Contents

1 Interface Overview	1
2 Glossary	4
3 Change History	6
4 Interface Authentication Modes	21
4.1 Authentication Mode Description	21
4.2 C1 System Configuration Interface Authentication	22
4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication	23
4.4 C3 OIAP Interface Authentication	43
4.5 C4 Agent Operation Interface Authentication	46
4.6 C5 Intelligent Auxiliary Interface Authentication	48
5 Call Center Configuration Interface Reference	51
5.1 Agent Management	51
5.1.1 Creating a Single Agent Account (agentAccount/create)	51
5.1.2 Deleting a Specified Agent Account (agentAccount/delete)	55
5.1.3 Modifying Information About an Agent Account (agentAccount/update)	58
5.1.4 Querying Agent Account Information (agentAccount/query)	62
5.1.5 Binding an Agent to a Skill Queue (addSkillsToAgent)	66
5.1.6 Unbinding an Agent from a Skill Queue (releaseAgentBySkillId)	69
5.1.7 Querying Agent Information by Skill Queue ID (queryAgentInfoBySkillId)	71
5.1.8 Changing the SIP Phone Number Login Password of an Agent (updateSipPhonePassword)	74
5.1.9 Querying Softphone Information of All Agents, Excluding Business Accounts (querySysInfo)	77
5.1.10 Querying Softphone Information of All Agents, Including Business Accounts (queryAgentInfo)	80
5.1.11 Querying the Account Sign-in Result (queryAgentLoginParams)	83
5.1.12 Querying Agent Information by Sign-in Account (queryAgentInfoByAccount)	86
5.1.13 Deleting Data by Customer Number (cleancustpersonaldata)	88
5.2 Skill Queue Management	90
5.2.1 Creating a Skill Queue (createSkill)	90
5.2.2 Deleting a Skill Queue (deleteSkill)	96
5.2.3 Modifying a Skill Queue (modifySkill)	98
5.2.4 Querying Skill Queues (querySkills)	103
5.2.5 Obtaining the Total Number of Users in a Configured Skill Queue	109
5.2.6 Obtaining the Number of Users in a Skill Queue to Which an Agent Has Signed In	111

5.2.7 Obtaining the Skill Queue Information of the Home VDN of an Agent.....	113
5.2.8 Obtaining the Total Number of Users in a Specified Skill Queue.....	117
5.2.9 Querying the Statistics About a Set of Skill Queues.....	119
5.2.10 Querying the IVR Information of the VDN to Which an Agent Belongs.....	124
5.2.11 Querying Information About Agents That Have Signed In to a Skill Queue.....	126
5.2.12 Querying the Details About a Specified Agent.....	130
5.2.13 Querying the Details About All Online Agents That Have Signed In to a Skill Queue.....	135
5.3 Number Management.....	140
5.3.1 Querying Access Codes (queryAccessCodeList).....	140
5.3.2 Creating a Binding Relationship Between an Access Code, Skill Queue, and IVR (createCalledRoute)	144
5.3.3 Deleting the Binding Relationships Between Access Codes, Skill Queues, and IVR Flows (deleteCalledRoute).....	148
5.3.4 Modifying a Binding Relationship Between an Access Code, Skill Queue, and IVR (modifyCalledRoute).....	151
5.3.5 Querying the Binding Relationships Between Access Codes, Skill Queues, and IVR Flows (queryCalledRoute).....	153
5.3.6 Querying the Home Area of a Number (getPhoneNoRegionInfo).....	158
5.4 IVR Flow Management.....	160
5.4.1 Querying All IVR Flows of a Specified Tenant Space (queryIVRFlowList).....	161
5.4.2 Querying Satisfaction Survey Information (querySatisfactionConfig).....	163
5.4.3 Querying Satisfaction Survey Results (satisfaction /query).....	166
5.4.4 Uploading IVR Voice Files (importVoiceFile/upload).....	169
5.4.5 Uploading a TTS Template for Voice Notifications (createVoiceTemplate).....	174
6 Agent Workbench Interface Reference.....	182
6.1 Agent Control.....	182
6.1.1 Agent Operation Interfaces: onlineagent.....	182
6.1.1.1 Signing In.....	182
6.1.1.2 Forcibly Signing In.....	189
6.1.1.3 Maintaining the Heartbeat by an Agent.....	195
6.1.1.4 Sending Notes.....	197
6.1.1.5 Querying Configured Skill Queues.....	199
6.1.1.6 Querying Configured Skill Queues of Specified Agents.....	202
6.1.1.7 Setting Automatic Answering.....	206
6.1.1.8 Resetting Skill Queues.....	208
6.1.1.9 Setting Idle.....	211
6.1.1.10 Setting Busy.....	213
6.1.1.11 Canceling the Busy State.....	216
6.1.1.12 Applying for Rest.....	218
6.1.1.13 Canceling Rest.....	221
6.1.1.14 Entering the Work State.....	223
6.1.1.15 Quitting the Work State.....	225
6.1.1.16 Changing the Password (Extended).....	227

6.1.1.17 Setting Whether to Enter the Idle State.....	230
6.1.1.18 Signing Out.....	233
6.1.1.19 Forcibly Signing Out.....	235
6.1.1.20 Forcibly Signing Out with a Cause Code.....	237
6.1.1.21 Getting Agent Status.....	239
6.1.1.22 Setting Whether to Answer Inbound Calls.....	242
6.1.1.23 Signing In to the Platform by an Agent.....	244
6.1.1.24 Actively Requesting to Update the GUID When the Agent Page Is Refreshed.....	249
6.1.1.25 Synchronizing the Agent Status and Call Information When the Agent Page Is Refreshed.....	252
6.1.1.26 Obtaining Token Information.....	258
6.1.1.27 Customizing Status by an Agent.....	260
6.1.1.28 Querying Customized Status by an Agent.....	262
6.1.1.29 Canceling Status Customization by an Agent.....	264
6.1.2 Call Control Interfaces: voicecall.....	267
6.1.2.1 Making a Common Outbound Call.....	267
6.1.2.2 Making a Previewed Outbound Call.....	270
6.1.2.3 Answering a Call.....	273
6.1.2.4 Making an Internal Call.....	275
6.1.2.5 Asking for Internal Help.....	279
6.1.2.6 Muting a Call.....	282
6.1.2.7 Unmuting a Muted Call.....	284
6.1.2.8 Holding a Call.....	286
6.1.2.9 Holding a Call.....	288
6.1.2.10 Unholding a Call.....	290
6.1.2.11 Transferring a Call.....	293
6.1.2.12 Canceling Transfer.....	299
6.1.2.13 Performing Two-Stage Dialing (Extended).....	301
6.1.2.14 Making a Three-Party Call.....	303
6.1.2.15 Disconnecting a Call of a Specified ID.....	306
6.1.2.16 Dropping a Call.....	308
6.1.2.17 Releasing a Connection of a Specified Number.....	310
6.1.2.18 Switching Between Voice and Video Calls.....	313
6.1.2.19 Controlling the Image Display Mode of a Three-Party Video Call.....	315
6.1.2.20 Requesting a Specified Call.....	318
6.1.2.21 Picking Up a Call for Other Agents.....	320
6.1.2.22 Rejecting an Inbound Call.....	323
6.1.2.23 Taking the Phone Off the Hook.....	326
6.1.2.24 Rejecting a Call.....	328
6.1.2.25 Passing Numbers in a Conference.....	330
6.1.2.26 Answering Calls on a Mobile Phone (login).....	332
6.1.2.27 Exiting the Function of Answering Calls on a Mobile Phone (logout).....	335
6.1.2.28 Querying Whether a Specified Agent Answers Calls on a Mobile Phone (isOfflineAgent).....	337

6.1.3 Call Data (calldata).....	339
6.1.3.1 Querying Call Information.....	339
6.1.3.2 Querying Call-Associated Data.....	348
6.1.3.3 Configuring Call-Associated Data (Extended).....	351
6.1.3.4 Querying the List of Held Calls.....	355
6.1.3.5 Querying Call Information Before Answering a Call.....	358
6.1.3.6 Querying Call Information by Call ID.....	362
6.1.3.7 Querying Call IDs of a Specified Agent.....	365
6.1.3.8 Querying the Number of Current Calls of an Agent.....	368
6.1.3.9 Querying Current Call Statistics Information About an Agent.....	370
6.1.3.10 Querying the Current Call Statistics of an Agent (Extended).....	374
6.1.3.11 Querying Information About Calls Waiting in a Specified Skill Queue.....	376
6.1.3.12 Querying All Calls Placed on Hold by a Specified Agent.....	380
6.1.4 Agent Event: agentevent.....	383
6.1.4.1 Obtaining Events of One Agent in Polling Mode.....	383
6.1.4.2 Calling Back Pushed Events.....	386
6.1.5 Multimedia: mediaCall.....	389
6.1.5.1 Sending Messages: sendmessage.....	389
6.1.5.2 Agent Session Quantity Configuration: setcallnums.....	395
6.1.5.3 Session Transfer: transfer.....	398
6.1.5.4 Obtaining Connection Information: getconnectinfo.....	402
6.1.5.5 Screenshot: imagecapture.....	405
6.1.6 Agent Conference: agentconf.....	407
6.1.6.1 Applying for an Agent Conference.....	407
6.1.6.2 Answering an Agent Conference Call.....	411
6.1.6.3 Rejecting an Agent Conference Call.....	414
6.1.6.4 Leaving an Agent Conference.....	416
6.1.6.5 Releasing an Agent Conference.....	418
6.1.6.6 Holding a Participant in a Conference.....	420
6.1.6.7 Unholding a Participant in a Conference.....	423
6.1.6.8 Applying for Extending a Conference.....	426
6.1.6.9 Transferring the Chairperson Permission.....	428
6.1.6.10 Inviting Participants in Batches.....	431
6.1.6.11 Deleting Participants in Batches.....	435
6.1.6.12 Modifying Participant Attributes.....	439
6.1.6.13 Playing an Announcement in an Agent Conference.....	442
6.1.6.14 Stopping Conference Announcement Playing.....	444
6.1.6.15 Playing an Announcement in an Agent Conference Channel.....	447
6.1.6.16 Stopping Announcement Playing in an Agent Conference Channel.....	450
6.1.6.17 Changing the Number of Conference Participants.....	453
6.1.6.18 Querying Conference Information in Batches.....	455
6.1.6.19 Querying an Ongoing Conference ID in the VDN.....	460

6.2 Agent Bidirectional Calls.....	462
6.2.1 Creating a Bidirectional Call (V1.0.0) (createCall).....	462
6.2.2 Creating a Bidirectional Call (V3.0.0) (createCall).....	471
6.2.3 Querying Call History Records (queryCallDetailRecord).....	476
6.2.4 Querying Call Status (queryCallState).....	485
6.2.5 Obtaining the Recording File URL (getRecordingAddress).....	492
6.2.6 Querying Allocated Softphone Numbers (V1.0.0) (queryPhone).....	495
6.2.7 Querying Allocated Softphone Numbers (V2.0.0) (queryPhone).....	499
6.2.8 Obtaining the Information About the Destination Device of a Call (getCalledInfo).....	503
6.2.9 Creating a Voice Outbound Call (V1.0.0) (createVoiceNotification).....	506
6.2.10 Creating a Voice Outbound Call (V2.0.0) (createVoiceNotification).....	508
6.2.11 Querying Contact Records (queryUserContactLimit).....	512
6.2.12 Querying Call Information (queryCallInfoByCallId).....	514
6.2.13 Sending an ITA Bidirectional Call Result Notification (statusnotify).....	516
6.2.14 Callback Interface.....	519
6.2.14.1 Callback Interface Description.....	519
6.2.14.2 Call Status Event Callback.....	521
6.2.14.3 Release Event Callback.....	523
6.3 Voice Recognition Result Subscription Interfaces.....	526
6.3.1 Subscription.....	526
6.3.2 Subscription Modification.....	531
6.3.3 Unsubscription.....	534
6.3.4 Handshake.....	536
6.3.5 Handshake (Extended).....	538
6.3.6 Recognition Result Notification.....	540
6.3.7 Error Code Definition.....	549
6.3.7.1 Error Codes Returned by the CC-Gateway.....	549
6.3.7.2 Common Voice Recognition Result Subscription Interface Error Codes.....	552
6.3.7.3 Common Error Codes Returned by the CTI Platform.....	553
6.3.7.4 VDN Configuration Interface Error Codes Returned by the CTI Platform.....	554
6.3.7.5 System Configuration Interface Error Codes Returned by the CTI Platform.....	558
6.3.7.6 Error Code Returned by UAP.....	560
6.3.8 Role Permission Bit Description.....	560
6.4 App Personal Settings.....	561
6.4.1 Creating App Personal Settings (create).....	561
6.4.2 Updating App Personal Settings (update).....	565
6.4.3 Querying App Personal Settings (query).....	568
6.4.4 Deleting App Personal Settings (delete).....	571
6.5 Appendix.....	573
6.5.1 Events.....	573
6.5.1.1 Events Related to Agent State.....	573
6.5.1.1.1 Busy.....	573

6.5.1.1.2 Working.....	574
6.5.1.1.3 Idle.....	574
6.5.1.1.4 Entering the Busy State Successfully.....	574
6.5.1.1.5 Quitting the Busy State Successfully.....	574
6.5.1.1.6 Requesting Rest Successfully.....	575
6.5.1.1.7 Quitting the Rest State Successfully.....	575
6.5.1.1.8 Rest Timeout Reminder.....	575
6.5.1.1.9 Turning to the Working State.....	576
6.5.1.1.10 Quitting the Working State.....	576
6.5.1.1.11 Receiving Notes.....	576
6.5.1.2 Audio and Video Call Event.....	576
6.5.1.2.1 Entering the Talking State.....	576
6.5.1.2.2 Customer Ringing.....	577
6.5.1.2.3 Holding Success.....	577
6.5.1.2.4 Entering Three-Party Conversation Successfully.....	578
6.5.1.2.5 Making an Outgoing Call Unsuccessfully.....	578
6.5.1.2.6 Outbound Call Failure Cause Detected.....	578
6.5.1.2.7 Making an Internal Call Unsuccessfully.....	579
6.5.1.2.8 No Answer from an Agent for a Long Time.....	579
6.5.1.2.9 Agent Exiting a Call.....	579
6.5.1.2.10 User Exiting a Call.....	580
6.5.1.2.11 Automatically Answering a Call.....	580
6.5.1.2.12 Notifying the Agent of an Inbound Call.....	580
6.5.1.2.13 Connection Failure.....	581
6.5.1.2.14 Consultation Failure.....	581
6.5.1.2.15 Notifying the Transfer Success Result.....	581
6.5.1.2.16 Returning from IVR.....	582
6.5.1.2.17 Switching Between Audio and Video Calls.....	582
6.5.1.2.18 Media Capability Check.....	583
6.5.1.2.19 Inbound Call Notification.....	583
6.5.1.3 Events Related to Outgoing Call.....	584
6.5.1.3.1 Previewed Outbound Call Released.....	584
6.5.1.3.2 Agent Preoccupied.....	584
6.5.1.3.3 Previewed Outgoing Call Initiated.....	584
6.5.1.3.4 Previewed Outbound Call.....	585
6.5.1.3.5 New Previewed Outbound Call.....	585
6.5.1.4 Recording Events.....	586
6.5.1.4.1 Recording Started.....	586
6.5.1.4.2 Recording Startup Failed.....	587
6.5.1.4.3 Recording Stopped.....	587
6.5.1.5 Events Related to Voice Playback by Quality Checks.....	588
6.5.1.5.1 Recording Playback Started.....	588

6.5.1.5.2 Recording Playback Succeeded.....	588
6.5.1.5.3 Recording Playback Failed.....	588
6.5.1.5.4 Stopping Playing the Recording.....	588
6.5.1.5.5 Recording Playback Paused.....	589
6.5.1.5.6 Recording Playback Resumed.....	589
6.5.1.5.7 Recording Playback Fast-Forwarded.....	589
6.5.1.6 Events Related to Real-time Quality Control.....	590
6.5.1.6.1 Agent Monitoring.....	590
6.5.1.7 Events Related to Physical Phone.....	590
6.5.1.7.1 Phone State Unknown.....	590
6.5.1.7.2 Phone in On-Hook State.....	590
6.5.1.7.3 Phone in Off-Hook State.....	591
6.5.1.7.4 Phone in Ringing State.....	591
6.5.1.7.5 Phone in Busy State.....	591
6.5.1.8 Other Agent-Related Events.....	591
6.5.1.8.1 Agent Starting to Sign In.....	592
6.5.1.8.2 Agent Successfully Signed Out.....	592
6.5.1.8.3 All Agents in Busy State.....	592
6.5.1.9 Events Related to Multimedia.....	592
6.5.1.9.1 Multimedia Message.....	592
6.5.1.9.2 HTML5 Access Information Event.....	593
6.5.1.9.3 HTML5 Screenshot Event.....	594
6.5.1.10 Agent Conference Event.....	594
6.5.1.10.1 Successful Conference Application.....	594
6.5.1.10.2 Failed Conference Application.....	594
6.5.1.10.3 Joining a Conference.....	595
6.5.1.10.4 Conference Timeout Notification.....	595
6.5.1.10.5 Conference Ringing.....	595
6.5.1.10.6 Participant Change.....	596
6.5.1.10.7 Leaving a Conference.....	596
6.5.1.10.8 Chairperson Change.....	597
6.5.1.10.9 Stopping Conference Announcement Playing.....	597
6.5.1.10.10 Stopping Announcement Playing in a Conference Channel.....	597
6.5.1.11 Events Related to Disaster Recovery.....	598
6.5.1.12 Phone Linkage Events.....	598
6.5.1.12.1 Linkage Capability.....	598
6.5.1.12.2 Linkage Status.....	599
6.5.1.12.3 Muting a Call.....	599
6.5.1.12.4 Unmuting a Call.....	599
6.5.1.12.5 Transfer-out Notification.....	600
6.5.1.12.6 Transfer-out Result Notification.....	600
6.5.1.12.7 Holding a Call.....	600

6.5.1.12.8 Unholding a Call.....	601
6.5.1.12.9 Making an Outbound Call.....	601
6.5.2 Error Codes.....	602
6.5.3 Agent Status.....	619
6.5.4 Call Type.....	621
6.5.5 Device Type.....	621
6.5.6 Interface Parameters.....	622
7 Telemarketing Outbound Call Interface Reference.....	624
7.1 Outbound Campaign Management Interfaces.....	624
7.1.1 Adding an Outbound Campaign (V1).....	624
7.1.2 Adding an Outbound Campaign (V2).....	637
7.1.3 Modifying an Outbound Campaign (V1).....	656
7.1.4 Modifying an Outbound Campaign (V2).....	668
7.1.5 Deleting an Outbound Campaign.....	686
7.1.6 Querying Details About an Outbound Campaign.....	689
7.1.7 Querying All Outbound Campaigns.....	702
7.1.8 Suspending an Outbound Campaign.....	708
7.1.9 Resuming an Outbound Campaign.....	711
7.1.10 Setting the Retry Policy of an Outbound Campaign.....	714
7.1.11 Querying the Retry Policy of an Outbound Campaign.....	718
7.1.12 Adding the Definition of an Outbound Call Business Result.....	724
7.1.13 Querying the Definitions of Outbound Call Business Results.....	728
7.1.14 Collecting Outbound Call Exception Statistics.....	732
7.1.15 Adding Calling Numbers.....	736
7.1.16 Deleting Calling Numbers.....	740
7.2 Interfaces for Managing Outbound Campaign Holidays.....	743
7.2.1 Querying the Holiday List of an Outbound Campaign.....	743
7.2.2 Adding a Holiday for an Outbound Campaign.....	748
7.2.3 Modifying a Holiday for an Outbound Campaign.....	752
7.2.4 Deleting a Holiday for an Outbound Campaign.....	756
7.2.5 Deleting All Holidays for an Outbound Campaign.....	759
7.3 Interface for Outbound Blacklist Management.....	762
7.3.1 Adding Outbound Numbers to the Blacklist.....	762
7.3.2 Deleting an Outbound Number from the Blacklist.....	767
7.3.3 Deleting All Outbound Numbers from the Blacklist.....	770
7.3.4 Querying Blacklisted Outbound Numbers.....	773
7.3.5 Importing a Blacklist Data File from the Server.....	777
7.3.6 Querying Blacklist Data File Import Results.....	782
7.4 Outbound Call Data Interfaces.....	786
7.4.1 Adding Outbound Numbers.....	787
7.4.2 Adding Outbound Numbers (V2).....	792
7.4.3 Deleting an Outbound Number.....	799

7.4.4 Adding Number Types.....	803
7.4.5 Querying Number Types.....	807
7.4.6 Querying Outbound Numbers.....	809
7.4.7 Collecting Outbound Call Statistics on the Current Day.....	814
7.4.8 Importing an Outbound Call Data File from the Server.....	819
7.4.9 Querying Outbound Call Data File Import Results.....	824
7.5 Outbound Result Interface.....	828
7.5.1 Querying Outbound Call Results.....	829
7.5.2 Querying Details About a Single Outbound Call Result.....	835
7.5.3 Querying Call Records of Automatic and Intelligent Outbound Calls (V1.0.0).....	839
7.5.4 Querying Call Records of Automatic and Intelligent Outbound Calls (V2.0.0).....	844
7.6 Outbound Callback.....	848
7.6.1 Calling Back Outbound Call Results.....	849
7.7 Business Result Writeback.....	852
7.7.1 Writing Back Business Results.....	852
7.8 File Server Management Interfaces.....	856
7.8.1 Adding a File Server.....	856
7.8.2 Deleting a File Server.....	860
7.8.3 Modifying a File Server.....	863
7.8.4 Querying a File Server.....	866
7.9 Outbound Call External Result Definition Interfaces.....	871
7.9.1 Querying OBS Outbound Call Result Codes.....	871
7.9.2 Creating an External Result.....	874
7.9.3 Modifying an External Result.....	877
7.9.4 Deleting an External Result.....	880
7.9.5 Querying the External Result List.....	883
7.9.6 Querying a Single External Result.....	886
7.10 Querying Interface Invocation Records.....	890
8 Survey Interface Reference.....	895
8.1 Creating Answers (createScriptAnswer).....	895
8.2 Obtaining the Next Question (getNextQuestionInfo).....	898
8.3 Creating Answers to Questions (createQuestionAnswer).....	901
8.4 Updating Answers to Questions (updateQuestionAnswer).....	903
8.5 Updating Surveys (updateScriptAnswer).....	906
8.6 Updating Ratings (updateScore).....	908
9 iKBS Interface Reference.....	912
9.1 Authentication.....	912
9.1.1 SIA Authentication.....	912
9.1.2 Authentication Mode of Knowledge Base Interfaces.....	914
9.2 Interface Description.....	933
9.2.1 Querying Knowledge Details.....	933
9.2.2 Querying a Category.....	941

