** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap must be defined

**Table 5-2647** io.k8s.api.core.v1.SecretEnvSource

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret must be defined

**Table 5-2648** io.k8s.api.core.v1.Lifecycle

Parameter	Mandatory	Type	Description
postStart	No	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

Parameter	Mandatory	Type	Description
preStop	No	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-2649** io.k8s.api.core.v1.Handler

Parameter	Mandatory	Type	Description
exec	No	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	No	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
tcpSocket	No	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-2650** io.k8s.api.core.v1.ContainerPort

Parameter	Mandatory	Type	Description
containerPort	Yes	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	No	String	What host IP to bind the external port to.
hostPort	No	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	No	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	No	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-2651** io.k8s.api.core.v1.SecurityContext

Parameter	Mandatory	Type	Description
allowPrivilegeEscalation	No	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN

Parameter	Mandatory	Type	Description
capabilities	No	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	No	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.
procMount	No	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	No	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	No	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

Parameter	Mandatory	Type	Description
runAsUser	No	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	No	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	No	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.
windowsOptions	No	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2652** io.k8s.api.core.v1.Capabilities

Parameter	Mandatory	Type	Description
add	No	Array of strings	Added capabilities
drop	No	Array of strings	Removed capabilities

**Table 5-2653** io.k8s.api.core.v1.Probe

Parameter	Mandatory	Type	Description
exec	No	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	No	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	No	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	No	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	No	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	No	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.
tcpSocket	No	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	No	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-2654** io.k8s.api.core.v1.ExecAction

Parameter	Mandatory	Type	Description
command	No	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-2655** io.k8s.api.core.v1.HTTPGetAction

Parameter	Mandatory	Type	Description
host	No	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	No	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	No	String	Path to access on the HTTP server.
port	Yes	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	No	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-2656** io.k8s.api.core.v1.HTTPHeader

Parameter	Mandatory	Type	Description
name	Yes	String	The header field name

Parameter	Mandatory	Type	Description
value	Yes	String	The header field value

**Table 5-2657** io.k8s.api.core.v1.TCPSocketAction

Parameter	Mandatory	Type	Description
host	No	String	Optional: Host name to connect to, defaults to the pod IP.
port	Yes	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-2658** io.k8s.api.core.v1.VolumeDevice

Parameter	Mandatory	Type	Description
devicePath	Yes	String	devicePath is the path inside of the container that the device will be mapped to.
name	Yes	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-2659** io.k8s.api.core.v1.VolumeMount

Parameter	Mandatory	Type	Description
extendPathMode	No	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	Yes	String	Path within the container at which the volume should be mounted. Must not contain '!'.

Parameter	Mandatory	Type	Description
mountPropagation	No	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	Yes	String	This must match the Name of a Volume.
policy	No	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	No	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	No	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	No	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$ (VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-2660** io.k8s.api.core.v1.Policy

Parameter	Mandatory	Type	Description
logs	No	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-2661** io.k8s.api.core.v1.Logs

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations for log.
rotate	Yes	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-2662** io.k8s.api.core.v1.PodReadinessGate

Parameter	Mandatory	Type	Description
conditionType	Yes	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-2663** io.k8s.api.core.v1.PodSecurityContext

Parameter	Mandatory	Type	Description
fsGroup	No	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>

Parameter	Mandatory	Type	Description
fsGroupChangePolicy	No	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	No	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	No	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

Parameter	Mandatory	Type	Description
runAsUser	No	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seLinuxOptions	No	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	No	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	No	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	No	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	No	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2664** io.k8s.api.core.v1.SELinuxOptions

Parameter	Mandatory	Type	Description
level	No	String	Level is SELinux level label that applies to the container.
role	No	String	Role is a SELinux role label that applies to the container.
type	No	String	Type is a SELinux type label that applies to the container.
user	No	String	User is a SELinux user label that applies to the container.

**Table 5-2665** io.k8s.api.core.v1.SeccompProfile

Parameter	Mandatory	Type	Description
localhostProfile	No	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	Yes	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-2666** io.k8s.api.core.v1.Sysctl

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a property to set
value	Yes	String	Value of a property to set

**Table 5-2667** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Mandatory	Type	Description
gmsaCredentialSpec	No	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	No	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	No	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2668** io.k8s.api.core.v1.Toleration

Parameter	Mandatory	Type	Description
effect	No	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	No	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.

Parameter	Mandatory	Type	Description
operator	No	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	No	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	No	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-2669** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Mandatory	Type	Description
labelSelector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Mandatory	Type	Description
maxSkew	Yes	Integer	<p>MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i>, it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3     P   P     - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1 (zone2) would make the ActualSkew(2-0) on zone1 (zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i>, it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.</p>
topologyKey	Yes	String	<p>TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each &lt;key, value&gt; as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.</p>

Parameter	Mandatory	Type	Description
whenUnsatisfiable	Yes	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3     P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-2670** io.k8s.api.core.v1.Volume

Parameter	Mandatory	Type	Description
awsElasticBlockStore	No	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Parameter	Mandatory	Type	Description
azureDisk	No	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	No	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	No	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	No	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	No	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	No	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	No	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	No	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Mandatory	Type	Description
ephemeral	No	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	No	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	<p>FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.</p>
flexVolume	No	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	<p>FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.</p>

Parameter	Mandatory	Type	Description
flocker	No	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	No	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
gitRepo	No	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	No	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	No	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	No	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>

Parameter	Mandatory	Type	Description
localDir	No	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	Yes	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	No	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	No	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine
portworxVolume	No	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	No	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	No	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime

Parameter	Mandatory	Type	Description
rbd	No	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	No	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	No	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	No	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	No	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-2671** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

Parameter	Mandatory	Type	Description
partition	No	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	No	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticsearch">https://kubernetes.io/docs/concepts/storage/volumes#awselasticsearch</a>
volumeID	Yes	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticsearch">https://kubernetes.io/docs/concepts/storage/volumes#awselasticsearch</a>

**Table 5-2672** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Mandatory	Type	Description
cachingMode	No	String	Host Caching mode: None, Read Only, Read Write.
diskName	Yes	String	The Name of the data disk in the blob storage
diskURI	Yes	String	The URI the data disk in the blob storage
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.

Parameter	Mandatory	Type	Description
kind	No	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-2673** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	Yes	String	the name of secret that contains Azure Storage Account Name and Key
shareName	Yes	String	Share Name

**Table 5-2674** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Mandatory	Type	Description
monitors	Yes	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	No	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	No	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a>	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	No	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-2675** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

Parameter	Mandatory	Type	Description
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	Yes	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-2676** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Mandatory	Type	Description
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-2677** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Mandatory	Type	Description
driver	Yes	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	No	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	No	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Mandatory	Type	Description
volumeAttributes	No	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-2678** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	No	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-2679** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Mandatory	Type	Description
medium	No	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	No	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-2680** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Mandatory	Type	Description
volumeClaimTemplate	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-2681** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Mandatory	Type	Description
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	Yes	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-2682** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-2683** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2684** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2685** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-2686** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-2687** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-2688** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-2689** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-2690** io.k8s.api.core.v1.FCVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	No	Integer	Optional: FC target lun number
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	No	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	No	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-2691** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Mandatory	Type	Description
driver	Yes	String	Driver is the name of the driver to use for this volume.

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	No	Map<String,String>	Optional: Extra command options if any.
readOnly	No	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-2692** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Mandatory	Type	Description
datasetName	No	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	No	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-2693** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	No	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	Yes	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-2694** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Mandatory	Type	Description
directory	No	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	Yes	String	Repository URL
revision	No	String	Commit hash for the specified revision.

**Table 5-2695** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Mandatory	Type	Description
endpoints	Yes	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	Yes	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	No	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-2696** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Mandatory	Type	Description
path	Yes	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
type	No	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-2697** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Mandatory	Type	Description
chapAuthDiscovery	No	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	No	Boolean	whether support iSCSI Session CHAP authentication
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	No	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	Yes	String	Target iSCSI Qualified Name.
iscsiInterface	No	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Yes	Integer	iSCSI Target Lun number.

Parameter	Mandatory	Type	Description
portals	No	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	Yes	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-2698** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Mandatory	Type	Description
sizeLimit	No	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or</p>

Parameter	Mandatory	Type	Description
			<p>suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that will cause implementors to also use a fixed point implementation.</p>

**Table 5-2699** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Mandatory	Type	Description
path	Yes	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	No	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	Yes	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-2700** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Mandatory	Type	Description
claimName	Yes	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	No	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-2701** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	Yes	String	ID that identifies Photon Controller persistent disk

**Table 5-2702** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	FSType represents the filesystem type to mount Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	Yes	String	VolumeID uniquely identifies a Portworx volume

**Table 5-2703** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Yes	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-2704** io.k8s.api.core.v1.VolumeProjection

Parameter	Mandatory	Type	Description
configMap	No	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	No	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project
secret	No	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	No	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-2705** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '.' path or start with '..'.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-2706** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-2707** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Mandatory	Type	Description
fieldRef	No	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.

Parameter	Mandatory	Type	Description
mode	No	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	Yes	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	No	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-2708** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Mandatory	Type	Description
apiVersion	No	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	Yes	String	Path of the field to select in the specified API version.

**Table 5-2709** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Mandatory	Type	Description
containerName	No	String	Container name: required for volumes, optional for env vars

Parameter	Mandatory	Type	Description
divisor	No	String	Specifies the output format of the exposed resources, defaults to "1"
resource	Yes	String	Required: resource to select

**Table 5-2710** io.k8s.api.core.v1.SecretProjection

Parameter	Mandatory	Type	Description
items	No	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	No	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2711** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Mandatory	Type	Description
audience	No	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	No	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	Yes	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-2712** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Mandatory	Type	Description
group	No	String	Group to map volume access to Default is no group
readOnly	No	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	Yes	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes

Parameter	Mandatory	Type	Description
tenant	No	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	No	String	User to map volume access to Defaults to serviceaccount user
volume	Yes	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-2713** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	Yes	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	No	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Yes	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
pool	No	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Mandatory	Type	Description
readOnly	No	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	No	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-2714** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	Yes	String	The host address of the ScaleIO API Gateway.
protectionDomain	No	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	Yes	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	No	Boolean	Flag to enable/disable SSL communication with Gateway, default false

Parameter	Mandatory	Type	Description
storageMode	No	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	No	String	The ScaleIO Storage Pool associated with the protection domain.
system	Yes	String	The name of the storage system as configured in ScaleIO.
volumeName	No	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-2715** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Mandatory	Type	Description
defaultMode	No	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

Parameter	Mandatory	Type	Description
items	No	Array of <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	No	Boolean	Specify whether the Secret or its keys must be defined
secretName	No	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-2716** io.k8s.api.core.v1.KeyToPath

Parameter	Mandatory	Type	Description
key	Yes	String	The key to project.
mode	No	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.

Parameter	Mandatory	Type	Description
path	Yes	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-2717** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	No	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	No	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	No	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.

Parameter	Mandatory	Type	Description
volumeNamespace	No	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-2718** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Mandatory	Type	Description
fsType	No	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	No	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	No	String	Storage Policy Based Management (SPBM) profile name.
volumePath	Yes	String	Path that identifies vSphere volume vmdk

**Table 5-2719** io.k8s.api.apps.v1.DeploymentStatus

Parameter	Mandatory	Type	Description
availableReplicas	No	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.

Parameter	Mandatory	Type	Description
collisionCount	No	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	No	Array of <a href="#">io.k8s.api.apps.v1.DeploymentCondition</a> objects	Represents the latest available observations of a deployment's current state.
observedGeneration	No	Long	The generation observed by the deployment controller.
readyReplicas	No	Integer	Total number of ready pods targeted by this deployment.
replicas	No	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	No	Integer	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.
updatedReplicas	No	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

**Table 5-2720** io.k8s.api.apps.v1.DeploymentCondition

Parameter	Mandatory	Type	Description
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.
lastUpdateTime	No	String	The last time this condition was updated.

Parameter	Mandatory	Type	Description
message	No	String	A human readable message indicating details about the transition.
reason	No	String	The reason for the condition's last transition.
status	Yes	String	Status of the condition, one of True, False, Unknown.
type	Yes	String	Type of deployment condition.

## Response Parameters

Status code: 200

Table 5-2721 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata.
spec	<a href="#">io.k8s.api.apps.v1.DeploymentSpec</a> object	Specification of the desired behavior of the Deployment.
status	<a href="#">io.k8s.api.apps.v1.DeploymentStatus</a> object	Most recently observed status of the Deployment.

**Table 5-2722** io.k8s.api.apps.v1.DeploymentSpec

Parameter	Type	Description
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
paused	Boolean	Indicates that the deployment is paused.
progressDeadlineSeconds	Integer	The maximum time in seconds for a deployment to make progress before it is considered to be failed. The deployment controller will continue to process failed deployments and a condition with a ProgressDeadlineExceeded reason will be surfaced in the deployment status. Note that progress will not be estimated during the time a deployment is paused. Defaults to 600s.
replicas	Integer	Number of desired pods. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.
revisionHistoryLimit	Integer	The number of old ReplicaSets to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	Label selector for pods. Existing ReplicaSets whose pods are selected by this will be the ones affected by this deployment. It must match the pod template's labels.
strategy	<a href="#">io.k8s.api.apps.v1.DeploymentStrategy</a> object	The deployment strategy to use to replace existing pods with new ones.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	Template describes the pods that will be created.

**Table 5-2723** io.k8s.api.apps.v1.DeploymentStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateDeployment</a> object	Rolling update config params. Present only if DeploymentStrategyType = RollingUpdate.
type	String	Type of deployment. Can be "Recreate" or "RollingUpdate". Default is RollingUpdate.

**Table 5-2724** io.k8s.api.apps.v1.RollingUpdateDeployment

Parameter	Type	Description
maxSurge	String	The maximum number of pods that can be scheduled above the desired number of pods. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This can not be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up. Defaults to 25%. Example: when this is set to 30%, the new ReplicaSet can be scaled up immediately when the rolling update starts, such that the total number of old and new pods do not exceed 130% of desired pods. Once old pods have been killed, new ReplicaSet can be scaled up further, ensuring that total number of pods running at any time during the update is at most 130% of desired pods.
maxUnavailable	String	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding down. This can not be 0 if MaxSurge is 0. Defaults to 25%. Example: when this is set to 30%, the old ReplicaSet can be scaled down to 70% of desired pods immediately when the rolling update starts. Once new pods are ready, old ReplicaSet can be scaled down further, followed by scaling up the new ReplicaSet, ensuring that the total number of pods available at all times during the update is at least 70% of desired pods.

**Table 5-2725** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-2726** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

Parameter	Type	Description
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Type	Description
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/types/#io.k8s.api.core.v1.PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-2727** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-2728** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-2729** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-2730** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-2731** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-2732** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-2733** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2734** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2735** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-2736** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-2737** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-2738** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-2739** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2740** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-2741** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-2742** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2743** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-2744** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-2745** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-2746** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2747** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-2748** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-2749** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-2750** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-2751** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-2752** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-2753** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2754** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-2755** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-2756** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-2757** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-2758** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-2759** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-2760** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-2761** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-2762** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-2763** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-2764** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-2765** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2766** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-2767** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-2768** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-2769** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2770** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-2771** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-2772** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-2773** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-2774** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-2775** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-2776** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-2777** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-2778** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-2779** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-2780** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-2781** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-2782** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-2783** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-2784** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-2785** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2786** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2787** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-2788** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-2789** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-2790** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-2791** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-2792** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-2793** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.

Parameter	Type	Description
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-2794** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-2795** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-2796** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-2797** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-2798** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Parameter	Type	Description
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-2799** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-2800** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-2801** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-2802** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-2803** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-2804** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-2805** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-2806** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-2807** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-2808** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-2809** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-2810** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-2811** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-2812** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2813** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-2814** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-2815** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-2816** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-2817** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-2818** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-2819** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-2820** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-2821** io.k8s.api.apps.v1.DeploymentStatus

Parameter	Type	Description
availableReplicas	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
collisionCount	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	Array of <a href="#">io.k8s.api.apps.v1.DeploymentCondition</a> objects	Represents the latest available observations of a deployment's current state.
observedGeneration	Long	The generation observed by the deployment controller.
readyReplicas	Integer	Total number of ready pods targeted by this deployment.
replicas	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	Integer	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.

Parameter	Type	Description
updatedReplicas	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

**Table 5-2822** io.k8s.api.apps.v1.DeploymentCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
lastUpdateTime	String	The last time this condition was updated.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of deployment condition.

**Status code: 201**

**Table 5-2823** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata.
spec	<a href="#">io.k8s.api.apps.v1.DeploymentSpec</a> object	Specification of the desired behavior of the Deployment.
status	<a href="#">io.k8s.api.apps.v1.DeploymentStatus</a> object	Most recently observed status of the Deployment.

**Table 5-2824** io.k8s.api.apps.v1.DeploymentSpec

Parameter	Type	Description
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
paused	Boolean	Indicates that the deployment is paused.
progressDeadlineSeconds	Integer	The maximum time in seconds for a deployment to make progress before it is considered to be failed. The deployment controller will continue to process failed deployments and a condition with a ProgressDeadlineExceeded reason will be surfaced in the deployment status. Note that progress will not be estimated during the time a deployment is paused. Defaults to 600s.
replicas	Integer	Number of desired pods. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.
revisionHistoryLimit	Integer	The number of old ReplicaSets to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 10.

Parameter	Type	Description
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	Label selector for pods. Existing ReplicaSets whose pods are selected by this will be the ones affected by this deployment. It must match the pod template's labels.
strategy	<a href="#">io.k8s.api.apps.v1.DeploymentStrategy</a> object	The deployment strategy to use to replace existing pods with new ones.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	Template describes the pods that will be created.

**Table 5-2825** io.k8s.api.apps.v1.DeploymentStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateDeployment</a> object	Rolling update config params. Present only if DeploymentStrategyType = RollingUpdate.
type	String	Type of deployment. Can be "Recreate" or "RollingUpdate". Default is RollingUpdate.

**Table 5-2826** io.k8s.api.apps.v1.RollingUpdateDeployment

Parameter	Type	Description
maxSurge	String	The maximum number of pods that can be scheduled above the desired number of pods. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This can not be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up. Defaults to 25%. Example: when this is set to 30%, the new ReplicaSet can be scaled up immediately when the rolling update starts, such that the total number of old and new pods do not exceed 130% of desired pods. Once old pods have been killed, new ReplicaSet can be scaled up further, ensuring that total number of pods running at any time during the update is at most 130% of desired pods.

Parameter	Type	Description
maxUnavailable	String	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding down. This can not be 0 if MaxSurge is 0. Defaults to 25%. Example: when this is set to 30%, the old ReplicaSet can be scaled down to 70% of desired pods immediately when the rolling update starts. Once new pods are ready, old ReplicaSet can be scaled down further, followed by scaling up the new ReplicaSet, ensuring that the total number of pods available at all times during the update is at least 70% of desired pods.

**Table 5-2827** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-2828** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.

Parameter	Type	Description
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.

Parameter	Type	Description
hostname	String	Specifies the hostname of the Pod. If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images/#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/objects/PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-2829** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-2830** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-2831** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-2832** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-2833** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-2834** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-2835** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2836** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2837** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-2838** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-2839** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-2840** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-2841** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2842** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-2843** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-2844** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2845** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-2846** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-2847** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-2848** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2849** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-2850** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-2851** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-2852** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-2853** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-2854** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-2855** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2856** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-2857** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCP socket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-2858** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-2859** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-2860** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-2861** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-2862** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-2863** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-2864** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-2865** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-2866** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-2867** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	<p>A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:</p> <ol style="list-style-type: none"> <li>1. The owning GID will be the FSGroup</li> <li>2. The setgid bit is set (new files created in the volume will be owned by FSGroup)</li> <li>3. The permission bits are OR'd with rw-rw----</li> </ol> <p>If unset, the Kubelet will not modify the ownership and permissions of any volume.</p>
fsGroupChangePolicy	String	<p>fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".</p>
runAsGroup	Long	<p>The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>
runAsNonRoot	Boolean	<p>Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.</p>
runAsUser	Long	<p>The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.</p>

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2868** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-2869** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-2870** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-2871** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-2872** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-2873** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-2874** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-2875** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-2876** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-2877** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-2878** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-2879** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-2880** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-2881** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-2882** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-2883** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-2884** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-2885** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-2886** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-2887** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2888** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2889** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-2890** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-2891** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-2892** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-2893** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-2894** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-2895** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.

Parameter	Type	Description
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-2896** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-2897** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-2898** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-2899** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-2900** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Parameter	Type	Description
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-2901** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-2902** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-2903** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-2904** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-2905** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-2906** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-2907** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-2908** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-2909** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-2910** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-2911** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-2912** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-2913** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-2914** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2915** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-2916** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-2917** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-2918** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-2919** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-2920** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-2921** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-2922** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-2923** io.k8s.api.apps.v1.DeploymentStatus

Parameter	Type	Description
availableReplicas	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
collisionCount	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	Array of <a href="#">io.k8s.api.apps.v1.DeploymentCondition</a> objects	Represents the latest available observations of a deployment's current state.
observedGeneration	Long	The generation observed by the deployment controller.
readyReplicas	Integer	Total number of ready pods targeted by this deployment.
replicas	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	Integer	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.

Parameter	Type	Description
updatedReplicas	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

**Table 5-2924** io.k8s.api.apps.v1.DeploymentCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
lastUpdateTime	String	The last time this condition was updated.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of deployment condition.

## Example Requests

Changing the image of an existing Deployment to ...:20202/cci/redis:V1

```
{
  "apiVersion": "apps/v1",
  "kind": "Deployment",
  "metadata": {
    "name": "deployment-test"
  },
  "spec": {
    "replicas": 2,
    "selector": {
      "matchLabels": {
        "app": "redis"
      }
    },
    "template": {
      "metadata": {
        "labels": {
          "app": "redis"
        }
      },
      "spec": {
        "containers": [ {
          "image": "***:20202/cci/redis:V1",
          "name": "container-0",
          "resources": {
            "limits": {
              "cpu": "500m",
              "memory": "1024Mi"
            },
            "requests": {
```

```
        "cpu" : "500m",
        "memory" : "1024Mi"
    }
  },
  "imagePullSecrets" : [ {
    "name" : "imagepull-secret"
  } ]
}
}
```

## Example Responses

**Status code: 200**

OK

## 5.5.9 Querying the Scaling Operation of a Specified Deployment

### Function

This API is used to query the scaling operation of a specified Deployment.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale

**Table 5-2925** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Scale
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-2926** Query Parameters

Parameter	Mandatory	Type	Description
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-2927** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-2928** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
spec	<a href="#">io.k8s.api.autoscaling.v1.ScaleSpec</a> object	defines the behavior of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> .
status	<a href="#">io.k8s.api.autoscaling.v1.ScaleStatus</a> object	current status of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> . Read-only.

**Table 5-2929** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2930** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2931** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2932** io.k8s.api.autoscaling.v1.ScaleSpec

Parameter	Type	Description
replicas	Integer	desired number of instances for the scaled object.

**Table 5-2933** io.k8s.api.autoscaling.v1.ScaleStatus

Parameter	Type	Description
replicas	Integer	actual number of observed instances of the scaled object.
selector	String	label query over pods that should match the replicas count. This is same as the label selector but in the string format to avoid introspection by clients. The string will be in the same format as the query-param syntax. More info about label selectors: <a href="http://kubernetes.io/docs/user-guide/labels#label-selectors">http://kubernetes.io/docs/user-guide/labels#label-selectors</a>

### Example Requests

None

### Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "autoscaling/v1",
  "kind": "Scale",
  "metadata": {
    "creationTimestamp": "2022-08-30T09:23:43Z",
    "name": "nginx",
    "namespace": "test-api",
    "resourceVersion": "34017936",
    "selfLink": "/apis/apps/v1/namespaces/test-api/deployments/nginx/scale",
    "uid": "3bd1306c-ac3e-41c2-81ab-14c79fa006d3"

503	ServiceUnavailable
504	ServerTimeout

## 5.5.10 Updating the Scaling Operation of a Specified Deployment

### Function

This API is used to partially update scale of the specified Scale.

The following fields can be updated:

- metadata.resourceVersion
- metadata.creationTimestamp
- spec.replicas

### Calling Method

For details, see [Calling APIs](#).

### URI

PATCH /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale

**Table 5-2934** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Scale
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-2935** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	No	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-2936** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-2937** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-2938** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
spec	<a href="#">io.k8s.api.autoscaling.v1.ScaleSpec</a> object	defines the behavior of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> .
status	<a href="#">io.k8s.api.autoscaling.v1.ScaleStatus</a> object	current status of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> . Read-only.

**Table 5-2939** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.
generateName	String	GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.  If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).  Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a>
generation	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2940** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2941** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2942** io.k8s.api.autoscaling.v1.ScaleSpec

Parameter	Type	Description
replicas	Integer	desired number of instances for the scaled object.