9.2.3 Querying the Knowledge List.....	944
9.2.4 Querying an Attachment Download Address.....	949
10 Chatbot Management Interface Reference.....	952
10.1 Overview.....	953
10.2 Domain Query Interface.....	955
10.3 Dialog ID Binding Interfaces.....	958
10.3.1 Interface for Querying Dialog ID Binding Relationships.....	958
10.3.2 Interface for Adding Dialog ID Binding Relationships.....	961

12.3.3.6 Querying Information About All Tenants Accessible to an Access User.....	1949
12.3.4 Inspection Relationship Maintenance Interfaces.....	1952
12.3.4.1 Querying a User Group Member.....	1952
12.3.4.2 Deleting Members from a Group in Batches.....	1955
12.3.4.3 Adding Members to a Group in Batches.....	1957
12.3.4.4 Querying All User Groups.....	1959

12.3.4.5 Adding a User Group.....	1962
12.3.4.6 Deleting a User Group.....	1964
12.3.4.7 Updating User Group Information.....	1966
12.3.4.8 Setting Inspection Relationships.....	1968
12.3.4.9 Deleting Configured Inspection Relationships.....	1970
12.3.4.10 Adding an Agent to a User Group.....	1972
12.3.4.11 Updating Agent Names.....	1976
12.3.5 Querying Outbound Call Task Lists.....	1979
12.3.5.1 Querying the Outbound Call Task List of a Tenant.....	1979
12.3.5.2 Querying the Daily Settlement Statistics of a Specified Task.....	1983
12.3.5.3 Querying the Real-Time Statistics of a Specified Task.....	1987
12.3.6 Interfaces for Querying System Indicators.....	1990
12.3.6.1 Querying UAP Performance Information.....	1990
12.3.6.2 Querying Key Information About Control Blocks.....	1996
12.3.6.3 Querying the Registration Status of a Terminal.....	2002
12.3.6.4 Interface for Querying UAP Performance Indicator Statistics.....	2007
12.3.6.5 Interface for Querying UAP Terminal Statistics.....	2010
12.3.6.6 Interface for Querying CTI System Indicators.....	2013
12.3.6.7 Querying the Time of the CTI Platform Server.....	2017
12.3.6.8 Querying the Current License Usage in the System.....	2019
12.3.7 Checking Cluster Health Status.....	2023
12.3.8 Appendix.....	2024
12.3.8.1 Indicator Code Reference.....	2024
12.3.8.1.1 Skill Queue Monitoring Indicators.....	2025
12.3.8.1.2 Agent Monitoring Indicators.....	2035
12.3.8.1.3 VDN Monitoring Indicators.....	2045
12.3.8.1.4 IVR Monitoring Indicators.....	2052
12.3.8.2 Error Code Reference.....	2053
12.3.8.3 CTI Platform Agent Status Code Reference.....	2054
12.3.8.4 Description of Call Media Types.....	2054
12.3.8.5 Description of Call Submedia Types.....	2056
12.3.8.6 Description of Call Types.....	2056
12.3.8.7 Description of Agent Types.....	2059
12.3.8.8 Call Features.....	2060
12.3.8.9 Reasons for Leaving the Device of the Call.....	2060
12.3.8.10 Cause Code.....	2063
12.3.8.11 Device Types.....	2068
12.3.8.12 Agent Operation Types.....	2069
12.3.8.13 Interfaces of Earlier Versions (Versions Earlier Than 8.13.0).....	2076
12.3.8.13.1 Querying Details of a Specified Agent.....	2076
12.3.8.13.2 Querying System Status by Agent.....	2079
12.3.8.13.3 Querying the Agent Information in Rest State.....	2082

12.3.8.13.4 Querying Statistics Details of Skill Queues in Batches.....	2085
12.3.8.13.5 Querying Details About Agents in Configured Skill Queues.....	2089
13 Recording and CDR Interface Reference.....	2093
13.1 Recording.....	2093
13.1.1 Recording Playback.....	2093
13.1.1.1 Starting Playing an Announcement.....	2093
13.1.1.2 Pausing an Announcement.....	2096
13.1.1.3 Resuming an Announcement.....	2098
13.1.1.4 Fast Forwarding.....	2100
13.1.1.5 Rewinding.....	2103
13.1.1.6 Stopping Playing an Announcement.....	2105
13.1.1.7 Starting Screen Recording.....	2107
13.1.1.8 Stopping Screen Recording.....	2109
13.1.1.9 Starting Voice Recording.....	2111
13.1.1.10 Stopping Voice Recording.....	2115
13.1.1.11 Playing Network Call Recordings.....	2117
13.1.2 Recording Download: record.....	2121
13.1.2.1 Downloading Recordings.....	2121
13.1.2.2 Downloading Recordings (Extended).....	2125
13.1.3 Video File Download: Video.....	2129
13.1.3.1 Downloading Video Files.....	2129
13.1.3.2 Downloading Video Files (Extended).....	2132
13.2 CDR Download and Recording Playback and Download.....	2135
13.2.1 Data Access Interface.....	2135
13.2.1.1 Obtaining a Recording Download and Playback URL.....	2135
13.2.1.2 Generating CDRs and Recording Indexes.....	2138
13.2.1.3 Downloading CDRs and Recording Indexes.....	2145
13.2.1.4 Downloading a Recording File.....	2148
13.2.1.5 Downloading a Recording File (Extended).....	2151
13.2.1.6 Generating Indexes of Agent Operation Details.....	2155
13.2.1.7 Downloading Indexes of Agent Operation Details.....	2160
13.2.1.8 Requesting to Play Back a Recording File.....	2163
13.2.1.9 Playing Back a Recording File.....	2167
13.2.1.10 Downloading an Intelligent IVR Recording File.....	2169
13.2.1.11 Downloading IVR Voice Messages.....	2172
13.2.1.12 Downloading a Recording File as a Third Party.....	2176
13.2.1.13 Uploading a File as a Third Party.....	2179
13.2.1.14 Generating a File Hash Value as a Third Party.....	2183
13.2.1.15 Deleting an Uploaded File as a Third Party.....	2186
13.2.2 Index File Definition.....	2189
13.2.2.1 Definitions of CDR and Recording Index Files.....	2189
13.2.2.2 Definition of Index Files for Agent Operation Details.....	2194

13.2.3 Reference Description.....	2195
13.2.3.1 Error Code Reference.....	2195
13.2.3.2 Status Code Description.....	2200
13.2.3.3 Cause Code.....	2202
13.2.3.4 Agent Operation Type.....	2208
13.2.3.5 Media Type.....	2212
13.2.3.6 Description of Call Types.....	2213
13.2.3.7 Reasons for Leaving the Device of the Call.....	2215
13.2.3.8 Description of Call Media Types.....	2218
13.2.3.9 Description of Call Submedia Types.....	2219
14 Voice Notification Interface Reference.....	2220
14.1 Querying Voice Notification Recording Files (queryVoiceNotificationRecording).....	2220
14.2 Creating a Voice Notification (V1.0.0) (createVoiceNotification).....	2225
14.3 Creating a Voice Notification (V2.0.0) (createVoiceNotification).....	2232
14.4 Callback APIs.....	2242
14.4.1 Callback API Description.....	2243
14.4.2 Release Event Callback API.....	2244
15 OMA Interface Reference.....	2248
15.1 Business Software Mall Connection Interfaces.....	2248
15.1.1 Querying Customer Information.....	2248
15.1.2 Querying Subscription Information.....	2251
15.1.3 Calling Back Data by the Huawei IMC.....	2255
15.1.4 Querying Basic Trial Tenant Information by the Business Software Mall.....	2257
15.1.5 Querying System Parameters by the Business Software Mall.....	2259
16 DataProcess Interface Reference.....	2262
16.1 Querying Call Result Data.....	2262
17 Other Interfaces Reference.....	2268
17.1 Verifying Token Information.....	2268
17.2 Generating a Verification Code for One-Click Trial Use.....	2270
17.3 Applying for One-Click Trial Use of a Tenant.....	2272
17.4 API Fabric Interfaces Provided for AICC Internal NEs.....	2276
17.4.1 Verifying the Third-Party System During Connection Bar Integration.....	2276
17.4.2 Querying Third-Party Customer Information.....	2276

1 Interface Overview

The section describes open interfaces provided by the CEC for external use. For details about the types and basic functions of main interfaces, see [Table 1-1](#).

NOTICE

Some interfaces contain distributed locks to ensure that only one modification or addition request from an agent can be processed at a time in concurrent scenarios, preventing the atomicity and consistency of businesses from being damaged. A distributed lock is triggered when an interface is invoked. It is automatically released after the interface invocation is complete (whether the invocation succeeds or not) so that the interface can be invoked again.

Table 1-1 Interfaces

Interface Type	Description
Call center configuration interfaces	Interfaces related to agent management, skill queue management, number management, and IVR management. These interfaces can be used to create agents and skill queues, query information about agents, skill queues, access codes, and IVR flows, and upload IVR voice files.
Agent workbench interfaces	Interfaces of the agent control, agent bidirectional call (used in the mobile app scenario), voice recognition result subscription, and app personal settings (used in the mobile app scenario). These interfaces can be used for agent sign-in and sign-out, call control, call data query, agent bidirectional call, and voice recognition result subscription to the CTI platform of the call center. To use the interfaces related to the agent workbench, you also need to consider to use the phone. For details, see <i>Development Guide</i> .

Interface Type	Description
Telemarketing outbound call interfaces	Interfaces of the CC-iSales (telemarketing outbound calls). These interfaces can be used for businesses such as adding outbound call campaigns, adding outbound numbers, and querying outbound call results.
Survey interfaces	Interfaces of the CC-Survey. These interfaces can be used for businesses such as creating surveys, creating answers to questions, and updating surveys.
Knowledge base interfaces	Interfaces of the CC-iKBS. These interfaces can be used for businesses such as querying knowledge details and the knowledge list.
Chatbot management interfaces	Interfaces of the Online Intelligent Assistant Platform (OIAP). These interfaces can be used for businesses such as domain query, dialog query, Q&A management, and FAQ group management.
Web client access interfaces	Interfaces for accessing the web client. These interfaces can be used for users to send online messages, send and receive files, and initiate click-to-dial businesses.
Inspection, monitoring, and statistics collection interfaces	<p>Interfaces of real-time inspection, real-time data query, historical data query, and configuration data query.</p> <p>These interfaces can be used for inspectors to perform real-time inspection operations such as insertion, listening, and interception on agents, and query real-time and historical monitoring indicators in different dimensions such as agents and skill queues of tenant space.</p> <p>NOTICE</p> <p>For monitoring and statistics interfaces, the following structure is used to be compatible with earlier versions. In this version, resultCode instead of result is used as the result code, and resultDesc instead of resultDatas is used as the data returned by the interface.</p> <ul style="list-style-type: none"> • result: Query result. The data type is string. The options are as follows: <ul style="list-style-type: none"> • 0: success • Other values: failure • resultDatas: JSON object array in the returned result after a successful query.
Recording/CDR interfaces	Interfaces related to recording playback, recording download, video download, and CDR download. These interfaces can be used to play recordings to agents after agents sign-in, download voice and video files from agents, download CDRs from third parties, and play recordings.

Interface Type	Description
Voice notification interfaces	<p>Interfaces for querying voice notification recording files and creating voice notifications.</p> <p>These interfaces can be used to initiate voice notifications and play specified voice files to specified customers.</p>
OMA interfaces	<p>Interfaces for customer information query, subscription information query, and more.</p> <p>These interfaces can be used to invoke the business software mall to query related information. Currently, these interfaces are for trial use only.</p>
DataProcess interfaces	<p>Interfaces for querying call result data.</p>
Other interfaces	<p>Interfaces for token information authentication, one-click trial use, and more.</p>

2 Glossary

Table 2-1 Terms

Term	Description
VDN	The virtual directory number (VDN) is a concept on the CTI platform. In the AICC, a tenant corresponds to a VDN after being created and configured. A VDN is equivalent to a tenant or tenant space.
skill queue	<p>A skill queue is a group of agents who can handle problems of the same type or answer questions of the same type. Skill queues can improve the work efficiency of agents and shorten the service duration. Skill queues are classified into the voice, multimedia, video, voice click-to-dial, and video click-to-dial types, which are used to handle different problems.</p> <p>When a user requests a media service, the user's call accesses a skill queue of the media service, and an agent who signs in to the skill queue provides services for the user.</p>
access code	An access code is a customer service hotline provided for customers. Customers can dial an access code to connect to agents.
extension code	To set multiple destination devices for an access code, you can configure extension codes. Assume that the access code is 12345. Extension code 1 is added for routing calls to skill queue A, and extension code 2 to skill queue B. In this way, customers can dial 123451 to directly access skill queue A.
softphone number	A softphone number is a login account on the OpenEye. The OpenEye is a multimedia soft terminal.
app key	An app key (AK or app ID) indicates a developer account. When a third party invokes an open API of the AICC, the third party needs to obtain token authentication information using the AK and SK.
app secret	An app secret (SK) indicates an authentication key. When a third party invokes an open API of the AICC, the third party needs to obtain token authentication information using the AK and SK.

Term	Description
<i>ip:port</i>	<i>ip:port</i> indicates the domain name of the AICC sign-in page. It is used in the URLs in interface documents. Take the URL <code>https://ip:port/oifde/rest/api/spellcheck</code> as an example. If the domain name of the AICC sign-in page is <code>southvideo.aicccloud.com</code> , you can replace <i>ip:port</i> in the URL with <code>southvideo.aicccloud.com</code> .

3 Change History

Issue 12 (2023-05-13)

This issue is released with MicroService 2.2.0.0. The following interfaces are modified.

Table 3-1 Interface change history

No.	Interface	Type	Remarks
1	Interface for the Huawei IMC to call back data (https://Domain name/apiaccess/rest/oma/v1/imcopenapi/callback)	New	This interface is invoked by the Huawei IMC to call back data.
2	Interface for the business software mall to query basic trial tenant information (https://Domain name/rest/oma/softwareconsole/trialtenant/querytenantinfo)	New	This interface is invoked by the business software mall to query basic trial tenant information.
3	Interface for the business software mall to query system parameters	New	This interface is invoked to query system parameters. It is open to the business software mall official website.
4	Interface for querying customer information	Modified	The vdn , createDate , tenantSpaceStatus , and portalUrl parameters are added to the response body.

Issue 11 (2023-04-07)

This issue is released with MicroService 2.1.0.0. The following interfaces are modified.

Table 3-2 Interface change history

No.	Interface	Type	Remarks
1	https:// <i>Domain name</i> /rest/oma/softwareconsole/tenant/queryresource	New	This interface is invoked by the business software mall to query business software mall subscription information stored on the OMA.

Issue 10 (2023-03-07)

This issue is released with MicroService 2.0.0.0. The following interfaces are modified.

Table 3-3 Interface change history

No.	Interface	Type	Remarks
-----	-----------	------	---------

Issue 09 (2022-12-05)

This issue is released with MicroService 1.11.0 The following interfaces are modified.

Table 3-4 Interface change history

No.	Interface	Type	Remarks
16	https:// <i>Domain name</i> /oifde/rest/crs/process	Modified	The interface invoked after dialog interaction (inaction=9) (V1) is modified.

No.	Interface	Type	Remarks
17	https:// <i>Domain name</i> /oifde/rest/crs/process	Modified	The interface invoked after dialog interaction (inaction=9) (V2) is modified.
18	Release event callback interface	Modified	The releaseReason parameter is added to the request body.

Issue 08 (2022-10-20)

This issue is released with MicroService 1.10.0. The following interfaces are modified.

Table 3-5 Interface change history

No.	Interface	Type	Remarks
1	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/create	Modified	The maximum length of the request body parameter phone is changed to 25 characters.
2	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/update	New	The maximum length of the request body parameter phone is changed to 25 characters.
3	https:// <i>Domain name</i> /apiaccess/ccmessaging/queryHistoryChatMessage	New	The interface for querying historical messages is added.
4	https:// <i>Domain name</i> /apiaccess/ccmessaging/send (For example, the domain name is https://service.besclouds.com.)	Modified	The value LOCATE (location message) is added to the mediaType request parameter.

Issue 07 (2022-08-31)

This issue is released with MicroService 1.0.9. The following interfaces are modified.

Table 3-6 Interface change history

No.	Interface	Type	Remarks
1	https:// <i>Domain name</i> /apiaccess/CC-Management/v1/mobileAgent/createCall	Modified	The agentWorkNo request parameter is added to the interface for creating a bidirectional call (V1.0.0).
2	https:// <i>Domain name</i> /apiaccess/CC-Management/v1/openapp/agentsettings/create	New	The interface for creating app personal settings is added.
3	https:// <i>Domain name</i> /apiaccess/CC-Management/v1/openapp/agentsettings/update	New	The interface for updating app personal settings is added.
4	https:// <i>Domain name</i> /apiaccess/CC-Management/v1/openapp/agentsettings/query	New	The interface for querying app personal settings is added.
5	https:// <i>Domain name</i> /apiaccess/CC-Management/v1/openapp/agentsettings/delete	New	The interface for deleting app personal settings is added.
6	https:// <i>Domain name</i> /service-cloud/rest/isales/v1/openapi/campaigns/{vdnId}/callresult/{campaignId}	Modified	The beginTime and endTime request parameters are added to the interface for querying outbound call results.

Issue 06 (2022-07-31)

This issue is released with MicroService 1.0.8. The following interfaces are modified.

Table 3-7 Interface change history

No.	Interface	Type	Remarks
1	https:// <i>ip.port</i> /oifde/rest/api/queryRecordHistory	Modified	For the interface for querying session records, the locationId field (node ID) is added to the JSON string of the response parameter businessInfoStr .
2	https:// <i>ip.port</i> /CCFS/resource/ccfs/downloadOiapRecord?locationId= <i>xx</i>	Modified	For the interface for downloading an intelligent IVR recording file, the locationId field in the request URL is changed from mandatory in CTI pool mode to optional.
3	https:// <i>ip.port</i> /CCFS/resource/ccfs/downloadIVRRecordFile?locationId= <i>xx</i>	Modified	For the interface for downloading IVR voice messages, the locationId field in the request URL is changed from mandatory in CTI pool mode to optional.
4	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/ita/twopartiescall/statusnotify	New	The interface for sending an ITA bidirectional call result notification is added.

Issue 05 (2022-05-30)

This issue is released with MicroService 1.0.7. The following interfaces are modified.

Table 3-8 Interface change history

No.	Interface	Type	Remarks
1	https:// <i>Domain name</i> /apiaccess/rest/voiceNotification/v2/createVoiceNotification	Modified	The following optional request parameter is added to the interface for creating a voice notification (V2): voiceFileName (IVR voice name)

No.	Interface	Type	Remarks
2	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/importVoiceFile/upload	Modified	The following optional request parameter is added to the interface for uploading IVR voice files: voiceFileName (IVR voice name)
3	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/createVoiceTemplate	New	The interface for uploading TTS template files of voice notifications is added.
4	https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callRecord	New	The interface for querying call records of automatic and intelligent outbound calls is added.

Issue 04 (2022-04-30)

This issue is released with MicroService 1.0.6. The following interfaces are modified.

Table 3-9 Interface change history

No.	Interface	Type	Remarks
1	https:// <i>ip.port</i> /rest/isales/v1/openapi/campaigns/{vdnId}/blocklist/add	Modified	The following optional request parameters are added to the interface for adding outbound numbers to the blacklist: restrictTimes (maximum number of calls) restrictPeriod (restriction period)
2	https:// <i>ip.port</i> /oifde/rest/api/tts/texttovoice	New	The interface for generating TTS voices based on texts is added.
3	https:// <i>Domain name</i> /apiaccess/rest/voiceNotification/v2/createVoiceNotification	New	The interface for creating a voice notification (V2) is added.

No.	Interface	Type	Remarks
4	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/satisfactionconfig/querySatisfaction-Config	Modified	The following optional parameter is added to the response parameters of the interface for querying the IVR flows for satisfaction surveys: accessCode (flow access code)
5	https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/skill https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/skillforday https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/skillformonth	Modified	Interface for obtaining historical monitoring indicators by skill Interface for obtaining historical monitoring indicators by skill on a specified date Interface for obtaining historical monitoring indicators by skill in a specified month The calculation logic of the IDX_COUNT_SKILL_INCOMING_CALL (number of manual inbound call requests) parameter of the preceding three interfaces is modified.

Issue 03 (2022-03-31)

This issue is released with MicroService 1.0.5. The following interfaces are modified.

Table 3-10 Interface change history

No.	Interface	Type	Remarks
1	<p>https://<i>ip.port</i>/CCFS/resource/ccfs/queryBillData</p> <p>https://<i>ip.port</i>/CCFS/resource/ccfs/downloadBillFile</p>	Modified	<p>The following parameters are added to the CDR and recording index files downloaded using the interface for generating CDRs and recording indexes and the interface for downloading CDRs and recording indexes.</p> <p>Parameters added to CDR index files:</p> <ul style="list-style-type: none"> • vdn (VDN ID) • pre_device_type (type of the previous device that a call passes through) • pre_device_no (No. of the previous device that a call passes through) • skill_id (skill queue ID to which a call belongs) • current_skill_id (skill queue ID that processes the current call) <p>Parameters added to recording index files:</p> <ul style="list-style-type: none"> • vdn (VDN ID) • call_type (call type) • media_type (media type) • user_wanted_skill_id (direction skill) • current_skill_id (skill queue ID that processes the current call)
2	<p>https://<i>Domain name</i>/apiaccess/rest/cc-management/v1/importVoiceFile/upload</p>	Modified	<p>The MP3 voice file type is added to the request parameter fileType of the interface for uploading IVR voice files.</p>

No.	Interface	Type	Remarks
3	https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/agent/agentoprinfo	Modified	For the interface for obtaining agent operation details, the request parameter operateType is changed from mandatory to optional.
4	https:// <i>Domain name</i> /apiaccess/ccmessaging/send	Modified	WEBCARD (web card) is added to the request parameter mediaType (message media type) of the interface for sending messages from a web client.
5	https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/skill https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/skillforday https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/skillformonth	Modified	Interface for obtaining historical monitoring indicators by skill Interface for obtaining historical monitoring indicators by skill on a specified date Interface for obtaining historical monitoring indicators by skill in a specified month The following monitoring indicator is added for the preceding three interfaces: IDX_COUNT_SKILL_INCOMING_CALL (number of manual inbound call requests)
6	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/satisfaction/query	New	The interface for querying satisfaction survey results is added.
7	https:// <i>Domain name</i> /apiaccess/rest/service-pub/authentication	New	The interface for authenticating token information is added.

Issue 02 (2022-02-11)

This issue is released with MicroService 1.0.4. The following interfaces are modified.

No.	Interface	Type	Remarks
1	https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/query	Modified	The transparentDisplay-Flag parameter is added to the request and response parameters of the interface for querying agent account information.
2	https://Domain name/apiaccess/rest/cc-management/v1/importVoiceFile/upload	New	The interface for uploading IVR voice files is added.
3	https://Domain name/apiaccess/rest/voiceNotification/v1/queryVoiceNotificationRecording	New	The interface for querying recording files of voice notifications is added.
4	https://Domain name/apiaccess/rest/voiceNotification/v1/createVoiceNotification	New	The interface for creating a voice notification is added.
5	https://Domain name/apiaccess/CC-Management/v1/mobileAgent/createCall	Modified	The request parameter callbackUrl is added to the interface for creating a bidirectional call (V1.0.0).
6	https://ip.port/rest/isales/v1/openapi/campaigns/{vdnId}/callresultdetail/{callId}	New	The interface for querying details about a single outbound call result is added.
7	https://ip.port/CCFS/resource/ccfs/getRecordFileUrlFromObs	Modified	The response parameter url of the interface for obtaining the recording download and playback URL is modified. If a call ID corresponds to multiple recording files, the download and playback URLs of multiple recording files are returned.

Issue 01 (2021-12-15)

This issue is released with Service Cloud 8.21.0. The following interfaces are modified.

No.	Interface	Type	Remarks
1	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/create	New	The interface for creating an agent account is added.
2	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/delete	New	The interface for deleting a specified agent account is added.
3	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/update	New	The interface for modifying agent account information is added.
4	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/query	New	The interface for querying agent account information is added.
5	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/addSkillsToAgent	New	The interface for binding an agent to a skill queue is added.
6	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/releaseAgentBySkillId	New	The interface for unbinding an agent from a skill queue is added.
7	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/sipPhone/updateSipPhonePassword	New	The interface for changing the softphone number login password of an agent is added.
8	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/agentAccount/queryAgentInfoBySkillId	New	The interface for querying agent information by skill queue ID is added.
9	https:// <i>Domain name</i> /apiaccess/rest/cc-management/v1/skill/createSkill	New	The interface for creating a skill queue is added.

No.	Interface	Type	Remarks
10	https://Domain name/apiaccess/rest/cc-management/v1/skill/deleteSkill	New	The interface for deleting a skill queue is added.
11	https://Domain name/apiaccess/rest/cc-management/v1/skill/modifySkill	New	The interface for modifying a skill queue is added.
12	https://Domain name/apiaccess/rest/cc-management/v1/skill/querySkills	New	The interface for querying skill queues is added.
13	https://Domain name/apiaccess/rest/cc-management/v1/accessCodeInfo/queryAccessCodeList	New	The interface for querying access codes of a specified tenant space is added.
14	https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/createCalledRoute	New	The interface for creating a binding relationship between an access code, skill queue, and IVR is added.
15	https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/deleteCalledRoute	New	The interface for deleting the binding relationships between access codes, skill queues, and IVRs is added.
16	https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/modifyCalledRoute	New	The interface for modifying a binding relationship between an access code, skill queue, and IVR is added.
17	https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/queryCalledRoute	New	The interface for querying the binding relationships between access codes, skill queues, and IVRs is added.
18	https://Domain name/apiaccess/rest/cc-management/v1/phonearea/getPhoneNoRegionInfo	New	The interface for querying the home region of a phone number is added.

No.	Interface	Type	Remarks
19	https://Domain name/apiaccess/rest/cc-management/v1/ivrFlow/queryIVRFlowList	New	The interface for querying all IVR flows of a specified tenant space is added.
20	https://Domain name/apiaccess/rest/cc-management/v1/satisfactionconfig/querySatisfyConfig	New	The interface for querying the IVR flows for satisfaction surveys is added.
21	https://Domain name/apiaccess/rest/cc-management/v1/offline/agent/login	New	The interface for answering calls on a mobile phone is added.
22	https://Domain name/apiaccess/rest/cc-management/v1/offline/agent/logout	New	The interface for exiting the function of answering calls on a mobile phone is added.
23	https://Domain name/apiaccess/rest/cc-management/v1/offline/agent/isOfflineAgent	New	The interface for querying whether a specified agent answers calls on a mobile phone is added.
24	https://ip.port/rest/cmsapp/v2/openapi/vdn/querycalls	New	The interface for querying call information of a specified VDN (V2) is added.
25	https://ip.port/rest/cmsapp/v1/openapi/vdn/queryAgentByStatus	New	The interface for querying agent information by agent status in pagination mode is added.
26	https://ip.port/CCFS/resource/ccfs/getRecordFileUrlFromObs	New	The interface for obtaining the recording download and playback URL is added.

No.	Interface	Type	Remarks
27	https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/agent	Modified	The following two monitoring indicators are added: IDX_COUNT_TOTAL_AGENT_CALL_OUT (total number of outbound calls) IDX_RATE_AGENT_SUCC_CALL_OUT (success rate of outbound calls)
28	https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/agentforday	Modified	The following two monitoring indicators are added: IDX_COUNT_TOTAL_AGENT_CALL_OUT (total number of outbound calls) IDX_RATE_AGENT_SUCC_CALL_OUT (success rate of outbound calls)
29	https:// <i>ip.port</i> /rest/cmsapp/v1/openapi/hisindex/agentformonth	Modified	The following two monitoring indicators are added: IDX_COUNT_TOTAL_AGENT_CALL_OUT (total number of outbound calls) IDX_RATE_AGENT_SUCC_CALL_OUT (success rate of outbound calls)
30	https:// <i>ip.port</i> /rest/cmsapp/v1/callinday/querymanualindexesbycondition	Modified	The following response parameter is added: inCallAllCostMinute (total charging duration of each call, in minutes)

No.	Interface	Type	Remarks
31	https:// <i>ip.port</i> /rest/cmsapp/v1/calloutday/ querymanualindexesbycondition	Modified	The following response parameter is added: outCallAllCostMinute (total charging duration of each call, in minutes)

4 Interface Authentication Modes

[4.1 Authentication Mode Description](#)

[4.2 C1 System Configuration Interface Authentication](#)

[4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#)

[4.4 C3 OIAP Interface Authentication](#)

[4.5 C4 Agent Operation Interface Authentication](#)

[4.6 C5 Intelligent Auxiliary Interface Authentication](#)

4.1 Authentication Mode Description

There are five authentication modes for all interfaces provided by the AICC. [Table 4-1](#) describes the authentication modes.

Table 4-1 Authentication modes

Authentication Mode	Description	Reference
C1 system configuration interface authentication	The API Fabric AK/SK authentication used by call center configuration interfaces, agent bidirectional call interfaces, and web client access (online chat) interfaces uses the tokenByAkSk interface to obtain tokens.	4.2 C1 System Configuration Interface Authentication

Authentication Mode	Description	Reference
C2 monitoring, system outbound call, and CDR interface authentication	The authentication algorithm for the CC-CMS (system monitoring and statistics collection), CC-iSales (telemarketing outbound call), and CC-FS (CDR and recording download and others) uses AK/SK-based request signature authentication.	4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication
C3 intelligent chatbot interface authentication	The authentication algorithm for the OIAP (intelligent chatbot) uses the gettoken interface to obtain tokens.	4.4 C3 OIAP Interface Authentication
C4 agent operation interface authentication	The authentication algorithm for the CC-Gateway (agent voice gateway) uses static or dynamic authentication to obtain GUID information for agent authentication.	4.5 C4 Agent Operation Interface Authentication
C5 intelligent auxiliary interface authentication	The authentication algorithm for voice recognition result subscription interfaces uses the sign-in authentication interface of the CC-Gateway (agent voice gateway) to obtain GUID information for agent authentication.	4.6 C5 Intelligent Auxiliary Interface Authentication

4.2 C1 System Configuration Interface Authentication

Scenario

The API Fabric generates a token.

URL: `https://Domain address/apigovernance/api/oauth/tokenByAkSk`

NOTE

Replace *Domain address* with the actual address or domain name of the CEC.

For example, in the Huawei Cloud production environment, replace *Domain address* with **service.besclouds.com**. The invoking URL is **`https://service.besclouds.com/apigovernance/api/oauth/tokenByAkSk`**.

Request Header

```
{
  Content-Type: application/json
}
```

```
X-Token-Expire:600  
}
```

 NOTE

X-Token-Expire indicates the token expiration time, in seconds. In this example, the token expiration time is 600 seconds. The maximum value is **3600**.

Request Parameters

```
{  
  "app_key": "xxxxxxxxxxxxxxxxxx",  
  "app_secret": "yyyyyyyyyyyyyyyyyy"  
}
```

 NOTE

- **app_key** indicates the app ID. Contact operations personnel to obtain it.
- **app_secret** indicates the secret. Contact operations personnel to obtain it.

Response Parameters

```
{  
  "AccessToken": "zzzzzzzzzzzzzzzzzz",  
  "ApplyType": "Bearer",  
  "CreateTime": "1545650171",  
  "Expires": "600",  
  "Scope": "XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX",  
  "AppKey": "xxxxxxxxxxxxxxxxxx",  
  "UserID": "Anonymous"  
}
```

 NOTE

AccessToken indicates the token of the API.

4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication

Obtaining AK/SK

AK/SK Authentication

In AK/SK-based authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- Access Key ID (AK): ID of the access key. It is a unique identifier that is associated with a secret access key. The AK and SK are used together to sign requests cryptographically.
- Secret Access Key (SK): secret access key that works with AK to obtain an encrypted signature for a request, identify the sender, and prevent the request from being modified.

In AK/SK-based authentication, you can use an AK/SK to sign requests based on the signature algorithm.

Obtaining the Private AK/SK

- Integrated environment: Contact operations personnel to obtain it.

NOTE

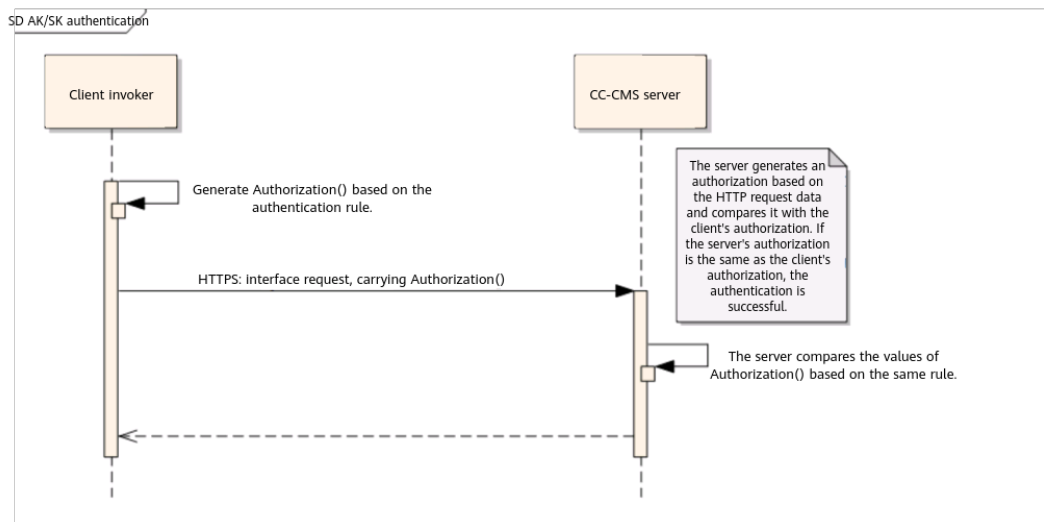

If the interface authentication is successful, the HTTPS response code 200 is returned. If the authentication fails, the HTTPS response code 401 is returned.

Authentication Algorithm

NOTICE

Assume that the CC-CMS interface is used as an example to describe the authentication algorithm. The authentication algorithms of the CC-iKBS, CC-FS, and CC-iSales are similar.

All interface servers authenticate the signature of the request data sent from the client. The authentication process is as follows.

The rule for the invoker to generate **Authorization** is as follows.

CanonicalRequest

```
$HttpMethod + "\n" +
$HttpURI + "\n" +
$HttpParameters + "\n" +
SignedHeaders($HttpHeaders) + "\n" +
CanonicalHeaders ($HttpHeaders) + "\n" +
Normalize($HttpBody)
```

SignedHeaders

Records are sorted by dictionary.

```
lowerCase($HeadName)+";"
lowerCase($HeadName)+";"
.....
lowerCase($HeadName)
```

CanonicalHeaders

Records are sorted by dictionary.

```
Normalize (lowerCase($HeadName))+":"*Normalize($HeadValue)+"\n"
Normalize (lowerCase($HeadName))+":"*Normalize($HeadValue)+"\n"
.....
Normalize (lowerCase($HeadName))+":"*Normalize($HeadValue)
```

Signature

```
SigningKey=Sha256Hex($SecreKey, "auth-v2/$AccessKey/$Timestamp/$SignedHeaders")
Signature=Sha256Hex($SigningKey, $CanonicalRequest)
```

Authorization:auth-v2/\$AccessKey/\$Timestamp/\$SignedHeaders/\$Signature

Algorithm and Rule of Each Content Segment

- **CmsParameters**

NOTE

This parameter class is a parameter summary in the CC-CMS secondary development demo. In the subsequent description and invocation, the parameters in this class are directly used. You only need to modify the parameter class in a unified manner to complete the authentication configuration.

The following is a basic parameter example in the demo. You can add parameters based on the site requirements to facilitate subsequent project management.

```
/**
 * Parameter class definition in CC-CMS interface requests
 */
public class CmsParameters
{
    //Replace the following information with the actual information.
    /**
     * Host access URL
     */
    public static final String host = "10.22.26.181:28080";
    public static final String url = "https://" + host;

    /**
     * Developer ID, that is, AK
     */
    public static final String accessKey= "globalaktest";
```

```
/**
 * Developer key (unencrypted), that is, SK
 */
public static final String secretKey = "1q*****20";
}
```

- **SignInfo**

 **NOTE**

This class contains some fixed **HEAD** definitions and some basic functions used to construct **CanonicalRequest** and **Signature**.

```
package com.huawei.client.rest.v2.demo.sign;

import java.io.UnsupportedEncodingException;
import java.security.InvalidKeyException;
import java.security.NoSuchAlgorithmException;
import java.text.SimpleDateFormat;
import java.util.Date;
import java.util.HashMap;
import java.util.Locale;
import java.util.Map;
import java.util.Map.Entry;
import java.util.Set;
import java.util.TimeZone;
import java.util.TreeSet;

@Setter
@Getter
public class SignInfo
{

    {
        return false;
    }
    return true;
}
}
```

The PathUtils tool class used by **SignInfo** is as follows:

```
package com.huawei.client.rest.v2.demo.utils;

import java.io.UnsupportedEncodingException;
import java.net.URI;
import java.net.URISyntaxException;
import java.net.URLDecoder;
import java.util.BitSet;

public class PathUtils {

    private static final String CHARSET = "UTF-8";

    private static BitSet URI_UNRESERVED_CHARACTERS = new BitSet();

    private static String[] PERCENT_ENCODED_STRINGS = new String[256];

    static {
        for (int i = 97; i <= 122; i++) {
            PathUtils.URI_UNRESERVED_CHARACTERS.set(i);
        }
    }
}
```

```
for (int i = 65; i <= 90; i++) {
    PathUtils.URI_UNRESERVED_CHARACTERS.set(i);
}
for (int i = 48; i <= 57; i++) {
    PathUtils.URI_UNRESERVED_CHARACTERS.set(i);
}
PathUtils.URI_UNRESERVED_CHARACTERS.set(45);
PathUtils.URI_UNRESERVED_CHARACTERS.set(46);
PathUtils.URI_UNRESERVED_CHARACTERS.set(95);
PathUtils.URI_UNRESERVED_CHARACTERS.set(126);

for (int i = 0; i < PathUtils.PERCENT_ENCODED_STRINGS.length; i++) {
    PathUtils.PERCENT_ENCODED_STRINGS[i] = String.format("%02X", new Object[]
{Integer.valueOf(i)});
}

}

public static String normalizePath(String path) {
    return PathUtils.normalize(path).replace("%2F", "/");
}

public static String normalize(String value) {
    try {
        StringBuilder builder = new StringBuilder();
        for (byte b : value.getBytes(PathUtils.CHARSET)) {
            if (PathUtils.URI_UNRESERVED_CHARACTERS.get(b & 0xFF)) {
                builder.append((char) b);
            } else {
                builder.append(PathUtils.PERCENT_ENCODED_STRINGS[(b & 0xFF)]);
            }
        }
        return builder.toString();
    } catch (UnsupportedEncodingException e) {
        throw new RuntimeException(e);
    }
}

}

/**
 * URL normalization
 *
 * @param url
 * @return
 */
public static String normalizeURL(String url) {
    try {
        return URLDecoder.decode(new URI(url).normalize().toString(), PathUtils.CHARSET);
    } catch (URISyntaxException | UnsupportedEncodingException e) {
        return url;
    }
}

}

public static void main(String[] args)
{
    System.out.println(PathUtils.normalize("123%456"));
}
}
```

- **SignedHeaders**

 **NOTE**

The invoker can selectively encode the header part in an HTTPS request. The only requirement is that the **Host** field must be encoded. However, the head whose **headname** is **Authorization** cannot be involved in the encoding calculation because **Authorization** is the final authentication head field.

Note: The value of **Host** is the value of *ip:port* in the HTTPS URL of the corresponding service.

In most cases, you are advised to encode the following headers:

```
Host="10.22.26.181:28080"  
Content-Length="22"  
Content-Type="application/json;charset=UTF-8"
```

– Content calculation rule

Traverse the header names in the **HttpHead** involved in encoding.

- i. Invoke the `lowerCase()` function to convert a header name to lowercase letters.
- ii. Add a semicolon (;) to the end of the characters converted from the header name to generate a record. Do not add a semicolon (;) to the last field.
- iii. Sort all the preceding records in alphabetical order, and then concatenate the records into a character string in sequence.

– Code implementation

- i. Construct the map of **signedHeaders**, fill in the required field information, and invoke the `lowerCaseSignedHeaders` function to process characters.

```
//Head field for signature authentication. The host field is mandatory.  
Map<String, String> signedHeaders = new HashMap<>();  
signedHeaders.put(SignInfo.HEAD_HOST, CmsParameters.host);  
signedHeaders.put(SignInfo.HEAD_CONTENT_LENGTH,  
String.valueOf(bodyJson.getBytes("UTF-8").length));  
signedHeaders.put(SignInfo.HEAD_CONTENT_TYPE, "application/json;charset=UTF-8");  
  
//Set the authentication data interface.  
SignInfo signInfo = new SignInfo();  
signInfo.setAccessKey(CmsParameters.accessKey);  
signInfo.setSecretKey(CmsParameters.secretKey);  
signInfo.setPayload(bodyJson);  
signInfo.setTimestamp(new Date());  
signInfo.setHttpMethod(HttpProxyHelper.HTTP_METHOD_POST);  
signInfo.setUri(httpPath);  
signInfo.setSignedHeaders(lowerCaseSignedHeaders(signedHeaders));
```

For details about the complete code of the preceding function, see [a](#).

- ii. Function: `lowerCaseSignedHeaders`

```
/**  
 * The signedHeaders involved in the calculation are converted.  
 * @param  
 * @return Map<String, String>  
 */  
private Map<String, String> lowerCaseSignedHeaders(Map<String, String> signedHeaders)  
{  
    if ((null == signedHeaders) || signedHeaders.isEmpty())  
    {  
        throw new IllegalArgumentException("signedHeaders can't be null.");  
    }  
    Map<String, String> headers = new HashMap<>();  
    for (Entry<String, String> e : signedHeaders.entrySet())  
    {  
        String name = e.getKey();  
        String value = e.getValue();  
        headers.put(name.toLowerCase(Locale.ENGLISH), value.trim());  
    }  
    if (!signedHeaders.containsKey(SignInfo.HEAD_HOST))  
    {  
        throw new IllegalArgumentException("signedHeaders must has host.");  
    }  
    return headers;  
}
```

- Example

The **HttpHead** involved in encoding is as follows:

```
Host="10.22.26.181:28080"
```

```
Content-Length="22"
```

```
Content-Type="application/json;charset=UTF-8"
```

After the processing based on the preceding rules, the result is as follows:

```
SignedHeaders=content-length;content-type;host
```

- **CanonicalHeaders**

- 📖 **NOTE**

The encoding rule is the same as that of **SignedHeaders**, but head value encoding is added.

- Content calculation rule

Traverse the header names in the **HttpHead** involved in encoding.

- Invoke the `lowerCase()` function to convert a header name to lowercase letters.
- Invoke the `NormalizePath` function to format the converted lowercase character string.
- Generate a record character string in the format of *Formatted character string:NormalizePath((Header value).trim())*.
- Sort the preceding records in alphabetical order.
- Traverse the sorted records and add the character string `\n` to connect them to a long character string.

Note that `\n` is not added to the last record.

The **HttpHead** involved in encoding is as follows:

```
Host="10.22.26.181:28080"
```

```
Content-Length="22"
```

```
Content-Type="application/json;charset=UTF-8"
```

After the processing based on the preceding rules, **CanonicalHeaders** is as follows:

```
content-length:22\n
```

```
content-type:application%2Fjson%3Bcharset%3DUTF-8\n
```

```
host:10.22.26.181%3A28080
```

- **CanonicalRequest**

- Content calculation rule

```
CanonicalRequest = $HttpMethod + "\n" + $HttpURI + "\n" + $HttpParameters + "\n" +  
SignedHeaders($HttpHeaders) + "\n" + CanonicalHeaders ($HttpHeaders) + "\n" +  
NormalizePath($HttpBody)
```

Parameter description:

- \$HttpMethod**: GET, PUT, and POST requests defined in the HTTPS protocol. The value must be all in uppercase. The involved HTTP methods include GET, POST, PUT, DELETE, and HEAD. However, the CC-CMS service supports only POST.
- \$HttpURI**: HTTPS URI of the interface request. For example, if the complete URL is `https://10.22.26.181:28080/rest/cmsapp/v1/ping`, the value is `/rest/cmsapp/v1/ping`. The value must start with a slash (/). If the value does not start with a slash (/), add it. If this parameter is left empty, the value is a slash (/).
- \$HttpParameters**: request parameter following the request URI. For example, if the request URI is `https://10.22.26.181:28080/rest/cmsapp/v1/ping?id=123&name=test`, the value of **\$HttpParameters** is `id=123&name=test`. Currently, this parameter does not exist in the CC-CMS interface.

- iv. **\$HttpBody**: character string submitted to the server through the HTTPS body. The character string is a standard JSON string. For details about the fields, see the definition of each interface.
- Code implementation
For details, see the canonicalRequest() function in **•SignInfo**.
- **Generating the Character String Authorization**
 - Content calculation rule
 - i. Generate **authStringPrefix** and **SigningKey**.

- 1) The rules for generating **authStringPrefix** and **SigningKey** are as follows:

```
authStringPrefix="auth-v2/{accessKey}/{timestamp}/{SignedHeaders}";  
SigningKey = sha256Hex(secretKey, authStringPrefix);
```

Note:

auth-v2: authentication version number. In the current version, the value is fixed to **auth-v2**.

accessKey: authentication ID of the invoker, that is, the AK.

secretKey: authentication key of the invoker, that is, the SK.

timestamp: UTC time generated by the invoker. The time is in *yyyy-MM-dd'T'HH:mm:ss.SSS'Z* format.