**Table 5-2943** io.k8s.api.autoscaling.v1.ScaleStatus

Parameter	Type	Description
replicas	Integer	actual number of observed instances of the scaled object.
selector	String	label query over pods that should match the replicas count. This is same as the label selector but in the string format to avoid introspection by clients. The string will be in the same format as the query-param syntax. More info about label selectors: <a href="http://kubernetes.io/docs/user-guide/labels#label-selectors">http://kubernetes.io/docs/user-guide/labels#label-selectors</a>

## Example Requests

Updating the scaling operation of a specified Deployment

```
[ {
  "op": "add",
  "path": "/spec/replicas",
  "value": 2
}]
```

## Example Responses

**Status code: 200**

OK

```
{

## 5.5.11 Replacing the Scaling Operation of a Specified Deployment

### Function

This API is used to replace scale of the specified Scale.

The following fields can be updated:

- metadata.resourceVersion
- metadata.creationTimestamp
- spec.replicas

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /apis/apps/v1/namespaces/{namespace}/deployments/{name}/scale

**Table 5-2944** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Scale
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-2945** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-2946** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-2947** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
spec	No	<a href="#">io.k8s.api.autoscaling.v1.ScaleSpec</a> object	defines the behavior of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> .

Parameter	Mandatory	Type	Description
status	No	<a href="#">io.k8s.api.autoscaling.v1.ScaleStatus</a> object	current status of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> . Read-only.

**Table 5-2948** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Mandatory	Type	Description
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-2949** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2950** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2951** io.k8s.api.autoscaling.v1.ScaleSpec

Parameter	Mandatory	Type	Description
replicas	No	Integer	desired number of instances for the scaled object.

**Table 5-2952** io.k8s.api.autoscaling.v1.ScaleStatus

Parameter	Mandatory	Type	Description
replicas	Yes	Integer	actual number of observed instances of the scaled object.

Parameter	Mandatory	Type	Description
selector	No	String	label query over pods that should match the replicas count. This is same as the label selector but in the string format to avoid introspection by clients. The string will be in the same format as the query-param syntax. More info about label selectors: <a href="http://kubernetes.io/docs/user-guide/labels#label-selectors">http://kubernetes.io/docs/user-guide/labels#label-selectors</a>

## Response Parameters

Status code: 200

Table 5-2953 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
spec	<a href="#">io.k8s.api.autoscaling.v1.ScaleSpec</a> object	defines the behavior of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> .

Parameter	Type	Description
status	<a href="#">io.k8s.api.autoscaling.v1.ScaleStatus</a> object	current status of the scale. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a> . Read-only.

**Table 5-2954** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2955** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2956** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2957** io.k8s.api.autoscaling.v1.ScaleSpec

Parameter	Type	Description
replicas	Integer	desired number of instances for the scaled object.

**Table 5-2958** io.k8s.api.autoscaling.v1.ScaleStatus

Parameter	Type	Description
replicas	Integer	actual number of observed instances of the scaled object.
selector	String	label query over pods that should match the replicas count. This is same as the label selector but in the string format to avoid introspection by clients. The string will be in the same format as the query-param syntax. More info about label selectors: <a href="http://kubernetes.io/docs/user-guide/labels#label-selectors">http://kubernetes.io/docs/user-guide/labels#label-selectors</a>

**Status code: 201**

**Table 5-2959** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata; More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a> .
spec	<a href="#">io.k8s.api.autoscaling.v1.ScaleSpec</a> object	defines the behavior of the scale. Read-only.

**Table 5-2960** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2961** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-2962** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-2963** io.k8s.api.autoscaling.v1.ScaleSpec

Parameter	Type	Description
replicas	Integer	desired number of instances for the scaled object.

**Table 5-2964** io.k8s.api.autoscaling.v1.ScaleStatus

Parameter	Type	Description
replicas	Integer	actual number of observed instances of the scaled object.
selector	String	label query over pods that should match the replicas count. This is same as the label selector but in the string format to avoid introspection by clients. The string will be in the same format as the query-param syntax. More info about label selectors: <a href="http://kubernetes.io/docs/user-guide/labels#label-selectors">http://kubernetes.io/docs/user-guide/labels#label-selectors</a>

## Example Requests

Replacing the scaling operation of a specified Deployment

```
{
  "apiVersion": "autoscaling/v1",
  "kind": "Scale",
  "metadata": {
    "creationTimestamp": "2022-08-30T09:23:43Z",
    "name": "nginx",
    "namespace": "test-api",
    "resourceVersion": "34017936",
    "selfLink": "/apis/apps/v1/namespaces/test-api/deployments/nginx/scale",
    "uid": "3bd1306c-ac3e-41c2-81ab-14c79fa006d3"
  },
  "spec": {
    "replicas": 2
  },
  "status": {
    "replicas": 2,
    "selector": "app=nginx"
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "autoscaling/v1",
  "kind": "Scale",
  "metadata": {
    "creationTimestamp": "2022-08-30T09:23:43Z",
    "name": "nginx",
    "namespace": "test-api",
    "resourceVersion": "34017936",
    "selfLink": "/apis/apps/v1/namespaces/test-api/deployments/nginx/scale",
    "uid": "3bd1306c-ac3e-41c2-81ab-14c79fa006d3"
  },
  "spec": {
    "replicas": 2
  },
  "status": {
    "replicas": 2,

```

```
"selector" : "app=nginx"  
}  
}
```

## Status Codes

Status Code	Description
200	OK
201	Created
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.5.12 Querying the Status of a Deployment

### Function

This API is used to query the status of a specified Deployment.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps/v1/namespaces/{namespace}/deployments/{name}/status

**Table 5-2965** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Deployment
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-2966** Query Parameters

Parameter	Mandatory	Type	Description
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-2967** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-2968** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object metadata.
spec	<a href="#">io.k8s.api.apps.v1.DeploymentSpec</a> object	Specification of the desired behavior of the Deployment.
status	<a href="#">io.k8s.api.apps.v1.DeploymentStatus</a> object	Most recently observed status of the Deployment.

**Table 5-2969** io.k8s.api.apps.v1.DeploymentSpec

Parameter	Type	Description
minReadySeconds	Integer	Minimum number of seconds for which a newly created pod should be ready without any of its container crashing, for it to be considered available. Defaults to 0 (pod will be considered available as soon as it is ready)
paused	Boolean	Indicates that the deployment is paused.
progressDeadlineSeconds	Integer	The maximum time in seconds for a deployment to make progress before it is considered to be failed. The deployment controller will continue to process failed deployments and a condition with a ProgressDeadlineExceeded reason will be surfaced in the deployment status. Note that progress will not be estimated during the time a deployment is paused. Defaults to 600s.
replicas	Integer	Number of desired pods. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.

Parameter	Type	Description
revisionHistoryLimit	Integer	The number of old ReplicaSets to retain to allow rollback. This is a pointer to distinguish between explicit zero and not specified. Defaults to 10.
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	Label selector for pods. Existing ReplicaSets whose pods are selected by this will be the ones affected by this deployment. It must match the pod template's labels.
strategy	<a href="#">io.k8s.api.apps.v1.DeploymentStrategy</a> object	The deployment strategy to use to replace existing pods with new ones.
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	Template describes the pods that will be created.

**Table 5-2970** io.k8s.api.apps.v1.DeploymentStrategy

Parameter	Type	Description
rollingUpdate	<a href="#">io.k8s.api.apps.v1.RollingUpdateDeployment</a> object	Rolling update config params. Present only if DeploymentStrategyType = RollingUpdate.
type	String	Type of deployment. Can be "Recreate" or "RollingUpdate". Default is RollingUpdate.

**Table 5-2971** io.k8s.api.apps.v1.RollingUpdateDeployment

Parameter	Type	Description
maxSurge	String	The maximum number of pods that can be scheduled above the desired number of pods. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). This can not be 0 if MaxUnavailable is 0. Absolute number is calculated from percentage by rounding up. Defaults to 25%. Example: when this is set to 30%, the new ReplicaSet can be scaled up immediately when the rolling update starts, such that the total number of old and new pods do not exceed 130% of desired pods. Once old pods have been killed, new ReplicaSet can be scaled up further, ensuring that total number of pods running at any time during the update is at most 130% of desired pods.
maxUnavailable	String	The maximum number of pods that can be unavailable during the update. Value can be an absolute number (ex: 5) or a percentage of desired pods (ex: 10%). Absolute number is calculated from percentage by rounding down. This can not be 0 if MaxSurge is 0. Defaults to 25%. Example: when this is set to 30%, the old ReplicaSet can be scaled down to 70% of desired pods immediately when the rolling update starts. Once new pods are ready, old ReplicaSet can be scaled down further, followed by scaling up the new ReplicaSet, ensuring that the total number of pods available at all times during the update is at least 70% of desired pods.

**Table 5-2972** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-2973** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.

Parameter	Type	Description
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>
initContainers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>

Parameter	Type	Description
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	NodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.

Parameter	Type	Description
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_readiness_gates.go">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="https://github.com/kubernetes/api/blob/master/core/v1/pod_security_context.go">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.

Parameter	Type	Description
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="https://kubernetes.io/api-reference/v1.27/types/#io.k8s.api.core.v1.Toleration">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.

Parameter	Type	Description
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-2974** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-2975** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-2976** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-2977** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-2978** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-2979** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-2980** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.

Parameter	Type	Description
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2981** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-2982** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-2983** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-2984** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.

Parameter	Type	Description
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-2985** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-2986** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>

Parameter	Type	Description
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2987** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-2988** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-2989** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-2990** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-2991** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-2992** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-2993** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-2994** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-2995** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-2996** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-2997** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-2998** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-2999** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-3000** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-3001** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-3002** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-3003** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-3004** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-3005** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-3006** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-3007** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-3008** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-3009** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-3010** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-3011** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-3012** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-3013** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-3014** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-3015** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-3016** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-3017** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-3018** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-3019** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-3020** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-3021** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-3022** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-3023** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-3024** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-3025** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-3026** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-3027** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-3028** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-3029** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-3030** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-3031** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3032** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3033** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3034** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3035** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3036** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3037** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3038** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3039** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-3040** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.

Parameter	Type	Description
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-3041** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-3042** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-3043** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-3044** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-3045** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Parameter	Type	Description
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-3046** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-3047** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-3048** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-3049** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-3050** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-3051** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-3052** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-3053** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-3054** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-3055** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-3056** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-3057** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-3058** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-3059** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-3060** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-3061** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-3062** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-3063** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-3064** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-3065** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-3066** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-3067** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-3068** io.k8s.api.apps.v1.DeploymentStatus

Parameter	Type	Description
availableReplicas	Integer	Total number of available pods (ready for at least minReadySeconds) targeted by this deployment.
collisionCount	Integer	Count of hash collisions for the Deployment. The Deployment controller uses this field as a collision avoidance mechanism when it needs to create the name for the newest ReplicaSet.
conditions	Array of <a href="#">io.k8s.api.apps.v1.DeploymentCondition</a> objects	Represents the latest available observations of a deployment's current state.
observedGeneration	Long	The generation observed by the deployment controller.
readyReplicas	Integer	Total number of ready pods targeted by this deployment.
replicas	Integer	Total number of non-terminated pods targeted by this deployment (their labels match the selector).
unavailableReplicas	Integer	Total number of unavailable pods targeted by this deployment. This is the total number of pods that are still required for the deployment to have 100% available capacity. They may either be pods that are running but not yet available or pods that still have not been created.

Parameter	Type	Description
updatedReplicas	Integer	Total number of non-terminated pods targeted by this deployment that have the desired template spec.

**Table 5-3069** io.k8s.api.apps.v1.DeploymentCondition

Parameter	Type	Description
lastTransitionTime	String	Last time the condition transitioned from one status to another.
lastUpdateTime	String	The last time this condition was updated.
message	String	A human readable message indicating details about the transition.
reason	String	The reason for the condition's last transition.
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of deployment condition.

## Example Requests

None

## Example Responses

**Status code: 200**

OK

## 5.6 Ingress

### 5.6.1 Deleting Ingresses in a Namespace

#### Function

This API is used to delete all ingresses in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

DELETE /apis/extensions/v1beta1/namespaces/{namespace}/ingresses

**Table 5-3070** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3071** Query Parameters

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset

Parameter	Mandatory	Type	Description
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3072** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3073** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3074** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-3075** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3076** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3077** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3078** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

None

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion" : "extensions/v1beta1",
  "items" : null,
  "kind" : "IngressList",
  "metadata" : {
    "resourceVersion" : "5160862",
    "selfLink" : "/apis/extensions/v1beta1/namespaces/namespace-test/ingresses"
  }
}
```

## Status Codes

Status Code	Description
200	OK
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed

Status Code	Description
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.6.2 Querying Ingresses in a Namespace

### Function

This API is used to query the details about all ingresses in a specified namespace.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses

**Table 5-3079** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3080** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3081 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3082 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.extensions.v1beta1.Ingress</a> objects	Items is the list of Ingress.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

**Table 5-3083** io.k8s.api.extensions.v1beta1.Ingress

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3084** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3085** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3086** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3087** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3088** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3089** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3090** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3091** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3092** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3093** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3094** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3095** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3096** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

**Table 5-3097** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.6.3 Creating an Ingress

### Function

This API is used to create an HTTP ingress. The associated backend service is Redis:8080. A load balancer from ELB is used as the ingress controller. The IP address of the load balancer is 192.168.137.182, and the port number is 6071.

To display the ingress on the **Access Settings** tab of the CCI workload details page, you need to add labels to the created ingress. The added labels must meet the following requirements:

- The labels set for the Service must be the same as the **matchLabels** settings under **selector** of the workload.

For example, **matchLabels** is set as follows:

```
"spec": {
  "replicas": 1,
  "selector": {
    "matchLabels": {
      "app": "redis"
    }
  }
}
```

- **labels** must be set to **"app": "redis"** for the Service.

```
"metadata": {
  "name": "redis",
  "labels": {
    "app": "redis"
  }
}
```

**serviceName** defined in the ingress must be the same as the name of the Service.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /apis/extensions/v1beta1/namespaces/{namespace}/ingresses

**Table 5-3098** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3099** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3100** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3101** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

Parameter	Mandatory	Type	Description
status	No	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3102** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Mandatory	Type	Description
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3103** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3104** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3105** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Mandatory	Type	Description
backend	No	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.

Parameter	Mandatory	Type	Description
ingressClassName	No	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	No	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	No	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3106** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Mandatory	Type	Description
host	No	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character ' ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</i></p>

Parameter	Mandatory	Type	Description
http	No	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

**Table 5-3107** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Mandatory	Type	Description
paths	Yes	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3108** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Mandatory	Type	Description
backend	Yes	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	No	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.

Parameter	Mandatory	Type	Description
pathType	No	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	No	Map<String,String>	Extension property on the path.

**Table 5-3109** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Mandatory	Type	Description
resource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.

Parameter	Mandatory	Type	Description
serviceName	No	String	Specifies the name of the referenced service.
servicePort	No	String	Specifies the port of the referenced service.

**Table 5-3110** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-3111** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Mandatory	Type	Description
hosts	No	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.

Parameter	Mandatory	Type	Description
secretName	No	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3112** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Mandatory	Type	Description
loadBalancer	No	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3113** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Mandatory	Type	Description
ingress	No	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3114** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Mandatory	Type	Description
hostname	No	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	No	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## Response Parameters

Status code: 200

**Table 5-3115** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3116** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3117** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3118** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3119** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3120** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3121** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3122** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3123** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3124** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3125** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3126** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3127** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3128** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

**Status code: 201**

**Table 5-3129** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3130** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3131** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3132** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3133** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3134** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*").</i></p> <p>Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3135** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3136** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values:</p> <ul style="list-style-type: none"> <li>* Exact: Matches the URL path exactly.</li> <li>* Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</li> </ul> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3137** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3138** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3139** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3140** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3141** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3142** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

**Status code: 202**

**Table 5-3143** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3144** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3145** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3146** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3147** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3148** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3149** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3150** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3151** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3152** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3153** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3154** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3155** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3156** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## Example Requests

```
{
  "apiVersion": "extensions/v1beta1",

## 5.6.4 Deleting an Ingress

### Function

This API is used to delete a specified ingress.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

**Table 5-3157** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Ingress
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3158** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3159** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3160** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.

Parameter	Mandatory	Type	Description
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3161** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-3162** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.

Parameter	Type	Description
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3163** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

Parameter	Type	Description
kind	String	The kind attribute of the resource associated with the status <code>StatusReason</code> . On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status <code>StatusReason</code> (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3164** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3165** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

**Status code: 202**

**Table 5-3166** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3167** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3168** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3169** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.6.5 Querying an Ingress

### Function

This API is used to query the details about a specified ingress.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

**Table 5-3170** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Ingress
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3171** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3172** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-3173** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3174** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3175** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3176** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3177** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3178** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3179** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3180** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values:</p> <ul style="list-style-type: none"> <li>* Exact: Matches the URL path exactly.</li> <li>* Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</li> </ul> <ul style="list-style-type: none"> <li>• ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3181** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3182** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3183** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3184** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3185** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3186** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## Example Requests

## 5.6.6 Updating an Ingress

### Function

This API is used to update a specified ingress.

The following fields can be updated:

- **metadata.labels**
- **metadata.generateName**
- **metadata.annotations**
- **spec.rules**

## Calling Method

For details, see [Calling APIs](#).

## URI

PATCH /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

**Table 5-3187** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Ingress
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3188** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).

Parameter	Mandatory	Type	Description
force	No	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3189** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-3190** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-3191** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3192** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3193** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3194** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3195** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3196** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3197** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3198** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3199** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3200** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3201** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3202** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3203** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3204** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## Example Requests

Changing the **servicePort** value of the ingress to **8082**

```
{
  "spec": {
    "rules": [ {
      "http": {
        "paths": [ {
          "backend": {
            "serviceName": "redis",
            "servicePort": 8082
          },
          "path": "/"
        } ]
      }
    } ]
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "extensions/v1beta1",
  "kind": "Ingress",
  "metadata": {
    "annotations": {
      "kubernetes.io/elb.id": "2d48d034-6046-48db-8bb2-53c67e8148b5",
      "kubernetes.io/elb.ip": "192.168.137.182",
      "kubernetes.io/elb.port": "6071"
    },
    "creationTimestamp": "2018-09-04T02:16:14Z",
  }
}
```

```

## Status Codes

Status Code	Description
200	OK
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable

Status Code	Description
504	ServerTimeout

## 5.6.7 Replacing an Ingress

### Function

This API is used to replace a specified ingress.

The following fields can be updated:

- **metadata.labels**
- **metadata.generateName**
- **metadata.annotations**
- **spec.rules**

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}

**Table 5-3205** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Ingress
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3206** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3207** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3208** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	No	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3209** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Mandatory	Type	Description
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3210** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3211** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3212** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Mandatory	Type	Description
backend	No	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.

Parameter	Mandatory	Type	Description
ingressClassName	No	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	No	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	No	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3213** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Mandatory	Type	Description
host	No	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character ' ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</i></p>

Parameter	Mandatory	Type	Description
http	No	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -> backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.

**Table 5-3214** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Mandatory	Type	Description
paths	Yes	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3215** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Mandatory	Type	Description
backend	Yes	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	No	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.

Parameter	Mandatory	Type	Description
pathType	No	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	No	Map<String,String>	Extension property on the path.

**Table 5-3216** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Mandatory	Type	Description
resource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.

Parameter	Mandatory	Type	Description
serviceName	No	String	Specifies the name of the referenced service.
servicePort	No	String	Specifies the port of the referenced service.

**Table 5-3217** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-3218** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Mandatory	Type	Description
hosts	No	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.

Parameter	Mandatory	Type	Description
secretName	No	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3219** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Mandatory	Type	Description
loadBalancer	No	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3220** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Mandatory	Type	Description
ingress	No	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3221** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Mandatory	Type	Description
hostname	No	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	No	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## Response Parameters

Status code: 200

**Table 5-3222** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3223** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3224** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3225** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3226** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3227** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3228** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3229** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3230** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3231** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3232** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3233** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3234** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3235** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

**Status code: 201**

**Table 5-3236** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3237** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3238** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3239** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3240** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3241** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3242** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	A collection of paths that map requests to backends.

**Table 5-3243** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3244** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3245** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3246** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3247** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3248** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3249** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## Example Requests

Changing the **servicePort** value of an existing ingress from **8080** to **8081**

```
{
  "apiVersion": "extensions/v1beta1",
  "kind": "Ingress",
  "metadata": {
    "annotations": {
      "kubernetes.io/elb.id": "2d48d034-6046-48db-8bb2-53c67e8148b5",
      "kubernetes.io/elb.ip": "192.168.137.182",
      "kubernetes.io/elb.port": "6071"
    },
    "labels": {
      "app": "redis",
      "isExternal": "true",
      "zone": "data"
    },
    "name": "redis"
  },
  "spec": {
    "rules": [ {

## 5.6.8 Querying the Status of an Ingress

### Function

This API is used to query the status of a specified ingress.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/extensions/v1beta1/namespaces/{namespace}/ingresses/{name}/status

**Table 5-3250** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Ingress
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3251** Query Parameters

Parameter	Mandatory	Type	Description
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3252** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3253** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
spec	<a href="#">io.k8s.api.extensions.v1beta1.IngressSpec</a> object	Spec is the desired state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.extensions.v1beta1.IngressStatus</a> object	Status is the current state of the Ingress. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3254** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3255** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3256** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3257** io.k8s.api.extensions.v1beta1.IngressSpec

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	A default backend capable of servicing requests that don't match any rule. At least one of 'backend' or 'rules' must be specified. This field is optional to allow the loadbalancer controller or defaulting logic to specify a global default.
ingressClassName	String	IngressClassName is the name of the IngressClass cluster resource. The associated IngressClass defines which controller will implement the resource. This replaces the deprecated <i>kubernetes.io/ingress.class</i> annotation. For backwards compatibility, when that annotation is set, it must be given precedence over this field. The controller may emit a warning if the field and annotation have different values. Implementations of this API should ignore Ingresses without a class specified. An IngressClass resource may be marked as default, which can be used to set a default value for this field. For more information, refer to the IngressClass documentation.
rules	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressRule</a> objects	A list of host rules used to configure the Ingress. If unspecified, or no rule matches, all traffic is sent to the default backend.
tls	Array of <a href="#">io.k8s.api.extensions.v1beta1.IngressTLS</a> objects	TLS configuration. Currently the Ingress only supports a single TLS port, 443. If multiple members of this list specify different hosts, they will be multiplexed on the same port according to the hostname specified through the SNI TLS extension, if the ingress controller fulfilling the ingress supports SNI.

**Table 5-3258** io.k8s.api.extensions.v1beta1.IngressRule

Parameter	Type	Description
host	String	<p>Host is the fully qualified domain name of a network host, as defined by RFC 3986. Note the following deviations from the "host" part of the URI as defined in RFC 3986: 1. IPs are not allowed. Currently an IngressRuleValue can only apply to the IP in the Spec of the parent Ingress. 2. The : delimiter is not respected because ports are not allowed. Currently the port of an Ingress is implicitly :80 for http and :443 for https. Both these may change in the future. Incoming requests are matched against the host before the IngressRuleValue. If the host is unspecified, the Ingress routes all traffic based on the specified IngressRuleValue.</p> <p>Host can be "precise" which is a domain name without the terminating dot of a network host (e.g. "foo.bar.com") or "wildcard", which is a domain name prefixed with a single wildcard label (e.g. ".foo.com"). <i>The wildcard character</i> ' must appear by itself as the first DNS label and matches only a single label. You cannot have a wildcard label by itself (e.g. Host == "*"). Requests will be matched against the Host field in the following way: 1. If Host is precise, the request matches this rule if the http host header is equal to Host. 2. If Host is a wildcard, then the request matches this rule if the http host header is to equal to the suffix (removing the first label) of the wildcard rule.</p>
http	<a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue</a> object	<p>HTTPIngressRuleValue is a list of http selectors pointing to backends. In the example: http:///? -&gt; backend where where parts of the url correspond to RFC 3986, this resource will be used to match against everything after the last '/' and before the first '?' or '#'.</p>

**Table 5-3259** io.k8s.api.extensions.v1beta1.HTTPIngressRuleValue

Parameter	Type	Description
paths	Array of <a href="#">io.k8s.api.extensions.v1beta1.HTTPIngressPath</a> objects	<p>A collection of paths that map requests to backends.</p>

**Table 5-3260** io.k8s.api.extensions.v1beta1.HTTPIngressPath

Parameter	Type	Description
backend	<a href="#">io.k8s.api.extensions.v1beta1.IngressBackend</a> object	Backend defines the referenced service endpoint to which the traffic will be forwarded to.
path	String	Path is matched against the path of an incoming request. Currently it can contain characters disallowed from the conventional "path" part of a URL as defined by RFC 3986. Paths must begin with a '/'. When unspecified, all paths from incoming requests are matched.
pathType	String	<p>PathType determines the interpretation of the Path matching. PathType can be one of the following values: * Exact: Matches the URL path exactly. * Prefix: Matches based on a URL path prefix split by '/'. Matching is done on a path element by element basis. A path element refers is the list of labels in the path split by the '/' separator. A request is a match for path p if every p is an element-wise prefix of p of the request path. Note that if the last element of the path is a substring of the last element in request path, it is not a match (e.g. /foo/bar matches /foo/bar/baz, but does not match /foo/barbaz).</p> <ul style="list-style-type: none"> <li>ImplementationSpecific: Interpretation of the Path matching is up to the IngressClass. Implementations can treat this as a separate PathType or treat it identically to Prefix or Exact path types. Implementations are required to support all path types. Defaults to ImplementationSpecific.</li> </ul>
property	Map<String,String>	Extension property on the path.

**Table 5-3261** io.k8s.api.extensions.v1beta1.IngressBackend

Parameter	Type	Description
resource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	Resource is an ObjectRef to another Kubernetes resource in the namespace of the Ingress object. If resource is specified, serviceName and servicePort must not be specified.
serviceName	String	Specifies the name of the referenced service.

Parameter	Type	Description
servicePort	String	Specifies the port of the referenced service.

**Table 5-3262** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3263** io.k8s.api.extensions.v1beta1.IngressTLS

Parameter	Type	Description
hosts	Array of strings	Hosts are a list of hosts included in the TLS certificate. The values in this list must match the name/s used in the tlsSecret. Defaults to the wildcard host setting for the loadbalancer controller fulfilling this Ingress, if left unspecified.
secretName	String	SecretName is the name of the secret used to terminate SSL traffic on 443. Field is left optional to allow SSL routing based on SNI hostname alone. If the SNI host in a listener conflicts with the "Host" header field used by an IngressRule, the SNI host is used for termination and value of the Host header is used for routing.

**Table 5-3264** io.k8s.api.extensions.v1beta1.IngressStatus

Parameter	Type	Description
loadBalancer	<a href="#">io.k8s.api.core.v1.LoadBalancerStatus</a> object	LoadBalancer contains the current status of the load-balancer.

**Table 5-3265** io.k8s.api.core.v1.LoadBalancerStatus

Parameter	Type	Description
ingress	Array of <a href="#">io.k8s.api.core.v1.LoadBalancerIngress</a> objects	Ingress is a list containing ingress points for the load-balancer. Traffic intended for the service should be sent to these ingress points.

**Table 5-3266** io.k8s.api.core.v1.LoadBalancerIngress

Parameter	Type	Description
hostname	String	Hostname is set for load-balancer ingress points that are DNS based (typically AWS load-balancers)
ip	String	IP is set for load-balancer ingress points that are IP based (typically GCE or OpenStack load-balancers)

## 5.8 VolcanoJob

### 5.8.1 Deleting Volcano Jobs in a Specified Namespace

#### Function

This API is used to delete all Volcano jobs in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

DELETE /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs

**Table 5-3268** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3269** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3270** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

## Response Parameters

**Status code: 200**

**Table 5-3271** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3272** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>

Parameter	Type	Description
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3273** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3274** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

None

## Example Responses

## 5.8.2 Querying Volcano Jobs in a Namespace

### Function

This API is used to query all Volcano jobs in a specified namespace.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs

**Table 5-3275** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3276** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3277 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3278 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">sh.volcano.batch.v1alpha1.Job</a> objects	List of jobs. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3279** sh.volcano.batch.v1alpha1.Job

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3280** spec

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job

Parameter	Type	Description
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3281** spec.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3282** spec.tasks

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3283** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

Parameter	Type	Description
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3284** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3285** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

Parameter	Type	Description
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3286** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3287** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3288** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3289** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3290** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3291** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3292** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3293** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3294** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3295** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3296** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3297** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

**Table 5-3298** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.8.3 Creating a Volcano Job

### Function

This API is used to create a Volcano job.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs

**Table 5-3299** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3300** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3301** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3302** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	No	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	No	<a href="#">status</a> object	Current status of Job

**Table 5-3303** spec

Parameter	Mandatory	Type	Description
maxRetry	No	Integer	The limit for retrying submitting job, default is 3
minAvailable	No	Integer	The minimal available pods to run for this Job
plugins	No	Object	Enabled task plugins when creating job.

Parameter	Mandatory	Type	Description
policies	No	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	No	String	The name of the queue on which job should be created
schedulerName	No	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	No	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job
volumes	No	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3304** spec.policies

Parameter	Mandatory	Type	Description
action	No	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	No	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	No	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3305** spec.tasks

Parameter	Mandatory	Type	Description
name	No	String	Name specifies the name of tasks
policies	No	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task

Parameter	Mandatory	Type	Description
replicas	No	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	No	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3306** spec.tasks.policies

Parameter	Mandatory	Type	Description
action	No	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	No	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	No	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3307** spec.volumes

Parameter	Mandatory	Type	Description
mountPath	Yes	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	No	<a href="https://kubernetes.io/api-references/objects/persistentvolumeclaim/">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	No	String	The name of the volume claim.

**Table 5-3308** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3309** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3310** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3311** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3312** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3313** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-3314** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3315** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3316** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3317** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	No	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3318** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Mandatory	Type	Description
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
reason	No	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	Yes	String	status is the status of the condition.
type	Yes	String	type is the type of the condition.

**Table 5-3319** status

Parameter	Mandatory	Type	Description
ControlledResources	No	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	No	Integer	The number of pods which reached phase Succeeded.
failed	No	Integer	The number of pods which reached phase Failed.
minAvailable	No	Integer	The minimal available pods to run for this Job
pending	No	Integer	The number of pending pods.
retryCount	No	Integer	The number that volcano retried to submit the job.
running	No	Integer	The number of running pods.
state	No	<a href="#">status.state</a> object	Current state of Job.
version	No	Integer	Job's current version

**Table 5-3320** status.state

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
phase	No	String	The phase of Job
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.

## Response Parameters

Status code: 200

**Table 5-3321** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3322 spec**

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3323 spec.policies**

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3324 spec.tasks**

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task

Parameter	Type	Description
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3325** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3326** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3327** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3328** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3329** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3330** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3331** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3332** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3333** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3334** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3335** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3336** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3337** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3338** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3339** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

**Status code: 201**

**Table 5-3340** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3341** spec

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job

Parameter	Type	Description
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3342** spec.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3343** spec.tasks

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3344** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

Parameter	Type	Description
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3345** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3346** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

Parameter	Type	Description
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3347** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3348** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3349** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3350** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3351** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3352** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3353** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3354** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3355** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3356** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3357** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3358** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

**Status code: 202**

**Table 5-3359** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3360** spec

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job

Parameter	Type	Description
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3361** spec.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3362** spec.tasks

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3363** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

Parameter	Type	Description
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3364** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3365** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

Parameter	Type	Description
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3366** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3367** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3368** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3369** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3370** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3371** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3372** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3373** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3374** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3375** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3376** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3377** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

Status Code	Description
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	AlreadyExists
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.8.4 Deleting a Volcano Job

### Function

This API is used to delete a specified Volcano job.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

**Table 5-3378** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Job
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3379** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.

Parameter	Mandatory	Type	Description
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3380** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3381** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3382** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-3383** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3384** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3385** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3386** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Status code: 202

Table 5-3387 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3388** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>

Parameter	Type	Description
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3389** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3390** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

None

## Example Responses

Status code: 200

## 5.8.5 Querying a Volcano Job

### Function

This API is used to query the details about a specified Volcano job.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

**Table 5-3391** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Job
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3392** Query Parameters

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3393** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3394** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3395** spec

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job

Parameter	Type	Description
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3396** spec.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3397** spec.tasks

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3398** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

Parameter	Type	Description
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3399** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3400** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

Parameter	Type	Description
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3401** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3402** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3403** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3404** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3405** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3406** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3407** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3408** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3409** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3410** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3411** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3412** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

## 5.8.6 Updating a Volcano Job

### Function

This API is used to update a specified Volcano job.

The following fields can be updated:

- **metadata.labels**
- **metadata.generateName**
- **metadata.annotations**
- **spec.template**
- **spec.replicas**

### Calling Method

For details, see [Calling APIs](#).

### URI

PATCH /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

**Table 5-3413** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Job
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3414** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3415** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-3416** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-3417** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3418** spec

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job

Parameter	Type	Description
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3419** spec.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3420** spec.tasks

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3421** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3422** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3423** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3424** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3425** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3426** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3427** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3428** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3429** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3430** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3431** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3432** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3433** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3434** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3435** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

## Example Requests

Changing the **labels** value of an existing Volcano job to **"app": "patchlabel"**

```
{
  "metadata": {
    "labels": {
      "app": "patchlabel"
    }
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "batch.volcano.sh/v1alpha1",
  "kind": "Job",
  "metadata": {
    "creationTimestamp": "2019-06-26T03:16:26Z",
    "generation": 1,
    "labels": {
      "app": "patchlabel"
    },
    "name": "openmpi-hello-2-com",
    "namespace": "cci-namespace-42263891",
    "resourceVersion": "7695210",

## 5.8.7 Replacing a Volcano Job

### Function

This API is used to replace a specified Volcano job.

The following fields can be updated:

- **metadata.labels**
- **metadata.generateName**
- **metadata.annotations**
- **spec.template**
- **spec.replicas**

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /apis/batch.volcano.sh/v1alpha1/namespaces/{namespace}/jobs/{name}

**Table 5-3436** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Job

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3437** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3438** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3439** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	No	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	No	<a href="#">status</a> object	Current status of Job

**Table 5-3440 spec**

Parameter	Mandatory	Type	Description
maxRetry	No	Integer	The limit for retrying submitting job, default is 3
minAvailable	No	Integer	The minimal available pods to run for this Job
plugins	No	Object	Enabled task plugins when creating job.
policies	No	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	No	String	The name of the queue on which job should be created
schedulerName	No	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	No	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job
volumes	No	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3441 spec.policies**

Parameter	Mandatory	Type	Description
action	No	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	No	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	No	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3442** spec.tasks

Parameter	Mandatory	Type	Description
name	No	String	Name specifies the name of tasks
policies	No	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	No	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	No	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3443** spec.tasks.policies

Parameter	Mandatory	Type	Description
action	No	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	No	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	No	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3444** spec.volumes

Parameter	Mandatory	Type	Description
mountPath	Yes	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	No	String	The name of the volume claim.

**Table 5-3445** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	No	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3446** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3447** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3448** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3449** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Mandatory	Type	Description
dataSource	No	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	No	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	No	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>

Parameter	Mandatory	Type	Description
volumeMode	No	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	No	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3450** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Mandatory	Type	Description
apiGroup	No	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.
kind	Yes	String	Kind is the type of resource being referenced
name	Yes	String	Name is the name of resource being referenced

**Table 5-3451** io.k8s.api.core.v1.ResourceRequirements

Parameter	Mandatory	Type	Description
limits	No	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

Parameter	Mandatory	Type	Description
requests	No	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3452** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Mandatory	Type	Description
matchExpressions	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	No	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3453** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Mandatory	Type	Description
key	Yes	String	key is the label key that the selector applies to.
operator	Yes	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.

Parameter	Mandatory	Type	Description
values	No	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3454** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Mandatory	Type	Description
accessModes	No	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	No	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	No	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	No	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3455** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Mandatory	Type	Description
lastProbeTime	No	String	Last time we probed the condition.
lastTransitionTime	No	String	Last time the condition transitioned from one status to another.

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
reason	No	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	Yes	String	status is the status of the condition.
type	Yes	String	type is the type of the condition.

**Table 5-3456** status

Parameter	Mandatory	Type	Description
ControlledResources	No	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	No	Integer	The number of pods which reached phase Succeeded.
failed	No	Integer	The number of pods which reached phase Failed.
minAvailable	No	Integer	The minimal available pods to run for this Job
pending	No	Integer	The number of pending pods.
retryCount	No	Integer	The number that volcano retried to submit the job.
running	No	Integer	The number of running pods.
state	No	<a href="#">status.state</a> object	Current state of Job.
version	No	Integer	Job's current version

**Table 5-3457** status.state

Parameter	Mandatory	Type	Description
message	No	String	Human-readable message indicating details about last transition.
phase	No	String	The phase of Job
reason	No	String	Unique, one-word, CamelCase reason for the condition's last transition.

## Response Parameters

Status code: 200

**Table 5-3458** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3459 spec**

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3460 spec.policies**

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3461 spec.tasks**

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task

Parameter	Type	Description
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3462** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3463** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3464** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3465** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3466** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3467** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3468** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3469** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3470** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3471** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3472** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3473** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3474** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3475** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3476** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

**Status code: 201**

**Table 5-3477** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/api-conventions.md#metadata</a>
spec	<a href="#">spec</a> object	Specification of the desired behavior of a cron job, including the minAvailable
status	<a href="#">status</a> object	Current status of Job

**Table 5-3478** spec

Parameter	Type	Description
maxRetry	Integer	The limit for retrying submitting job, default is 3
minAvailable	Integer	The minimal available pods to run for this Job
plugins	Object	Enabled task plugins when creating job.
policies	Array of <a href="#">spec.policies</a> objects	Specifies the default lifecycle of tasks
queue	String	The name of the queue on which job should be created
schedulerName	String	SchedulerName is the default value of <i>tasks.template.spec.schedulerName</i> .
tasks	Array of <a href="#">spec.tasks</a> objects	Tasks specifies the task specification of Job

Parameter	Type	Description
volumes	Array of <a href="#">spec.volumes</a> objects	The volumes for Job

**Table 5-3479** spec.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3480** spec.tasks

Parameter	Type	Description
name	String	Name specifies the name of tasks
policies	Array of <a href="#">spec.tasks.policies</a> objects	Specifies the lifecycle of task
replicas	Integer	Replicas specifies the replicas of this TaskSpec in Job
template	Object	Specifies the pod that will be created for this TaskSpec when executing a Job

**Table 5-3481** spec.tasks.policies

Parameter	Type	Description
action	String	The action that will be taken to the PodGroup according to Event. One of "Restart", "None". Default to None.
event	String	The Event recorded by scheduler; the controller takes actions according to this Event.

Parameter	Type	Description
timeout	Object	Timeout is the grace period for controller to take actions. Default to nil (take action immediately).

**Table 5-3482** spec.volumes

Parameter	Type	Description
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
volumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaim</a> object	VolumeClaim defines the PVC used by the VolumeMount.
volumeClaim Name	String	The name of the volume claim.

**Table 5-3483** io.k8s.api.core.v1.PersistentVolumeClaim

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	Spec defines the desired characteristics of a volume requested by a pod author. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

Parameter	Type	Description
status	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimStatus</a> object	Status represents the current information/status of a persistent volume claim. Read-only. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>

**Table 5-3484** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3485** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3486** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3487** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3488** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3489** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3490** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3491** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3492** io.k8s.api.core.v1.PersistentVolumeClaimStatus

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the actual access modes the volume backing the PVC has. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>
capacity	Map<String,String>	Represents the actual resources of the underlying volume.
conditions	Array of <a href="#">io.k8s.api.core.v1.PersistentVolumeClaimCondition</a> objects	Current Condition of persistent volume claim. If underlying persistent volume is being resized then the Condition will be set to 'ResizeStarted'.
phase	String	Phase represents the current phase of PersistentVolumeClaim.

**Table 5-3493** io.k8s.api.core.v1.PersistentVolumeClaimCondition

Parameter	Type	Description
lastProbeTime	String	Last time we probed the condition.
lastTransitionTime	String	Last time the condition transitioned from one status to another.
message	String	Human-readable message indicating details about last transition.

Parameter	Type	Description
reason	String	Unique, this should be a short, machine understandable string that gives the reason for condition's last transition. If it reports "ResizeStarted" that means the underlying persistent volume is being resized.
status	String	status is the status of the condition.
type	String	type is the type of the condition.

**Table 5-3494** status

Parameter	Type	Description
ControlledResources	Map<String,String>	All of the resources that are controlled by this job.
Succeeded	Integer	The number of pods which reached phase Succeeded.
failed	Integer	The number of pods which reached phase Failed.
minAvailable	Integer	The minimal available pods to run for this Job
pending	Integer	The number of pending pods.
retryCount	Integer	The number that volcano retried to submit the job.
running	Integer	The number of running pods.
state	<a href="#">status.state</a> object	Current state of Job.
version	Integer	Job's current version

**Table 5-3495** status.state

Parameter	Type	Description
message	String	Human-readable message indicating details about last transition.
phase	String	The phase of Job
reason	String	Unique, one-word, CamelCase reason for the condition's last transition.

## Example Requests

Changing the number of replicas from 1 to 2 for a Volcano job task

```

## 5.9 Namespace

### 5.9.1 Querying All Namespaces

#### Function

This API is used to query the details about all namespaces in the current project.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api/v1/namespaces

**Table 5-3496** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3497** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3498** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.core.v1.Namespace</a> objects	Items is the list of Namespace objects in the list. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3499** io.k8s.api.core.v1.Namespace

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.NamespaceSpec</a> object	Spec defines the behavior of the Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.core.v1.NamespaceStatus</a> object	Status describes the current status of a Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3500** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3501** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3502** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3503** io.k8s.api.core.v1.NamespaceSpec

Parameter	Type	Description
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3504** io.k8s.api.core.v1.NamespaceStatus

Parameter	Type	Description
conditions	Array of <a href="#">io.k8s.api.core.v1.NamespaceCondition</a> objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3505** io.k8s.api.core.v1.NamespaceCondition

Parameter	Type	Description
lastTransitionTime	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

**Table 5-3506** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.9.2 Creating a Namespace

### Function

This API is used to create a namespace.

Currently, CCI provides two types of resources: general-computing resources and GPU-accelerated resources. When creating a namespace, you need to select a type. Subsequent workloads will run on clusters of this type. When calling an API, set the **namespace.kubernetes.io/flavor** field in **metadata.annotations** to the following value:

- **general-computing:** This type of namespace provides basic computing, storage, and network resources, well suited to common workload scenarios.
- **gpu-accelerated:** This type of namespace provides outstanding graphics processing capacity, applicable to high-performance computing scenarios, such as AI.

A network must be created in a namespace to define the mapping between this network and a Virtual Private Cloud (VPC). For more information, see "Namespace and Network" (devg\_na.xml).

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /api/v1/namespaces

**Table 5-3507** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3508** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3509** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	No	<a href="#">io.k8s.api.core.v1.NamespaceSpec</a> object	Spec defines the behavior of the Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	No	<a href="#">io.k8s.api.core.v1.NamespaceStatus</a> object	Status describes the current status of a Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3510** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Mandatory	Type	Description
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3511** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3512** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3513** io.k8s.api.core.v1.NamespaceSpec

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3514** io.k8s.api.core.v1.NamespaceStatus

Parameter	Mandatory	Type	Description
conditions	No	Array of <a href="#">io.k8s.api.core.v1.NamespaceCondition</a> objects	Represents the latest available observations of a namespace's current state.
phase	No	String	Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3515** io.k8s.api.core.v1.NamespaceCondition

Parameter	Mandatory	Type	Description
lastTransitionTime	No	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	No	String	
reason	No	String	
status	Yes	String	Status of the condition, one of True, False, Unknown.
type	Yes	String	Type of namespace controller condition.

## Response Parameters

Status code: 200

**Table 5-3516** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.NamespaceSpec</a> object	Spec defines the behavior of the Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.core.v1.NamespaceStatus</a> object	Status describes the current status of a Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3517** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. **Table 5-3518** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3519** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3520** io.k8s.api.core.v1.NamespaceSpec

Parameter	Type	Description
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3521** io.k8s.api.core.v1.NamespaceStatus

Parameter	Type	Description
conditions	Array of <a href="#">io.k8s.api.core.v1.NamespaceCondition</a> objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3522** io.k8s.api.core.v1.NamespaceCondition

Parameter	Type	Description
lastTransitionTime	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

**Status code: 201**

**Table 5-3523** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. status	<a href="#">io.k8s.api.core.v1.NamespaceStatus</a> object	Status describes the current status of a Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3524** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3525** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3526** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3527** io.k8s.api.core.v1.NamespaceSpec

Parameter	Type	Description
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3528** io.k8s.api.core.v1.NamespaceStatus

Parameter	Type	Description
conditions	Array of <a href="#">io.k8s.api.core.v1.NamespaceCondition</a> objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3529** io.k8s.api.core.v1.NamespaceCondition

Parameter	Type	Description
lastTransitionTime	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

**Status code: 202**

**Table 5-3530** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.NamespaceSpec</a> object	Spec defines the behavior of the Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.core.v1.NamespaceStatus</a> object	Status describes the current status of a Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3531** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.

Parameter	Type	Description
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.  Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3532** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3533** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3534** io.k8s.api.core.v1.NamespaceSpec

Parameter	Type	Description
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3535** io.k8s.api.core.v1.NamespaceStatus

Parameter	Type	Description
conditions	Array of <a href="#">io.k8s.api.core.v1.NamespaceCondition</a> objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3536** io.k8s.api.core.v1.NamespaceCondition

Parameter	Type	Description
lastTransitionTime	String	Time is a wrapper around time.Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

## Example Requests

Creating a GPU-accelerated namespace

```
{
  "apiVersion": "v1",
  "kind": "Namespace",
  "metadata": {
    "annotations": {
      "namespace.kubernetes.io/flavor": "gpu-accelerated"
    },
    "labels": {
      "sys_enterprise_project_id": "0"
    },
    "name": "namespace-test"
  }
}
```

## Example Responses

**Status code: 201**

Created

```
{
  "metadata": {
    "annotations": {
      "namespace.kubernetes.io/flavor": "gpu-accelerated",
      "pv.kubernetes.io/enable-dynamic-provisioning": "true",
      "tenant.kubernetes.io/domain-id": "aadb43c0b14c4cafbcfff483d075987",
      "tenant.kubernetes.io/domain-name": "cci",
      "tenant.kubernetes.io/project-id": "51bf52609f2a49c68bfda3398817b376",
      "tenant.kubernetes.io/project-name": "southchina"
    },
    "creationTimestamp": "2018-09-03T11:20:48Z",
    "labels": {
      "sys_enterprise_project_id": "0503dda897000fed2f78c00909158a4d"
    },
    "name": "namespace-test",
    "resourceVersion": "5016746",
    "selfLink": "/api/v1/namespaces/namespace-test",
    "uid": "68a68c5a-af6b-11e8-8f17-c81fbc371a17"
  },
  "spec": {
    "finalizers": [ "kubernetes" ]

504	ServerTimeout

## 5.9.3 Deleting a Namespace

### Function

This API is used to delete a specified namespace.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /api/v1/namespaces/{name}

**Table 5-3537** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Namespace

**Table 5-3538** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3539 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3540** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3541** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-3542** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3543** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3544** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3545** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

**Status code: 202**

**Table 5-3546** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3547** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

Parameter	Type	Description
kind	String	The kind attribute of the resource associated with the status <code>StatusReason</code> . On some operations may differ from the requested resource <code>Kind</code> . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status <code>StatusReason</code> (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3548** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3549** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

Deleting a namespace (Wait for 10 seconds before the deletion.)

```
{
  "apiVersion": "v1",
  "gracePeriodSeconds": 10,
  "kind": "DeleteOptions"
}
```

## Example Responses

None

## Status Codes

Status Code	Description
200	OK
202	Accepted
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.9.4 Querying a Namespace

### Function

This API is used to query the details about a specified namespace.

## Calling Method

For details, see [Calling APIs](#).

## URI

GET /api/v1/namespaces/{name}

**Table 5-3550** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Namespace

**Table 5-3551** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3552** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-3553** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.NamespaceSpec</a> object	Spec defines the behavior of the Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.core.v1.NamespaceStatus</a> object	Status describes the current status of a Namespace. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3554** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3555** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3556** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3557** io.k8s.api.core.v1.NamespaceSpec

Parameter	Type	Description
finalizers	Array of strings	Finalizers is an opaque list of values that must be empty to permanently remove object from storage. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3558** io.k8s.api.core.v1.NamespaceStatus

Parameter	Type	Description
conditions	Array of <a href="#">io.k8s.api.core.v1.NamespaceCondition</a> objects	Represents the latest available observations of a namespace's current state.
phase	String	Phase is the current lifecycle phase of the namespace. More info: <a href="https://kubernetes.io/docs/tasks/administer-cluster/namespaces/">https://kubernetes.io/docs/tasks/administer-cluster/namespaces/</a>

**Table 5-3559** io.k8s.api.core.v1.NamespaceCondition

Parameter	Type	Description
lastTransitionTime	String	Time is a wrapper around time. Time which supports correct marshaling to YAML and JSON. Wrappers are provided for many of the factory methods that the time package offers.
message	String	
reason	String	
status	String	Status of the condition, one of True, False, Unknown.
type	String	Type of namespace controller condition.

## 5.10 ClusterRole

### 5.10.1 Listing ClusterRoles

#### Function

This API is used to list or watch objects of kind ClusterRole

#### Calling Method

For details, see [Calling APIs](#).

**URI**

GET /apis/rbac.authorization.k8s.io/v1/clusterroles

**Table 5-3560** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3561** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3562** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.rbac.v1.ClusterRole</a> objects	Items is a list of ClusterRoles
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard object's metadata.

**Table 5-3563** io.k8s.api.rbac.v1.ClusterRole

Parameter	Type	Description
aggregationRule	<a href="#">io.k8s.api.rbac.v1.AggregationRule</a> object	AggregationRule is an optional field that describes how to build the Rules for this ClusterRole. If AggregationRule is set, then the Rules are controller managed and direct changes to Rules will be stomped by the controller.
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
rules	Array of <a href="#">io.k8s.api.rbac.v1.PolicyRule</a> objects	Rules holds all the PolicyRules for this ClusterRole

**Table 5-3564** io.k8s.api.rbac.v1.AggregationRule

Parameter	Type	Description
clusterRoleSelectors	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> objects	ClusterRoleSelectors holds a list of selectors which will be used to find ClusterRoles and create the rules. If any of the selectors match, then the ClusterRole's permissions will be added

**Table 5-3565** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3566** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3567** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3568** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3569** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3570** io.k8s.api.rbac.v1.PolicyRule

Parameter	Type	Description
apiGroups	Array of strings	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed.