- 2) Code implementation: **authStringPrefix**

The function for generating **authStringPrefix** is implemented in the following functions of the **SignInfo** class:

```
authStringPrefix()  
appendSignedHeaders(StringBuilder buffer)
```

- 3) Code implementation: **SigningKey**

For details, see **authString()** in the **SignInfo** class.

```
String signingKey = SignerUtils.sha256Hex(this.getSecretKey(), authStringPrefix);
```

For details about the **sha256Hex()** encryption algorithm, see the following tool class:

```
package com.huawei.client.rest.v2.demo.utils;  
  
import java.io.UnsupportedEncodingException;  
import java.security.InvalidKeyException;  
import java.security.NoSuchAlgorithmException;  
  
import javax.crypto.Mac;  
import javax.crypto.spec.SecretKeySpec;  
  
/**  
 * Tool class for the authentication digest algorithm of RESTful interfaces  
 */  
public class SignerUtils {  
  
    private static final String CHARSET = "UTF-8";  
    private static final char[] DIGITS_LOWER = {'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a',  
    'b', 'c', 'd', 'e', 'f'};  
  
    /**  
     * Digest algorithm  
     * @param key  
     * @param toSigned  
     * @return String  
     * @throws NoSuchAlgorithmException  
     * @throws InvalidKeyException  
     * @throws UnsupportedEncodingException
```

```
*/
public static String sha256Hex(String key, String toSigned) throws
NoSuchAlgorithmException, InvalidKeyException, UnsupportedEncodingException {
    Mac mac = Mac.getInstance("HmacSHA256");
    mac.init(new SecretKeySpec(key.getBytes(SignerUtils.CHARSET),
"HmacSHA256"));

    String digit = new
String(SignerUtils.encodeHex(mac.doFinal(toSigned.getBytes(SignerUtils.CHARSET)))
);
    return digit;
}

private static char[] encodeHex(final byte[] data) {
    final int l = data.length;
    final char[] out = new char[l << 1];
    for (int i = 0, j = 0; i < l; i++) {
        out[j++] = SignerUtils.DIGITS_LOWER[(0xF0 & data[i]) >>> 4];
        out[j++] = SignerUtils.DIGITS_LOWER[0x0F & data[i]];
    }
    return out;
}
}
```

ii. Generate a signature.

1) Signature generation rule:

```
Signature = sha256Hex(SigningKey, CanonicalRequest)
```

2) Code implementation: The encryption function sha256Hex is included.

For details, see the implementation method of sha256Hex() in [Code implementation: SigningKey](#).

iii. Authentication character string

1) Rule for generating an authentication string:

```
Authorization:$authStringPrefix/$Signature
```

2) Code implementation: **signedHeaders** is the map constructed in the signedHeaders module.

```
//Generate a signature.
String signature = signInfo.authString();
Map<String, String> httpHeads = new HashMap<>(signedHeaders);
//Append to HTTPHEAD and send it to the server.
httpHeads.put(SignInfo.HEAD_AUTHORIZATION, signature);
```

NOTICE

The authentication character string is sent to the CC-CMS server using the **Authorization** field of **HttpHead**.

- Example
 - a. Commission the first interface.

 NOTE

Authentication is necessary for commissioning an interface.

In this project, the authentication entry is the `buildSignHttpHead()` function. This function constructs the map of signedHeaders and transfers the map to **SignInfo**.

The `authString()` function in the `SignInfo` class reveals the main process of constructing the authentication character string and generates the signature.

The key component of the authentication string is the signature. Other information concatenation functions are also included in the `SignInfo` class.

Define **BaseRequest**.

```
package com.huawei.client.rest.v2.demo.base;

@Setter
@Getter
public class BaseRequest
{
    private RequestHeader request;

    private Object msgBody;

    public BaseRequest(Object body)
    {
        this.request = new RequestHeader();
        this.msgBody = body;
    }

    public BaseRequest(RequestHeader head, Object body)
    {
        this.request = head;
        this.msgBody = body;
    }

    public RequestHeader getRequest()
    {
        return this.request;
    }

    public void setRequest(RequestHeader request)
    {
        this.request = request;
    }

    public Object getMsgBody()
    {
        return this.msgBody;
    }

    public void setMsgBody(Object msgBody)
    {
        this.msgBody = msgBody;
    }
}
```

RequestHeader is as follows:

```
package com.huawei.client.rest.v2.demo.base;

public class RequestHeader
{
    /**
     * Version
     */
    private String version = "2.0";

    public String getVersion()
    {
```

```
        return this.version;
    }

    public void setVersion(String version)
    {
        this.version = version;
    }
}
```

Define **BaseResponse**.

```
package com.huawei.client.rest.v2.demo.base;

@Setter
@Getter
public class BaseResponse
{
    final static int SUCCESS = 0;

    private ResponseHead resultHead;

    private Object resultData;

    public BaseResponse()
    {
    }

    public BaseResponse(String resultCode, String resultMsg, Object resultData)
    {
        this.resultHead = new ResponseHead(resultCode, resultMsg);
        this.resultData = resultData;
    }

    public BaseResponse(ResponseHead resultHead, Object resultData)
    {
        this.resultHead = resultHead;
        this.resultData = resultData;
    }
}
```

ResponseHead is as follows:

```
package com.huawei.client.rest.v2.demo.base;

public class ResponseHead
{
    private String resultCode;

    /**
     * Response result
     */
    private String resultMsg;

    public ResponseHead()
    {
    }

    public ResponseHead(String resultCode, String resultMsg)
    {
        this.resultCode = resultCode;
        this.resultMsg = resultMsg;
    }

    public String getResultCode()
    {
        return this.resultCode;
    }

    public void setResultCode(String resultCode)
```

```
{
    this.resultCode = resultCode;
}

public String getResultMsg()
{
    return this.resultMsg;
}

public void setResultMsg(String resultMsg)
{
    this.resultMsg = resultMsg;
}
}
```

For details about the implementation of the `buildSignHttpHead()` function, see **ToolUtils**.

```

 * @throws InvalidKeyException
 * @throws NoSuchAlgorithmException
 * @throws UnsupportedEncodingException
 */
```

```
public Map<String, String> buildSignHttpHead(String httpPath, String bodyJson)
    throws InvalidKeyException, NoSuchAlgorithmException, UnsupportedEncodingException
{
    //Head field for signature authentication. The host field is mandatory.
    Map<String, String> signedHeaders = new HashMap<>();
    signedHeaders.put(SignInfo.HEAD_HOST, CmsParameters.host);
    signedHeaders.put(SignInfo.HEAD_CONTENT_LENGTH,
String.valueOf(bodyJson.getBytes("UTF-8").length));
    signedHeaders.put(SignInfo.HEAD_CONTENT_TYPE, "application/json;charset=UTF-8");

    //Set the authentication data interface.
    SignInfo signInfo = new SignInfo();
    signInfo.setAccessKey(CmsParameters.accessKey);
    signInfo.setSecretKey(CmsParameters.secretKey);
    signInfo.setPayload(bodyJson);
    signInfo.setTimestamp(new Date());
    signInfo.setHttpMethod(HttpProxyHelper.HTTP_METHOD_POST);
    signInfo.setUri(httpPath);
    signInfo.setSignedHeaders(this.lowerCaseSignedHeaders(signedHeaders));

    //Generate a signature.
    String signature = signInfo.authString();
    Map<String, String> httpHeads = new HashMap<>(signedHeaders);
    //Append to HTTPHEAD and send it to the server.
    httpHeads.put(SignInfo.HEAD_AUTHORIZATION, signature);

    return httpHeads;
}

/**
 * The signedHeaders involved in the calculation are converted.
 * @param
 * @return Map<String, String>
 */
private Map<String, String> lowerCaseSignedHeaders(Map<String, String> signedHeaders)
{
    if ((null == signedHeaders) || signedHeaders.isEmpty())
    {
        throw new IllegalArgumentException("signedHeaders can't be null.");
    }
    Map<String, String> headers = new HashMap<>();
    for (Entry<String, String> e : signedHeaders.entrySet())
    {
        String name = e.getKey();
        String value = e.getValue();
        headers.put(name.toLowerCase(Locale.ENGLISH), value.trim());
    }
    if (!signedHeaders.containsKey(SignInfo.HEAD_HOST))
    {
        throw new IllegalArgumentException("signedHeaders must has host.");
    }
    return headers;
}
}
```

b. Code implementation:

■ Main function for creating a project

```
public static void main(String[] args)
{
    HttpClientMain demo = new HttpClientMain();

    try
    {
        demo.cmsPingTest();
    }
    catch (Exception e)
    {
        e.printStackTrace();
    }
}
```

```
}  
}
```

- Main function for implementing the POST request of the interface (including authentication)

```
public void cmsPingTest() throws Exception  
{  
    HttpClientHelper httpProxy = new HttpClientHelper();  
    //URL of the request interface.  
    final String httpPath = "/rest/cmsapp/v1/ping";  
    final String postUrl = CmsParameters.url + httpPath;  
    //Construct bodyJson in the request interface.  
    JSONObject jsonObject = new JSONObject();  
    jsonObject.put("say", "Hello world!");  
    String jsonObjectStr = JSONObject.toJSONString(jsonObject);  
  
    //Construct authentication information.  
    Map<String, String> httpHeads = ToolUtils.buildSignHttpHead(httpPath, jsonObjectStr);  
    //Execute the HTTPS request and obtain the returned JSON character string.  
    String response = httpProxy.doPost(postUrl, httpHeads, jsonObjectStr);  
    //If the interface is successfully invoked, information containing responseId is  
    returned.  
    System.out.println(response);  
}
```

- Main function for implementing the GET request of the interface (including authentication) (compared with the POST request, other code of the get request remains unchanged)

```
public void cmsPingTest() throws Exception  
{  
    HttpClientHelper httpProxy = new HttpClientHelper();  
    //URL of the request interface.  
    final String httpPath = "/rest/cmsapp/v1/ping";  
    final String postUrl = CmsParameters.url + httpPath;  
    //GET request parameters.  
    Map<String, String> queryParameters = new HashMap<>();  
    //Authentication information constructed in a GET request.  
    Map<String, String> httpHeads = ToolUtils.buildSignHttpHead(httpPath, null,  
    queryParameters, HttpClientHelper.HTTP_METHOD_GET);  
    System.out.println("httpHeads:" + httpHeads);  
    //Execute the HTTPS request and obtain the returned JSON character string.  
    String response = httpProxy.doGet(postUrl, httpHeads, queryParameters);  
    //If the interface is successfully invoked, information containing responseId is  
    returned.  
    System.out.println(response);  
}
```

- For the implementation of the ToolUtils.toJsonString() function, the actual invoker needs to convert **BaseRequest** into a JSON string based on the JSON framework. The following is an example:

```
/**  
 * During actual client development, BaseRequest is directly converted into a JSON string  
 based on the JSON framework.  
 * @param request  
 * @return String  
 * @throws Exception  
 */  
public static String toJsonString(BaseRequest request) throws Exception  
{  
    JSONObject jsonObject = new JSONObject();  
    StringBuilder buffer = new StringBuilder();  
    buffer.append("{");  
    buffer.append("\"request\":");  
    buffer.append(jsonObject.toJSONString(request.getRequest()));  
    buffer.append(",");  
    buffer.append("\"msgBody\":");  
    buffer.append(jsonObject.toJSONString(request.getMsgBody()));  
    buffer.append("}");  
}
```

```
        return buffer.toString();  
    }  
}
```

- Implement the POST method of the HTTPS request. The actual invoker can also use the POST method of its own framework.

```
package com.huawei.client.rest.v2.demo;  
  
import java.io.BufferedInputStream;  
import java.io.ByteArrayOutputStream;  
import java.io.Closeable;  
import java.io.IOException;

public class HttpProxyHelper  
{  
    public static final String HTTP_METHOD_POST = "POST";  
  
    public String doPost(String urlAddress, Map<String, String> httpHeads, String  
bodyJson) throws IOException, NoSuchAlgorithmException, KeyManagementException  
    {  
        byte[] byteData = bodyJson.getBytes("UTF-8");  
        OutputStream out = null;  
        InputStream in = null;  
  
        //Set up a connection.  
        this.initHttpsURLConnection();  
        URL url = new URL(urlAddress);  
        HttpURLConnection httpConn = (HttpURLConnection) url.openConnection();  
  
        //Set parameters.  
        httpConn.setRequestMethod(HttpProxyHelper.HTTP_METHOD_POST);  
        httpConn.setRequestProperty("Charset", "UTF-8");  
        //httpConn.setRequestProperty("Content-Type", "application/json; charset=UTF-8");  
        httpConn.setRequestProperty("accept", "application/json");  
        //httpConn.setRequestProperty("Content-Length", String.valueOf(byteData.length));  
        httpConn.setDoOutput(true);  
        httpConn.setDoInput(true);  
        httpConn.setUseCaches(false);  
        httpConn.setConnectTimeout(20 * 1000);  
        httpConn.setReadTimeout(30 * 1000);  
        //Set the parameters carried by the business.  
        if ((null != httpHeads) && !httpHeads.isEmpty())  
        {  
            for (Entry<String, String> e : httpHeads.entrySet())  
            {  
                httpConn.setRequestProperty(e.getKey(), e.getValue());  
            }  
        }  
  
        try  
        {  
            //Send data.  

```

```
        out = httpConn.getOutputStream();
        out.write(byteData);
        out.flush();

        //Receive data.
        int responseCode = httpConn.getResponseCode();
        if (responseCode != HttpURLConnection.HTTP_OK)
        {
            throw new RuntimeException("Failed responseCode " + responseCode);
        }

        in = httpConn.getInputStream();
        String reponseJson = this.getStreamAsString(in, "UTF-8");
        return reponseJson;
    }

4.4 C3 OIAP Interface Authentication

Description

When the OIAP provides interfaces for internal system or third-party access, the token obtaining interface needs to be invoked to obtain the token and the validity period of the token. The token is carried in the business interface invoked later. If the validity period of the token expires, the token obtaining interface needs to be invoked again.

Interface Method

POST

URL

https://IP:PORT/oifde/rest/api/gettoken

Request

Table 4-2 Parameter in the request header

No.	Parameter	Type	Mandatory	Description
1	Content-Type	String	Yes	The value is fixed at application/json; charset=UTF-8 .

Table 4-3 Parameters in the request body

Parameter	Type	Position	Mandatory	Description
appKey	String	Body	Yes	App key. The value is the tenant ID.
appSecret	String	Body	Yes	App secret, which must be agreed by both parties and can be dynamically changed.

 NOTE

How do I obtain **appKey** and **appSecret**?

1. Check whether the OIAP needs to interconnect with a tenant (third-party system), a third-party system (such as iFLYTEK ASR), or an internal system (such as the AICC or CSP).
2. If a tenant (third-party system) needs to be interconnected, obtain a token using the tenant ID and invoke the interface within the token validity period. The obtained token must be passed for each interface invocation. The request body of the interface must contain **authToken**.
 - Set **appKey** to the tenant ID. After signing in to the tenant space, you can use the browser development tool to view cookies and obtain the value of **TenantId**.
 - Set **appSecret** to the value of **API Password** on the **API Password Settings** tab page on **System Management > System Configuration** page in the IVR.
3. If a third-party system needs to be interconnected, obtain a token using the default user specified for system interconnection and invoke the interface within the token validity period. In addition, the obtained token must be passed for each interface invocation. The request header of the interface must contain **appkey** (username) and **authToken** (token).

Currently, only the interface described in [10.22 Offline Conversion Callback Interface](#) can be invoked in this authentication mode.

- Set **appKey** to the machine-machine communication account provided by the ODFS functioning as the server for the third-party system. The account is configured during ODFS installation. Generally, the value is **ODFS_SYS_OPENAPI**.
 - Set **appSecret** to machine-machine communication password provided by the ODFS functioning as the server for the third-party system, which is configured during installation.
4. If an internal system (the AICC or CSP) needs to be interconnected, obtain a token using the default user specified for system interconnection and invoke the interface within the token validity period. In addition, the obtained token must be passed for each interface invocation. The request header of the interface must contain **appkey** (username) and **authToken** (token).
 - Set **appKey** to the username for accessing the machine-machine interface provided by the ODFS, which is configured during ODFS installation. Generally, the value is **ipcc**.
 - Set **appSecret** to the password provided by the ODFS for accessing the machine-machine interface server. The password is configured during installation.

Response

Parameter	Type	Position	Mandatory	Description
errorCode	Integer	Body	Yes	Error code. <ul style="list-style-type: none"> • 0: success • Other values: failure The status code 200 also indicates success.
errorMsg	String	Body	No	Error description.
authToken	String	Body	Yes	Authentication token.
expireTime	Integer	Body	No	Token validity period, in seconds. The default value is 3600 seconds. If the error code is not 0, no value is returned.

Example

- Request body

```
{
  "appKey": "tenant001",
  "appSecret": "XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX"
}
```

- Response body

```
{
  "errorCode" : 0, //Error code, which is an integer. If no error is reported, the value is 0.
  "errorMsg" : "", //Error message, which is a string. If no error is reported, this parameter is left empty.
  "authToken": "2*****",
  "expireTime" : 3600
}
```

4.5 C4 Agent Operation Interface Authentication

The interface authentication mode can be static or dynamic authentication. The dynamic authentication mode is used by default.

NOTICE

- The static authentication mode is used only at historical sites that are compatible with earlier versions. The new sites need to use the dynamic authentication mode.
- When the static authentication mode is used, GUIDs may be stolen by guessing and used for spoofing, which is insecure. Exercise caution when using this mode. At historical sites, upgrade the third-party system as soon as possible and use the dynamic authentication mode.

Static Authentication

- Modify the configuration in **agentgateway/WEB-INF/config/basic.properties**:
AUTHMODE = 1
- After invoking the sign-in interface to sign in successfully, the agent can obtain the **Set-GUID** header from the response header of the request, for example, **JSESSIONID=27 *****f5.AgentGateway0**. In the header, **27 *****f5.AgentGateway0** is the GUID, which is the authentication information of the agent. When invoking another interface, the agent needs to set the **guid** header in the HTTP request header to the obtained GUID. The CC-Gateway will obtain the GUID from the HTTP request header to compare with the value of the **Set-GUID** header delivered previously. If they are the same, the agent is authenticated. If they are different, the agent fails to be authenticated, and code 100-006 or 000-003 is returned.

Dynamic Authentication

Dynamic authentication is an enhancement of static authentication. The GUID updates periodically.

- Modify the configuration in **agentgateway/WEB-INF/config/basic.properties**:
AUTHMODE = 2
- When the GUID is changed, obtain the **Set-GUID** header from the response header of the HTTP request of the event obtaining interface, for example, **JSESSIONID=27 *****f5.AgentGateway0**. In the header, **27 *****f5.AgentGateway0** is the GUID, which is the authentication information of the agent.
- The **basic.properties** file for dynamic authentication has the following two configuration items, which are not included in the **basic.properties** file for static authentication:
GUIDINTERVAL = 60000 //GUID update interval
GUIDTIMEOUT = 120000 //GUID timeout interval

The units of both configuration items are millisecond. The value of **GUIDINTERVAL** must be less than the value of **GUIDTIMEOUT**.

4.6 C5 Intelligent Auxiliary Interface Authentication

Description

This interface is used to perform authentication upon sign-in. When this interface is invoked, the request must contain the system administrator ID or VDN administrator ID, and the corresponding password. The system administrator ID is used to modify system configurations and the VDN administrator ID is used to modify VDN configurations. Upon successful sign-in authentication, the response header contains **Guid=xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxx.AgentGateway1**. When a configuration interface is invoked subsequently, the **Guid** header field must be carried.

Interface Method

This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/config/login

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Method Name in Logs

auth

Request Description

- Message header

Table 4-4 Parameter in the message header

No.	Parameter	Value Type	Mandatory	Description
1	Content-Type	String	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

- Message body

Table 4-5 Parameters in the message body

No.	Parameter	Value Type	Mandatory	Description
1	agentId	Number	Yes	<p>1. Configure the agent ID for the administrator to log in.</p> <p>The value is an integer ranging from 1 to 59999.</p> <p>2. When a VDN account is used for login, the value is a number consisting of the <i>VDN ID</i> and 100000.</p>
2	password	String	Yes	<p>1. Configure the password corresponding to the employee ID for the administrator to log in.</p> <p>2. When a VDN account is used for login, the value is the password for connecting to the VDN.</p>

Response Description

Table 4-6 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	String	Response message.

No.	Parameter	Value Type	Description
2	retcode	String	Error code. The options are as follows: <ul style="list-style-type: none"> • 0: success • Others: failure. For details, see 6.5.2 Error Codes.
3	result	Object	Result content object. For details about the parameters of this object, see Table 4-7 .

Table 4-7 Parameter of result

No.	Parameter	Value Type	Description
3.1	guid	String	GUID, which is assigned to each configuration user upon sign-in.

Example

- Message header
Content-Type:application/json; charset=UTF-8
- Request parameter

```
{
  "agentId": 101,
  "password": "*****"
}
```
- Response parameter

```
{
  "result": {
    "guid": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1"
  },
  "message": "success",
  "retcode": "0"
}
```

5 Call Center Configuration Interface Reference

- [5.1 Agent Management](#)
- [5.2 Skill Queue Management](#)
- [5.3 Number Management](#)
- [5.4 IVR Flow Management](#)

5.1 Agent Management

5.1.1 Creating a Single Agent Account (agentAccount/create)

Scenario

Create a single agent account. The **skills** parameter is related to the skill queue. The skill queue information can be obtained by invoking the interface for querying skill queues.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/create>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-1 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-2 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1	requestParam	Object	Yes	Request parameter object.
1.1	userAccount	String	Yes	Agent account. The value is a string of 6 to 50 characters and can contain only letters, digits, and special characters. Special characters include the following: @.-_
1.2	userName	String	Yes	Agent name. The value contains a maximum of 20 characters and does not contain the following special characters: "[]'&()=;<>,"

No.	Name	Type	Mandatory or Not	Description
1.3	password	String	Yes	<p>Password. The value is a string of eight characters (default password rule group). By default, four types of characters are required: uppercase letters, lowercase letters, digits, and special characters (~`!@#%\$%^*()-+ _= \ , / < > ? ; : " ' [] { } \ &).</p> <p>The password validity period is 90 days. Change the password within 90 days.</p>
1.4	email	String	Yes	<p>Email address (complying with RFC 2882).</p> <p>The value of localPart contains a maximum of 64 characters, and the value of domainPart contains a maximum of 255 characters. The first part of domainPart dot contains a maximum of 63 characters.</p>
1.5	agentType	Integer	Yes	<p>Agent type.</p> <p>4: audio agent 11: video agent 5: multimedia agent 99: versatile agent</p>
1.6	ccRoleId	Integer	Yes	<p>Agent role ID.</p> <p>2: agent 3: inspector 4: outbound call agent</p>

No.	Name	Type	Mandatory or Not	Description
1.7	skills	Array [Object]	No	Skill parameter group. The skill queue type must be the same as the value of agenttype .
1.7.1	skillId	Integer	No	Skill queue ID, which is obtained using the querySkills interface.
1.7.2	agentWeight	Integer	No	Agent weight. A larger weight indicates a higher priority. The minimum value is 1 .
1.7.3	skillWeight	Integer	No	Skill queue weight. The minimum value is 1 .
1.8	phone	String	No	Phone number, which is optional and can contain a maximum of 25 characters.

Response Description

- **Status code: 200**

Table 5-3 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	Object	Yes	Successful request.
1.1	resultCode	String	Yes	Character string. The options are 0 (success) and 1 (failure).
1.2	resultMessage	String	Yes	Related message.
1.3	workNo	Integer	No	Agent ID.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.

1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
 - **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

- Scenario: Create an agent account.

URL: See the document.

x-app-key: XXXXXXXXXXXXXXXXXXXXXXXX

Content-Type: application/json

Authorization: Bearer XXXXXXXXXXXXXXXXXXXXXXXX

Request parameters:

```
{
  "userAccount": "test123456",
  "userName": "test111",
  "password": "Te***34",
  "email": "t**@***.com",

  "agentType": 11,
  "ccRoleId": 2,
  "skills": [{
    "skillId": 3,
    "agentWeight": 1,
    "skillWeight": 1
  },
  {
    "skillId": 2,
    "agentWeight": 1,
    "skillWeight": 2
  }
]}
```

Response parameters:

```
{
  "resultCode": "0",
  "resultMessage": "create agent account success",
  "workNo": 108
}
```

5.1.2 Deleting a Specified Agent Account (agentAccount/delete)

Scenario

Delete a specified agent account. Agents in any state can be deleted.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/delete>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-4 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the tokenByAkSk interface}</i> . (A space is required after Bearer .)

Table 5-5 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestParams	Object	Yes	Request parameter object.
1.1	userAccount	String	Yes	Agent account. The value contains 6 to 50 characters and cannot contain the following characters: [`~!@#\$%^&*()+={} :~\[\ \].< > / ? ~ @ # % & * — — + { }] \n \r \t. \s indicates any blank character, including spaces, tabs, and form feeds.

Response Description

- **Status code: 200**

Table 5-6 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	Successful request.
1.1	resultCode	String	Yes	The options are 0 (success) and 1 (failure).
1.2	resultMessage	String	Yes	Returned message.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
x-app-key: XXXXXXXXXXXXXXXXXXXXXXXX
Content-Type: application/json
Authorization: Bearer XXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "userAccount": "test123456"
}
```

Response parameters:

```
{
  "resultCode": "0",
  "resultMessage": "delete AgentAccount success"
}
```

5.1.3 Modifying Information About an Agent Account (agentAccount/update)

Scenario

Modify information about an agent account. The **skills** parameter is related to the skill queue. The skill queue information can be obtained by invoking the interface for querying skill queues.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/update>.
For example, the domain name is service.besclouds.com.