Parameter	Type	Description
nonResourceURLs	Array of strings	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
resourceNames	Array of strings	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
resources	Array of strings	Resources is a list of resources this rule applies to. ResourceAll represents all resources.
verbs	Array of strings	Verbs is a list of Verbs that apply to ALL the ResourceKinds and AttributeRestrictions contained in this rule. VerbAll represents all kinds.

**Table 5-3571** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

None

## Example Responses

## 5.10.2 Querying a Cluster Role

### Function

This API is used to read the specified ClusterRole

### Calling Method

For details, see [Calling APIs](#).

## URI

GET /apis/rbac.authorization.k8s.io/v1/clusterroles/{name}

**Table 5-3572** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the ClusterRole

**Table 5-3573** Query Parameters

Parameter	Mandatory	Type	Description
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3574** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3575** Response body parameters

Parameter	Type	Description
aggregationRule	<a href="#">io.k8s.api.rbac.v1.AggregationRule</a> object	AggregationRule is an optional field that describes how to build the Rules for this ClusterRole. If AggregationRule is set, then the Rules are controller managed and direct changes to Rules will be stomped by the controller.

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata.
rules	Array of <a href="#">io.k8s.api.rbac.v1.PolicyRule</a> objects	Rules holds all the PolicyRules for this ClusterRole

**Table 5-3576** io.k8s.api.rbac.v1.AggregationRule

Parameter	Type	Description
clusterRoleSelectors	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> objects	ClusterRoleSelectors holds a list of selectors which will be used to find ClusterRoles and create the rules. If any of the selectors match, then the ClusterRole's permissions will be added

**Table 5-3577** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3578** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3579** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3580** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3581** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3582** io.k8s.api.rbac.v1.PolicyRule

Parameter	Type	Description
apiGroups	Array of strings	APIGroups is the name of the APIGroup that contains the resources. If multiple API groups are specified, any action requested against one of the enumerated resources in any API group will be allowed.

Parameter	Type	Description
nonResourceURLs	Array of strings	NonResourceURLs is a set of partial urls that a user should have access to. *s are allowed, but only as the full, final step in the path Since non-resource URLs are not namespaced, this field is only applicable for ClusterRoles referenced from a ClusterRoleBinding. Rules can either apply to API resources (such as "pods" or "secrets") or non-resource URL paths (such as "/api"), but not both.
resourceNames	Array of strings	ResourceNames is an optional white list of names that the rule applies to. An empty set means that everything is allowed.
resources	Array of strings	Resources is a list of resources this rule applies to. ResourceAll represents all resources.
verbs	Array of strings	Verbs is a list of Verbs that apply to ALL the ResourceKinds and AttributeRestrictions contained in this rule. VerbAll represents all kinds.

## 5.11 Secret

### 5.11.1 Deleting Secrets in a Namespace

#### Function

This API is used to delete all secrets in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

DELETE /api/v1/namespaces/{namespace}/secrets

**Table 5-3583** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3584** Query Parameters

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset

Parameter	Mandatory	Type	Description
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3585** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3586** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3587** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-3588** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3589** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3590** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3591** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.11.2 Querying Secrets in a Namespace

### Function

This API is used to query all secrets in a specified namespace.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /api/v1/namespaces/{namespace}/secrets

**Table 5-3592** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3593** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3594** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3595** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.core.v1.Secret</a> objects	Items is a list of secret objects. More info: <a href="https://kubernetes.io/docs/concepts/configuration/secret">https://kubernetes.io/docs/concepts/configuration/secret</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3596** io.k8s.api.core.v1.Secret

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3597** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3598** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3599** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3600** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

### 5.11.3 Creating a Secret

#### Function

This API is used to create a secret that Kubernetes uses to process sensitive information.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

POST /api/v1/namespaces/{namespace}/secrets

**Table 5-3601** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3602** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3603** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3604** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Mandatory	Type	Description
data	No	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	No	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="https://git.k8s.io/api/meta/v1/objects">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	No	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.

Parameter	Mandatory	Type	Description
type	No	String	Used to facilitate programmatic handling of secret data.

**Table 5-3605** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Mandatory	Type	Description
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3606** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3607** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

## Response Parameters

Status code: 200

**Table 5-3608** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3609** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3610** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3611** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Status code: 201**

**Table 5-3612** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3613** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3614** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3615** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Status code: 202**

**Table 5-3616** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3617** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3618** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3619** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

## Example Requests

Creating a secret with two key-value pairs

```
{
  "apiVersion": "v1",
  "data": {
    "key1": "MWYyZDFIMmU2N2Rm",
    "key2": "YWRTaW4="
  },
  "kind": "Secret",
  "metadata": {
```

```

    "name" : "secret-test"
  },
  "type" : "Opaque"
}

```

## Example Responses

**Status code: 201**

Created

```

{
  "apiVersion" : "v1",
  "data" : {
    "key1" : "MWYyZDFIMmU2N2Rm",
    "key2" : "YWRtaW4="
  },
  "kind" : "Secret",
  "metadata" : {
    "creationTimestamp" : "2018-09-04T03:59:19Z",
    "name" : "secret-test",
    "namespace" : "namespace-test",
    "resourceVersion" : "5177770",
    "selfLink" : "/api/v1/namespaces/namespace-test/secrets/secret-test",
    "uid" : "e6170b6d-aff6-11e8-8f17-c81fbe371a17"
  },
  "type" : "Opaque"
}

```

## Status Codes

Status Code	Description
200	OK
201	Created
202	Accepted
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	AlreadyExists
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable

Status Code	Description
504	ServerTimeout

## 5.11.4 Deleting a Secret

### Function

This API is used to delete a secret.

### Calling Method

For details, see [Calling APIs](#).

### URI

DELETE /api/v1/namespaces/{namespace}/secrets/{name}

**Table 5-3620** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Secret
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3621** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3622** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3623** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.

Parameter	Mandatory	Type	Description
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3624** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

**Status code: 200**

**Table 5-3625** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.

Parameter	Type	Description
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3626** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

Parameter	Type	Description
kind	String	The kind attribute of the resource associated with the status <code>StatusReason</code> . On some operations may differ from the requested resource <code>Kind</code> . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status <code>StatusReason</code> (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3627** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3628** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

**Status code: 202**

**Table 5-3629** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3630** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3631** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional.  Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"

Parameter	Type	Description
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3632** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

### Example Requests

```
{
  "apiVersion": "v1",
  "gracePeriodSeconds": 10,
  "kind": "DeleteOptions"
}
```

### Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",
  "code": 200,
  "details": {
    "kind": "secrets",
    "name": "secret-test",
    "uid": "e6170b6d-aff6-11e8-8f17-c81fbe371a17"
  },
  "kind": "Status",
  "metadata": { },
  "status": "Success"
}
```

### Status Codes

Status Code	Description
200	OK
202	Accepted
400	BadRequest

Status Code	Description
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.11.5 Querying a Secret

### Function

This API is used to query the details about a specified secret.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /api/v1/namespaces/{namespace}/secrets/{name}

**Table 5-3633** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Secret
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3634** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3635** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

**Status code: 200**

**Table 5-3636** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3637** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3638** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3639** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

## 5.11.6 Updating a Secret

### Function

This API is used to update partial information about a specified secret.

### Calling Method

For details, see [Calling APIs](#).

## URI

PATCH /api/v1/namespaces/{namespace}/secrets/{name}

**Table 5-3640** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Secret
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3641** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	No	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3642 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-3643** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-3644** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3645** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3646** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3647** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

## Example Requests

Changing the **data** value in the secret to **"test2": "dGVzdA=="**

Content-Type: application/merge-patch+json

```
{
  "data": {
    "test2": "dGVzdA=="
  }
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",
  "data": {
    "key1": "MWYyZDFIMmU2N2Rm",
    "key2": "YWRtaW4=",
    "test2": "dGVzdA=="
  },
  "kind": "Secret",
  "metadata": {
    "creationTimestamp": "2018-09-04T03:59:19Z",
    "name": "secret-test",
    "namespace": "namespace-test",
    "resourceVersion": "5199399",
    "selfLink": "/api/v1/namespaces/namespace-test/secrets/secret-test",
    "uid": "e6170b6d-aff6-11e8-8f17-c81fbe371a17"
  },
  "type": "Opaque"
}
```

## Status Codes

Status Code	Description
200	OK
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.11.7 Replacing a Secret

### Function

This API is used to replace a specified secret.

The following fields can be updated:

- **metadata.labels**
- **metadata.annotations**
- **data**
- If **type** is set to **Opaque**, the key and value of **data** can be updated.
- If **type** is not set to **Opaque**, only the value of **data** can be updated.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /api/v1/namespaces/{namespace}/secrets/{name}

**Table 5-3648** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Secret
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3649** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed

Parameter	Mandatory	Type	Description
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3650** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3651** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Mandatory	Type	Description
data	No	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	No	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	No	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.

Parameter	Mandatory	Type	Description
type	No	String	Used to facilitate programmatic handling of secret data.

**Table 5-3652** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Mandatory	Type	Description
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3653** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3654** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

## Response Parameters

Status code: 200

**Table 5-3655** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '.'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3656** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3657** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3658** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Status code: 201**

**Table 5-3659** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
data	Map<String,String>	Data contains the secret data. Each key must consist of alphanumeric characters, '-', '_' or '!'. The serialized form of the secret data is a base64 encoded string, representing the arbitrary (possibly non-string) data value here. Described in <a href="https://tools.ietf.org/html/rfc4648#section-4">https://tools.ietf.org/html/rfc4648#section-4</a>
immutable	Boolean	Immutable, if set to true, ensures that data stored in the Secret cannot be updated (only object metadata can be modified). If not set to true, the field can be modified at any time. Defaulted to nil. This is a beta field enabled by ImmutableEphemeralVolumes feature gate.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
stringData	Map<String,String>	stringData allows specifying non-binary secret data in string form. It is provided as a write-only convenience method. All keys and values are merged into the data field on write, overwriting any existing values. It is never output when reading from the API.
type	String	Used to facilitate programmatic handling of secret data.

**Table 5-3660** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3661** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3662** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

## Example Requests

Changing the **key2** value of an existing secret to **test**

```
{
  "apiVersion": "v1",
  "data": {
    "key1": "MWYyZDFmU2N2Rm",
    "test": "dGVzdA=="
  },
  "kind": "Secret",
  "metadata": {
```

```

    "name" : "secret-test"
  },
  "type" : "Opaque"
}

```

## Example Responses

**Status code: 200**

OK

```

{
  "apiVersion" : "v1",
  "data" : {
    "key1" : "MWYyZDFIMmU2N2Rm",
    "test" : "dGVzdA=="
  },
  "kind" : "Secret",
  "metadata" : {
    "creationTimestamp" : "2018-09-04T03:59:19Z",
    "name" : "secret-test",
    "namespace" : "namespace-test",
    "resourceVersion" : "5199399",
    "selfLink" : "/api/v1/namespaces/namespace-test/secrets/secret-test",
    "uid" : "e6170b6d-aff6-11e8-8f17-c81fbe371a17"
  },
  "type" : "Opaque"
}

```

## Status Codes

Status Code	Description
200	OK
201	Created
400	BadRequest
401	Unauthorized
403	Forbidden
404	NotFound
405	MethodNotAllowed
406	NotAcceptable
409	Conflict
415	UnsupportedMediaType
422	Invalid
429	TooManyRequests
500	InternalServerError
503	ServiceUnavailable
504	ServerTimeout

## 5.12 Endpoint

### 5.12.1 Querying Endpoints in a Namespace

#### Function

This API is used to query all endpoints in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api/v1/namespaces/{namespace}/endpoints

**Table 5-3663** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3664** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3665** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3666** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.core.v1.Endpoint</a> s objects	List of endpoints.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3667** io.k8s.api.core.v1.Endpoints

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3668** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3669** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3670** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3671** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3672** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3673** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3674** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

**Table 5-3675** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

## 5.12.2 Creating an Endpoint

### Function

This API is used to create an endpoint.

### Calling Method

For details, see [Calling APIs](#).

### URI

POST /api/v1/namespaces/{namespace}/endpoints

**Table 5-3676** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3677** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3678** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3679** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	No	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3680** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3681** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3682** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3683** io.k8s.api.core.v1.EndpointSubset

Parameter	Mandatory	Type	Description
addresses	No	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Mandatory	Type	Description
notReadyAddresses	No	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	No	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3684** io.k8s.api.core.v1.EndpointAddress

Parameter	Mandatory	Type	Description
hostname	No	String	The Hostname of this endpoint
ip	Yes	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	No	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	No	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3685** io.k8s.api.core.v1.ObjectReference

Parameter	Mandatory	Type	Description
apiVersion	No	String	API version of the referent.

Parameter	Mandatory	Type	Description
fieldPath	No	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	No	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	No	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	No	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>

Parameter	Mandatory	Type	Description
uid	No	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3686** io.k8s.api.core.v1.EndpointPort

Parameter	Mandatory	Type	Description
appProtocol	No	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Un-prefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.
name	No	String	The name of this port. This must match the 'name' field in the corresponding <code>ServicePort</code> . Must be a <code>DNS_LABEL</code> . Optional only if one port is defined.
port	Yes	Integer	The port number of the endpoint.
protocol	No	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

## Response Parameters

Status code: 200

**Table 5-3687** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3688** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3689** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3690** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3691** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3692** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3693** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3694** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

**Status code: 201**

**Table 5-3695** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3696** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3697** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3698** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3699** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3700** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3701** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3702** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

**Status code: 202**

**Table 5-3703** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3704** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3705** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3706** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3707** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3708** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3709** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3710** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

## Example Requests

Creating an endpoint with the port name set to **service0**, port number to 80, and protocol to TCP

```
{
  "apiVersion": "v1",
  "kind": "Endpoints",
  "metadata": {
    "name": "test-endpoint",
    "namespace": "test-namespace"
  },
  "subsets": [ {
    "addresses": [ {
      "ip": "192.168.226.222",
      "targetRef": {
        "kind": "Pod",
        "name": "nginx-686bccd6f-ccsqb",
        "namespace": "test-namespace",
        "resourceVersion": "262055491",
        "uid": "ae417968-4f69-40da-9228-2434671e9c66"
      }
    }
  ]
},
  "ports": [ {
    "name": "service0",
    "port": 80,
    "protocol": "TCP"
  }
]
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",

### 5.12.3 Deleting an Endpoint

#### Function

This API is used to delete an endpoint.

## Calling Method

For details, see [Calling APIs](#).

## URI

DELETE /api/v1/namespaces/{namespace}/endpoints/{name}

**Table 5-3711** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Endpoints
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3712** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Integer	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3713 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3714** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
dryRun	No	Array of strings	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
gracePeriodSeconds	No	Long	The duration in seconds before the object should be deleted. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period for the specified type will be used. Defaults to a per object value if not specified. zero means delete immediately.

Parameter	Mandatory	Type	Description
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
orphanDependents	No	Boolean	Deprecated: please use the PropagationPolicy, this field will be deprecated in 1.7. Should the dependent objects be orphaned. If true/false, the "orphan" finalizer will be added to/removed from the object's finalizers list. Either this field or PropagationPolicy may be set, but not both.
preconditions	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions</a> object	Must be fulfilled before a deletion is carried out. If not possible, a 409 Conflict status will be returned.
propagationPolicy	No	String	Whether and how garbage collection will be performed. Either this field or OrphanDependents may be set, but not both. The default policy is decided by the existing finalizer set in the metadata.finalizers and the resource-specific default policy. Acceptable values are: 'Orphan' - orphan the dependents; 'Background' - allow the garbage collector to delete the dependents in the background; 'Foreground' - a cascading policy that deletes all dependents in the foreground.

**Table 5-3715** io.k8s.apimachinery.pkg.apis.meta.v1.Preconditions

Parameter	Mandatory	Type	Description
resourceVersion	No	String	Specifies the target ResourceVersion
uid	No	String	Specifies the target UID.

## Response Parameters

Status code: 200

**Table 5-3716** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3717** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3718** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3719** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

**Status code: 202**

**Table 5-3720** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>

Parameter	Type	Description
code	Integer	Suggested HTTP return code for this status, 0 if not set.
details	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails</a> object	Extended data associated with the reason. Each reason may define its own extended details. This field is optional and the data returned is not guaranteed to conform to any schema except that defined by the reason type.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
message	String	A human-readable description of the status of this operation.
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
reason	String	A machine-readable description of why this operation is in the "Failure" status. If this value is empty there is no information available. A Reason clarifies an HTTP status code but does not override it.
status	String	Status of the operation. One of: "Success" or "Failure". More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3721** io.k8s.apimachinery.pkg.apis.meta.v1.StatusDetails

Parameter	Type	Description
causes	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause</a> objects	The Causes array includes more details associated with the StatusReason failure. Not all StatusReasons may provide detailed causes.
group	String	The group attribute of the resource associated with the status StatusReason.

Parameter	Type	Description
kind	String	The kind attribute of the resource associated with the status StatusReason. On some operations may differ from the requested resource Kind. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	The name attribute of the resource associated with the status StatusReason (when there is a single name which can be described).
retryAfterSeconds	Integer	If specified, the time in seconds before the operation should be retried. Some errors may indicate the client must take an alternate action <ul style="list-style-type: none"> <li>for those errors this field may indicate how long to wait before taking the alternate action.</li> </ul>
uid	String	UID of the resource. (when there is a single resource which can be described). More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3722** io.k8s.apimachinery.pkg.apis.meta.v1.StatusCause

Parameter	Type	Description
field	String	The field of the resource that has caused this error, as named by its JSON serialization. May include dot and postfix notation for nested attributes. Arrays are zero-indexed. Fields may appear more than once in an array of causes due to fields having multiple errors. Optional. Examples: "name" - the field "name" on the current resource "items[0].name" - the field "name" on the first array entry in "items"
message	String	A human-readable description of the cause of the error. This field may be presented as-is to a reader.
reason	String	A machine-readable description of the cause of the error. If this value is empty there is no information available.

**Table 5-3723** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## Example Requests

## 5.12.4 Querying an Endpoint

### Function

This API is used to query a specified endpoint.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /api/v1/namespaces/{namespace}/endpoints/{name}

**Table 5-3724** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Endpoints
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3725** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3726 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3727 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3728** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3729** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3730** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3731** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3732** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3733** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3734** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

## Example Requests

None

## Example Responses

**Status code: 200**

OK

```

## 5.12.5 Updating an Endpoint

### Function

This API is used to update an endpoint.

### Calling Method

For details, see [Calling APIs](#).

### URI

PATCH /api/v1/namespaces/{namespace}/endpoints/{name}

**Table 5-3735** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Endpoints
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3736** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> . This field is required for apply requests (application/apply-patch) but optional for non-apply patch types (JsonPatch, MergePatch, StrategicMergePatch).
force	No	Boolean	Force is going to "force" Apply requests. It means user will re-acquire conflicting fields owned by other people. Force flag must be unset for non-apply patch requests.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3737** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

Parameter	Mandatory	Type	Description
Content-Type	Yes	String	<p>Currently, three types of patch request methods are supported. For details, see "Update API Objects in Place Using kubectl patch" (<a href="https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/">https://kubernetes.io/docs/tasks/manage-kubernetes-objects/update-api-object-kubectl-patch/</a>).</p> <ul style="list-style-type: none"> <li>• <b>Json Patch, Content-Type: application/json-patch+json</b> As defined in RFC6902, Json Patch contains a series of operations on a JSON object. After receiving the object, the server applies the represented operations to the JSON object.</li> <li>• <b>Merge Patch, Content-Type: application/merge-patch+json</b> According to RFC 7386, Merge Patch contains some description of a JSON object. The JSON object is submitted to the server end and merges with the current object of the server end, which means to replace the list field of the current resource object to form a new object.</li> <li>• <b>Strategic Merge Patch, Content-Type: application/strategic-merge-patch+json</b> Strategic Merge Patch is used to add legal metadata to API objects and uses new metadata to determine which lists should be merged and which ones should not. The current metadata is used as the structure labels.</li> </ul>

**Table 5-3738** Request body parameters

Parameter	Mandatory	Type	Description
-	Yes	Object	Patch is provided to give a concrete name and type to the Kubernetes PATCH request body.

## Response Parameters

Status code: 200

**Table 5-3739** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3740** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3741** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3742** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3743** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3744** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3745** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3746** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

## Example Requests

Updating an endpoint

```
[ {
  "op": "add",
  "path": "/metadata/annotations",
  "value": {
    "test-key": "test-value"
  }
}]
```

## Example Responses

**Status code: 200**

OK

## 5.12.6 Replacing an Endpoint

### Function

This API is used to replace an endpoint.

### Calling Method

For details, see [Calling APIs](#).

### URI

PUT /api/v1/namespaces/{namespace}/endpoints/{name}

**Table 5-3747** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the Endpoints
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3748** Query Parameters

Parameter	Mandatory	Type	Description
dryRun	No	String	When present, indicates that modifications should not be persisted. An invalid or unrecognized dryRun directive will result in an error response and no further processing of the request. Valid values are: - All: all dry run stages will be processed
fieldManager	No	String	fieldManager is a name associated with the actor or entity that is making these changes. The value must be less than or 128 characters long, and only contain printable characters, as defined by <a href="https://golang.org/pkg/unicode/#IsPrint">https://golang.org/pkg/unicode/#IsPrint</a> .
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

**Table 5-3749** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.
Content-Type	Yes	String	Message body type (format). The default value is <b>application/json</b> . Default: <b>application/json</b>

**Table 5-3750** Request body parameters

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	No	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	No	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	No	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3751** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Mandatory	Type	Description
annotations	No	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	No	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	No	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	No	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Mandatory	Type	Description
deletionTimestamp	No	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Mandatory	Type	Description
finalizers	No	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>

Parameter	Mandatory	Type	Description
generateName	No	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	No	Long	A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.
labels	No	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>

Parameter	Mandatory	Type	Description
managedFields	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	No	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	No	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>

Parameter	Mandatory	Type	Description
ownerReferences	No	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.
resourceVersion	No	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	No	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

Parameter	Mandatory	Type	Description
uid	No	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3752** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Mandatory	Type	Description
apiVersion	No	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	No	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	No	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.
manager	No	String	Manager is an identifier of the workflow managing these fields.
operation	No	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	No	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3753** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Mandatory	Type	Description
apiVersion	Yes	String	API version of the referent.
blockOwnerDeletion	No	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	No	Boolean	If true, this reference points to the managing controller.
kind	Yes	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	Yes	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	Yes	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3754** io.k8s.api.core.v1.EndpointSubset

Parameter	Mandatory	Type	Description
addresses	No	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Mandatory	Type	Description
notReadyAddresses	No	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	No	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3755** io.k8s.api.core.v1.EndpointAddress

Parameter	Mandatory	Type	Description
hostname	No	String	The Hostname of this endpoint
ip	Yes	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	No	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	No	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3756** io.k8s.api.core.v1.ObjectReference

Parameter	Mandatory	Type	Description
apiVersion	No	String	API version of the referent.

Parameter	Mandatory	Type	Description
fieldPath	No	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	No	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	No	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	No	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	No	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>

Parameter	Mandatory	Type	Description
uid	No	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3757** io.k8s.api.core.v1.EndpointPort

Parameter	Mandatory	Type	Description
appProtocol	No	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Un-prefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.
name	No	String	The name of this port. This must match the 'name' field in the corresponding <code>ServicePort</code> . Must be a <code>DNS_LABEL</code> . Optional only if one port is defined.
port	Yes	Integer	The port number of the endpoint.
protocol	No	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

## Response Parameters

Status code: 200

**Table 5-3758** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3759** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3760** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3761** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3762** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3763** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3764** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3765** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

**Status code: 201**

**Table 5-3766** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
subsets	Array of <a href="#">io.k8s.api.core.v1.EndpointSubset</a> objects	The set of all endpoints is the union of all subsets. Addresses are placed into subsets according to the IPs they share. A single address with multiple ports, some of which are ready and some of which are not (because they come from different containers) will result in the address being displayed in different subsets for the different ports. No address will appear in both Addresses and NotReadyAddresses in the same subset. Sets of addresses and ports that comprise a service.

**Table 5-3767** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed.</p> <p>Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3768** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3769** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3770** io.k8s.api.core.v1.EndpointSubset

Parameter	Type	Description
addresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports that are marked as ready. These endpoints should be considered safe for load balancers and clients to utilize.

Parameter	Type	Description
notReadyAddresses	Array of <a href="#">io.k8s.api.core.v1.EndpointAddress</a> objects	IP addresses which offer the related ports but are not currently marked as ready because they have not yet finished starting, have recently failed a readiness check, or have recently failed a liveness check.
ports	Array of <a href="#">io.k8s.api.core.v1.EndpointPort</a> objects	Port numbers available on the related IP addresses.

**Table 5-3771** io.k8s.api.core.v1.EndpointAddress

Parameter	Type	Description
hostname	String	The Hostname of this endpoint
ip	String	The IP of this endpoint. May not be loopback (127.0.0.0/8), link-local (169.254.0.0/16), or link-local multicast ((224.0.0.0/24). IPv6 is also accepted but not fully supported on all platforms. Also, certain kubernetes components, like kube-proxy, are not IPv6 ready.
nodeName	String	Optional: Node hosting this endpoint. This can be used to determine endpoints local to a node.
targetRef	<a href="#">io.k8s.api.core.v1.ObjectReference</a> object	Reference to object providing the endpoint.

**Table 5-3772** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.

Parameter	Type	Description
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as <code>desiredState.manifest.containers[2]</code> . For example, if the object reference is to a container within a pod, this would take on a value like: <code>"spec.containers{name}"</code> (where "name" refers to the name of the container that triggered the event) or if no container name is specified <code>"spec.containers[2]"</code> (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3773** io.k8s.api.core.v1.EndpointPort

Parameter	Type	Description
appProtocol	String	The application protocol for this port. This field follows standard Kubernetes label syntax. Unprefixed names are reserved for IANA standard service names (as per RFC-6335 and <a href="http://www.iana.org/assignments/service-names">http://www.iana.org/assignments/service-names</a> ). Non-standard protocols should use prefixed names such as <code>mycompany.com/my-custom-protocol</code> . This is a beta field that is guarded by the <code>ServiceAppProtocol</code> feature gate and enabled by default.

Parameter	Type	Description
name	String	The name of this port. This must match the 'name' field in the corresponding ServicePort. Must be a DNS_LABEL. Optional only if one port is defined.
port	Integer	The port number of the endpoint.
protocol	String	The IP protocol for this port. Must be UDP, TCP, or SCTP. Default is TCP.

## Example Requests

### Replacing an endpoint