Request Description

Table 5-7 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-8 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1	requestParam	Object	No	Request parameter object.

No.	Name	Type	Mandatory or Not	Description
1.1	userAccount	String	Yes	Agent account, which is used to query agents and cannot be modified.
1.2	userName	String	No	Agent name. The value contains a maximum of 20 bytes and does not contain the following special characters: "[] = ; < >
1.3	email	String	No	Email address (complying with RFC 2882). The value of localPart contains a maximum of 64 characters, and the value of domainPart contains a maximum of 255 characters. The first part of domainPart dot contains a maximum of 63 characters.
1.4	phone	String	No	Phone number, which is optional and can contain a maximum of 25 characters.
1.5	agentType	Integer	No	Agent type. 4 : audio agent 11 : video agent 5 : multimedia agent 99 : versatile agent
1.6	ccRoleId	Integer	No	Agent role ID. 2 : agent 3 : inspector 4 : outbound call agent

No.	Name	Type	Mandatory or Not	Description
1.7	skills	Array [Object]	No	When this parameter exists, the skillId , agentWeight , and skillWeight parameters must be set. The skill queue type must be the same as the value of agenttype .
1.7.1	skillId	Integer	No	Skill queue ID, which is obtained using the querySkills interface.
1.7.2	agentWeight	Integer	No	Agent weight. A larger weight indicates a higher priority. The minimum value is 1 .
1.7.3	skillWeight	Integer	No	Skill queue weight. The minimum value is 1 .
1.8	oldPassWord	String	No	Current password of an agent. This parameter is mandatory when the agent password is changed. If the input current password is incorrect for three consecutive times, the account will be locked for 30 minutes, and you need to log in to the system as a tenant administrator to unlock the account. The password can be changed only once within 24 hours.

No.	Name	Type	Mandatory or Not	Description
1.9	newPassWord	String	No	<p>Password. The value is a string of eight characters (default password rule group). By default, four types of characters are required: uppercase letters, lowercase letters, digits, and special characters (~`!@#\$\$%^*()-+ _= \ , / < > ? ; : " ' [] { } \ &).</p> <p>The password validity period is 90 days. Change the password within 90 days.</p>

Response Description

- **Status code: 200**

Table 5-9 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	Object	Yes	Successful request.
1.1	resultCode	String	Yes	The options are 0 (success) and 1 (failure).
1.2	resultMessage	String	Yes	Returned message.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.
 1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
x-app-key: XXXXXXXXXXXXXXXXXXXXXXXX  
Content-Type: application/json  
Authorization: Bearer XXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{  
  "userAccount": "test123456",  
  "userName": "test123",  
  "email": "Test@***.com",  
  "phone": "184***5555",  
  "agentType": 5,  
  "ccRoleId": 2,  
  "skills": [{  
    "skillId": 1,  
    "agentWeight": 1,  
    "skillWeight": 1  
  }],  
  "oldPassWord": "xxxxx",  
  "newPassWord": "xxxxxxx"  
}
```

Response parameters:

```
{  
  "resultCode": "0",  
  "resultMessage": "edit success"  
}
```

5.1.4 Querying Agent Account Information (agentAccount/query)

Scenario

Query agent account information. When the agent account condition is entered, the specified agent account is queried. If the **pageNum** and **pageSize** parameters are set but the agent account parameter is not set, batch query is performed.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/query>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-10 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .)

Table 5-11 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1	requestParams	Object	Yes	Request parameter object.
1.1	userAccount	String	No	Agent account. This parameter is mandatory when pageNum and pageSize are not contained. When userAccount is transferred, other input parameters are invalid.
1.2	pageNum	Integer	No	Page number. This parameter is valid when userAccount is not set. The value starts from 0 .
1.3	pageSize	Integer	No	Size of each page. This parameter is valid when userAccount is not set.

No.	Name	Type	Mandatory or Not	Description
1.4	agentType	Array	No	Agent type. 4 : audio agent 11 : video agent 5 : multimedia agent 99 : versatile agent
1.5	transparentDisplayFlag	Boolean	No	Agent anonymization flag.

Response Description

- **Status code: 200**

Table 5-12 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	Object	Yes	Successful request.
1.1	resultCode	String	Yes	The options are 0 (success) and 1 (failure).
1.2	resultMessage	String	Yes	Returned message.
1.3	data	Array [Object]	No	Returned result object.
1.3.1	userAccount	String	No	Account.
1.3.2	userName	String	No	Username.
1.3.3	phone	String	No	Phone number.
1.3.4	email	String	No	Email.
1.3.5	agentType	Integer	No	Agent type. 4 : audio agent 11 : video agent 5 : multimedia agent 99 : versatile agent 255 : idle agent

No.	Name	Type	Mandatory or Not	Description
1.3.6	ccRoleId	Integer	No	Agent role ID. 2: agent 3: inspector 4: outbound call agent 255: idle role
1.3.7	sipAccount	String	No	Default SIP phone number of an agent.
1.3.8	skills	Array [Object]	No	Skill parameter array.
1.3.8.1	skillId	Integer	No	Skill queue ID.
1.3.8.2	agentWeight	Integer	No	Agent weight.
1.3.8.3	skillWeight	Integer	No	Skill queue weight.
1.3.9	workNo	Integer	No	Agent ID.
1.3.10	transparentDisplayFlag	Boolean	No	Agent anonymization flag.
1.4	total	Integer	No	Total number.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.
1. Check whether you have purchased related services.
2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

- Scenario: Query an agent account.

Request header:

```
x-app-key: XXXXXXXXXXXXXXXXXXXXXXXX  
Content-Type: application/json  
Authorization: Bearer XXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{  
  "userAccount": "test123456"  
}
```

Response parameters:

```
{ "data": [  
  { "skills": [ { "skillId": 2, "agentWeight": 1, "skillWeight": 2 } ],  
    "agentType": 11,  
    "phone": "",  
    "userAccount": "test123456",  
    "ccRoleId": 2,  
    "userName": "test111",  
    "sipAccount": "88880551",  
    "email": "tst@****.com"  
  }  
],  
  "resultCode": "0",  
  "resultMessage": "get agent account info success"  
}
```

- Scenario: Query agents in pagination mode.

Request header:

```
x-app-key: XXXXXXXXXXXXXXXXXXXXXXXX  
Content-Type: application/json  
Authorization: Bearer XXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{  
  "pageNum": 0,  
  "pageSize": 1  
}
```

Response parameters:

```
{  
  "data": [ { "skills": [ { "skillId": 3, "agentWeight": 1, "skillWeight": 1 } ],  
    "agentType": 4, "phone": "", "userAccount": "chenchuang0513",  
    "ccRoleId": 2, "sipAccount": "88880550", "userName": "chenchuang0513",  
    "email": "che@****.com"  
  }, ... ],  
  "resultCode": "0",  
  "resultMessage": "get agent account info success"  
}
```

5.1.5 Binding an Agent to a Skill Queue (addSkillsToAgent)

Scenario

Bind an agent to a skill queue based on the skill queue ID and agent account.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/addSkillsToAgent>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-13 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the tokenByAkSk interface}</i> . (A space is required after Bearer .)

Table 5-14 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	userAccounts	Array	Yes	Agent account array, which is a string of a maximum of 50 characters.
1.2	skillId	Integer	Yes	Skill queue ID.
1.3	agentWeight	Integer	Yes	Agent weight. A larger weight indicates a higher priority. The minimum value is 1 .
1.4	skillWeight	Integer	Yes	Skill queue weight. The minimum value is 1 .

Response Description

- **Status code: 200**

Table 5-15 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	resultCode	String	No	If the modification is successful, 0 is returned. If the modification fails, 1 is returned, and resultMessage carries the failure cause.
1.2	resultMessage	String	No	Request return information.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.
 1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
x-app-key: 68b*****6ec8e4
Content-Type: application/json
Authorization: Bearer xxx
```

Request parameters:

```
{
  "userAccounts":["x1","x2"],
  "skillId":4,
  "agentWeight":1,
  "skillWeight":1
}
```

Response parameters:

```
{
  "resultCode": "0",
  "resultMessage": "success"
}
```

5.1.6 Unbinding an Agent from a Skill Queue (releaseAgentBySkillId)

Scenario

Unbind an agent from a skill queue based on the skill queue ID and agent account.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/releaseAgentBySkillId>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-16 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-17 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	skillId	Integer	Yes	Skill queue ID.

No.	Parameter	Type	Mandatory or Not	Description
1.2	userAccounts	Array	Yes	Agent account array. The value is a character string. An empty array can be transferred, indicating that all agents bound to the skill queue are unbound from the skill queue.

Response Description

- **Status code: 200**

Table 5-18 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	resultCode	String	Yes	If the request is successful, 0 is returned. If the request fails, 1 is returned.
1.2	resultMessage	String	Yes	Carried failure cause if the request fails.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Scenario description: Unbind agents from skill queue 3.

Request parameters:

```
{
  "skillId":3,
  "userAccounts":[]
}
```

Response parameters:

```
{
  "resultCode": "0",
  "resultMessage": "success"
}
```

5.1.7 Querying Agent Information by Skill Queue ID (queryAgentInfoBySkillId)

Scenario

Query agent information in a skill queue based on the skill queue ID.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/agentAccount/queryAgentInfoBySkillId>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-19 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the tokenByAkSk interface}</i> . (A space is required after Bearer .)

Table 5-20 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestParam	Object	Yes	Request parameter.
1.1	skillId	Integer	Yes	Skill queue ID.
1.2	pageSize	Integer	Yes	Page size. The maximum value is 100 .
1.3	pageNum	Integer	Yes	Page number, starting from 0 .

Response Description

- **Status code: 200**

Table 5-21 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	Successful request.
1.1	data	Array (object)	No	Returned data.
1.1.1	workNo	Number	No	Employee ID.
1.1.2	agentType	Number	No	Agent type. 4 : audio agent 11 : video agent 5 : multimedia agent 99 : versatile agent
1.1.3	agentWeight	Number	No	Agent weight. A larger weight indicates a higher priority. The minimum value is 1 .
1.1.4	accountName	String	No	User name.
1.1.5	sipAccount	String	No	Softphone number.
1.1.6	skillWeight	Number	No	Skill queue weight. The minimum value is 1 .

No.	Parameter	Type	Mandatory or Not	Description
1.1.7	userAccount	String	No	Agent account, which is the same as the agent account for creating an agent.
1.2	count	Integer	No	Number of agents whose information is queried.
1.3	resultCode	String	No	If the request is successful, 0 is returned. If the request fails, 1 is returned, and resultMessage carries the error cause.

- Status code: 400**
 Incorrect request. Check the request path and parameters.
- Status code: 401**
 Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- Status code: 404**
 The requested content is not found. Check the request path.
- Status code: 500**
 Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Scenario description: Query agent information by skill queue ID.

Request parameters:

```
{
  "skillId":3,
  "pageSize":10,
  "pageNum":0
}
```

Response parameters:

```
{"data": [
  {
    "workNo": 107,
```

```

"accountCode": "xxxxx",
"agentType": 4,
"agentWeight": 1,
"accountName": "xxxxx",
"sipAccount": "88880006",
"skillWeight": 1
}
],
"count": 1,
"resultCode": "0"
}

```

5.1.8 Changing the SIP Phone Number Login Password of an Agent (updateSipPhonePassword)

Scenario

Change the login password of the SIP phone number of an agent. SIP phone numbers are OpenEye numbers used by agents or WebRTC registration numbers.

Method

POST

URI

https://Domain_name/apiaccess/rest/cc-management/v1/sipPhone/updateSipPhonePassword. For example, the domain name is service.besclouds.com.

Request Description

Table 5-22 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	x-app-key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-23 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestParam	Object	Yes	Request parameter.
1.1	accountPwd	String	Yes	Current password of an agent. When the SIP phone password is changed, the current password of the agent needs to be input for verification. If the verification fails for three consecutive times, the account will be locked and will be unlocked 30 minutes later. You can also log in to the system as a tenant administrator to manually unlock the account.
1.2	newPhonePwd	String	Yes	New SIP phone password. The value is a string of 8 to 16 characters (default password rule group). By default, any combination of the following three types is required: uppercase letters, lowercase letters, digits, and the following special characters: ~@^*_{+}?
1.3	userAccount	String	Yes	Agent account.

Response Description

- **Status code: 200**

Table 5-24 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	Successful request.

No.	Parameter	Type	Mandatory or Not	Description
1.1	resultCode	String	Yes	If the request is successful, the value is 0 . If the request fails, the value is 1 .
1.2	resultMessage	String	No	When the request fails and the value of resultCode is 1, the specific cause is carried.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Scenario description: The SIP phone password is changed successfully.

Request parameters:

```
{
  "userAccount": "xxxxx",
  "accountPwd": "xxxxx",
  "newPhonePwd": "xxxxx"
}
```

Response parameters:

```
{
  "resultCode": "0",
  "resultMessage": "success"
}
```

5.1.9 Querying Softphone Information of All Agents, Excluding Business Accounts (querySysInfo)

Scenario

Query system information such as the agent sign-in service address.

Method

GET

URI

<https://Domain name/apiaccess/CC-Management/v1/querySysInfo>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-25 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Response Description

- Status code: 200

Table 5-26 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	servicelp	String	No	Agent sign-in service instance address, which is the address of the Nginx or SLB. Length limit: string (50)

No.	Name	Type	Mandatory or Not	Description
1.2	sipServicePort	String	No	Softphone registration port. The value ranges from 1 to 65535. Length limit: string (5)
1.3	sipServiceIp	String	No	Softphone registration address. Length limit: string (50)
1.4	servicePort	String	No	Agent sign-in service port. Length limit: string (5)
1.5	agents	Array [Object]	No	Agent set.
1.5.1	workNo	Integer	Yes	Agent ID, ranging from 101 to 59999.
1.5.2	sipAccount	String	No	SIP softphone number. Length limit: string (24)
1.5.3	sipPwd	String	No	SIP softphone password before encryption. Length limit: string (24)
1.5.4	password	String	No	Password for an agent to sign in to the platform before encryption. Length limit: string (8)

- **Status code: 400**

Table 5-27 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	String	Yes	Incorrect request. Check the request path and parameters.

- **Status code: 401**

Table 5-28 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	String	Yes	Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.

- **Status code: 404**

Table 5-29 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	String	Yes	The requested content is not found. Check the request path.

- **Status code: 500**

Table 5-30 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1	schema	String	Yes	Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{
  "x-app-key": "f*****f",
  "Authorization": "Bearer 0*****8"
}
```

Response parameters:

```
{
  "servicePort": 448,
  "serviceIp": "127.0.0.0",
  "sipServiceIp": "127.0.0.0",
  "sipServicePort": 5060,
  "agents": [{
    "workNo": 1522,
    "password": "7****t",
    "sipAccount": "88881619",
    "sipPwd": "1****t"
  }, {
    "workNo": 1523,
    "password": "f****xL",
    "sipAccount": "88881620",
    "sipPwd": "1****xL"
  }]
}
```

5.1.10 Querying Softphone Information of All Agents, Including Business Accounts (queryAgentInfo)

Scenario

Query agent information.

Method

GET

URI

<https://Domain name/apiaccess/CC-Management/v1/queryAgentInfo> (For example, the domain name is service.besclouds.com.)

Request Description

Table 5-31 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key.

No.	Parameter	Type	Mandatory or Not	Description
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .)

Response Description

- Status code: 200

Table 5-32 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	sipServicePort	String	No	Softphone registration port. The value ranges from 1 to 65535. Length limit: string (5)
1.2	sipServiceIp	String	No	Softphone registration address, in IPv4 format. Length limit: string (50)
1.3	agents	Array [Object]	No	Agent set.
1.3.1	workNo	Integer	Yes	Agent ID, ranging from 101 to 59999.
1.3.2	sipAccount	String	No	SIP softphone number. Length limit: string (24)
1.3.3	sipPwd	String	No	SIP softphone password before encryption. Length limit: string (24)

No.	Parameter	Type	Mandatory or Not	Description
1.3.4	accountCode	String	No	Associated sign-in account of the Service Cloud. Length limit: string (100)

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.
 1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{
  "x-app-key": "f*****f",
  "Authorization": "Bearer 0*****8"
}
{
  "connection": "keep-alive",
  "content-type": "application/json;charset=UTF-8"
}
```

Response header:

Response parameters:

```
{
  "sipServiceIp": "10.10.96.98",
  "sipServicePort": 5060,
  "agents": [
    {
      "workNo": 1522,
      "accountCode": "aaaa",
      "sipAccount": "88881619",
      "sipPwd": "****"
    },
    {
      "workNo": 1523,
      "sipAccount": "88881620",
      "sipPwd": "****"
    }
  ]
}
```

```
}  
  ]  
}
```

5.1.11 Querying the Account Sign-in Result (queryAgentLoginParams)

Description

Query the unified account of the mobile app and PC business system.

Method

POST

URI

<https://Domain name/apiaccess/CC-Management/v1/queryAgentLoginParams> (For example, the domain name is service.besclouds.com.)

Request Description

Table 5-33 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-34 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	password	String (100)	Yes	Sign-in password.
1.2	account	String (100)	Yes	Sign-in account.

Response Description

- **Status code: 200**

Table 5-35 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	message	String (1024)	No	Account verification information.
1.2	returnCode	String (10)	No	Account verification return code. 0 : success 1 : failure
1.3	results	Object	No	Query result.

Table 5-36 Results parameter structure

No.	Parameter	Type	Mandatory or Not	Description
1.1	workNo	String (5)	No	Agent ID.
1.2	password	String (100)	No	Password for an agent to sign in to the platform before encryption.
1.3	sipAccount	String (24)	No	SIP softphone number.
1.4	sipPwd	String (100)	No	SIP softphone password before encryption.
1.5	sipServerInfo	Array [SIPServerInfo]	No	SIP service information.

Table 5-37 SIPServerInfo parameter structure

No.	Parameter	Type	Mandatory or Not	Description
1.1	sipServiceIp	String (50)	No	Softphone registration address.
1.2	sipServicePort	String (5)	No	Agent sign-in service port.
1.3	node	String (10)	No	SIP service node.