```
{
  "apiVersion": "v1",
  "kind": "Endpoints",
  "metadata": {
    "annotations": {
      "new-key": "new-value",
      "test-key": "test-value"
    },
    "creationTimestamp": "2023-03-28T13:55:52Z",
    "name": "test-endpoint",
    "namespace": "test-namespace",
    "resourceVersion": "263561274",
    "selfLink": "/api/v1/namespaces/test-namespace/endpoints/test-endpoint",
    "uid": "3907aa64-c3f3-4de0-b938-9d23e8d12f94"
  },
  "subsets": [ {
    "addresses": [ {
      "ip": "192.168.226.222",
      "targetRef": {
        "kind": "Pod",
        "name": "nginx-686bccd6f-ccsqb",
        "namespace": "test-namespace",
        "resourceVersion": "262055491",
        "uid": "ae417968-4f69-40da-9228-2434671e9c66"
      }
    }
  ]
  },
  "ports": [ {
    "name": "service0",
    "port": 80,
    "protocol": "TCP"
  }
  ]
}
```

## Example Responses

**Status code: 200**

OK

```
{
  "apiVersion": "v1",
  "kind": "Endpoints",
  "metadata": {
    "annotations": {
      "new-key": "new-value",
```

```

    "test-key" : "test-value"
  },
  "creationTimestamp" : "2023-03-28T13:55:52Z",
  "name" : "test-endpoint",
  "namespace" : "test-namespace",
  "resourceVersion" : "263576210",
  "selfLink" : "/api/v1/namespaces/test-namespace/endpoints/test-endpoint",

504	ServerTimeout

## 5.13 ResourceQuota

### 5.13.1 Querying resourcequotas in a Namespace

#### Function

This API is used to query the resourcequotas in a specified namespace.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api/v1/namespaces/{namespace}/resourcequotas

**Table 5-3774** Path Parameters

Parameter	Mandatory	Type	Description
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3775** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3776 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3777 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.core.v1.ResourceQuota</a> objects	Items is a list of ResourceQuota objects. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3778** io.k8s.api.core.v1.ResourceQuota

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.ResourceQuotaSpec</a> object	Spec defines the desired quota. <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.core.v1.ResourceQuotaStatus</a> object	Status defines the actual enforced quota and its current usage. <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3779** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>

Parameter	Type	Description
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	<p>An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.</p> <p>Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a></p>
selfLink	String	<p>SelfLink is a URL representing this object. Populated by the system. Read-only.</p> <p>DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.</p>
uid	String	<p>UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.</p> <p>Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a></p>

**Table 5-3780** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	<p>APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.</p>
fieldsType	String	<p>FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"</p>
fieldsV1	Object	<p>FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.</p>

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3781** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3782** io.k8s.api.core.v1.ResourceQuotaSpec

Parameter	Type	Description
hard	Map<String,String>	hard is the set of desired hard limits for each named resource. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>

Parameter	Type	Description
scopeSelector	<a href="#">io.k8s.api.core.v1.ScopeSelector</a> object	scopeSelector is also a collection of filters like scopes that must match each object tracked by a quota but expressed using ScopeSelectorOperator in combination with possible values. For a resource to match, both scopes AND scopeSelector (if specified in spec), must be matched.
scopes	Array of strings	A collection of filters that must match each object tracked by a quota. If not specified, the quota matches all objects.

**Table 5-3783** io.k8s.api.core.v1.ScopeSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.ScopedResourceSelectorRequirement</a> objects	A list of scope selector requirements by scope of the resources.

**Table 5-3784** io.k8s.api.core.v1.ScopedResourceSelectorRequirement

Parameter	Type	Description
operator	String	Represents a scope's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist.
scopeName	String	The name of the scope that the selector applies to.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3785** io.k8s.api.core.v1.ResourceQuotaStatus

Parameter	Type	Description
hard	Map<String,String>	Hard is the set of enforced hard limits for each named resource. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>
used	Map<String,String>	Used is the current observed total usage of the resource in the namespace.

**Table 5-3786** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.

Parameter	Type	Description
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.13.2 Querying a resourcequota

### Function

This API is used to query a specified resourcequota.

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /api/v1/namespaces/{namespace}/resourcequotas/{name}

**Table 5-3787** Path Parameters

Parameter	Mandatory	Type	Description
name	Yes	String	name of the ResourceQuota
namespace	Yes	String	object name and auth scope, such as for teams and projects

**Table 5-3788** Query Parameters

Parameter	Mandatory	Type	Description
exact	No	Boolean	Should the export be exact. Exact export maintains cluster-specific fields like 'Namespace'. Deprecated. Planned for removal in 1.18.

Parameter	Mandatory	Type	Description
export	No	Boolean	Should this value be exported. Export strips fields that a user can not specify. Deprecated. Planned for removal in 1.18.
pretty	No	String	If 'true', then the output is pretty printed.

## Request Parameters

Table 5-3789 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3790 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.ResourceQuotaSpec</a> object	Spec defines the desired quota. <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.core.v1.ResourceQuotaStatus</a> object	Status defines the actual enforced quota and its current usage. <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3791** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

Parameter	Type	Description
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3792** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3793** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3794** io.k8s.api.core.v1.ResourceQuotaSpec

Parameter	Type	Description
hard	Map<String,String>	hard is the set of desired hard limits for each named resource. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>

Parameter	Type	Description
scopeSelector	<a href="#">io.k8s.api.core.v1.ScopeSelector</a> object	scopeSelector is also a collection of filters like scopes that must match each object tracked by a quota but expressed using ScopeSelectorOperator in combination with possible values. For a resource to match, both scopes AND scopeSelector (if specified in spec), must be matched.
scopes	Array of strings	A collection of filters that must match each object tracked by a quota. If not specified, the quota matches all objects.

**Table 5-3795** io.k8s.api.core.v1.ScopeSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.ScopedResourceSelectorRequirement</a> objects	A list of scope selector requirements by scope of the resources.

**Table 5-3796** io.k8s.api.core.v1.ScopedResourceSelectorRequirement

Parameter	Type	Description
operator	String	Represents a scope's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist.
scopeName	String	The name of the scope that the selector applies to.
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3797** io.k8s.api.core.v1.ResourceQuotaStatus

Parameter	Type	Description
hard	Map<String,String>	Hard is the set of enforced hard limits for each named resource. More info: <a href="https://kubernetes.io/docs/concepts/policy/resource-quotas/">https://kubernetes.io/docs/concepts/policy/resource-quotas/</a>
used	Map<String,String>	Used is the current observed total usage of the resource in the namespace.

## Example Requests

None

## Example Responses

## 5.14 CronJob

### 5.14.1 Querying CronJobs in All Namespaces

#### Function

This API is used to query the details about all CronJobs in all namespaces.

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /apis/batch/v1beta1/cronjobs

**Table 5-3798** Query Parameters

Parameter	Mandatory	Type	Description
allowWatchBookmarks	No	Boolean	allowWatchBookmarks requests watch events with type "BOOKMARK". Servers that do not implement bookmarks may ignore this flag and bookmarks are sent at the server's discretion. Clients should not assume bookmarks are returned at any specific interval, nor may they assume the server will send any BOOKMARK event during a session. If this is not a watch, this field is ignored. If the feature gate WatchBookmarks is not enabled in apiserver, this field is ignored.

Parameter	Mandatory	Type	Description
continue	No	String	<p>The continue option should be set when retrieving more results from the server. Since this value is server defined, clients may only use the continue value from a previous query result with identical query parameters (except for the value of continue) and the server may reject a continue value it does not recognize. If the specified continue value is no longer valid whether due to expiration (generally five to fifteen minutes) or a configuration change on the server, the server will respond with a 410 ResourceExpired error together with a continue token. If the client needs a consistent list, it must restart their list without the continue field. Otherwise, the client may send another list request with the token received with the 410 error, the server will respond with a list starting from the next key, but from the latest snapshot, which is inconsistent from the previous list results - objects that are created, modified, or deleted after the first list request will be included in the response, as long as their keys are after the "next key".</p> <p>This field is not supported when watch is true. Clients may start a watch from the last resourceVersion value returned by the server and not miss any modifications.</p>
fieldSelector	No	String	A selector to restrict the list of returned objects by their fields. Defaults to everything.
labelSelector	No	String	A selector to restrict the list of returned objects by their labels. Defaults to everything.

Parameter	Mandatory	Type	Description
limit	No	Integer	<p>limit is a maximum number of responses to return for a list call. If more items exist, the server will set the <i>continue</i> field on the list metadata to a value that can be used with the same initial query to retrieve the next set of results. Setting a limit may return fewer than the requested amount of items (up to zero items) in the event all requested objects are filtered out and clients should only use the presence of the continue field to determine whether more results are available. Servers may choose not to support the limit argument and will return all of the available results. If limit is specified and the continue field is empty, clients may assume that no more results are available. This field is not supported if watch is true.</p> <p>The server guarantees that the objects returned when using continue will be identical to issuing a single list call without a limit - that is, no objects created, modified, or deleted after the first request is issued will be included in any subsequent continued requests. This is sometimes referred to as a consistent snapshot, and ensures that a client that is using limit to receive smaller chunks of a very large result can ensure they see all possible objects. If objects are updated during a chunked list the version of the object that was present at the time the first list result was calculated is returned.</p>
pretty	No	String	If 'true', then the output is pretty printed.

Parameter	Mandatory	Type	Description
resourceVersion	No	String	resourceVersion sets a constraint on what resource versions a request may be served from. See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
resourceVersionMatch	No	String	resourceVersionMatch determines how resourceVersion is applied to list calls. It is highly recommended that resourceVersionMatch be set for list calls where resourceVersion is set See <a href="https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions">https://kubernetes.io/docs/reference/using-api/api-concepts/#resource-versions</a> for details. Defaults to unset
timeoutSeconds	No	Integer	Timeout for the list/watch call. This limits the duration of the call, regardless of any activity or inactivity.
watch	No	Boolean	Watch for changes to the described resources and return them as a stream of add, update, and remove notifications. Specify resourceVersion.

## Request Parameters

**Table 5-3799** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3800** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
items	Array of <a href="#">io.k8s.api.batch.v1beta1.CronJob</a> objects	items is the list of CronJobs.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta</a> object	Standard list metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>

**Table 5-3801** io.k8s.api.batch.v1beta1.CronJob

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.batch.v1beta1.CronJobSpec</a> object	Specification of the desired behavior of a cron job, including the schedule. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>
status	<a href="#">io.k8s.api.batch.v1beta1.CronJobStatus</a> object	Current status of a cron job. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3802** io.k8s.api.batch.v1beta1.CronJobSpec

Parameter	Type	Description
concurrencyPolicy	String	Specifies how to treat concurrent executions of a Job. Valid values are: - "Allow" (default): allows CronJobs to run concurrently; - "Forbid": forbids concurrent runs, skipping next run if previous run hasn't finished yet; - "Replace": cancels currently running job and replaces it with a new one
failedJobsHistoryLimit	Integer	The number of failed finished jobs to retain. This is a pointer to distinguish between explicit zero and not specified. Defaults to 1.
jobTemplate	<a href="#">io.k8s.api.batch.v1beta1.JobTemplateSpec</a> object	Specifies the job that will be created when executing a CronJob.
schedule	String	The schedule in Cron format, see <a href="https://en.wikipedia.org/wiki/Cron">https://en.wikipedia.org/wiki/Cron</a> .
startingDeadlineSeconds	Long	Optional deadline in seconds for starting the job if it misses scheduled time for any reason. Missed jobs executions will be counted as failed ones.
successfulJobsHistoryLimit	Integer	The number of successful finished jobs to retain. This is a pointer to distinguish between explicit zero and not specified. Defaults to 3.

Parameter	Type	Description
suspend	Boolean	This flag tells the controller to suspend subsequent executions, it does not apply to already started executions. Defaults to false.

**Table 5-3803** io.k8s.api.batch.v1beta1.JobTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata of the jobs created from this template. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.batch.v1.JobSpec</a> object	Specification of the desired behavior of the job. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3804** io.k8s.api.batch.v1.JobSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Specifies the duration in seconds relative to the startTime that the job may be active before the system tries to terminate it; value must be positive integer
backoffLimit	Integer	Specifies the number of retries before marking this job failed. Defaults to 6
completions	Integer	Specifies the desired number of successfully finished pods the job should be run with. Setting to nil means that the success of any pod signals the success of all pods, and allows parallelism to have any positive value. Setting to 1 means that parallelism is limited to 1 and the success of that pod signals the success of the job. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>

Parameter	Type	Description
manualSelector or	Boolean	manualSelector controls generation of pod labels and pod selectors. Leave <i>manualSelector</i> unset unless you are certain what you are doing. When false or unset, the system pick labels unique to this job and appends those labels to the pod template. When true, the user is responsible for picking unique labels and specifying the selector. Failure to pick a unique label may cause this and other jobs to not function correctly. However, You may see <i>manualSelector=true</i> in jobs that were created with the old <i>extensions/v1beta1</i> API. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/#specifying-your-own-pod-selector</a>
parallelism	Integer	Specifies the maximum desired number of pods the job should run at any given time. The actual number of pods running in steady state will be less than this number when $((.spec.completions - .status.successful) < .spec.parallelism)$ , i.e. when the work left to do is less than max parallelism. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over pods that should match the pod count. Normally, the system sets this field for you. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors">https://kubernetes.io/docs/concepts/overview/working-with-objects/labels/#label-selectors</a>
template	<a href="#">io.k8s.api.core.v1.PodTemplateSpec</a> object	Describes the pod that will be created when executing a job. More info: <a href="https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/">https://kubernetes.io/docs/concepts/workloads/controllers/jobs-run-to-completion/</a>
ttlSecondsAfterFinished	Integer	ttlSecondsAfterFinished limits the lifetime of a Job that has finished execution (either Complete or Failed). If this field is set, ttlSecondsAfterFinished after the Job finishes, it is eligible to be automatically deleted. When the Job is being deleted, its lifecycle guarantees (e.g. finalizers) will be honored. If this field is unset, the Job won't be automatically deleted. If this field is set to zero, the Job becomes eligible to be deleted immediately after it finishes. This field is alpha-level and is only honored by servers that enable the TTLAfterFinished feature.

**Table 5-3805** io.k8s.api.core.v1.PodTemplateSpec

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	Standard object's metadata. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
spec	<a href="#">io.k8s.api.core.v1.PodSpec</a> object	Specification of the desired behavior of the pod. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-and-status</a>

**Table 5-3806** io.k8s.api.core.v1.PodSpec

Parameter	Type	Description
activeDeadlineSeconds	Long	Optional duration in seconds the pod may be active on the node relative to StartTime before the system will actively try to mark it failed and kill associated containers. Value must be a positive integer.
affinity	<a href="#">io.k8s.api.core.v1.Affinity</a> object	If specified, the pod's scheduling constraints
automountServiceAccountToken	Boolean	AutomountServiceAccountToken indicates whether a service account token should be automatically mounted.
containers	Array of <a href="#">io.k8s.api.core.v1.Container</a> objects	List of containers belonging to the pod. Containers cannot currently be added or removed. There must be at least one container in a Pod. Cannot be updated.
dnsConfig	<a href="#">io.k8s.api.core.v1.PodDNSConfig</a> object	Specifies the DNS parameters of a pod. Parameters specified here will be merged to the generated DNS configuration based on DNSPolicy.
dnsPolicy	String	Set DNS policy for the pod. Defaults to "ClusterFirst". Valid values are 'ClusterFirstWithHostNet', 'ClusterFirst', 'Default' or 'None'. DNS parameters given in DNSConfig will be merged with the policy selected with DNSPolicy. To have DNS options set along with hostNetwork, you have to specify DNS policy explicitly to 'ClusterFirstWithHostNet'.

Parameter	Type	Description
enableServiceLinks	Boolean	EnableServiceLinks indicates whether information about services should be injected into pod's environment variables, matching the syntax of Docker links. Optional: Defaults to true.
ephemeralContainers	Array of <a href="#">io.k8s.api.core.v1.EphemeralContainer</a> objects	List of ephemeral containers run in this pod. Ephemeral containers may be run in an existing pod to perform user-initiated actions such as debugging. This list cannot be specified when creating a pod, and it cannot be modified by updating the pod spec. In order to add an ephemeral container to an existing pod, use the pod's ephemeralcontainers subresource. This field is alpha-level and is only honored by servers that enable the EphemeralContainers feature.
hostAliases	Array of <a href="#">io.k8s.api.core.v1.HostAliases</a> objects	HostAliases is an optional list of hosts and IPs that will be injected into the pod's hosts file if specified. This is only valid for non-hostNetwork pods.
hostIPC	Boolean	Use the host's ipc namespace. Optional: Default to false.
hostNetwork	Boolean	Host networking requested for this pod. Use the host's network namespace. If this option is set, the ports that will be used must be specified. Default to false.
hostPID	Boolean	Use the host's pid namespace. Optional: Default to false.
hostname	String	Specifies the hostname of the Pod If not specified, the pod's hostname will be set to a system-defined value.
imagePullSecrets	Array of <a href="#">io.k8s.api.core.v1.LocalObjectReference</a> objects	ImagePullSecrets is an optional list of references to secrets in the same namespace to use for pulling any of the images used by this PodSpec. If specified, these secrets will be passed to individual puller implementations for them to use. For example, in the case of docker, only DockerConfig type secrets are honored. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod">https://kubernetes.io/docs/concepts/containers/images#specifying-imagepullsecrets-on-a-pod</a>

Parameter	Type	Description
initContainers	Array of <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">io.k8s.api.core.v1.Container</a> objects	List of initialization containers belonging to the pod. Init containers are executed in order prior to containers being started. If any init container fails, the pod is considered to have failed and is handled according to its restartPolicy. The name for an init container or normal container must be unique among all containers. Init containers may not have Lifecycle actions, Readiness probes, Liveness probes, or Startup probes. The resourceRequirements of an init container are taken into account during scheduling by finding the highest request/limit for each resource type, and then using the max of that value or the sum of the normal containers. Limits are applied to init containers in a similar fashion. Init containers cannot currently be added or removed. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/init-containers/">https://kubernetes.io/docs/concepts/workloads/pods/init-containers/</a>
nodeName	String	nodeName is a request to schedule this pod onto a specific node. If it is non-empty, the scheduler simply schedules this pod onto that node, assuming that it fits resource requirements.
nodeSelector	Map<String,String>	nodeSelector is a selector which must be true for the pod to fit on a node. Selector which must match a node's labels for the pod to be scheduled on that node. More info: <a href="https://kubernetes.io/docs/concepts/configuration/assign-pod-node/">https://kubernetes.io/docs/concepts/configuration/assign-pod-node/</a>

Parameter	Type	Description
overhead	Map<String,String>	Overhead represents the resource overhead associated with running a pod for a given RuntimeClass. This field will be autopopulated at admission time by the RuntimeClass admission controller. If the RuntimeClass admission controller is enabled, overhead must not be set in Pod create requests. The RuntimeClass admission controller will reject Pod create requests which have the overhead already set. If RuntimeClass is configured and selected in the PodSpec, Overhead will be set to the value defined in the corresponding RuntimeClass, otherwise it will remain unset and treated as zero. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md">https://git.k8s.io/enhancements/keps/sig-node/20190226-pod-overhead.md</a> This field is alpha-level as of Kubernetes v1.16, and is only honored by servers that enable the PodOverhead feature.
preemptionPolicy	String	PreemptionPolicy is the Policy for preempting pods with lower priority. One of Never, PreemptLowerPriority. Defaults to PreemptLowerPriority if unset. This field is beta-level, gated by the NonPreemptingPriority feature-gate.
priority	Integer	The priority value. Various system components use this field to find the priority of the pod. When Priority Admission Controller is enabled, it prevents users from setting this field. The admission controller populates this field from PriorityClassName. The higher the value, the higher the priority.
priorityClassName	String	If specified, indicates the pod's priority. "system-node-critical" and "system-cluster-critical" are two special keywords which indicate the highest priorities with the former being the highest priority. Any other name must be defined by creating a PriorityClass object with that name. If not specified, the pod priority will be default or zero if there is no default.
readinessGates	Array of <a href="https://kubernetes.io/api-reference/v1.27/objects/PodReadinessGate">io.k8s.api.core.v1.PodReadinessGate</a> objects	If specified, all readiness gates will be evaluated for pod readiness. A pod is ready when all its containers are ready AND all conditions specified in the readiness gates have status equal to "True" More info: <a href="https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md">https://git.k8s.io/enhancements/keps/sig-network/0007-pod-ready%2B%2B.md</a>

Parameter	Type	Description
restartPolicy	String	Restart policy for all containers within the pod. Only use Always when creating a deployment. Default to Always. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle/#restart-policy</a>
runtimeClassName	String	RuntimeClassName refers to a RuntimeClass object in the node.k8s.io group, which should be used to run this pod. If no RuntimeClass resource matches the named class, the pod will not be run. If unset or empty, the "legacy" RuntimeClass will be used, which is an implicit class with an empty definition that uses the default runtime handler. More info: <a href="https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md">https://git.k8s.io/enhancements/keps/sig-node/runtime-class.md</a> This is a beta feature as of Kubernetes v1.14.
schedulerName	String	If specified, the pod will be dispatched by specified scheduler. If not specified, the pod will be dispatched by default scheduler.
securityContext	<a href="#">io.k8s.api.core.v1.PodSecurityContext</a> object	SecurityContext holds pod-level security attributes and common container settings. Optional: Defaults to empty. See type description for default values of each field.
serviceAccount	String	DeprecatedServiceAccount is a deprecated alias for ServiceAccountName. Deprecated: Use serviceAccountName instead.
serviceAccountName	String	ServiceAccountName is the name of the ServiceAccount to use to run this pod. More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/">https://kubernetes.io/docs/tasks/configure-pod-container/configure-service-account/</a>
setHostnameAsFQDN	Boolean	If true the pod's hostname will be configured as the pod's FQDN, rather than the leaf name (the default). In Linux containers, this means setting the FQDN in the hostname field of the kernel (the nodename field of struct utsname). In Windows containers, this means setting the registry value of hostname for the registry key HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters to FQDN. If a pod does not have FQDN, this has no effect. Default to false.

Parameter	Type	Description
shareProcessNamespace	Boolean	Share a single process namespace between all of the containers in a pod. When this is set containers will be able to view and signal processes from other containers in the same pod, and the first process in each container will not be assigned PID 1. HostPID and ShareProcessNamespace cannot both be set. Optional: Default to false.
subdomain	String	If specified, the fully qualified Pod hostname will be "...svc.". If not specified, the pod will not have a domainname at all.
terminationGracePeriodSeconds	Long	Optional duration in seconds the pod needs to terminate gracefully. May be decreased in delete request. Value must be non-negative integer. The value zero indicates delete immediately. If this value is nil, the default grace period will be used instead. The grace period is the duration in seconds after the processes running in the pod are sent a termination signal and the time when the processes are forcibly halted with a kill signal. Set this value longer than the expected cleanup time for your process. Defaults to 30 seconds.
tolerations	Array of <a href="#">io.k8s.api.core.v1.Toleration</a> objects	If specified, the pod's tolerations.
topologySpreadConstraints	Array of <a href="#">io.k8s.api.core.v1.TopologySpreadConstraint</a> objects	TopologySpreadConstraints describes how a group of pods ought to spread across topology domains. Scheduler will schedule pods in a way which abides by the constraints. All topologySpreadConstraints are ANDed.
volumes	Array of <a href="#">io.k8s.api.core.v1.Volume</a> objects	List of volumes that can be mounted by containers belonging to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes">https://kubernetes.io/docs/concepts/storage/volumes</a>

**Table 5-3807** io.k8s.api.core.v1.Affinity

Parameter	Type	Description
nodeAffinity	<a href="#">io.k8s.api.core.v1.NodeAffinity</a> object	Describes node affinity scheduling rules for the pod.