No.	Parameter	Type	Mandatory or Not	Description
1.4	type	String (10)	No	SIP service type. The default type is SIP. 0: SIP 1: WebRTC

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.
 1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
"x-app-key": "e*****a",
"Authorization": "Bearer e*****8"
"Content-Type": "application/json;charset=UTF-8",
"Connection": "keep-alive"
```

Request parameters:

```
{
  "account": "1s120201",
  "password": "S****x"
}
```

Response parameters:

```
{
  "returnCode": "0",
  "results": {
    "sipServerInfo": [{
      "sipServiceIp": "10.10.10.11",
      "sipServicePort": "33",
      "type": "0"
    }],
    "password": "11****8Q",
    "sipAccount": "88887818",
    "workNo": "1516"
  },
  "message": "verify Account or password success."
}
```

5.1.12 Querying Agent Information by Sign-in Account (queryAgentInfoByAccount)

Scenario

Query agent information by the sign-in account.

Method

POST

URI

https://*Domain name*/apiaccess/rest/CC-Management/v1/
queryAgentInfoByAccount (For example, the domain name is
service.besclouds.com.)

Request Description

Table 5-38 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key, which is the user ID.
2	Authorization	String	No	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the tokenByAkSk interface}</i> . (A space is required after Bearer .)

Table 5-39 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	accountCode	String (64)	Yes	Sign-in account, which can contain a maximum of 64 strings.
1.2	password	String (64)	No	Password of the authentication user, which can contain a maximum of 64 strings.

No.	Name	Type	Mandatory or Not	Description
1.3	username	String (64)	No	Authentication user name, which can contain a maximum of 64 strings.

Response Description

- **Status code: 200**

Table 5-40 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	returnCode	String	Yes	Return code. The value 0 indicates success. The value 1 indicates failure.
1.2	description	String	Yes	Description.
1.3	data	Object	No	Returned data. When data fails to be returned, an empty string is returned for the workNo parameter.
1.3.1	workNo	Integer	No	Agent ID.
1.3.2	agentType	Integer	No	Agent type.
1.3.3	agentStatus	String	No	Agent status. The default value is 0 .

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation.
 1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.

- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

- **Request header:**
x-app-Key:f*****e
Authorization:Bearer a*****2
- Request parameters:**

```
{
  "accountCode": "Agents"
}
```
- Response parameters:**

```
{
  "returnCode": "0",
  "data": {
    "workNo": 7094,
    "agentType": 5,
    "agentStatus": "0"
  },
  "description": "query success"
}
```
- **Scenario: A user signs in using the user name and password.**
Request header:
Content-Type:application/json
- Request parameters:**

```
{
  "accountCode": "Agents",
  "username": "itau_group",
  "password": "*****"
}
```
- Response parameters:**

```
{
  "returnCode": "0",
  "data": {
    "workNo": 7094,
    "agentType": 5,
    "agentStatus": "0"
  },
  "description": "query success"
}
```

5.1.13 Deleting Data by Customer Number (cleancustpersonaldata)

Scenario

Delete data by customer number.

Method

POST

URI

<https://Domain name/apiaccess/CC-Management/v1/clearUserInfo/cleancustpersonaldata>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-41 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key, which is the user ID.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)
3	Content-Type	String	No	Content type. Set this parameter to application/json .

Table 5-42 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	customNos	Array	Yes	List of customer numbers (a maximum of 1000 numbers, which can be calling numbers or called numbers).

Response Description

- **Status code: 200**

Table 5-43 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	retMsg	String	Yes	Failure cause.

No.	Name	Type	Mandatory or Not	Description
1.2	retCode	String	Yes	Return code. The value 0 indicates success. Other values indicate failure.

- Status code: 400**
 Incorrect request. Check the request path and parameters.
- Status code: 401**
 Unauthorized operation.
 1. Check whether you have purchased related services.
 2. Contact customer service to check the status of your account.
- Status code: 404**
 The requested content is not found. Check the request path.
- Status code: 500**
 Business failure. Check the values of parameters in the request.

Error Codes

None

Example

- Request header:
 Content-Type: application/json
 X-APP-Key: *****
 Authorization: Bearer *****

Request parameters:

```
{
  "customNos": ["135****1111", "wen11", "kehu@****.com"]
}
```

Response parameters:

```
{
  "retCode": "0",
  "retMsg": "VerifyParams success"
}
```

5.2 Skill Queue Management

5.2.1 Creating a Skill Queue (createSkill)

Scenario

Create a single skill queue.

Method

POST

URI

https://*Domain name*/apiaccess/rest/cc-management/v1/skill/createSkill. For example, the domain name is service.besclouds.com.

Request Description

Table 5-44 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	X-APP-KEY	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-45 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	mediaTypeId	Number	Yes	Media type. The options are as follows: 5 : voice 53 : multimedia 19 : video 2 : voice click-to-dial 18 : video click-to-dial
1.2	description	String	Yes	Skill short name or description. The value can contain a maximum of 50 characters, including Chinese characters, letters, and digits.

No.	Name	Type	Mandatory or Not	Description
1.3	name	String	Yes	Name of a skill queue. The value contains a maximum of 20 characters. The following special characters are not allowed: [`~!#\$%^&*()+= {}';<>/?~#%.....&*+ {}]\n\r\t
1.4	maxWaitTime	Number	Yes	Maximum queuing duration, in seconds. The maximum value is 60000 .
1.5	maxWaitNum	Number	Yes	Maximum number of users waiting in a queue. The maximum value is 10000 .
1.6	maxAgentWrapup Time	Number	Yes	Duration of the wrap-up state, in seconds. The maximum value is 3600 .
1.7	skillParam	Object	Yes	Skill queue parameter information. When mediaTypeid is 53, 2, or 18 , only noAgents, busy, and timeOut are available. When mediaTypeid is 53 , deviceType must be set to 1 . When mediaTypeid is 5 or 19 , noAgents, busy, timeOut, answerFunction, and waitVoice are mandatory.
1.7.1	noAgents	Object	Yes	Configuration when no agent is on-duty.
1.7.1.1	deviceType	String	No	Device type. 3 : IVR 1 : skill queue

No.	Name	Type	Mandatory or Not	Description
1.7.1.2	transferType	String	Yes	Processing policy. Release: If this value is used, leave other parameters at the same level empty. Transfer: If this value is used, other parameters at the same level are mandatory.
1.7.1.3	value	Number	No	For a skill queue, the value is the skill queue ID (skillId). For an IVR flow, the value is the IVR flow ID.
1.7.2	busy	Object	Yes	Configuration when the queue is busy or overflows.
1.7.2.1	deviceType	String	No	Device type. 3: IVR 1: skill queue
1.7.2.2	transferType	String	Yes	Processing policy. Release: If this value is used, leave other parameters at the same level empty. Transfer: If this value is used, other parameters at the same level are mandatory.
1.7.2.3	value	Number	No	For a skill queue, the value is the skill queue ID (skillId). For an IVR flow, the value is the IVR flow ID.
1.7.3	answerFunction	String	No	Agent answering mode. The options are 0 (reporting the agent ID) and 2 (reporting no voice).
1.7.4	timeOut	Object	Yes	Queuing timeout configuration.

No.	Name	Type	Mandatory or Not	Description
1.7.4.1	deviceType	String	No	Device type. 3: IVR 1: skill queue
1.7.4.2	transferType	String	Yes	Processing policy. Release: If this value is used, leave other parameters at the same level empty. Transfer: If this value is used, other parameters at the same level are mandatory.
1.7.4.3	value	Number	No	For a skill queue, the value is the skill queue ID (skillId). For an IVR flow, the value is the IVR flow ID.
1.7.5	waitVoice	Object	No	Queuing configuration.
1.7.5.1	parameterType	String	Yes	Parameter type. <ul style="list-style-type: none"> • Voice: default waiting tone. If this value is used, leave other parameters at the same level empty. • IVR: If this value is used, other parameters at the same level are mandatory.
1.7.5.2	id	String	No	For an IVR flow, the value is the IVR flow ID.

Response Description

- **Status code: 200**

Table 5-46 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	returnCode	String	Yes	Operation result. The value 0 indicates success, and other values indicates failure.
1.2	description	String	No	Description.
1.3	skillId	String	No	Skill queue ID.

- **Status code: 401**
Authentication fails.
- **Status code: 404**
The requested resource does not exist.
- **Status code: 500**
An exception occurs on the server.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
X-APP-KEY:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "mediaTypeId": 5,
  "description": "ccfdc",
  "name": "dddpodfst",
  "maxWaitTime": 30,
  "maxWaitNum": 100,
  "maxAgentWrapupTime": 5,
  "skillParam": {
    "noAgents": {
      "deviceType": "1",
      "transferType": "Transfer",
      "value": 2
    },
    "busy": {
      "deviceType": "1",
      "transferType": "Transfer",
      "value": 1
    },
    "answerFunction": "0",
    "timeOut": {
      "deviceType": "1",
      "transferType": "Transfer",
      "value": 1
    }
  }
}
```

```
    },
    "waitVoice": {
      "parameterType": "Voice"
    }
  }
}
```

Response parameters:

```
{
  "returnCode": "0",
  "skillId": "5",
  "description": "Create Skill successfully"
}
```

5.2.2 Deleting a Skill Queue (deleteSkill)

Scenario

Delete a skill queue.

Method

POST

URI

[https://Domain name/apiaccess/rest/cc-management/v1/skill/deleteSkill](https://Domain%20name/apiaccess/rest/cc-management/v1/skill/deleteSkill). For example, the domain name is service.besclouds.com.

Request Description

Table 5-47 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-KEY	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication information. The format is <i>Bearer +AccessToken returned by the tokenByAKSK interface</i> . (A space is required next to Bearer .)

Table 5-48 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	skillIds	String	Yes	Skill queue ID. Multiple IDs are separated by commas (,), semicolons (;), or hyphens (-). A maximum of 10 skill queue IDs are supported.

Response Description

- **Status code: 200**

Table 5-49 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Operation result. The options are as follows: 0 : success; other values: failure.
1.2	description	String	No	Description.

- **Status code: 401**
Authentication fails.
- **Status code: 404**
The requested resource does not exist.
- **Status code: 500**
An exception occurs on the server.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
X-APP-KEY:XXXXXXXXXXXXXXXXXXXXXXXXXX
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{"skillIds":"3,4"}
```

Response parameters:

```
{  
  "returnCode": "0",  
  "description": "Success"  
}
```

5.2.3 Modifying a Skill Queue (modifySkill)

Scenario

Modify a skill queue.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/skill/modifySkill>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-50 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-KEY	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication information. The format is <i>Bearer +AccessToken</i> returned by the <i>tokenByAKSK</i> interface. (A space is required next to Bearer .)

Table 5-51 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	description	String	No	Skill short name or description. The value can contain a maximum of 50 characters, including Chinese characters, letters, and digits.
1.2	maxWaitTime	Number	No	Maximum queuing duration, in seconds. The maximum value is 60000 .
1.3	maxWaitNum	Number	No	Maximum number of users waiting in a queue. The maximum value is 10000 .
1.4	maxAgentWrapup Time	Number	No	Duration of the wrap-up state, in seconds. The maximum value is 3600 .
1.5	skillParam	Object	No	Skill queue parameter information. When the media type is 53 , 2 , or 18 , only noAgents , busy , and timeOut are available. When the media type is 53 , deviceType must be set to 1 . When the media type is 5 or 19 , the noAgents , busy , timeOut , answerFunction , and waitVoice parameters are mandatory.
1.5.1	noAgents	Object	Yes	Absence of on-duty agents.
1.5.1.1	deviceType	String	No	Device type. 3 : IVR 1 : skill queue

No.	Parameter	Type	Mandatory or Not	Description
1.5.1.2	transferType	String	Yes	Handling policy. Release: If the parameter is set to this value, other parameters at the same level are left blank. Transfer: If the parameter is set to this value, other parameters at the same level are mandatory.
1.5.1.3	value	Number	No	For a skill queue, the value of this parameter is the skill queue ID. For an IVR flow, the value of this parameter is the IVR flow ID.
1.5.2	busy	Object	Yes	A queue is busy or overflows.
1.5.2.1	deviceType	String	No	Device type. 3: IVR 1: skill queue
1.5.2.2	transferType	String	Yes	Handling policy. Release: If the parameter is set to this value, other parameters at the same level are left blank. Transfer: If the parameter is set to this value, other parameters at the same level are mandatory.

No.	Parameter	Type	Mandatory or Not	Description
1.5.2.3	value	Number	No	For a skill queue, the value of this parameter is the skill queue ID. For an IVR flow, the value of this parameter is the IVR flow ID.
1.5.3	answerFunction	String	No	Agent answer mode. The options are 0 (report the agent ID) and 2 (reporting no voice).
1.5.4	timeOut	Object	Yes	Queuing timeout configuration.
1.5.4.1	deviceType	String	No	Device type. 3 : IVR 1 : skill queue
1.5.4.2	transferType	String	Yes	Handling policy. Release : If the parameter is set to this value, other parameters at the same level are left blank. Transfer : If the parameter is set to this value, other parameters at the same level are mandatory.
1.5.4.3	value	Number	No	For a skill queue, the value of this parameter is the skill queue ID. For an IVR flow, the value of this parameter is the IVR flow ID.
1.5.5	waitVoice	Object	No	Queuing and waiting configuration.

No.	Parameter	Type	Mandatory or Not	Description
1.5.5.1	parameterType	String	Yes	Voice: If the parameter is set to this value, other parameters at the same level are left blank. IVR: If the parameter is set to this value, other parameters at the same level are mandatory.
1.5.5.2	id	String	No	For an IVR flow, the value of this parameter is the IVR flow ID.
1.6	skillId	Integer	Yes	Skill queue ID.

Response Description

- **Status code: 200**

Table 5-52 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Operation result. The options are as follows: 0 : success; other values: failure.
1.2	description	String	No	Description.

- **Status code: 401**
Authentication fails.
- **Status code: 404**
The requested resource does not exist.
- **Status code: 500**
An exception occurs on the server.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
X-APP-KEY:XXXXXXXXXXXXXXXXXXXXXXXXX
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{"skillId":3,"description":"2021ok","maxWaitTime":60}
```

Response parameters:

```
{
  "returnCode": "0",
  "description": "Update Skill successfully"
}
```

5.2.4 Querying Skill Queues (querySkills)

Scenario

Query skill queues.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/skill/querySkills>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-53 Request header parameters

No.	Name	Type	Mandatory or Not	Description
1	X-APP-KEY	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the tokenByAkSk interface}</i> . (A space is required after Bearer .)

Table 5-54 Request body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	name	String	No	Name of a skill queue. The value contains a maximum of 20 characters. The following special characters are not allowed: [`~!#\$%^&*()+= {}';',<>/?~#%.....&*+ {}]\n\r\t
1.2	mediaTypeld	String	No	Media type. The options are as follows: 5 : voice 53 : multimedia 19 : video 2 : voice click-to-dial 18 : video click-to-dial
1.3	limit	String	No	Number of records on each page. The value is a positive integer and the maximum value is 100 .
1.4	offset	String	No	Parameter for determining the start page of the query. The value range of offset is as follows: Value of offset = Value of limit x (Page - 1). "Page" indicates the start page for query.
1.5	skilllds	Array	No	Parameter for querying skill queues. Multiple values can be transferred. The value is an array of the string type. An empty array can be transferred. A maximum of 100 values can be returned when all the skill queues are queried.

Response Description

- Status code: 200

Table 5-55 Response body parameters

No.	Name	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Operation result. The value 0 indicates success, and other values indicates failure.
1.2	description	String	No	Description.
1.3	total	Number	No	Total number of data records.
1.4	data	Array [Object]	No	Data information.
1.4.1	skillId	Number	No	Skill queue ID.
1.4.2	name	String	No	Name of a skill queue. The value contains a maximum of 20 characters. The following special characters are not allowed: [`~!#\$%^&*()+={}'";<>/? ~#%.....&*+{}]\n\r\t
1.4.3	description	String	No	Skill short name or description. The value can contain a maximum of 50 characters, including Chinese characters, letters, and digits.
1.4.4	mediaType	Number	No	Media type. The options are as follows: 5 : voice 53 : multimedia 19 : video 2 : voice click-to-dial 18 : video click-to-dial

No.	Name	Type	Mandatory or Not	Description
1.4.5	maxWaitTime	Number	No	Maximum queuing duration, in seconds. The maximum value is 60000 .
1.4.6	maxWaitNum	Number	No	Maximum number of users waiting in a queue. The maximum value is 10000 .
1.4.7	maxAgentWrapupTime	Number	No	Duration of the wrap-up state, in seconds. The maximum value is 3600 .
1.4.8	skillParam	Object	No	Skill queue parameter information. When the media type is 53 , 2 , or 18 , only the noAgents , busy , and timeOut parameters need to be set. When the media type is 53 , the value of deviceType must be 1 .
1.4.8.1	noAgents	Object	No	Configuration when no agent is on-duty.
1.4.8.1.1	deviceType	String	No	Device type. The options are 3 (IVR) and 1 (skill queue).
1.4.8.1.2	transferType	String	No	Processing policy. The options are Release and Transfer .
1.4.8.1.3	value	Number	No	For a skill queue, the value is the skill queue ID (skillId). For an IVR flow, the value is the IVR flow ID.

No.	Name	Type	Mandatory or Not	Description
1.4.8.2	busy	Object	No	Configuration when the queue is busy or overflows.
1.4.8.2.1	deviceType	String	No	Device type. The options are 3 (IVR) and 1 (skill queue).
1.4.8.2.2	transferType	String	No	Processing policy. The options are Release and Transfer .
1.4.8.2.3	value	Number	No	For a skill queue, the value is the skill queue ID (skillId). For an IVR flow, the value is the IVR flow ID.
1.4.8.3	answerFunction	String	No	Agent answering mode. 0 : reporting the agent ID 2 : reporting no voice
1.4.8.4	timeOut	Object	No	Queuing timeout configuration.
1.4.8.4.1	deviceType	String	No	Device type. The options are 3 (IVR) and 1 (skill queue).
1.4.8.4.2	transferType	String	No	Processing policy. The options are Release and Transfer .
1.4.8.4.3	value	Number	No	For a skill queue, the value is the skill queue ID (skillId). For an IVR flow, the value is the IVR flow ID.
1.4.8.5	waitVoice	Object	No	Queuing configuration.

No.	Name	Type	Mandatory or Not	Description
1.4.8.5.1	parameterType	String	No	Parameter type. <ul style="list-style-type: none"> • Voice: default waiting tone. If this value is used, leave other parameters at the same level empty. • IVR: If this value is used, other parameters at the same level are mandatory.
1.4.8.5.2	value	String	No	For an IVR flow, the value is the same as that of accessCode .
1.4.8.5.3	id	String	No	For an IVR flow, the value is the IVR flow ID.

- **Status code: 401**
Authentication fails.
- **Status code: 404**
The requested resource does not exist.
- **Status code: 500**
An exception occurs on the server.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
X-APP-KEY:XXXXXXXXXXXXXXXXXXXXXXXXX
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "limit": "10",
  "offset": 0
}
```

Response parameters:

```
{
  "returnCode": "0",
```

```
"total": 1,
"data": [
  {
    "skillId": 1,
    "maxAgentWrapupTime": 5,
    "maxWaitTime": 60,
    "name": "defaultVideoSkill",
    "mediaTypeId": 19,
    "description": "2021ok",
    "maxWaitNum": 100,
    "skillParam": {
      "noAgents": {
        "transferType": "Release"
      },
      "busy": {
        "transferType": "Release"
      },
      "answerFunction": "0",
      "timeOut": {
        "transferType": "Release"
      },
      "waitVoice": {
        "parameterType": "Voice"
      }
    }
  }
],
"description": "success"
}
```

5.2.5 Obtaining the Total Number of Users in a Configured Skill Queue

Prerequisites

- The agent has signed in.

Description

This interface is used to query the number of users in a skill queue configured for the current agent that has signed in.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

<https://ip:port/agentgateway/resource/queuedevice/{agentid}/waitnum>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-56 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryQueueLengthOnAgent

Request Description

- Message header

Table 5-57 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-58 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	int	Indicates the number of users in a skill queue returned after a successful query. No result is returned if the query fails.

Triggered Event

- None

Error Code

- 100-006

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

5.2.6 Obtaining the Number of Users in a Skill Queue to Which an Agent Has Signed In

Prerequisites

- The agent has signed in.

Description

This interface is used to query the number of users in a skill queue to which the current agent has signed in.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/queuedevice/{agentid}/waitnumbyagent

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-59 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryQueueLengthOnAgentSkills

Request Description

- Message header

Table 5-60 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-61 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	int	Indicates the number of users in a skill queue returned after a successful query. No result is returned if the query fails.

Triggered Event

- None

Error Code

- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

5.2.7 Obtaining the Skill Queue Information of the Home VDN of an Agent

Prerequisites

- The agent has signed in.

Description

The interface is used to obtain the skill queue information of the home VDN of an agent that has signed in.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/queuedevice/{agentid}/agentvdsnskill

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-62 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

querySkillQueueOnAgentVDN

Request Description

- Message header

Table 5-63 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-64 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	array	Indicates the return result of a successful query, that is, skill queue information. For details about the parameters of this object, see Table 5-65 .

Table 5-65 Parameter description of result

No.	Parameter	Value Type	Description
3.1	name	string	Skill name.
3.2	id	int	Skill ID.

No.	Parameter	Value Type	Description
3.3	mediatype	int	Media type. The options are as follows: <ul style="list-style-type: none"> • 1: text chat • 2: click-to-dial call • 4: callback request • 5: common voice or video call • 15: predicted outbound call • 16: previewed outbound call • 17: message call • 19: common video call • 51: multimedia web chat • 53: social chat
3.4	serviceType	int	Indicates the ID of a service type.
3.5	realFlag	int	1 : real queue. 0 : virtual queue.

Triggered Event

- None

Error Code

- 100-006
- 100-007
- 600-005

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1

- Request parameter

None

- Response parameter

```
{
  "message": "",
  "retcode": "0",
  "result": [
    {
      "name": "voice",
      "id": 1,
      "mediatype": 5,
      "serviceType": 1,
      "realFlag": 1
    },
    {
      "name": "callback",
      "id": 2,
      "mediatype": 4,

```

```

    "serviceType": 1,
    "realFlag": 1
  },
  {
    "name": "webchat",
    "id": 3,
    "mediatype": 1,
    "serviceType": 1,
    "realFlag": 1
  },
  {
    "name": "email",
    "id": 4,
    "mediatype": 6,
    "serviceType": 3,
    "realFlag": 1
  }
]
}

```

5.2.8 Obtaining the Total Number of Users in a Specified Skill Queue

Prerequisites

- The agent has signed in.

Description

This interface is used to query the number of users in a specified skill queue of the current agent that has signed in.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

<https://ip:port/agentgateway/resource/queuedevice/{agentid}/skillwaitnum/{skillid}>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-66 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	skillid	int	Yes	Skill queue ID.

Method Name in Logs

queryQueueLengthBySkillId

Request Description

- Message header

Table 5-67 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-68 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	int	Indicates the number of users in a skill queue returned after a successful query. No result is returned if the query fails.

Triggered Event

- None

Error Code

- 100-006

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

5.2.9 Querying the Statistics About a Set of Skill Queues

Prerequisites

- The agent has signed in.

Description

This interface is used to query the statistics about a set of skill queues after an agent has signed in.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

<https://ip:port/agentgateway/resource/queuedevice/{agentid}/queryacdstat>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-69 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryStatInfoOfAcid

Request Description

- Message header

Table 5-70 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 5-71 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	skills	List	Yes	Indicates a list of skill queue IDs. The maximum array size is 100.

Response Description

Table 5-72 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	array	Indicates the return result of a successful query, that is, skill queue statistics. For details about the parameters of this object, see Table 5-73 .

Table 5-73 Parameter description of result

No.	Parameter	Value Type	Description
4.1	pilotNbr	string	The pilot number of ACD group (It means accesscode .)
4.2	deviceNo	int	Skill queue ID.
4.3	queueSize	int	The number of calls in waiting queue
4.4	queueTime	long	The maximum duration of call in waiting queue (second)
4.5	loadFactor	int	It is not used.
4.6	estWaitTime	long	It is not used.
4.7	loggedOnAgents	int	Number of agents signing in to this ACD group.
4.8	availAgents	int	The number of available agents in this ACD group
4.9	transferFlg	int	Transfer flag (0 : release; 2 : transfer)
4.1 0	transferDeviceType	int	Device type. For details, see 6.5.5 Device Type .
4.1 1	transferDeviceNo	int	Device number
4.1 2	skillDescrip	string	Skill description.
4.1 3	resourceIdleRate	int	It is not used.
4.1 4	serviceLevel	int	It is not used.

No.	Parameter	Value Type	Description
4.1 5	oldCallIdEx	object	The call ID information object of waiting maximum duration. For details about the parameters of this object, see Table 5-74 .
4.1 6	maxQueueSize	int	The max number of calls in the queue

Table 5-74 Parameter description of oldCallIdEx

No.	Parameter	Value Type	Description
4.1 5.1	dateTime	Date	The time of call entering
4.1 5.2	dsn	int	The task number of call entering
4.1 5.3	server	int	Unique server identifier.
4.1 5.4	handle	int	The number of times that a call enters a task.

 **NOTE**

The method of converting oldCallIdEx to callId:

```

StringBuffer buffer = new StringBuffer(24);
buffer.append(dateTime);
buffer.append('-');
long identify = ((long) server << 24) + ((long) handle << 16) + dsn;
buffer.append(identify);

```

Triggered Event

```

5.2.10 Querying the IVR Information of the VDN to Which an Agent Belongs

Prerequisites

- The agent has signed in.