Parameter	Type	Description
podAffinity	<a href="#">io.k8s.api.core.v1.PodAffinity</a> object	Describes pod affinity scheduling rules (e.g. co-locate this pod in the same node, zone, etc. as some other pod(s)).
podAntiAffinity	<a href="#">io.k8s.api.core.v1.PodAntiAffinity</a> object	Describes pod anti-affinity scheduling rules (e.g. avoid putting this pod in the same node, zone, etc. as some other pod(s)).

**Table 5-3808** io.k8s.api.core.v1.NodeAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PreferredSchedulingTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node matches the corresponding matchExpressions; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	<a href="#">io.k8s.api.core.v1.NodeSelector</a> object	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to an update), the system may or may not try to eventually evict the pod from its node.

**Table 5-3809** io.k8s.api.core.v1.PreferredSchedulingTerm

Parameter	Type	Description
preference	<a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> object	A node selector term, associated with the corresponding weight.

Parameter	Type	Description
weight	Integer	Weight associated with matching the corresponding nodeSelectorTerm, in the range 1-100.

**Table 5-3810** io.k8s.api.core.v1.NodeSelectorTerm

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's labels.
matchFields	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorRequirement</a> objects	A list of node selector requirements by node's fields.

**Table 5-3811** io.k8s.api.core.v1.NodeSelector

Parameter	Type	Description
nodeSelectorTerms	Array of <a href="#">io.k8s.api.core.v1.NodeSelectorTerm</a> objects	Required. A list of node selector terms. The terms are ORed.

**Table 5-3812** io.k8s.api.core.v1.NodeSelectorRequirement

Parameter	Type	Description
key	String	The label key that the selector applies to.
operator	String	Represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists, DoesNotExist. Gt, and Lt.

Parameter	Type	Description
values	Array of strings	An array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. If the operator is Gt or Lt, the values array must have a single element, which will be interpreted as an integer. This array is replaced during a strategic merge patch.

**Table 5-3813** io.k8s.api.core.v1.PodAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-3814** io.k8s.api.core.v1.PodAntiAffinity

Parameter	Type	Description
preferredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.WeightedPodAffinityTerm</a> objects	The scheduler will prefer to schedule pods to nodes that satisfy the anti-affinity expressions specified by this field, but it may choose a node that violates one or more of the expressions. The node that is most preferred is the one with the greatest sum of weights, i.e. for each node that meets all of the scheduling requirements (resource request, requiredDuringScheduling anti-affinity expressions, etc.), compute a sum by iterating through the elements of this field and adding "weight" to the sum if the node has pods which matches the corresponding podAffinityTerm; the node(s) with the highest sum are the most preferred.
requiredDuringSchedulingIgnoredDuringExecution	Array of <a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> objects	If the anti-affinity requirements specified by this field are not met at scheduling time, the pod will not be scheduled onto the node. If the anti-affinity requirements specified by this field cease to be met at some point during pod execution (e.g. due to a pod label update), the system may or may not try to eventually evict the pod from its node. When there are multiple elements, the lists of nodes corresponding to each podAffinityTerm are intersected, i.e. all terms must be satisfied.

**Table 5-3815** io.k8s.api.core.v1.WeightedPodAffinityTerm

Parameter	Type	Description
podAffinityTerm	<a href="#">io.k8s.api.core.v1.PodAffinityTerm</a> object	Required. A pod affinity term, associated with the corresponding weight.
weight	Integer	weight associated with matching the corresponding podAffinityTerm, in the range 1-100.

**Table 5-3816** io.k8s.api.core.v1.PodAffinityTerm

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over a set of resources, in this case pods.
namespaces	Array of strings	namespaces specifies which namespaces the labelSelector applies to (matches against); null or empty list means "this pod's namespace"
topologyKey	String	This pod should be co-located (affinity) or not co-located (anti-affinity) with the pods matching the labelSelector in the specified namespaces, where co-located is defined as running on a node whose value of the label with key topologyKey matches that of any node on which any of the selected pods is running. Empty topologyKey is not allowed.

**Table 5-3817** io.k8s.api.core.v1.PodDNSConfig

Parameter	Type	Description
nameservers	Array of strings	A list of DNS name server IP addresses. This will be appended to the base nameservers generated from DNSPolicy. Duplicated nameservers will be removed.
options	Array of <a href="#">io.k8s.api.core.v1.PodDNSConfigOption</a> objects	A list of DNS resolver options. This will be merged with the base options generated from DNSPolicy. Duplicated entries will be removed. Resolution options given in Options will override those that appear in the base DNSPolicy.
searches	Array of strings	A list of DNS search domains for host-name lookup. This will be appended to the base search paths generated from DNSPolicy. Duplicated search paths will be removed.

**Table 5-3818** io.k8s.api.core.v1.PodDNSConfigOption

Parameter	Type	Description
name	String	Required.
value	String	value is the value of the option

**Table 5-3819** io.k8s.api.core.v1.EphemeralContainer

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a>

Parameter	Type	Description
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Lifecycle is not allowed for ephemeral containers.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
name	String	Name of the ephemeral container specified as a DNS_LABEL. This name must be unique among all containers, init containers and ephemeral containers.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	Ports are not allowed for ephemeral containers.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources are not allowed for ephemeral containers. Ephemeral containers use spare resources already allocated to the pod.
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	SecurityContext is not allowed for ephemeral containers.
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Probes are not allowed for ephemeral containers.
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.

Parameter	Type	Description
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
targetContainerName	String	If set, the name of the container from PodSpec that this ephemeral container targets. The ephemeral container will be run in the namespaces (IPC, PID, etc) of this container. If not set then the ephemeral container is run in whatever namespaces are shared for the pod. Note that the container runtime must support this feature.
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.

Parameter	Type	Description
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-3820** io.k8s.api.core.v1.HostAlias

Parameter	Type	Description
hostnames	Array of strings	Hostnames for the above IP address.
ip	String	IP address of the host file entry.

**Table 5-3821** io.k8s.api.core.v1.LocalObjectReference

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

**Table 5-3822** io.k8s.api.core.v1.Container

Parameter	Type	Description
args	Array of strings	Arguments to the entrypoint. The docker image's CMD is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
command	Array of strings	Entrypoint array. Not executed within a shell. The docker image's ENTRYPOINT is used if this is not provided. Variable references \$(VAR_NAME) are expanded using the container's environment. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$\$(VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Cannot be updated. More info: <a href="https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell">https://kubernetes.io/docs/tasks/inject-data-application/define-command-argument-container/#running-a-command-in-a-shell</a>
env	Array of <a href="#">io.k8s.api.core.v1.EnvVar</a> objects	List of environment variables to set in the container. Cannot be updated.
envFrom	Array of <a href="#">io.k8s.api.core.v1.EnvFromSource</a> objects	List of sources to populate environment variables in the container. The keys defined within a source must be a C_IDENTIFIER. All invalid keys will be reported as an event when the container is starting. When a key exists in multiple sources, the value associated with the last source will take precedence. Values defined by an Env with a duplicate key will take precedence. Cannot be updated.

Parameter	Type	Description
image	String	Docker image name. More info: <a href="https://kubernetes.io/docs/concepts/containers/images">https://kubernetes.io/docs/concepts/containers/images</a> This field is optional to allow higher level config management to default or override container images in workload controllers like Deployments and StatefulSets.
imagePullPolicy	String	Image pull policy. One of Always, Never, IfNotPresent. Defaults to Always if :latest tag is specified, or IfNotPresent otherwise. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/containers/images#updating-images">https://kubernetes.io/docs/concepts/containers/images#updating-images</a>
lifecycle	<a href="#">io.k8s.api.core.v1.Lifecycle</a> object	Actions that the management system should take in response to container lifecycle events. Cannot be updated.
livenessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container liveness. Container will be restarted if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
name	String	Name of the container specified as a DNS_LABEL. Each container in a pod must have a unique name (DNS_LABEL). Cannot be updated.
ports	Array of <a href="#">io.k8s.api.core.v1.ContainerPort</a> objects	List of ports to expose from the container. Exposing a port here gives the system additional information about the network connections a container uses, but is primarily informational. Not specifying a port here DOES NOT prevent that port from being exposed. Any port which is listening on the default "0.0.0.0" address inside a container will be accessible from the network. Cannot be updated.
readinessProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	Periodic probe of container service readiness. Container will be removed from service endpoints if the probe fails. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Compute Resources required by this container. Cannot be updated. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manager-compute-resources-container/</a>

Parameter	Type	Description
securityContext	<a href="#">io.k8s.api.core.v1.SecurityContext</a> object	Security options the pod should run with. More info: <a href="https://kubernetes.io/docs/concepts/policy/security-context/">https://kubernetes.io/docs/concepts/policy/security-context/</a> More info: <a href="https://kubernetes.io/docs/tasks/configure-pod-container/security-context/">https://kubernetes.io/docs/tasks/configure-pod-container/security-context/</a>
startupProbe	<a href="#">io.k8s.api.core.v1.Probe</a> object	StartupProbe indicates that the Pod has successfully initialized. If specified, no other probes are executed until this completes successfully. If this probe fails, the Pod will be restarted, just as if the livenessProbe failed. This can be used to provide different probe parameters at the beginning of a Pod's lifecycle, when it might take a long time to load data or warm a cache, than during steady-state operation. This cannot be updated. This is a beta feature enabled by the StartupProbe feature flag. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
stdin	Boolean	Whether this container should allocate a buffer for stdin in the container runtime. If this is not set, reads from stdin in the container will always result in EOF. Default is false.
stdinOnce	Boolean	Whether the container runtime should close the stdin channel after it has been opened by a single attach. When stdin is true the stdin stream will remain open across multiple attach sessions. If stdinOnce is set to true, stdin is opened on container start, is empty until the first client attaches to stdin, and then remains open and accepts data until the client disconnects, at which time stdin is closed and remains closed until the container is restarted. If this flag is false, a container processes that reads from stdin will never receive an EOF. Default is false
terminationMessagePath	String	Optional: Path at which the file to which the container's termination message will be written is mounted into the container's filesystem. Message written is intended to be brief final status, such as an assertion failure message. Will be truncated by the node if greater than 4096 bytes. The total message length across all containers will be limited to 12kb. Defaults to /dev/termination-log. Cannot be updated.

Parameter	Type	Description
terminationMessagePolicy	String	Indicate how the termination message should be populated. File will use the contents of terminationMessagePath to populate the container status message on both success and failure. FallbackToLogsOnError will use the last chunk of container log output if the termination message file is empty and the container exited with an error. The log output is limited to 2048 bytes or 80 lines, whichever is smaller. Defaults to File. Cannot be updated.
tty	Boolean	Whether this container should allocate a TTY for itself, also requires 'stdin' to be true. Default is false.
volumeDevices	Array of <a href="#">io.k8s.api.core.v1.VolumeDevice</a> objects	volumeDevices is the list of block devices to be used by the container.
volumeMounts	Array of <a href="#">io.k8s.api.core.v1.VolumeMount</a> objects	Pod volumes to mount into the container's filesystem. Cannot be updated.
workingDir	String	Container's working directory. If not specified, the container runtime's default will be used, which might be configured in the container image. Cannot be updated.

**Table 5-3823** io.k8s.api.core.v1.EnvVar

Parameter	Type	Description
name	String	Name of the environment variable. Must be a C_IDENTIFIER.
value	String	Variable references \$(VAR_NAME) are expanded using the previous defined environment variables in the container and any service environment variables. If a variable cannot be resolved, the reference in the input string will be unchanged. The \$(VAR_NAME) syntax can be escaped with a double \$\$, ie: \$\$ (VAR_NAME). Escaped references will never be expanded, regardless of whether the variable exists or not. Defaults to "".

Parameter	Type	Description
valueFrom	<a href="#">io.k8s.api.core.v1.EnvVarSource</a> object	Source for the environment variable's value. Cannot be used if value is not empty.

**Table 5-3824** io.k8s.api.core.v1.EnvVarSource

Parameter	Type	Description
configMapKeyRef	<a href="#">io.k8s.api.core.v1.ConfigMapKeySelector</a> object	Selects a key of a ConfigMap.
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Selects a field of the pod: supports <code>metadata.name</code> , <code>metadata.namespace</code> , <code>metadata.labels['&lt;KEY&gt;']</code> , <code>metadata.annotations['&lt;KEY&gt;']</code> , <code>spec.nodeName</code> , <code>spec.serviceAccountName</code> , <code>status.hostIP</code> , <code>status.podIP</code> , <code>status.podIPs</code> .
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, limits.ephemeral-storage, requests.cpu, requests.memory and requests.ephemeral-storage) are currently supported.
secretKeyRef	<a href="#">io.k8s.api.core.v1.SecretKeySelector</a> object	Selects a key of a secret in the pod's namespace

**Table 5-3825** io.k8s.api.core.v1.ConfigMapKeySelector

Parameter	Type	Description
key	String	The key to select.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its key must be defined

**Table 5-3826** io.k8s.api.core.v1.SecretKeySelector

Parameter	Type	Description
key	String	The key of the secret to select from. Must be a valid secret key.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-3827** io.k8s.api.core.v1.EnvFromSource

Parameter	Type	Description
configMapRef	<a href="#">io.k8s.api.core.v1.ConfigMapEnvSource</a> object	The ConfigMap to select from
prefix	String	An optional identifier to prepend to each key in the ConfigMap. Must be a C_IDENTIFIER.
secretRef	<a href="#">io.k8s.api.core.v1.SecretEnvSource</a> object	The Secret to select from

**Table 5-3828** io.k8s.api.core.v1.ConfigMapEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap must be defined

**Table 5-3829** io.k8s.api.core.v1.SecretEnvSource

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>

Parameter	Type	Description
optional	Boolean	Specify whether the Secret must be defined

**Table 5-3830** io.k8s.api.core.v1.Lifecycle

Parameter	Type	Description
postStart	<a href="#">io.k8s.api.core.v1.Handler</a> object	PostStart is called immediately after a container is created. If the handler fails, the container is terminated and restarted according to its restart policy. Other management of the container blocks until the hook completes. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>
preStop	<a href="#">io.k8s.api.core.v1.Handler</a> object	PreStop is called immediately before a container is terminated due to an API request or management event such as liveness/startup probe failure, preemption, resource contention, etc. The handler is not called if the container crashes or exits. The reason for termination is passed to the handler. The Pod's termination grace period countdown begins before the PreStop hooked is executed. Regardless of the outcome of the handler, the container will eventually terminate within the Pod's termination grace period. Other management of the container blocks until the hook completes or until the termination grace period is reached. More info: <a href="https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks">https://kubernetes.io/docs/concepts/containers/container-lifecycle-hooks/#container-hooks</a>

**Table 5-3831** io.k8s.api.core.v1.Handler

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported

**Table 5-3832** io.k8s.api.core.v1.ContainerPort

Parameter	Type	Description
containerPort	Integer	Number of port to expose on the pod's IP address. This must be a valid port number, 0 < x < 65536.
hostIP	String	What host IP to bind the external port to.
hostPort	Integer	Number of port to expose on the host. If specified, this must be a valid port number, 0 < x < 65536. If HostNetwork is specified, this must match ContainerPort. Most containers do not need this.
name	String	If specified, this must be an IANA_SVC_NAME and unique within the pod. Each named port in a pod must have a unique name. Name for the port that can be referred to by services.
protocol	String	Protocol for port. Must be UDP, TCP, or SCTP. Defaults to "TCP".

**Table 5-3833** io.k8s.api.core.v1.SecurityContext

Parameter	Type	Description
allowPrivilegeEscalation	Boolean	AllowPrivilegeEscalation controls whether a process can gain more privileges than its parent process. This bool directly controls if the no_new_privs flag will be set on the container process. AllowPrivilegeEscalation is true always when the container is: 1) run as Privileged 2) has CAP_SYS_ADMIN
capabilities	<a href="#">io.k8s.api.core.v1.Capabilities</a> object	The capabilities to add/drop when running containers. Defaults to the default set of capabilities granted by the container runtime.
privileged	Boolean	Run container in privileged mode. Processes in privileged containers are essentially equivalent to root on the host. Defaults to false.

Parameter	Type	Description
procMount	String	procMount denotes the type of proc mount to use for the containers. The default is DefaultProcMount which uses the container runtime defaults for readonly paths and masked paths. This requires the ProcMountType feature flag to be enabled.
readOnlyRootFilesystem	Boolean	Whether this container has a read-only root filesystem. Default is false.
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to the container. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by this container. If seccomp options are provided at both the pod & container level, the container options override the pod options.

Parameter	Type	Description
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options from the PodSecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-3834** io.k8s.api.core.v1.Capabilities

Parameter	Type	Description
add	Array of strings	Added capabilities
drop	Array of strings	Removed capabilities

**Table 5-3835** io.k8s.api.core.v1.Probe

Parameter	Type	Description
exec	<a href="#">io.k8s.api.core.v1.ExecAction</a> object	One and only one of the following should be specified. Exec specifies the action to take.
failureThreshold	Integer	Minimum consecutive failures for the probe to be considered failed after having succeeded. Defaults to 3. Minimum value is 1.
httpGet	<a href="#">io.k8s.api.core.v1.HTTPGetAction</a> object	HTTPGet specifies the http request to perform.
initialDelaySeconds	Integer	Number of seconds after the container has started before liveness probes are initiated. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>
periodSeconds	Integer	How often (in seconds) to perform the probe. Default to 10 seconds. Minimum value is 1.
successThreshold	Integer	Minimum consecutive successes for the probe to be considered successful after having failed. Defaults to 1. Must be 1 for liveness and startup. Minimum value is 1.

Parameter	Type	Description
tcpSocket	<a href="#">io.k8s.api.core.v1.TCPSocketAction</a> object	TCPSocket specifies an action involving a TCP port. TCP hooks not yet supported
timeoutSeconds	Integer	Number of seconds after which the probe times out. Defaults to 1 second. Minimum value is 1. More info: <a href="https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes">https://kubernetes.io/docs/concepts/workloads/pods/pod-lifecycle#container-probes</a>

**Table 5-3836** io.k8s.api.core.v1.ExecAction

Parameter	Type	Description
command	Array of strings	Command is the command line to execute inside the container, the working directory for the command is root ('/') in the container's filesystem. The command is simply exec'd, it is not run inside a shell, so traditional shell instructions (' ', etc) won't work. To use a shell, you need to explicitly call out to that shell. Exit status of 0 is treated as live/healthy and non-zero is unhealthy.

**Table 5-3837** io.k8s.api.core.v1.HTTPGetAction

Parameter	Type	Description
host	String	Host name to connect to, defaults to the pod IP. You probably want to set "Host" in httpHeaders instead.
httpHeaders	Array of <a href="#">io.k8s.api.core.v1.HTTPHeader</a> objects	Custom headers to set in the request. HTTP allows repeated headers.
path	String	Path to access on the HTTP server.
port	String	Name or number of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.
scheme	String	Scheme to use for connecting to the host. Defaults to HTTP.

**Table 5-3838** io.k8s.api.core.v1.HTTPHeader

Parameter	Type	Description
name	String	The header field name
value	String	The header field value

**Table 5-3839** io.k8s.api.core.v1.TCPSocketAction

Parameter	Type	Description
host	String	Optional: Host name to connect to, defaults to the pod IP.
port	String	Number or name of the port to access on the container. Number must be in the range 1 to 65535. Name must be an IANA_SVC_NAME.

**Table 5-3840** io.k8s.api.core.v1.VolumeDevice

Parameter	Type	Description
devicePath	String	devicePath is the path inside of the container that the device will be mapped to.
name	String	name must match the name of a persistentVolumeClaim in the pod

**Table 5-3841** io.k8s.api.core.v1.VolumeMount

Parameter	Type	Description
extendPathMode	String	Extend the volume path by appending the pod metadata to the path according to specified pattern. which provide a way of directory isolation and help prevent the writing conflict between different pods.
mountPath	String	Path within the container at which the volume should be mounted. Must not contain '!'.
mountPropagation	String	mountPropagation determines how mounts are propagated from the host to container and the other way around. When not set, MountPropagationNone is used. This field is beta in 1.10.
name	String	This must match the Name of a Volume.

Parameter	Type	Description
policy	<a href="#">io.k8s.api.core.v1.Policy</a> object	VolumeMount Policy.
readOnly	Boolean	Mounted read-only if true, read-write otherwise (false or unspecified). Defaults to false.
subPath	String	Path within the volume from which the container's volume should be mounted. Defaults to "" (volume's root).
subPathExpr	String	Expanded path within the volume from which the container's volume should be mounted. Behaves similarly to SubPath but environment variable references \$(VAR_NAME) are expanded using the container's environment. Defaults to "" (volume's root). SubPathExpr and SubPath are mutually exclusive.

**Table 5-3842** io.k8s.api.core.v1.Policy

Parameter	Type	Description
logs	<a href="#">io.k8s.api.core.v1.Logs</a> object	Logs describes log Volume and its rotate strategy.

**Table 5-3843** io.k8s.api.core.v1.Logs

Parameter	Type	Description
annotations	Map<String,String>	Annotations for log.
rotate	String	Rotate strategy, including 'Daily' 'Hourly' 'Weekly'.

**Table 5-3844** io.k8s.api.core.v1.PodReadinessGate

Parameter	Type	Description
conditionType	String	ConditionType refers to a condition in the pod's condition list with matching type.

**Table 5-3845** io.k8s.api.core.v1.PodSecurityContext

Parameter	Type	Description
fsGroup	Long	A special supplemental group that applies to all containers in a pod. Some volume types allow the Kubelet to change the ownership of that volume to be owned by the pod:  1. The owning GID will be the FSGroup 2. The setgid bit is set (new files created in the volume will be owned by FSGroup) 3. The permission bits are OR'd with rw-rw----  If unset, the Kubelet will not modify the ownership and permissions of any volume.
fsGroupChangePolicy	String	fsGroupChangePolicy defines behavior of changing ownership and permission of the volume before being exposed inside Pod. This field will only apply to volume types which support fsGroup based ownership (and permissions). It will have no effect on ephemeral volume types such as: secret, configmaps and emptydir. Valid values are "OnRootMismatch" and "Always". If not specified defaults to "Always".
runAsGroup	Long	The GID to run the entrypoint of the container process. Uses runtime default if unset. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
runAsNonRoot	Boolean	Indicates that the container must run as a non-root user. If true, the Kubelet will validate the image at runtime to ensure that it does not run as UID 0 (root) and fail to start the container if it does. If unset or false, no such validation will be performed. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.
runAsUser	Long	The UID to run the entrypoint of the container process. Defaults to user specified in image metadata if unspecified. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.

Parameter	Type	Description
seLinuxOptions	<a href="#">io.k8s.api.core.v1.SELinuxOptions</a> object	The SELinux context to be applied to all containers. If unspecified, the container runtime will allocate a random SELinux context for each container. May also be set in SecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence for that container.
seccompProfile	<a href="#">io.k8s.api.core.v1.SeccompProfile</a> object	The seccomp options to use by the containers in this pod.
supplementalGroups	Array of longs	A list of groups applied to the first process run in each container, in addition to the container's primary GID. If unspecified, no groups will be added to any container.
sysctls	Array of <a href="#">io.k8s.api.core.v1.Sysctl</a> objects	Sysctls hold a list of namespaced sysctls used for the pod. Pods with unsupported sysctls (by the container runtime) might fail to launch.
windowsOptions	<a href="#">io.k8s.api.core.v1.WindowsSecurityContextOptions</a> object	The Windows specific settings applied to all containers. If unspecified, the options within a container's SecurityContext will be used. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-3846** io.k8s.api.core.v1.SELinuxOptions

Parameter	Type	Description
level	String	Level is SELinux level label that applies to the container.
role	String	Role is a SELinux role label that applies to the container.
type	String	Type is a SELinux type label that applies to the container.
user	String	User is a SELinux user label that applies to the container.

**Table 5-3847** io.k8s.api.core.v1.SeccompProfile

Parameter	Type	Description
localhostProfile	String	localhostProfile indicates a profile defined in a file on the node should be used. The profile must be preconfigured on the node to work. Must be a descending path, relative to the kubelet's configured seccomp profile location. Must only be set if type is "Localhost".
type	String	type indicates which kind of seccomp profile will be applied. Valid options are: Localhost - a profile defined in a file on the node should be used. RuntimeDefault - the container runtime default profile should be used. Unconfined - no profile should be applied.

**Table 5-3848** io.k8s.api.core.v1.Sysctl

Parameter	Type	Description
name	String	Name of a property to set
value	String	Value of a property to set

**Table 5-3849** io.k8s.api.core.v1.WindowsSecurityContextOptions

Parameter	Type	Description
gmsaCredentialSpec	String	GMSACredentialSpec is where the GMSA admission webhook ( <a href="https://github.com/kubernetes-sigs/windows-gmsa">https://github.com/kubernetes-sigs/windows-gmsa</a> ) inlines the contents of the GMSA credential spec named by the GMSACredentialSpecName field.
gmsaCredentialSpecName	String	GMSACredentialSpecName is the name of the GMSA credential spec to use.
runAsUserName	String	The UserName in Windows to run the entrypoint of the container process. Defaults to the user specified in image metadata if unspecified. May also be set in PodSecurityContext. If set in both SecurityContext and PodSecurityContext, the value specified in SecurityContext takes precedence.