Description

This interface is used for an agent to query the IVR information of the VDN to which the agent belongs.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/queuedevice/{agentid}/ivrinfo

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-75 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryIVRInfoOnVdn

Request Description

- Message header

Table 5-76 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-77 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	int	Indicates the number of users in a skill queue returned after a successful query. No result is returned if the query fails. For details about the parameters of this object, see Table 5-78 .

Table 5-78 Parameter description of **result**

No.	Parameter	Value Type	Description
3.1	access	string	Indicates the access code of the IVR flow.
3.2	id	int	Indicates the ID of the IVR flow.
3.3	description	string	Indicates the description of the IVR flow.
3.4	serviceNo	int	Indicates the service ID.

Triggered Event

None

Error Code

- 600-004
- 100-007
- 100-006

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": [
    {
      "access": "1321",
      "id": 1,
      "description": "252",
      "serviceNo": 1
    }
  ],
  "message": "success",
  "retcode": "0"
}
```

5.2.11 Querying Information About Agents That Have Signed In to a Skill Queue

Prerequisites

- The agent has signed in.
- The agent has the permission to answer inbound calls.

Description

This interface is used by an agent that has logged in to query the detailed information about agents that have signed in to a skill queue by skill queue ID.

NOTE

If the agent has the permission to reject inbound calls, the query result does not contain the agent.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

`https://ip:port/agentgateway/resource/agentgroup/{agentid}/agentbyskill/{skillid}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-79 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	skillid	int	Yes	ID of the skill queue to be queried.

Method Name in Logs

queryAgentInfoBySkillId

Request Description

- Message header

Table 5-80 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-81 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	list	Indicates the return result of a successful query, that is, a list of agents. For details about the parameters of this object, see Table 5-82 .

Table 5-82 Parameter description of **result**

No.	Parameter	Value Type	Description
3.1	workno	string	Agent ID.
3.2	name	string	Agent name.

No.	Parameter	Value Type	Description
3.3	status	int	Status of an agent. For details, see Table 6-452 .
3.4	ctiStatus	int	Platform status of an agent. For details, see Table 6-453 .
3.5	groupid	int	Agent group ID.
3.6	groupname	string	It is not used.
3.7	skilliconfig	list	It is not used.
3.8	callids	list	It is not used.
3.9	mediatype	string	Indicates whether the agent successfully signs in to the media server. The parameter value consists of three characters. In the parameter value, T indicates success and F indicates failure. The three characters indicate CTI Server, WebM, and MailM respectively. The voice and video call business can be processed only after the agent successfully signs in to the CTI Server. The text chat business can be processed only after the agent successfully signs in to the WebM. Currently, the agent cannot sign in to the MailM.
3.10	vdnid	int	ID of the VDN to which a call belongs.
3.11	phonenum	string	Agent phone number.
3.12	currentstatetime	long	Duration of the current state, in seconds.
3.13	logindate	long	Sign-in time. The value is a timestamp, in milliseconds.
3.14	inMultimediaConf	int	It is not used.
3.15	currentStateReason	int	Reason code of the current status.

Triggered Event

- None

Error Code

- 100-006
- 100-007
- 300-002

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1

- Request parameter
None

- Response parameter

```
{
  "message": "",
  "retcode": "0",
  "result": [
    {
      "workno": "20011",
      "name": "20011",
      "status": "4",
      "ctiStatus": "1",
      "groupid": 1,
      "groupname": null,
      "skilllist": [],
      "mediatype": "TTT",
      "vdnid": 6,
      "phonenumber": "70942",
      "currentstatetime": 1376,
      "logindate": 1501125758000,
      "callids": [],
      "inMultimediaConf": 0,
      "currentStateReason": 0
    }
  ]
}
```

5.2.12 Querying the Details About a Specified Agent

Prerequisites

- The agent has signed in.

Description

This interface is used to query the details about a specified agent by agent ID after the agent has signed in.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/agentgroup/{agentid}/agentbyworkno/{workno}

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

Table 5-83 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	workno	string	Yes	ID of the agent to be queried. The value ranges from 101 to 59999. The agent ID must belong to the same VDN as the value of agentid .

Method Name in Logs

queryAgentInfoByWorkNo

Request Description

- Message header

Table 5-84 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-85 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Indicates the return result of a successful query, that is, a list of agents. For details about the parameters of this object, see Table 5-86 .

Table 5-86 Parameter description of result

No.	Parameter	Value Type	Description
3.1	workno	string	Agent ID.
3.2	name	string	Agent name.
3.3	status	int	Status of an agent. For details, see Table 6-452 .
3.4	ctiStatus	int	Platform status of an agent. For details, see Table 6-453 .
3.5	groupid	int	Agent group ID.
3.6	groupname	string	It is not used.
3.7	skilllist	list	Indicates an agent skill object list. For details about the parameters of this object, see Table 5-87 .
3.8	callids	list	It is not used.

No.	Parameter	Value Type	Description
3.9	mediatype	string	Indicates whether the agent successfully signs in to the media server. The parameter value consists of three characters. In the parameter value, T indicates success and F indicates failure. The three characters indicate CTI Server, WebM, and MailM respectively. The voice and video call business can be processed only after the agent successfully signs in to the CTI Server. The text chat business can be processed only after the agent successfully signs in to the WebM. Currently, the agent cannot sign in to the MailM.
3.1 0	vdnid	int	ID of the VDN to which a call belongs.
3.1 1	phonenummer	string	Agent phone number.
3.1 2	currentstatetime	long	Duration of the current state, in seconds.
3.1 3	logindate	long	Sign-in time, in milliseconds. The value is a timestamp.
3.1 4	inMultimediaConf	int	Indicates whether n agent is in a multimedia conference. The options are as follows: 0 : no 1 : yes
3.1 5	currentStateReason	int	Reason code of the current status.

Table 5-87 Parameter description of skilllist

No.	Parameter	Value Type	Description
3.7. 1	name	string	Skill name.
3.7. 2	id	int	Skill ID.

No.	Parameter	Value Type	Description
3.7.3	mediatype	int	Media type. The options are as follows: <ul style="list-style-type: none"> • 1: text chat • 2: click-to-dial call • 4: callback request • 5: common voice or video call • 15: predicted outbound call • 16: previewed outbound call • 17: message call • 19: common video call • 51: multimedia web chat • 53: social chat

5.2.13 Querying the Details About All Online Agents That Have Signed In to a Skill Queue

Prerequisites

- The agent has signed in.

Description

This interface is used to query the details about all online agents that have signed in to a skill queue.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

<https://ip:port/agentgateway/resource/agentgroup/{agentid}/allonlineagents>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 5-88 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryAllOnlineAgents

Request Description

- Message header

Table 5-89 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 5-90 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	list	Returned result after a successful query. For details about the parameters of this object, see Table 5-91 .

Table 5-91 Parameter description of result

No.	Parameter	Value Type	Description
3.1	skillMediaType	int	Media type of a skill queue. The options are as follows: <ul style="list-style-type: none"> • 1: text chat • 2: click-to-dial call • 4: callback request • 5: common voice or video call • 15: predicted outbound call • 16: previewed outbound call • 17: message call • 19: common video call • 51: multimedia web chat • 53: social chat
3.2	skillId	int	ID of a skill queue.
3.3	agent	list	Agent details. For details about the parameters of this object, see Table 5-92 .

Table 5-92 Parameter description of agent

No.	Parameter	Value Type	Description
3.3.1	workno	string	Agent ID.
3.3.2	name	string	Agent name.

No.	Parameter	Value Type	Description
3.3.3	status	int	Status of an agent. For details, see Table 6-452 .
3.3.4	ctiStatus	int	Platform status of an agent. For details, see Table 6-453 .
3.3.5	groupid	int	Agent group ID.
3.3.6	groupname	string	It is not used.
3.3.7	skilllist	list	It is not used.
3.3.8	callids	list	It is not used.
3.3.9	mediatype	string	Whether the agent successfully signs in to the media server of a specific type. T indicates success and F indicates failure. The three characters indicate CTI Server, WebM, and MailM, respectively. The voice and video call business can be processed only after the agent successfully signs in to the CTI Server. The text chat business can be processed only after the agent successfully signs in to the WebM. Currently, the agent cannot sign in to the MailM.
3.3.10	vdnid	int	ID of the VDN to which a call belongs.
3.3.11	phonenummer	string	Agent phone number.
3.3.12	currentstatetime	long	Duration of the current state, in seconds.
3.3.13	logindate	long	Sign-in time, in milliseconds. The value is a timestamp.
3.3.14	inMultimediaConf	int	It is not used.
3.3.15	currentStateReason	int	Reason code of the current status.

5.3 Number Management

5.3.1 Querying Access Codes (queryAccessCodeList)

Scenario

Query the access codes, that is, customer service hotlines you provide for customers, of a specified tenant space.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/accessCodeInfo/queryAccessCodeList> (For example, the domain name is service.besclouds.com.)

Request Description

Table 5-93 Request header parameters

No.	Parameter	Type	Mandato ry or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.

No.	Parameter	Type	Mandatory or Not	Description
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAKSk</i> interface}. (A space is required after Bearer .)

Table 5-94 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	accessCode	String	No	Access code. Fuzzy query is supported.
1.2	mediatypeld	Integer	No	Media type. 2 : click-to-dial 5 : audio and video 53 : multimedia
1.3	description	String	No	Access code description. Fuzzy query is supported.
1.4	limit	Integer	No	Number of records on each page. The value ranges from 0 to 100. The default value is 100 . If the value exceeds 100, 100 records are displayed on each page by default.
1.5	offset	Integer	No	Parameter for determining the start page of the query. The value range of offset is as follows: Value of offset = Value of limit x (Page - 1). "Page" indicates the start page for query. The default value of offset is 0 , and the maximum value is 100 .

Response Description

- **Status code: 200**

Table 5-95 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	data	Object	No	-
1.1.1	total	Number	No	Total number of access codes.
1.1.2	calledRouteList	Array [Object]	No	Access code information list.
1.1.2.1	id	String	No	Access code ID.
1.1.2.2	accessCode	String	No	Access code.
1.1.2.3	mediatypeId	Integer	No	Media type. 2: click-to-dial 5: audio and video 18: video click-to-dial 19: video 53: multimedia
1.1.2.4	n400Number	String	No	Service number configured on the access code page, which is generally the 400 number mapped by the core network.
1.1.2.5	description	String	No	Access code description.
1.1.2.6	numCallAttr	Number	No	Number attribute (3: inbound call and outbound call; 2: outbound call; 1: inbound call)
1.2	returnCode	String	No	Return code. The options are as follows: 0: success; other values: failure.
1.3	description	String	No	Description.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "accessCode": "9911411",
  "mediatypeId": 5,
  "description": "access code",
  "limit": 10,
  "offset": 0
}
```

Response parameters:

```
{
  "returnCode": "0",
  "data": {
    "total": 1,
    "calledRouteList": [
      {
        "id": "1124167935465633793",
        "accessCode": "9911411",
        "mediatypeId": 5,
        "n400Number": null,
        "description": null,
        "numCallAttr": 3
      }
    ]
  },
  "description": "success"
}
```

5.3.2 Creating a Binding Relationship Between an Access Code, Skill Queue, and IVR (createCalledRoute)

Scenario

Create a binding relationship between an access code, skill queue, and IVR.

Method

POST

URI

`https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/createCalledRoute`. For example, the domain name is `service.besclouds.com`.

Request Description

Table 5-96 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-97 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	accessCode	String	Yes	Access code. The value contains a maximum of 32 characters.

No.	Parameter	Type	Mandatory or Not	Description
1.2	extCode	String	No	<p>Extended code. The value contains a maximum of 12 characters. To set an access code for multiple destination devices, you can configure extension codes. For example, if the access code is 12345, you can add extension code 1 for routing calls to skill queue A, and the extension code 2 to skill queue B. In this way, a customer can dial 123451 to directly access skill queue A.</p>

No.	Parameter	Type	Mandatory or Not	Description
1.3	mediaTypeId	Integer	No	<p>Media type. The default value is 5.</p> <p>The options are as follows: 2: voice click-to-dial; 5: voice and video; 18: video click-to-dial; 19: video; 53: multimedia.</p> <p>Note:</p> <ol style="list-style-type: none"> When a skill queue (devicetype is 1) is transferred, the value of mediaTypeId is the same as that of mediaTypeId bound to the skill queue. If no skill queue is bound, the default value 5 is used. The mapping between the media type (mediaTypeId returned by the access code query interface) to which the access code belongs and the input parameter mediaTypeId is as follows: 5 corresponds to 5 and 19. 53 corresponds to 53. 2 corresponds to 2 and 18.
1.4	devicetype	Integer	Yes	<p>Device type.</p> <p>1: skill queue 3: IVR</p> <p>Note: The IVR flow cannot be selected for the multimedia channel.</p>

No.	Parameter	Type	Mandatory or Not	Description
1.5	deviceid	Integer	Yes	Target device ID (skill queue ID or IVR ID). Note: When the skill queue (devicetype is 1) is transferred, the media type corresponding to deviceid must be the same as the input parameter mediaTypeid .

Response Description

- **Status code: 200**

Table 5-98 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Return code. The options are as follows: 0 : success; other values: failure.
1.2	description	String	No	Description.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "accessCode": "9911411",
  "extCode": "11",
  "devicetype": 1,
  "deviceId": 1,
  "mediaTypeId": 19
}
```

Response parameters:

```
{
  "returnCode": "0",
  "description": "data create success"
}
```

5.3.3 Deleting the Binding Relationships Between Access Codes, Skill Queues, and IVR Flows (deleteCalledRoute)

Scenario

Delete the binding relationships between access codes, skill queues, and IVR flows.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/deleteCalledRoute>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-99 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.

No.	Parameter	Type	Mandatory or Not	Description
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-100 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	dnids	String	Yes	Configuration ID (dnid returned when the Called Route is queried). Use commas (,) to separate multiple IDs. A maximum of 1000 IDs can be deleted.

Response Description

- **Status code: 200**

Table 5-101 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Return code. The options are as follows: 0 : success; other values: failure.
1.2	description	String	No	Description.
1.3	data	Object	No	Deletion result.
1.3.1	id	String	No	ID of the deleted binding data record.
1.3.2	name	String	No	Deleted binding data, which is in the <i>accessCode+extCode</i> format.

No.	Parameter	Type	Mandatory or Not	Description
1.3.3	content	String	No	Deleted access code. 1. If all records are deleted successfully or fail to be deleted, the value of this parameter is the same as that of name . 2. If the deletion is partially successful, the character string is as follows: Success: + <i>Value of name</i> +,Failed: + <i>Value of name</i>

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "dnids": "1,2"
}
```

Response parameters:

```
{
  "returnCode": "0",
  "data": {
    "name": "9911411,99114111",
    "id": "1127983948544239618,1127986019188238339",
    "content": "9911411,99114111"
  },
  "description": "data delete success"
}
```

5.3.4 Modifying a Binding Relationship Between an Access Code, Skill Queue, and IVR (modifyCalledRoute)

Scenario

Modify a binding relationship between an access code, skill queue, and IVR.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/modifyCalledRoute>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-102 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the tokenByAkSk interface}. (A space is required after Bearer .)

Table 5-103 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	id	String	Yes	ID of a called party.
1.2	devicetype	Integer	Yes	Device type. The options are as follows: 1 : skill queue; 3 : IVR.
1.3	deviceid	Integer	Yes	Current device ID (skill queue ID or IVR ID).

Response Description

- **Status code: 200**

Table 5-104 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Return code. The options are as follows: 0 : success; other values: failure.
1.2	description	String	No	Description.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "id": "1125397061153369092",
  "devicetype": 1,
  "deviceId": 1
}
```

Response parameters:

```
{
  "returnCode": "0",
  "description": "data update success"
}
```

5.3.5 Querying the Binding Relationships Between Access Codes, Skill Queues, and IVR Flows (queryCalledRoute)

Scenario

Query the binding relationships between access codes, skill queues, and IVR flows.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/calledRoute/queryCalledRoute>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-105 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.

No.	Parameter	Type	Mandatory or Not	Description
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 5-106 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	accessCode	String	No	Access code.
1.2	extCode	String	No	Extension code.
1.3	devicetype	Integer	No	Device type. 1 : skill queue 3 : IVR
1.4	deviceDesc	String	No	Device name (skill queue or IVR name). Fuzzy match is supported.
1.5	mediaTypeeld	Integer	No	Media type. 2 : click-to-dial 5 : audio and video 18 : video click-to-dial 19 : video 53 : multimedia
1.6	limit	Integer	No	Number of records on each page. The value ranges from 0 to 100. The default value is 100 . If the value exceeds 100, 100 records are displayed on each page by default.

No.	Parameter	Type	Mandatory or Not	Description
1.7	offset	Integer	No	Parameter for determining the start page of the query. The value range of offset is as follows: Value of offset = Value of limit x (Page - 1). "Page" indicates the start page for query. The default value of offset is 0 . If a negative value is entered, 0 is used.

Response Description

- Status code: 200

Table 5-107 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Result code. 0 : success Other values: failure
1.2	description	String	No	Description.
1.3	data	Object	No	-
1.3.1	total	Integer	No	Total number.
1.3.2	calledRouteList	Array (object)	No	Called party list.
1.3.2.1	extCode	String	No	Extension code.
1.3.2.2	editable	String	No	0 or null : editable and deletable 1 : cannot be edited but can be deleted 2 : cannot be deleted 3 : cannot be edited or deleted

No.	Parameter	Type	Mandatory or Not	Description
1.3.2.3	accessCode	String	No	Access code.
1.3.2.4	dnid	Number	No	Configuration ID.
1.3.2.5	id	String	No	Called party ID (primary key ID of the table).
1.3.2.6	deviceid	Number	No	Current device ID.
1.3.2.7	devicetype	Number	No	Device type. 1: skill queue 3: IVR
1.3.2.8	deviceDesc	String	No	Destination device description.
1.3.2.9	mediatypeid	Number	No	Media type. 2: click-to-dial 5: audio and video 18: video click-to-dial 19: video 53: multimedia

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "accessCode": "9911411",
  "extCode": "11",
  "devicetype": 1,
  "deviceDesc": "defaultVideoSkill",
  "mediatypeld": 19,
  "limit":10,
  "offset":0
}
```

Response parameters:

```
{
  "returnCode": "0",
  "data": {
    "total": 3,
    "calledRouteList": [
      {
        "id": "1125397061153369092",
        "dnid": 3,
        "accessCode": "9911411",
        "mediatypeld": 19,
        "extCode": "11",
        "devicetype": 1,
        "deviceid": 1,
        "deviceDesc": "defaultVideoSkill",
        "editable": "0"
      },
      {
        "id": "1127983948544239618",
        "dnid": 1,
        "accessCode": "9911411",
        "mediatypeld": null,
        "extCode": "",
        "devicetype": 1,
        "deviceid": 1,
        "deviceDesc": "defaultVideoSkill",
        "editable": "0"
      },
      {
        "id": "1127986019188238339",
        "dnid": 2,
        "accessCode": "9911411",
        "mediatypeld": 19,
        "extCode": "1",
        "devicetype": 1,
        "deviceid": 1,
        "deviceDesc": "defaultVideoSkill",
        "editable": "0"
      }
    ]
  },
  "description": "success"
}
```

5.3.6 Querying the Home Area of a Number (getPhoneNoRegionInfo)

Scenario

Query the home area of a number. Mobile numbers and fixed-line phones are supported.

Method

POST

URI

`https://Domain name/apiaccess/rest/cc-management/v1/phonearea/getPhoneNoRegionInfo`. For example, the domain name is `service.besclouds.com`.

Request Description

Table 5-108 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-KEY	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .)

Table 5-109 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	phoneNo	String	Yes	11-digit mobile number or fixed-line phone number with an area code.

Response Description

- Status code: 200

Table 5-110 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	No	Return code. The value 0 indicates success. Other values indicate failure.
1.2	description	String	No	Return result description.
1.3	data	Object	No	Mobile number home area information.
1.3.1	areaCode	String	No	Area code.
1.3.2	province	String	No	Province.
1.3.3	city	String	No	City.
1.3.4	cityCode	String	No	City code. Multiple city codes are separated by slashes (/). If a fixed-line phone number is queried, the city code may be empty.
1.3.5	isp	String	No	Carrier: China Telecom, China Mobile, or China Unicom. For fixed-line phone query, a result indicating the carrier is unknown is returned.
1.3.6	postCode	String	No	Postal code. Multiple city codes are separated by slashes (/). If a fixed-line phone number is queried, the postal code may be empty.

No.	Parameter	Type	Mandatory or Not	Description
1.3.7	phoneNo	String	No	First seven digits of a mobile number or area code of a fixed-line phone

- Status code: 401**
 Authorization failed: 1. Whether the parameter is correct and valid. 2. Check whether you have purchased related services. 3. Contact customer service to check the status of your account.
- Status code: 404**
 The request path may be incorrect.
- Status code: 500**
 The service fails or an internal exception occurs on the server due to incorrect parameters.

Error Codes

None

Example

Request header:

```
Content-Type: application/json
X-APP-KEY: *****
Authorization: Bearer *****
```

Request parameters:

```
{"phoneNo":"13020017****"}
```

Response parameters:

```
{
  "returnCode": "0",
  "data": {
    "areaCode": "110100",
    "province": "Beijing",
    "city": "Beijing",
    "cityCode": "010",
    "isp": "China Unicom",
    "postCode": "100000",
    "phoneNo": "1302001"
  },
  "description": "success"
}
```

5.4 IVR Flow Management

5.4.1 Querying All IVR Flows of a Specified Tenant Space (queryIVRFlowList)

Scenario

Query all IVR flows of a specified tenant space.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/ivrFlow/queryIVRFlowList>.
For example, the domain name is service.besclouds.com.