**Table 5-3850** io.k8s.api.core.v1.Toleration

Parameter	Type	Description
effect	String	Effect indicates the taint effect to match. Empty means match all taint effects. When specified, allowed values are NoSchedule, PreferNoSchedule and NoExecute.
key	String	Key is the taint key that the toleration applies to. Empty means match all taint keys. If the key is empty, operator must be Exists; this combination means to match all values and all keys.
operator	String	Operator represents a key's relationship to the value. Valid operators are Exists and Equal. Defaults to Equal. Exists is equivalent to wildcard for value, so that a pod can tolerate all taints of a particular category.
tolerationSeconds	Long	TolerationSeconds represents the period of time the toleration (which must be of effect NoExecute, otherwise this field is ignored) tolerates the taint. By default, it is not set, which means tolerate the taint forever (do not evict). Zero and negative values will be treated as 0 (evict immediately) by the system.
value	String	Value is the taint value the toleration matches to. If the operator is Exists, the value should be empty, otherwise just a regular string.

**Table 5-3851** io.k8s.api.core.v1.TopologySpreadConstraint

Parameter	Type	Description
labelSelector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	LabelSelector is used to find matching pods. Pods that match this label selector are counted to determine the number of pods in their corresponding topology domain.

Parameter	Type	Description
maxSkew	Integer	MaxSkew describes the degree to which pods may be unevenly distributed. When <i>whenUnsatisfiable=DoNotSchedule</i> , it is the maximum permitted difference between the number of matching pods in the target topology and the global minimum. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 1/1/0:   zone1   zone2   zone3    P   P    - if MaxSkew is 1, incoming pod can only be scheduled to zone3 to become 1/1/1; scheduling it onto zone1(zone2) would make the ActualSkew(2-0) on zone1(zone2) violate MaxSkew(1). - if MaxSkew is 2, incoming pod can be scheduled onto any zone. When <i>whenUnsatisfiable=ScheduleAnyway</i> , it is used to give higher precedence to topologies that satisfy it. It's a required field. Default value is 1 and 0 is not allowed.
topologyKey	String	TopologyKey is the key of node labels. Nodes that have a label with this key and identical values are considered to be in the same topology. We consider each <key, value> as a "bucket", and try to put balanced number of pods into each bucket. It's a required field.
whenUnsatisfiable	String	WhenUnsatisfiable indicates how to deal with a pod if it doesn't satisfy the spread constraint. - DoNotSchedule (default) tells the scheduler not to schedule it. - ScheduleAnyway tells the scheduler to schedule the pod in any location, but giving higher precedence to topologies that would help reduce the skew. A constraint is considered "Unsatisfiable" for an incoming pod if and only if every possible node assignment for that pod would violate "MaxSkew" on some topology. For example, in a 3-zone cluster, MaxSkew is set to 1, and pods with the same labelSelector spread as 3/1/1:   zone1   zone2   zone3    P P P   P   P   If WhenUnsatisfiable is set to DoNotSchedule, incoming pod can only be scheduled to zone2(zone3) to become 3/2/1(3/1/2) as ActualSkew(2-1) on zone2(zone3) satisfies MaxSkew(1). In other words, the cluster can still be imbalanced, but scheduler won't make it <i>more</i> imbalanced. It's a required field.

**Table 5-3852** io.k8s.api.core.v1.Volume

Parameter	Type	Description
awsElasticBlockStore	<a href="#">io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource</a> object	AWSElasticBlockStore represents an AWS Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
azureDisk	<a href="#">io.k8s.api.core.v1.AzureDiskVolumeSource</a> object	AzureDisk represents an Azure Data Disk mount on the host and bind mount to the pod.
azureFile	<a href="#">io.k8s.api.core.v1.AzureFileVolumeSource</a> object	AzureFile represents an Azure File Service mount on the host and bind mount to the pod.
cephfs	<a href="#">io.k8s.api.core.v1.CephFSVolumeSource</a> object	CephFS represents a Ceph FS mount on the host that shares a pod's lifetime
cinder	<a href="#">io.k8s.api.core.v1.CinderVolumeSource</a> object	Cinder represents a cinder volume attached and mounted on kubelets host machine. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapVolumeSource</a> object	ConfigMap represents a configMap that should populate this volume
csi	<a href="#">io.k8s.api.core.v1.CSIVolumeSource</a> object	CSI (Container Storage Interface) represents ephemeral storage that is handled by certain external CSI drivers (Beta feature).
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIVolumeSource</a> object	DownwardAPI represents downward API about the pod that should populate this volume
emptyDir	<a href="#">io.k8s.api.core.v1.EmptyDirVolumeSource</a> object	EmptyDir represents a temporary directory that shares a pod's lifetime. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>

Parameter	Type	Description
ephemeral	<a href="#">io.k8s.api.core.v1.EphemeralVolumeSource</a> object	<p>Ephemeral represents a volume that is handled by a cluster storage driver (Alpha feature). The volume's lifecycle is tied to the pod that defines it - it will be created before the pod starts, and deleted when the pod is removed.</p> <p>Use this if: a) the volume is only needed while the pod runs, b) features of normal volumes like restoring from snapshot or capacity tracking are needed, c) the storage driver is specified through a storage class, and d) the storage driver supports dynamic volume provisioning through a PersistentVolumeClaim (see EphemeralVolumeSource for more information on the connection between this volume type and PersistentVolumeClaim).</p> <p>Use PersistentVolumeClaim or one of the vendor-specific APIs for volumes that persist for longer than the lifecycle of an individual pod.</p> <p>Use CSI for light-weight local ephemeral volumes if the CSI driver is meant to be used that way - see the documentation of the driver for more information.</p> <p>A pod can use both types of ephemeral volumes and persistent volumes at the same time.</p>
fc	<a href="#">io.k8s.api.core.v1.FCVolumeSource</a> object	FC represents a Fibre Channel resource that is attached to a kubelet's host machine and then exposed to the pod.
flexVolume	<a href="#">io.k8s.api.core.v1.FlexVolumeSource</a> object	FlexVolume represents a generic volume resource that is provisioned/attached using an exec based plugin.
flocker	<a href="#">io.k8s.api.core.v1.FlockerVolumeSource</a> object	Flocker represents a Flocker volume attached to a kubelet's host machine. This depends on the Flocker control service being running
gcePersistentDisk	<a href="#">io.k8s.api.core.v1.GCEPersistentDiskVolumeSource</a> object	GCEPersistentDisk represents a GCE Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
gitRepo	<a href="#">io.k8s.api.core.v1.GitRepoVolumeSource</a> object	GitRepo represents a git repository at a particular revision. DEPRECATED: GitRepo is deprecated. To provision a container with a git repo, mount an EmptyDir into an InitContainer that clones the repo using git, then mount the EmptyDir into the Pod's container.
glusterfs	<a href="#">io.k8s.api.core.v1.GlusterfsVolumeSource</a> object	Glusterfs represents a Glusterfs mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md">https://examples.k8s.io/volumes/glusterfs/README.md</a>
hostPath	<a href="#">io.k8s.api.core.v1.HostPathVolumeSource</a> object	HostPath represents a pre-existing file or directory on the host machine that is directly exposed to the container. This is generally used for system agents or other privileged things that are allowed to see the host machine. Most containers will NOT need this. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>
iscsi	<a href="#">io.k8s.api.core.v1.ISCSIVolumeSource</a> object	ISCSI represents an ISCSI Disk resource that is attached to a kubelet's host machine and then exposed to the pod. More info: <a href="https://examples.k8s.io/volumes/iscsi/README.md">https://examples.k8s.io/volumes/iscsi/README.md</a>
localDir	<a href="#">io.k8s.api.core.v1.LocalDirVolumeSource</a> object	LocalDir represents a LocalDir volume that is created by LVM and mounted into the pod
name	String	Volume's name. Must be a DNS_LABEL and unique within the pod. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
nfs	<a href="#">io.k8s.api.core.v1.NFSVolumeSource</a> object	NFS represents an NFS mount on the host that shares a pod's lifetime More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
persistentVolumeClaim	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource</a> object	PersistentVolumeClaimVolumeSource represents a reference to a PersistentVolumeClaim in the same namespace. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
photonPersistentDisk	<a href="#">io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource</a> object	PhotonPersistentDisk represents a PhotonController persistent disk attached and mounted on kubelets host machine

Parameter	Type	Description
portworxVolume	<a href="#">io.k8s.api.core.v1.PortworxVolumeSource</a> object	PortworxVolume represents a portworx volume attached and mounted on kubelets host machine
projected	<a href="#">io.k8s.api.core.v1.ProjectedVolumeSource</a> object	Items for all in one resources secrets, configmaps, and downward API
quobyte	<a href="#">io.k8s.api.core.v1.QuobyteVolumeSource</a> object	Quobyte represents a Quobyte mount on the host that shares a pod's lifetime
rbd	<a href="#">io.k8s.api.core.v1.RBDVolumeSource</a> object	RBD represents a Rados Block Device mount on the host that shares a pod's lifetime. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md">https://examples.k8s.io/volumes/rbd/README.md</a>
scaleIO	<a href="#">io.k8s.api.core.v1.ScaleIOVolumeSource</a> object	ScaleIO represents a ScaleIO persistent volume attached and mounted on Kubernetes nodes.
secret	<a href="#">io.k8s.api.core.v1.SecretVolumeSource</a> object	Secret represents a secret that should populate this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>
storageos	<a href="#">io.k8s.api.core.v1.StorageOSVolumeSource</a> object	StorageOS represents a StorageOS volume attached and mounted on Kubernetes nodes.
vsphereVolume	<a href="#">io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource</a> object	VsphereVolume represents a vSphere volume attached and mounted on kubelets host machine

**Table 5-3853** io.k8s.api.core.v1.AWSElasticBlockStoreVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty).
readOnly	Boolean	Specify "true" to force and set the ReadOnly property in VolumeMounts to "true". If omitted, the default is "false". More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>
volumeID	String	Unique ID of the persistent disk resource in AWS (Amazon EBS volume). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore">https://kubernetes.io/docs/concepts/storage/volumes#awselasticblockstore</a>

**Table 5-3854** io.k8s.api.core.v1.AzureDiskVolumeSource

Parameter	Type	Description
cachingMode	String	Host Caching mode: None, Read Only, Read Write.
diskName	String	The Name of the data disk in the blob storage
diskURI	String	The URI the data disk in the blob storage
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
kind	String	Expected values Shared: multiple blob disks per storage account Dedicated: single blob disk per storage account Managed: azure managed data disk (only in managed availability set). defaults to shared

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.

**Table 5-3855** io.k8s.api.core.v1.AzureFileVolumeSource

Parameter	Type	Description
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretName	String	the name of secret that contains Azure Storage Account Name and Key
shareName	String	Share Name

**Table 5-3856** io.k8s.api.core.v1.CephFSVolumeSource

Parameter	Type	Description
monitors	Array of strings	Required: Monitors is a collection of Ceph monitors More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
path	String	Optional: Used as the mounted root, rather than the full Ceph tree, default is /
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretFile	String	Optional: SecretFile is the path to key ring for User, default is /etc/ceph/user.secret More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the authentication secret for User, default is empty. More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>
user	String	Optional: User is the rados user name, default is admin More info: <a href="https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it">https://examples.k8s.io/volumes/cephfs/README.md#how-to-use-it</a>

**Table 5-3857** io.k8s.api.core.v1.CinderVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: points to a secret object containing parameters used to connect to OpenStack.
volumeID	String	volume id used to identify the volume in cinder. More info: <a href="https://examples.k8s.io/mysql-cinder-pd/README.md">https://examples.k8s.io/mysql-cinder-pd/README.md</a>

**Table 5-3858** io.k8s.api.core.v1.ConfigMapVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.

Parameter	Type	Description
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-3859** io.k8s.api.core.v1.CSIVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the CSI driver that handles this volume. Consult with your admin for the correct name as registered in the cluster.
fsType	String	Filesystem type to mount. Ex. "ext4", "xfs", "ntfs". If not provided, the empty value is passed to the associated CSI driver which will determine the default filesystem to apply.
nodePublishSecretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	NodePublishSecretRef is a reference to the secret object containing sensitive information to pass to the CSI driver to complete the CSI NodePublishVolume and NodeUnpublishVolume calls. This field is optional, and may be empty if no secret is required. If the secret object contains more than one secret, all secret references are passed.
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).
volumeAttributes	Map<String,String>	VolumeAttributes stores driver-specific properties that are passed to the CSI driver. Consult your driver's documentation for supported values.

**Table 5-3860** io.k8s.api.core.v1.DownwardAPIVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits to use on created files by default. Must be a Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of downward API volume file

**Table 5-3861** io.k8s.api.core.v1.EmptyDirVolumeSource

Parameter	Type	Description
medium	String	What type of storage medium should back this directory. The default is "" which means to use the node's default medium. Must be an empty string (default) or Memory. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#emptydir">https://kubernetes.io/docs/concepts/storage/volumes#emptydir</a>
sizeLimit	String	Total amount of local storage required for this EmptyDir volume. The size limit is also applicable for memory medium. The maximum usage on memory medium EmptyDir would be the minimum value between the SizeLimit specified here and the sum of memory limits of all containers in a pod. The default is nil which means that the limit is undefined. More info: <a href="http://kubernetes.io/docs/user-guide/volumes#emptydir">http://kubernetes.io/docs/user-guide/volumes#emptydir</a>

**Table 5-3862** io.k8s.api.core.v1.EphemeralVolumeSource

Parameter	Type	Description
readOnly	Boolean	Specifies a read-only configuration for the volume. Defaults to false (read/write).

Parameter	Type	Description
volumeClaimTemplate	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimTemplate</a> object	<p>Will be used to create a stand-alone PVC to provision the volume. The pod in which this EphemeralVolumeSource is embedded will be the owner of the PVC, i.e. the PVC will be deleted together with the pod. The name of the PVC will be <i>&lt;pod name&gt;-&lt;volume name&gt;</i> where <i>&lt;volume name&gt;</i> is the name from the <i>PodSpec.Volumes</i> array entry. Pod validation will reject the pod if the concatenated name is not valid for a PVC (for example, too long).</p> <p>An existing PVC with that name that is not owned by the pod will <i>not</i> be used for the pod to avoid using an unrelated volume by mistake. Starting the pod is then blocked until the unrelated PVC is removed. If such a pre-created PVC is meant to be used by the pod, the PVC has to updated with an owner reference to the pod once the pod exists. Normally this should not be necessary, but it may be useful when manually reconstructing a broken cluster.</p> <p>This field is read-only and no changes will be made by Kubernetes to the PVC after it has been created.</p> <p>Required, must not be nil.</p>

**Table 5-3863** io.k8s.api.core.v1.PersistentVolumeClaimTemplate

Parameter	Type	Description
metadata	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta</a> object	May contain labels and annotations that will be copied into the PVC when creating it. No other fields are allowed and will be rejected during validation.
spec	<a href="#">io.k8s.api.core.v1.PersistentVolumeClaimSpec</a> object	The specification for the PersistentVolumeClaim. The entire content is copied unchanged into the PVC that gets created from this template. The same fields as in a PersistentVolumeClaim are also valid here.

**Table 5-3864** io.k8s.apimachinery.pkg.apis.meta.v1.ObjectMeta

Parameter	Type	Description
annotations	Map<String,String>	Annotations is an unstructured key value map stored with a resource that may be set by external tools to store and retrieve arbitrary metadata. They are not queryable and should be preserved when modifying objects. More info: <a href="http://kubernetes.io/docs/user-guide/annotations">http://kubernetes.io/docs/user-guide/annotations</a>
clusterName	String	The name of the cluster which the object belongs to. This is used to distinguish resources with same name and namespace in different clusters. This field is not set anywhere right now and apiserver is going to ignore it if set in create or update request.
creationTimestamp	String	CreationTimestamp is a timestamp representing the server time when this object was created. It is not guaranteed to be set in happens-before order across separate operations. Clients may not set this value. It is represented in RFC3339 form and is in UTC.  Populated by the system. Read-only. Null for lists. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a>
deletionGracePeriodSeconds	Long	Number of seconds allowed for this object to gracefully terminate before it will be removed from the system. Only set when deletionTimestamp is also set. May only be shortened. Read-only.

Parameter	Type	Description
deletionTimestamp	String	<p>DeletionTimestamp is RFC 3339 date and time at which this resource will be deleted. This field is set by the server when a graceful deletion is requested by the user, and is not directly settable by a client. The resource is expected to be deleted (no longer visible from resource lists, and not reachable by name) after the time in this field, once the finalizers list is empty. As long as the finalizers list contains items, deletion is blocked. Once the deletionTimestamp is set, this value may not be unset or be set further into the future, although it may be shortened or the resource may be deleted prior to this time. For example, a user may request that a pod is deleted in 30 seconds. The Kubelet will react by sending a graceful termination signal to the containers in the pod. After that 30 seconds, the Kubelet will send a hard termination signal (SIGKILL) to the container and after cleanup, remove the pod from the API. In the presence of network partitions, this object may still exist after this timestamp, until an administrator or automated process can determine the resource is fully terminated. If not set, graceful deletion of the object has not been requested.</p> <p>Populated by the system when a graceful deletion is requested. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#metadata</a></p>

Parameter	Type	Description
finalizers	Array of strings	<p>Must be empty before the object is deleted from the registry. Each entry is an identifier for the responsible component that will remove the entry from the list. If the deletionTimestamp of the object is non-nil, entries in this list can only be removed. Finalizers may be processed and removed in any order. Order is NOT enforced because it introduces significant risk of stuck finalizers. finalizers is a shared field, any actor with permission can reorder it. If the finalizer list is processed in order, then this can lead to a situation in which the component responsible for the first finalizer in the list is waiting for a signal (field value, external system, or other) produced by a component responsible for a finalizer later in the list, resulting in a deadlock. Without enforced ordering finalizers are free to order amongst themselves and are not vulnerable to ordering changes in the list.</p>
generateName	String	<p>GenerateName is an optional prefix, used by the server, to generate a unique name ONLY IF the Name field has not been provided. If this field is used, the name returned to the client will be different than the name passed. This value will also be combined with a unique suffix. The provided value has the same validation rules as the Name field, and may be truncated by the length of the suffix required to make the value unique on the server.</p> <p>If this field is specified and the generated name exists, the server will NOT return a 409 - instead, it will either return 201 Created or 500 with Reason ServerTimeout indicating a unique name could not be found in the time allotted, and the client should retry (optionally after the time indicated in the Retry-After header).</p> <p>Applied only if Name is not specified. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#idempotency</a></p>
generation	Long	<p>A sequence number representing a specific generation of the desired state. Populated by the system. Read-only.</p>

Parameter	Type	Description
labels	Map<String,String>	Map of string keys and values that can be used to organize and categorize (scope and select) objects. May match selectors of replication controllers and services. More info: <a href="http://kubernetes.io/docs/user-guide/labels">http://kubernetes.io/docs/user-guide/labels</a>
managedFields	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry</a> objects	ManagedFields maps workflow-id and version to the set of fields that are managed by that workflow. This is mostly for internal housekeeping, and users typically shouldn't need to set or understand this field. A workflow can be the user's name, a controller's name, or the name of a specific apply path like "ci-cd". The set of fields is always in the version that the workflow used when modifying the object.
name	String	Name must be unique within a namespace. Is required when creating resources, although some resources may allow a client to request the generation of an appropriate name automatically. Name is primarily intended for creation idempotence and configuration definition. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
namespace	String	Namespace defines the space within which each name must be unique. An empty namespace is equivalent to the "default" namespace, but "default" is the canonical representation. Not all objects are required to be scoped to a namespace - the value of this field for those objects will be empty.  Must be a DNS_LABEL. Cannot be updated. More info: <a href="http://kubernetes.io/docs/user-guide/namespaces">http://kubernetes.io/docs/user-guide/namespaces</a>
ownerReferences	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference</a> objects	List of objects depended by this object. If ALL objects in the list have been deleted, this object will be garbage collected. If this object is managed by a controller, then an entry in this list will point to this controller, with the controller field set to true. There cannot be more than one managing controller.

Parameter	Type	Description
resourceVersion	String	An opaque value that represents the internal version of this object that can be used by clients to determine when objects have changed. May be used for optimistic concurrency, change detection, and the watch operation on a resource or set of resources. Clients must treat these values as opaque and passed unmodified back to the server. They may only be valid for a particular resource or set of resources.  Populated by the system. Read-only. Value must be treated as opaque by clients and . More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	SelfLink is a URL representing this object. Populated by the system. Read-only.  DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.
uid	String	UID is the unique in time and space value for this object. It is typically generated by the server on successful creation of a resource and is not allowed to change on PUT operations.  Populated by the system. Read-only. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3865** io.k8s.apimachinery.pkg.apis.meta.v1.ManagedFieldsEntry

Parameter	Type	Description
apiVersion	String	APIVersion defines the version of this resource that this field set applies to. The format is "group/version" just like the top-level APIVersion field. It is necessary to track the version of a field set because it cannot be automatically converted.
fieldsType	String	FieldsType is the discriminator for the different fields format and version. There is currently only one possible value: "FieldsV1"
fieldsV1	Object	FieldsV1 holds the first JSON version format as described in the "FieldsV1" type.

Parameter	Type	Description
manager	String	Manager is an identifier of the workflow managing these fields.
operation	String	Operation is the type of operation which lead to this ManagedFieldsEntry being created. The only valid values for this field are 'Apply' and 'Update'.
time	String	Time is timestamp of when these fields were set. It should always be empty if Operation is 'Apply'

**Table 5-3866** io.k8s.apimachinery.pkg.apis.meta.v1.OwnerReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
blockOwnerDeletion	Boolean	If true, AND if the owner has the "foregroundDeletion" finalizer, then the owner cannot be deleted from the key-value store until this reference is removed. Defaults to false. To set this field, a user needs "delete" permission of the owner, otherwise 422 (Unprocessable Entity) will be returned.
controller	Boolean	If true, this reference points to the managing controller.
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#names">http://kubernetes.io/docs/user-guide/identifiers#names</a>
uid	String	UID of the referent. More info: <a href="http://kubernetes.io/docs/user-guide/identifiers#uids">http://kubernetes.io/docs/user-guide/identifiers#uids</a>

**Table 5-3867** io.k8s.api.core.v1.PersistentVolumeClaimSpec

Parameter	Type	Description
accessModes	Array of strings	AccessModes contains the desired access modes the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#access-modes-1</a>

Parameter	Type	Description
dataSource	<a href="#">io.k8s.api.core.v1.TypedLocalObjectReference</a> object	This field can be used to specify either: * An existing VolumeSnapshot object (snapshot.storage.k8s.io/VolumeSnapshot - Beta) * An existing PVC (PersistentVolumeClaim) * An existing custom resource/object that implements data population (Alpha) In order to use VolumeSnapshot object types, the appropriate feature gate must be enabled (VolumeSnapshotDataSource or AnyVolumeDataSource) If the provisioner or an external controller can support the specified data source, it will create a new volume based on the contents of the specified data source. If the specified data source is not supported, the volume will not be created and the failure will be reported as an event. In the future, we plan to support more data source types and the behavior of the provisioner may change.
resources	<a href="#">io.k8s.api.core.v1.ResourceRequirements</a> object	Resources represents the minimum resources the volume should have. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources">https://kubernetes.io/docs/concepts/storage/persistent-volumes#resources</a>
selector	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector</a> object	A label query over volumes to consider for binding.
storageClassName	String	Name of the StorageClass required by the claim. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1">https://kubernetes.io/docs/concepts/storage/persistent-volumes#class-1</a>
volumeMode	String	volumeMode defines what type of volume is required by the claim. Value of Filesystem is implied when not included in claim spec.
volumeName	String	VolumeName is the binding reference to the PersistentVolume backing this claim.

**Table 5-3868** io.k8s.api.core.v1.TypedLocalObjectReference

Parameter	Type	Description
apiGroup	String	APIGroup is the group for the resource being referenced. If APIGroup is not specified, the specified Kind must be in the core API group. For any other third-party types, APIGroup is required.

Parameter	Type	Description
kind	String	Kind is the type of resource being referenced
name	String	Name is the name of resource being referenced

**Table 5-3869** io.k8s.api.core.v1.ResourceRequirements

Parameter	Type	Description
limits	Map<String,String>	Limits describes the maximum amount of compute resources allowed. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>
requests	Map<String,String>	Requests describes the minimum amount of compute resources required. If Requests is omitted for a container, it defaults to Limits if that is explicitly specified, otherwise to an implementation-defined value. More info: <a href="https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/">https://kubernetes.io/docs/concepts/configuration/manage-compute-resources-container/</a>

**Table 5-3870** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelector

Parameter	Type	Description
matchExpressions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement</a> objects	matchExpressions is a list of label selector requirements. The requirements are ANDed.
matchLabels	Map<String,String>	matchLabels is a map of {key,value} pairs. A single {key,value} in the matchLabels map is equivalent to an element of matchExpressions, whose key field is "key", the operator is "In", and the values array contains only "value". The requirements are ANDed.

**Table 5-3871** io.k8s.apimachinery.pkg.apis.meta.v1.LabelSelectorRequirement

Parameter	Type	Description
key	String	key is the label key that the selector applies to.

Parameter	Type	Description
operator	String	operator represents a key's relationship to a set of values. Valid operators are In, NotIn, Exists and DoesNotExist.
values	Array of strings	values is an array of string values. If the operator is In or NotIn, the values array must be non-empty. If the operator is Exists or DoesNotExist, the values array must be empty. This array is replaced during a strategic merge patch.

**Table 5-3872** io.k8s.api.core.v1.FCVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
lun	Integer	Optional: FC target lun number
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
targetWWNs	Array of strings	Optional: FC target worldwide names (WWNs)
wwids	Array of strings	Optional: FC volume world wide identifiers (wwids) Either wwids or combination of targetWWNs and lun must be set, but not both simultaneously.

**Table 5-3873** io.k8s.api.core.v1.FlexVolumeSource

Parameter	Type	Description
driver	String	Driver is the name of the driver to use for this volume.
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". The default filesystem depends on FlexVolume script.
options	Map<String,String>	Optional: Extra command options if any.

Parameter	Type	Description
readOnly	Boolean	Optional: Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	Optional: SecretRef is reference to the secret object containing sensitive information to pass to the plugin scripts. This may be empty if no secret object is specified. If the secret object contains more than one secret, all secrets are passed to the plugin scripts.

**Table 5-3874** io.k8s.api.core.v1.FlockerVolumeSource

Parameter	Type	Description
datasetName	String	Name of the dataset stored as metadata -> name on the dataset for Flocker should be considered as deprecated
datasetUUID	String	UUID of the dataset. This is unique identifier of a Flocker dataset

**Table 5-3875** io.k8s.api.core.v1.GCEPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
partition	Integer	The partition in the volume that you want to mount. If omitted, the default is to mount by volume name. Examples: For volume /dev/sda1, you specify the partition as "1". Similarly, the volume partition for /dev/sda is "0" (or you can leave the property empty). More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>
pdName	String	Unique name of the PD resource in GCE. Used to identify the disk in GCE. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

Parameter	Type	Description
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk">https://kubernetes.io/docs/concepts/storage/volumes#gcepersistentdisk</a>

**Table 5-3876** io.k8s.api.core.v1.GitRepoVolumeSource

Parameter	Type	Description
directory	String	Target directory name. Must not contain or start with '..'. If '.' is supplied, the volume directory will be the git repository. Otherwise, if specified, the volume will contain the git repository in the subdirectory with the given name.
repository	String	Repository URL
revision	String	Commit hash for the specified revision.

**Table 5-3877** io.k8s.api.core.v1.GlusterfsVolumeSource

Parameter	Type	Description
endpoints	String	EndpointsName is the endpoint name that details Glusterfs topology. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
path	String	Path is the Glusterfs volume path. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>
readOnly	Boolean	ReadOnly here will force the Glusterfs volume to be mounted with read-only permissions. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod">https://examples.k8s.io/volumes/glusterfs/README.md#create-a-pod</a>

**Table 5-3878** io.k8s.api.core.v1.HostPathVolumeSource

Parameter	Type	Description
path	String	Path of the directory on the host. If the path is a symlink, it will follow the link to the real path. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

Parameter	Type	Description
type	String	Type for HostPath Volume Defaults to "" More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#hostpath">https://kubernetes.io/docs/concepts/storage/volumes#hostpath</a>

**Table 5-3879** io.k8s.api.core.v1.ISCSIVolumeSource

Parameter	Type	Description
chapAuthDiscovery	Boolean	whether support iSCSI Discovery CHAP authentication
chapAuthSession	Boolean	whether support iSCSI Session CHAP authentication
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#iscsi">https://kubernetes.io/docs/concepts/storage/volumes#iscsi</a>
initiatorName	String	Custom iSCSI Initiator Name. If initiatorName is specified with iscsiInterface simultaneously, new iSCSI interface : will be created for the connection.
iqn	String	Target iSCSI Qualified Name.
iscsiInterface	String	iSCSI Interface Name that uses an iSCSI transport. Defaults to 'default' (tcp).
lun	Integer	iSCSI Target Lun number.
portals	Array of strings	iSCSI Target Portal List. The portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	CHAP Secret for iSCSI target and initiator authentication
targetPortal	String	iSCSI Target Portal. The Portal is either an IP or ip_addr:port if the port is other than default (typically TCP ports 860 and 3260).

**Table 5-3880** io.k8s.api.core.v1.LocalDirVolumeSource

Parameter	Type	Description
sizeLimit	String	<p>Quantity is a fixed-point representation of a number. It provides convenient marshaling/unmarshaling in JSON and YAML, in addition to String() and AsInt64() accessors.</p> <p>The serialization format is:</p> <p>::= (Note that may be empty, from the "" case in .) ::= 0   1   ...   9 ::=   ::=   .   .   . ::= "+"   "-" ::=   ::=     ::= Ki   Mi   Gi   Ti   Pi   Ei (International System of units; See: <a href="http://physics.nist.gov/cuu/Units/binary.html">http://physics.nist.gov/cuu/Units/binary.html</a>) ::= m   ""   k   M   G   T   P   E (Note that 1024 = 1Ki but 1000 = 1k; I didn't choose the capitalization.) ::= "e"   "E"</p> <p>No matter which of the three exponent forms is used, no quantity may represent a number greater than 2<sup>63</sup>-1 in magnitude, nor may it have more than 3 decimal places. Numbers larger or more precise will be capped or rounded up. (E.g.: 0.1m will rounded up to 1m.) This may be extended in the future if we require larger or smaller quantities.</p> <p>When a Quantity is parsed from a string, it will remember the type of suffix it had, and will use the same type again when it is serialized.</p> <p>Before serializing, Quantity will be put in "canonical form". This means that Exponent/suffix will be adjusted up or down (with a corresponding increase or decrease in Mantissa) such that: a. No precision is lost b. No fractional digits will be emitted c. The exponent (or suffix) is as large as possible. The sign will be omitted unless the number is negative.</p> <p>Examples: 1.5 will be serialized as "1500m" 1.5Gi will be serialized as "1536Mi"</p> <p>Note that the quantity will NEVER be internally represented by a floating point number. That is the whole point of this exercise.</p> <p>Non-canonical values will still parse as long as they are well formed, but will be re-emitted in their canonical form. (So always use canonical form, or don't diff.)</p> <p>This format is intended to make it difficult to use these numbers without writing some sort of special handling code in the hopes that that</p>

Parameter	Type	Description
		will cause implementors to also use a fixed point implementation.

**Table 5-3881** io.k8s.api.core.v1.NFSVolumeSource

Parameter	Type	Description
path	String	Path that is exported by the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
readOnly	Boolean	ReadOnly here will force the NFS export to be mounted with read-only permissions. Defaults to false. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>
server	String	Server is the hostname or IP address of the NFS server. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#nfs">https://kubernetes.io/docs/concepts/storage/volumes#nfs</a>

**Table 5-3882** io.k8s.api.core.v1.PersistentVolumeClaimVolumeSource

Parameter	Type	Description
claimName	String	ClaimName is the name of a PersistentVolumeClaim in the same namespace as the pod using this volume. More info: <a href="https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims">https://kubernetes.io/docs/concepts/storage/persistent-volumes#persistentvolumeclaims</a>
readOnly	Boolean	Will force the ReadOnly setting in VolumeMounts. Default false.

**Table 5-3883** io.k8s.api.core.v1.PhotonPersistentDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
pdID	String	ID that identifies Photon Controller persistent disk

**Table 5-3884** io.k8s.api.core.v1.PortworxVolumeSource

Parameter	Type	Description
fsType	String	FSType represents the filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
volumeID	String	VolumeID uniquely identifies a Portworx volume

**Table 5-3885** io.k8s.api.core.v1.ProjectedVolumeSource

Parameter	Type	Description
defaultMode	Integer	Mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
sources	Array of <a href="#">io.k8s.api.core.v1.VolumeProjection</a> objects	list of volume projections

**Table 5-3886** io.k8s.api.core.v1.VolumeProjection

Parameter	Type	Description
configMap	<a href="#">io.k8s.api.core.v1.ConfigMapProjection</a> object	information about the configMap data to project
downwardAPI	<a href="#">io.k8s.api.core.v1.DownwardAPIProjection</a> object	information about the downwardAPI data to project

Parameter	Type	Description
secret	<a href="#">io.k8s.api.core.v1.SecretProjection</a> object	information about the secret data to project
serviceAccountToken	<a href="#">io.k8s.api.core.v1.ServiceAccountTokenProjection</a> object	information about the serviceAccountToken data to project

**Table 5-3887** io.k8s.api.core.v1.ConfigMapProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced ConfigMap will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the ConfigMap, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the ConfigMap or its keys must be defined

**Table 5-3888** io.k8s.api.core.v1.DownwardAPIProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.DownwardAPIVolumeFile</a> objects	Items is a list of DownwardAPIVolume file

**Table 5-3889** io.k8s.api.core.v1.DownwardAPIVolumeFile

Parameter	Type	Description
fieldRef	<a href="#">io.k8s.api.core.v1.ObjectFieldSelector</a> object	Required: Selects a field of the pod: only annotations, labels, name and namespace are supported.
mode	Integer	Optional: mode bits used to set permissions on this file, must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	Required: Path is the relative path name of the file to be created. Must not be absolute or contain the '..' path. Must be utf-8 encoded. The first item of the relative path must not start with '..'
resourceFieldRef	<a href="#">io.k8s.api.core.v1.ResourceFieldSelector</a> object	Selects a resource of the container: only resources limits and requests (limits.cpu, limits.memory, requests.cpu and requests.memory) are currently supported.

**Table 5-3890** io.k8s.api.core.v1.ObjectFieldSelector

Parameter	Type	Description
apiVersion	String	Version of the schema the FieldPath is written in terms of, defaults to "v1".
fieldPath	String	Path of the field to select in the specified API version.

**Table 5-3891** io.k8s.api.core.v1.ResourceFieldSelector

Parameter	Type	Description
containerName	String	Container name: required for volumes, optional for env vars
divisor	String	Specifies the output format of the exposed resources, defaults to "1"
resource	String	Required: resource to select

**Table 5-3892** io.k8s.api.core.v1.SecretProjection

Parameter	Type	Description
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
optional	Boolean	Specify whether the Secret or its key must be defined

**Table 5-3893** io.k8s.api.core.v1.ServiceAccountTokenProjection

Parameter	Type	Description
audience	String	Audience is the intended audience of the token. A recipient of a token must identify itself with an identifier specified in the audience of the token, and otherwise should reject the token. The audience defaults to the identifier of the apiserver.
expirationSeconds	Long	ExpirationSeconds is the requested duration of validity of the service account token. As the token approaches expiration, the kubelet volume plugin will proactively rotate the service account token. The kubelet will start trying to rotate the token if the token is older than 80 percent of its time to live or if the token is older than 24 hours. Defaults to 1 hour and must be at least 10 minutes.
path	String	Path is the path relative to the mount point of the file to project the token into.

**Table 5-3894** io.k8s.api.core.v1.QuobyteVolumeSource

Parameter	Type	Description
group	String	Group to map volume access to Default is no group
readOnly	Boolean	ReadOnly here will force the Quobyte volume to be mounted with read-only permissions. Defaults to false.
registry	String	Registry represents a single or multiple Quobyte Registry services specified as a string as host:port pair (multiple entries are separated with commas) which acts as the central registry for volumes
tenant	String	Tenant owning the given Quobyte volume in the Backend Used with dynamically provisioned Quobyte volumes, value is set by the plugin
user	String	User to map volume access to Defaults to serviceaccount user
volume	String	Volume is a string that references an already created Quobyte volume by name.

**Table 5-3895** io.k8s.api.core.v1.RBDVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type of the volume that you want to mount. Tip: Ensure that the filesystem type is supported by the host operating system. Examples: "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#rbd">https://kubernetes.io/docs/concepts/storage/volumes#rbd</a>
image	String	The rados image name. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
keyring	String	Keyring is the path to key ring for RBDUser. Default is /etc/ceph/keyring. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
monitors	Array of strings	A collection of Ceph monitors. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

Parameter	Type	Description
pool	String	The rados pool name. Default is rbd. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
readOnly	Boolean	ReadOnly here will force the ReadOnly setting in VolumeMounts. Defaults to false. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef is name of the authentication secret for RBDUser. If provided overrides keyring. Default is nil. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>
user	String	The rados user name. Default is admin. More info: <a href="https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it">https://examples.k8s.io/volumes/rbd/README.md#how-to-use-it</a>

**Table 5-3896** io.k8s.api.core.v1.ScaleIOVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Default is "xfs".
gateway	String	The host address of the ScaleIO API Gateway.
protectionDomain	String	The name of the ScaleIO Protection Domain for the configured storage.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef references to the secret for ScaleIO user and other sensitive information. If this is not provided, Login operation will fail.
sslEnabled	Boolean	Flag to enable/disable SSL communication with Gateway, default false
storageMode	String	Indicates whether the storage for a volume should be ThickProvisioned or ThinProvisioned. Default is ThinProvisioned.
storagePool	String	The ScaleIO Storage Pool associated with the protection domain.

Parameter	Type	Description
system	String	The name of the storage system as configured in ScaleIO.
volumeName	String	The name of a volume already created in the ScaleIO system that is associated with this volume source.

**Table 5-3897** io.k8s.api.core.v1.SecretVolumeSource

Parameter	Type	Description
defaultMode	Integer	Optional: mode bits used to set permissions on created files by default. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. Defaults to 0644. Directories within the path are not affected by this setting. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
items	Array of <a href="#">io.k8s.api.core.v1.KeyToPath</a> objects	If unspecified, each key-value pair in the Data field of the referenced Secret will be projected into the volume as a file whose name is the key and content is the value. If specified, the listed keys will be projected into the specified paths, and unlisted keys will not be present. If a key is specified which is not present in the Secret, the volume setup will error unless it is marked optional. Paths must be relative and may not contain the '..' path or start with '..'.
optional	Boolean	Specify whether the Secret or its keys must be defined
secretName	String	Name of the secret in the pod's namespace to use. More info: <a href="https://kubernetes.io/docs/concepts/storage/volumes#secret">https://kubernetes.io/docs/concepts/storage/volumes#secret</a>

**Table 5-3898** io.k8s.api.core.v1.KeyToPath

Parameter	Type	Description
key	String	The key to project.

Parameter	Type	Description
mode	Integer	Optional: mode bits used to set permissions on this file. Must be an octal value between 0000 and 0777 or a decimal value between 0 and 511. YAML accepts both octal and decimal values, JSON requires decimal values for mode bits. If not specified, the volume defaultMode will be used. This might be in conflict with other options that affect the file mode, like fsGroup, and the result can be other mode bits set.
path	String	The relative path of the file to map the key to. May not be an absolute path. May not contain the path element '..'. May not start with the string '..'.

**Table 5-3899** io.k8s.api.core.v1.StorageOSVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
readOnly	Boolean	Defaults to false (read/write). ReadOnly here will force the ReadOnly setting in VolumeMounts.
secretRef	<a href="#">io.k8s.api.core.v1.LocalObjectReference</a> object	SecretRef specifies the secret to use for obtaining the StorageOS API credentials. If not specified, default values will be attempted.
volumeName	String	VolumeName is the human-readable name of the StorageOS volume. Volume names are only unique within a namespace.
volumeNamespace	String	VolumeNamespace specifies the scope of the volume within StorageOS. If no namespace is specified then the Pod's namespace will be used. This allows the Kubernetes name scoping to be mirrored within StorageOS for tighter integration. Set VolumeName to any name to override the default behaviour. Set to "default" if you are not using namespaces within StorageOS. Namespaces that do not pre-exist within StorageOS will be created.

**Table 5-3900** io.k8s.api.core.v1.VsphereVirtualDiskVolumeSource

Parameter	Type	Description
fsType	String	Filesystem type to mount. Must be a filesystem type supported by the host operating system. Ex. "ext4", "xfs", "ntfs". Implicitly inferred to be "ext4" if unspecified.
storagePolicyID	String	Storage Policy Based Management (SPBM) profile ID associated with the StoragePolicyName.
storagePolicyName	String	Storage Policy Based Management (SPBM) profile name.
volumePath	String	Path that identifies vSphere volume vmdk

**Table 5-3901** io.k8s.api.batch.v1beta1.CronJobStatus

Parameter	Type	Description
active	Array of <a href="#">io.k8s.api.core.v1.ObjectReference</a> objects	A list of pointers to currently running jobs.
lastScheduleTime	String	Information when was the last time the job was successfully scheduled.

**Table 5-3902** io.k8s.api.core.v1.ObjectReference

Parameter	Type	Description
apiVersion	String	API version of the referent.
fieldPath	String	If referring to a piece of an object instead of an entire object, this string should contain a valid JSON/Go field access statement, such as desiredState.manifest.containers[2]. For example, if the object reference is to a container within a pod, this would take on a value like: "spec.containers{name}" (where "name" refers to the name of the container that triggered the event) or if no container name is specified "spec.containers[2]" (container with index 2 in this pod). This syntax is chosen only to have some well-defined way of referencing a part of an object.

Parameter	Type	Description
kind	String	Kind of the referent. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	Name of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#names</a>
namespace	String	Namespace of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/">https://kubernetes.io/docs/concepts/overview/working-with-objects/namespaces/</a>
resourceVersion	String	Specific resourceVersion to which this reference is made, if any. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
uid	String	UID of the referent. More info: <a href="https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids">https://kubernetes.io/docs/concepts/overview/working-with-objects/names/#uids</a>

**Table 5-3903** io.k8s.apimachinery.pkg.apis.meta.v1.ListMeta

Parameter	Type	Description
continue	String	continue may be set if the user set a limit on the number of items returned, and indicates that the server has more data available. The value is opaque and may be used to issue another request to the endpoint that served this list to retrieve the next set of available objects. Continuing a consistent list may not be possible if the server configuration has changed or more than a few minutes have passed. The resourceVersion field returned when using this continue value will be identical to the value in the first response, unless you have received this token from an error message.

Parameter	Type	Description
remainingItemCount	Long	remainingItemCount is the number of subsequent items in the list which are not included in this list response. If the list request contained label or field selectors, then the number of remaining items is unknown and the field will be left unset and omitted during serialization. If the list is complete (either because it is not chunking or because this is the last chunk), then there are no more remaining items and this field will be left unset and omitted during serialization. Servers older than v1.15 do not set this field. The intended use of the remainingItemCount is <i>estimating</i> the size of a collection. Clients should not rely on the remainingItemCount to be set or to be exact.
resourceVersion	String	String that identifies the server's internal version of this object that can be used by clients to determine when objects have changed. Value must be treated as opaque by clients and passed unmodified back to the server. Populated by the system. Read-only. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#concurrency-control-and-consistency</a>
selfLink	String	selfLink is a URL representing this object. Populated by the system. Read-only. DEPRECATED Kubernetes will stop propagating this field in 1.20 release and the field is planned to be removed in 1.21 release.

## 5.15 API groups

### 5.15.1 Querying API Versions

#### Function

get available API versions

#### Calling Method

For details, see [Calling APIs](#).

#### URI

GET /api

## Request Parameters

**Table 5-3904** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3905** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
serverAddressByClientCIDRs	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR</a> objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.

Parameter	Type	Description
versions	Array of strings	versions are the api versions that are available.

**Table 5-3906** io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

Parameter	Type	Description
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

## 5.15.2 Querying All APIs of v1

### Function

get available resources

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /api/v1

### Request Parameters

**Table 5-3907** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

### Response Parameters

Status code: 200

**Table 5-3908** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
groupVersion	String	groupVersion is the group and version this APIResourceList is for.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
resources	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.APIResource</a> objects	resources contains the name of the resources and if they are namespaced.

**Table 5-3909** io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

Parameter	Type	Description
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.

Parameter	Type	Description
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

GET /apis

## Request Parameters

Table 5-3910 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3911 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
groups	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.APIGroup</a> objects	groups is a list of APIGroup.
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>

**Table 5-3912** io.k8s.apimachinery.pkg.apis.meta.v1.APIGroup

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	name is the name of the group.
preferredVersion	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> object	preferredVersion is the version preferred by the API server, which probably is the storage version.
serverAddressByClientCIDRs	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR</a> objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-IP header or request.RemoteAddr (in that order) to get the client IP.
versions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> objects	versions are the versions supported in this group.

**Table 5-3913** io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

Parameter	Type	Description
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

**Table 5-3914** io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

Parameter	Type	Description
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

## 5.15.4 Querying APIGroup (/apis/apps)

### Function

This API is used to query an APIGroup (/apis/apps).

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps

## Request Parameters

**Table 5-3915** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

**Table 5-3916** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
name	String	name is the name of the group.
preferredVersion	<a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> object	preferredVersion is the version preferred by the API server, which probably is the storage version.

Parameter	Type	Description
serverAddressByClientCIDRs	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR</a> objects	a map of client CIDR to server address that is serving this group. This is to help clients reach servers in the most network-efficient way possible. Clients can use the appropriate server address as per the CIDR that they match. In case of multiple matches, clients should use the longest matching CIDR. The server returns only those CIDRs that it thinks that the client can match. For example: the master will return an internal IP CIDR only, if the client reaches the server using an internal IP. Server looks at X-Forwarded-For header or X-Real-Ip header or request.RemoteAddr (in that order) to get the client IP.
versions	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery</a> objects	versions are the versions supported in this group.

**Table 5-3917** io.k8s.apimachinery.pkg.apis.meta.v1.GroupVersionForDiscovery

Parameter	Type	Description
groupVersion	String	groupVersion specifies the API group and version in the form "group/version"
version	String	version specifies the version in the form of "version". This is to save the clients the trouble of splitting the GroupVersion.

**Table 5-3918** io.k8s.apimachinery.pkg.apis.meta.v1.ServerAddressByClientCIDR

Parameter	Type	Description
clientCIDR	String	The CIDR with which clients can match their IP to figure out the server address that they should use.
serverAddress	String	Address of this server, suitable for a client that matches the above CIDR. This can be a hostname, hostname:port, IP or IP:port.

## Example Requests

None

## Example Responses

**Status code: 200**

OK

## 5.15.5 Querying APIs of apps/v1

### Function

get available resources

### Calling Method

For details, see [Calling APIs](#).

### URI

GET /apis/apps/v1

### Request Parameters

**Table 5-3919** Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

### Response Parameters

Status code: 200

**Table 5-3920** Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
groupVersion	String	groupVersion is the group and version this APIResourceList is for.

Parameter	Type	Description
kind	String	Kind is a string value representing the REST resource this object represents. Servers may infer this from the endpoint the client submits requests to. Cannot be updated. In CamelCase. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-kinds</a>
resources	Array of <a href="#">io.k8s.apimachinery.pkg.apis.meta.v1.APIResource</a> objects	resources contains the name of the resources and if they are namespaced.

**Table 5-3921** io.k8s.apimachinery.pkg.apis.meta.v1.APIResource

Parameter	Type	Description
categories	Array of strings	categories is a list of the grouped resources this resource belongs to (e.g. 'all')
group	String	group is the preferred group of the resource. Empty implies the group of the containing resource list. For subresources, this may have a different value, for example: Scale".
kind	String	kind is the kind for the resource (e.g. 'Foo' is the kind for a resource 'foo')
name	String	name is the plural name of the resource.
namespaced	Boolean	namespaced indicates if a resource is namespaced or not.
shortNames	Array of strings	shortNames is a list of suggested short names of the resource.
singularName	String	singularName is the singular name of the resource. This allows clients to handle plural and singular opaquely. The singularName is more correct for reporting status on a single item and both singular and plural are allowed from the kubectl CLI interface.

Parameter	Type	Description
storageVersionHash	String	The hash value of the storage version, the version this resource is converted to when written to the data store. Value must be treated as opaque by clients. Only equality comparison on the value is valid. This is an alpha feature and may change or be removed in the future. The field is populated by the apiserver only if the StorageVersionHash feature gate is enabled. This field will remain optional even if it graduates.
verbs	Array of strings	verbs is a list of supported kube verbs (this includes get, list, watch, create, update, patch, delete, deletecollection, and proxy)
version	String	version is the preferred version of the resource. Empty implies the version of the containing resource list For subresources, this may have a different value, for example: v1 (while inside a v1beta1 version of the core resource's group)".

For details, see [Calling APIs](#).

#### URI

GET /apis/batch/v1beta1

## Request Parameters

Table 5-3936 Request header parameters

Parameter	Mandatory	Type	Description
X-Auth-Token	Yes	String	User token. It can be obtained through the IAM API used to obtain a user token. The value of <b>X-Subject-Token</b> in the response header is the user token.

## Response Parameters

Status code: 200

Table 5-3937 Response body parameters

Parameter	Type	Description
apiVersion	String	APIVersion defines the versioned schema of this representation of an object. Servers should convert recognized schemas to the latest internal value, and may reject unrecognized values. More info: <a href="https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources">https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#resources</a>
groupVersion	String	groupVersion is the group and version this APIResourceList is for.