Request Description

Table 5-111 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Response Description

- Status code: 200

Table 5-112 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-

No.	Parameter	Type	Mandatory or Not	Description
1.1	result	Array (object)	No	IVR information.
1.1.1	isLoad	Number	No	Whether to load a flow. The options are as follows: 0 : no; 1 : yes.
1.1.2	accessCode	String	No	Flow access code.
1.1.3	maxCallNum	Integer	No	Maximum number of concurrent calls in a flow.
1.1.4	description	String	No	Flow description.
1.1.5	id	Number	No	Flow ID.
1.1.6	flowFileName	String	No	Flow file name.
1.1.7	flowType	Number	No	Flow type. 0 : unspecified service type 1 : GSL service file type 2 : VoiceXML service file type 3 : service type of the third-party IVR 4 : VXML flow supported by the CCIVR 5 : CCXML flow 6 : WaitScript flow
1.2	retCode	String	No	Return code. The options are as follows: 0 : success; other values: failure.
1.3	message	String	No	Return information.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.

- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

Response parameters:

```
{
  "result": [
    {
      "isLoad": 1,
      "accessCode": "90500",
      "maxCallNum": null,
      "description": "Exception handling",
      "id": 1,
      "flowFileName": "defaultIVR.GSL",
      "flowType": 1
    },
    {
      "isLoad": 1,
      "accessCode": "90501",
      "maxCallNum": null,
      "description": "1015",
      "id": 2,
      "flowFileName": "defaultIVR.GSL",
      "flowType": 1
    }
  ],
  "retCode": "0",
  "message": "success"
}
```

5.4.2 Querying Satisfaction Survey Information (querySatisfactionConfig)

Scenario

Query satisfaction surveys.

Method

POST

URI

https://Domain_name/apiaccess/rest/cc-management/v1/satisfactionconfig/querySatisfactionConfig. For example, the domain name is service.besclouds.com.

Request Description

Table 5-113 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-KEY	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Response Description

- Status code: 200

Table 5-114 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-
1.1	returnCode	String	Yes	Return code. The value 0 indicates success. Other values indicate failure.
1.2	description	String	No	Return result description.

No.	Parameter	Type	Mandatory or Not	Description
1.3	enabled	Boolean	Yes	Whether to enable the satisfaction survey. true : enabled; false : disabled. If this function is disabled, data is empty.
1.4	data	Array (object)	No	Currently, only one value is returned.
1.4.1	ivrId	String	No	IVR flow ID.
1.4.2	feedbackType	String	No	IVR : IVR flow. Currently, there is only one value.
1.4.3	channelType	String	No	audio : audio media : multimedia Currently, the value can only be audio .
1.4.4	accessCode	String	No	Flow access code.

- Status code: 401**
 Authorization failed: 1. Whether the parameter is correct and valid. 2. Check whether you have purchased related services. 3. Contact customer service to check the status of your account.
- Status code: 404**
 The request path may be incorrect.
- Status code: 500**
 The service fails or an internal exception occurs on the server due to incorrect parameters.

Error Codes

None

Example

Request header:

```
X-APP-KEY: *****
Authorization: Bearer *****
```

Response parameters:

```
{
  "returnCode": "0",
  "data": [
```

```

    {
      "accessCode": "6001",
      "channelType": "audio",
      "feedbackType": "IVR",
      "ivrId": "1239554736420597767"
    }
  ],
  "description": "success",
  "enabled": true
}

```

5.4.3 Querying Satisfaction Survey Results (satisfaction / query)

Scenario

Query the satisfaction survey result based on the call ID and evaluation time.

Before using this interface, understand how to configure a satisfaction survey flow. For details, see [Configuring a Satisfaction Survey](#).

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/satisfaction/query>. For example, the domain name is service.besclouds.com.

Request Description

Table 5-115 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .)

Table 5-116 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestBody	Object	Yes	Input parameters.
1.1	callId	String	Yes	Call ID.
1.2	beginTime	Number	Yes	Evaluation start time, in milliseconds. The value is a timestamp.
1.3	endTime	Number	Yes	Evaluation end time, in milliseconds. The value is a timestamp.

Response Description

- **Status code: 200**

Table 5-117 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-
1.1	returnCode	String	Yes	Result code. The value 0 indicates that the query is successful, -1 indicates that the query fails, and description indicates the failure cause.
1.2	description	String	Yes	Result description.
1.3	satisfactionEvaluations	Object	Yes	Satisfaction evaluation.

No.	Parameter	Type	Mandatory or Not	Description
1.3.1	evaluationValue	String	No	<p>Satisfaction degree, which is the dictionary key value configured for the satisfaction level.</p> <p>1: very dissatisfied 2: dissatisfied 3: minor 4: satisfied 5: very satisfied</p> <p>The value -1 indicates that the user does not reply within the specified period after receiving the satisfaction evaluation.</p> <p>The value -2 indicates that the satisfaction degree replied by the user is not included in the configured key values.</p>
1.3.2	channel	String	No	<p>Channel.</p> <p>audio indicates the audio channel, MSG indicates the SMS channel, and WEB indicates the web page text chat channel.</p>
1.3.3	evaluationTime	Number	No	<p>Evaluation time, in milliseconds. The value is a timestamp.</p>

- **Status code: 400**
 Incorrect request. Check the request path and parameters.
- **Status code: 401**
 Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**
 The requested content is not found. Check the request path.

- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
Content-Type:application/json
Authorization:Bearer XXXXXXXXXXXXXXXXXXXXXXXX
X-APP-Key:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
  "callId": "1647265024-xxxx",
  "beginTime": 1647265028000,
  "endTime": 1647265029000
}
```

Response parameters:

```
{
  "returnCode": "0",
  "satisfactionEvaluations": {
    "channel": "audio",
    "evaluationValue": "5",
    "evaluationTime": 1647265028000
  },
  "description": " query Success"
}
```

5.4.4 Uploading IVR Voice Files (importVoiceFile/upload)

Scenario

Upload IVR voice files.

This interface has a performance limit. After 10 requests are sent per second, traffic control is performed. If the number of requests exceeds the limit, the requests fail.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/importVoiceFile/upload>.
For example, the domain name is service.besclouds.com.

Request Description

Table 5-118 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .)
2	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.

Table 5-119 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	body	Object	No	-
1.1	fileInfo	String	Yes	Base64-encoded recording file information. The maximum size is 8 MB. The size of the uploaded file increases the upload time.
1.2	locale	String	Yes	Language of the recording file. The value can be zh_CN (Chinese), en_US (English), pt_BR (Portuguese), or th_TH (Thai).
1.3	voiceType	String	Yes	Voice type. 0 indicates IVR, 1 indicates prompt tone, 2 indicates fault tone, and 3 indicates voice notification.

No.	Parameter	Type	Mandatory or Not	Description
1.4	fileType	String	Yes	<p>File type. WAV and MP3 files are supported.</p> <p>The FFmpeg tool is used to transcode the WAV and MP3 formats to the audio file formats supported by the platform (A-law compression algorithm, mono, sampling bit: 8 bits, sampling frequency: 8000 Hz). After the conversion, the audio quality may be affected and audio file data may be lost. You are advised to use an audio file format that is supported by the platform.</p>
1.5	callbackUrl	String	No	<p>Callback URL. The system returns the review result to this URL.</p> <p>The callback URL indicates the API defined by the customer for receiving the system review result. For details about the request and response parameters, see Table 5-120.</p>
1.6	voiceFileName	String	No	<p>IVR voice name. The value can contain a maximum of 50 characters, including only Chinese characters, uppercase letters, lowercase letters, and digits.</p>

Table 5-120 Callback URL parameters

No.	Parameter	Type	Mandatory or Not	Description
Request parameters				
1.5.1	fileUrl	String	Yes	Address of the file to be reviewed. The value is a full file address, including the file name extension.
1.5.2	fileId	String	Yes	ID of the file to be reviewed. For details about how to set this parameter, see the description of the fileId parameter in Table 5-121 .
1.5.3	status	String	Yes	<ul style="list-style-type: none"> File review status. The options are as follows: <ul style="list-style-type: none"> 2: approved 3: rejected
1.5.4	comment	String	No	Review status remarks.
Response parameters				
1.5.5	returnCode	String	Yes	<p>Response code. The options are as follows:</p> <ul style="list-style-type: none"> 0: The review result is received successfully. Others: The review result fails to be received. <p>NOTE If the review result fails to be received, the callback API is repeatedly invoked to return the file review result. After six times, the file review result is no longer returned.</p>

Response Description

- **Status code: 200**

Table 5-121 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-

```
//Request parameters
{
  "fileUrl": "Y:/IVR/147/voice/0/nPqV9vU3_1666706957559.wav",

5.4.5 Uploading a TTS Template for Voice Notifications (createVoiceTemplate)

Scenario

Upload a TTS template for voice notifications.

Method

POST

URI

<https://Domain name/apiaccess/rest/cc-management/v1/createVoiceTemplate> (For example, the domain name is service.besclouds.com.)

Request Description

Table 5-122 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)
2	X-APP-Key	String	No	App key field, which is the user ID. Contact the operation personnel to obtain the app key.

Table 5-123 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestBody	Object	No	-
1.1	name	String	Yes	Name of the TTS template file. The value can contain Chinese characters, digits, and uppercase and lowercase letters. The value contains a maximum of 50 characters.
1.2	scene	String	No	Application scenario. The option is 3 , indicating voice notification.
1.3	speed	Number	No	Speed of the converted voice. The value ranges from – 200 to 500. If this parameter is left blank, the default value 0 is used.
1.4	volume	Number	No	Volume of the converted voice. The value ranges from 0 to 100. If this parameter is left blank, the default value 50 is used.

No.	Parameter	Type	Mandatory or Not	Description
1.5	voicename	String	No	<p>Timbre of the converted voice. The options are as follows:</p> <ul style="list-style-type: none"> ● cn_kefuman_common: graceful ● cn_chengshuxing_common: mature ● cn_roumeiqian_common: soft ● cn_ziranzhen_common: natural ● cn_tianmeiru_common: sweet <p>If this parameter is left blank, the default value cn_kefuman_common is used.</p>
1.6	voicecontent	Object	Yes	Text content to be converted to voice.

No.	Parameter	Type	Mandatory or Not	Description
1.6.1	textcontent	String	Yes	<p>Text content. The value contains a maximum of 500 bytes.</p> <p>The template content consists of fixed texts and variables. The template uses the UTF-8 encoding format. A Chinese character or symbol occupies three bytes. A letter, digit, or English symbol occupies one byte.</p> <ul style="list-style-type: none"> • The template content cannot start with a variable. • The template content can contain a maximum of 500 bytes. • A variable can contain a maximum of 32 bytes. (If a variable contains more than 32 bytes, you are advised to split it into multiple variables.) <p>The following variable formats are supported:</p> <ul style="list-style-type: none"> - <code>#{TXT_Digit}</code>: String. <i>Digit</i> indicates the maximum length of the string. For example, <code>#{TXT_9}</code> indicates a string of a

No.	Parameter	Type	Mandatory or Not	Description
				<p>maximum of nine characters.</p> <ul style="list-style-type: none"> - `\${NUM_Digit}`: Number. <i>Digit</i> indicates the maximum number of digits in the number. For example, `\${NUM_6}` indicates a number of a maximum of six digits. - `\${DATE}`: Date, in the format of <i>YYYY/MM/DD</i>. <i>YYYY</i> indicates the year, <i>MM</i> indicates the month, and <i>DD</i> indicates the day. An example is 2022/07/16. - `\${TIME}`: Time, in the format of <i>HH:MM</i> or <i>HH:MM:SS</i>. <i>HH</i> indicates the hour, <i>MM</i> indicates the minute, and <i>SS</i> indicates the second. Examples are 14:30 and 14:30:30. <p>Template examples:</p> <ul style="list-style-type: none"> • Example 1: Dear `\${TXT_8}`, your initial password is `\${NUM_6}`. • Example 2: Please pick up your express delivery before `\${TIME}` on `\${DATE}`.

No.	Parameter	Type	Mandatory or Not	Description
				NOTE \${TIME} and \${DATE} must be separated by " on ".
1.6.2	language	String	Yes	Language. <ul style="list-style-type: none"> • zh_CN: Chinese • en_US: English • pt_BR: Portuguese • th_TH: Thai
1.7	callbackUrl	String	No	<p>Callback URL. The system returns the review result to this URL.</p> <p>The callback URL indicates the API defined by the customer for receiving the system review result. For details about the request and response parameters, see Table 5-124.</p> <p>The callback URL must have been added to the IVR voice upload callback URL trustlist by the system administrator.</p>

Table 5-124 Callback URL parameters

No.	Parameter	Type	Mandatory or Not	Description
Request parameters				
1.7.1	fileUrl	String	Yes	Address of the file to be reviewed. The value is a full file address, including the file name extension.
1.7.2	fileId	String	Yes	ID of the file to be reviewed. For details about how to set this parameter, see the description of the templateId parameter in Table 5-125 .

No.	Parameter	Type	Mandatory or Not	Description
1.7.3	status	String	Yes	<ul style="list-style-type: none"> File review status. The options are as follows: <ul style="list-style-type: none"> 2: approved 3: rejected
1.7.4	comment	String	No	Review status remarks.
Response parameter				
1.7.5	return Code	String	Yes	<p>Response code. The options are as follows:</p> <ul style="list-style-type: none"> 0: The review result is received successfully. Others: The review result fails to be received. <p>NOTE If the review result fails to be received, the callback API is repeatedly invoked to return the file review result. After six times, the file review result is no longer returned.</p>

Response Description

- Response code: 200

Table 5-125 Response parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-
1.1	returnCode	String	Yes	Result code. 0: success; other values: failure.

6 Agent Workbench Interface Reference

[6.1 Agent Control](#)

[6.2 Agent Bidirectional Calls](#)

[6.3 Voice Recognition Result Subscription Interfaces](#)

[6.4 App Personal Settings](#)

[6.5 Appendix](#)

6.1 Agent Control

6.1.1 Agent Operation Interfaces: onlineagent

6.1.1.1 Signing In

Prerequisites

None

Description

This interface is used by an agent to sign in.

After an agent signs in, the poll interface is invoked immediately to poll events. If no event occurs within 2 minutes, the agent is signed out.

NOTE

For an agent:

- If the sign-out interface does not respond, the sign-in interface cannot be invoked.
- If the sign-in interface does not respond, the sign-out interface cannot be invoked.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-1 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	String	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

login

Request Description

- Message header

Table 6-2 Parameter in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	String	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

- Message body

Table 6-3 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	password	String	Yes	Password of an employee ID on the CTI platform. The value can contain a maximum of 32 characters.
2	phonenum	String	Yes	Softphone number. The value can contain a maximum of 24 characters.
3	autoanswer	Boolean	No	Whether to enable automatic answering. The default value is true .
4	autoenteridle	Boolean	No	Whether to automatically enter the idle state after a call ends. The default value is true .
5	releasephone	Boolean	No	Whether an agent enters the non-always-off-hook state (the phone is hung up after the call ends) after the agent hangs up. The default value is true .
6	agenttype	Integer	No	Type of the agent who signs in. The default value is 4 . <ul style="list-style-type: none"> ● 4: PC+phone agent ● 11: PC+phone video agent
7	status	Integer	No	Status after an agent signs in. The default value is 4 . <ul style="list-style-type: none"> ● 3: busy ● 4: idle ● 5: wrap-up
8	ip	String	No	Agent IP address. The default value is 127.0.0.1 and can contain a maximum of 15 characters. IPv6 addresses are not supported.
9	entryip	String	No	IP address of the gateway to which the agent client application connects.

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
10	phonelinkage	Boolean	No	Whether to enable phone linkage, including connection and hard phone linkage control. Currently, only eSpace 7910 phones on the CC network are supported. The default value is false .
11	checkInWebm	Boolean	No	Whether to sign in to the WebM media server. The default value is true .
12	checkInMailm	Boolean	No	Whether to sign in to the MailM server. The default value is false .
13	vcPhoneNumber	String	No	VC number. The value contains a maximum of 24 characters.
14	listenStatus	Boolean	No	Whether an inspector listens to the sign-in and sign-out operations of an agent. The default value is false .
15	callbackUri	String	No	Event callback address. For details about the interface definition, see 6.1.4.2 Calling Back Pushed Events .
16	serviceToken	String	No	Authentication code. The value contains a maximum of 50 characters and cannot contain special characters.
17	serviceworkid	String	No	Business employee ID. The value can contain a maximum of 30 characters.

 **NOTE**

If both **callbackUri** and **serviceToken** are transferred, the event push mode is used. Otherwise, the event polling mode is used.

Response Description

Table 6-4 Response header parameters

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	String	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	String	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).
3	Set-GUID	String	Yes	An example value is JSESSIONID=279fe2*****0f5.AgentGateway0 . In the value, 279fe2*****0f5.AgentGateway0 is the GUID.

Table 6-5 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	String	Description.
2	retcode	String	Error code. The options are as follows: 0 : success Other values: failure
3	result	Map	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-6 .

Table 6-6 Parameter description of result

No.	Parameter	Value Type	Description
3.1	vdnid	String	VDN ID.

No.	Parameter	Value Type	Description
3.2	workno	String	Agent ID.
3.3	mediatype	String	<p>Whether the agent successfully signs in to the media server of a specific type. T indicates success and F indicates failure. The three characters indicate CTI Server, WebM, and MailM, respectively. For example, TTF indicates that the agent successfully signs in to the CTI Server and WebM but fails to sign in to the MailM.</p> <p>The voice business can be processed only after the agent successfully signs in to the CTI Server. The text chat business can be processed only after the agent successfully signs in to the WebM. Currently, the agent cannot sign in to the MailM.</p>
3.4	loginTime	String	Sign-in time. The value is a timestamp.
3.5	isForceChange	String	<p>Whether to forcibly change the password. If the parameter is set to true, the agent must change the password after sign-in. To change the password, invoke the interface described in 6.1.1.16 Changing the Password (Extended).</p> <p>NOTE If the value is true but the agent does not change the password, the agent cannot make calls.</p>
3.6	serverName	String	Cluster name of the CC-Gateway to which an agent signs in.
3.7	timeRemaining	String	<p>Remaining password validity period.</p> <p>An empty string indicates that the agent password never expires. The value ranges from 0 to 180 days.</p>

Triggered Event

If the **status** parameter is set to **3** (busy) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready

- AgentState_SetNotReady_Success

If the **status** parameter is set to **4** (idle) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready

If the **status** parameter is set to **5** (wrap-up) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready
- AgentState_Work

If phone linkage is enabled during sign-in, the following event is triggered:

- AgentEvent_linkageCapability

Error Code

- 100-001
- 100-002
- 100-003
- 100-004
- 100-007
- 100-012
- 100-015
- 100-016
- 110-016
- 999-001

Example

- Message header
Content-Type:application/json; charset=UTF-8

- Request parameter

```
{
  "password": "",
  "phonenum": "40038",
  "status": "4",
  "releasephone": "false",
  "agenttype": "4"
}
```

- Response parameter

```
{
  "message": "",
  "retcode": "0",
  "result": {
    "vdnid": 1,
    "workno": "291",
    "mediatype": "TTF",
    "loginTime": "1471585949806",
    "isForceChange": "false",
    "serverName": "AgentGateway",
    "timeRemaining": "9"
  }
}
```

```
}  
}
```

6.1.1.2 Forcibly Signing In

Prerequisites

None

Description

This interface is used by a signed-in agent to sign in again.

NOTE

For an agent:

- If the sign-out interface does not respond, the sign-in interface cannot be invoked.
- If the sign-in interface does not respond, the sign-out interface cannot be invoked.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/forcelogin`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-7 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	String	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

forceLogin

Request Description

- Message header

Table 6-8 Parameter in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	String	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

- Message body

Table 6-9 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	password	String	Yes	Password of an employee ID on the CTI platform. The value can contain a maximum of 32 characters.
2	phonenum	String	Yes	Softphone number. The value can contain a maximum of 24 characters.
3	autoanswer	Boolean	No	Whether to enable automatic answering. The default value is true .
4	autoenteridle	Boolean	No	Whether to enter the idle state automatically. The default value is true .
5	releasephone	Boolean	No	Whether an agent enters the non-always-off-hook state (the phone is hung up after the call ends) after the agent hangs up. The default value is false .
6	agenttype	Integer	No	Type of the agent who signs in. The default value is 4 . The options are 4 (PC+phone agent) and 11 (PC+phone video agent).
7	status	Integer	No	Status after an agent signs in. The default value is 4 . The options are 3 (busy), 4 (idle), and 5 (wrap-up).

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
8	ip	String	No	Agent IP address. The default value is 127.0.0.1 and can contain a maximum of 15 characters. IPv6 addresses are not supported.
9	entryIp	String	No	IP address of the gateway to which the agent client application connects.
10	phoneLinkage	Boolean	No	Whether to enable phone linkage (connection and hardphone linkage control). The default value is false .
11	checkInWebm	Boolean	No	Whether to sign in to the WebM media server. The default value is true .
12	checkInMailm	Boolean	No	Whether to sign in to the MailM server. The default value is false .
13	vcPhoneNumber	String	No	VC number. The value contains a maximum of 24 characters.
14	listenStatus	Boolean	No	Whether an inspector listens to the sign-in and sign-out operations of an agent. The default value is false .
15	callbackUri	String	No	Event callback address. The value contains a maximum of 200 characters. For details about the interface definition, see 6.1.4.2 Calling Back Pushed Events .
16	serviceToken	String	No	Authentication code. The value contains a maximum of 50 characters and cannot contain special characters.

 NOTE

If both **callbackUri** and **serviceToken** are transferred, the event push mode is used. Otherwise, the event polling mode is used.

Response Description

Table 6-10 Response header parameters

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	String	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	String	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).
3	Set-GUID	String	Yes	An example value is JSESSIONID=279fe2*****0f5.AgentGateway0 . In the value, 279fe2*****0f5.AgentGateway0 is the GUID.

Table 6-11 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	String	Description.
2	retcode	String	Error code. The options are as follows: 0 : success Other values: failure
3	result	Map	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-12 .

Table 6-12 Parameter description of result

No.	Parameter	Value Type	Description
3.1	vdnid	String	VDN ID.

No.	Parameter	Value Type	Description
3.2	workno	String	Agent ID.
3.3	mediatype	String	<p>Whether the agent successfully signs in to the media server of a specific type. T indicates success and F indicates failure. The three characters indicate CTI Server, WebM, and MailM, respectively. For example, TTF indicates that the agent successfully signs in to the CTI Server and WebM but fails to sign in to the MailM.</p> <p>The voice business can be processed only after the agent successfully signs in to the CTI Server. The text chat business can be processed only after the agent successfully signs in to the WebM. Currently, the agent cannot sign in to the MailM.</p>
3.4	loginTime	String	Sign-in time. The value is a timestamp.
3.5	isForceChange	String	<p>Whether to forcibly change the password. If the parameter is set to true, the agent must change the password after sign-in. To change the password, invoke the interface described in 6.1.1.16 Changing the Password (Extended).</p> <p>NOTE If the value is true but the agent does not change the password, the agent cannot make calls.</p>
3.6	serverName	String	Cluster name of the CC-Gateway to which an agent signs in.
3.7	timeRemaining	String	<p>Remaining password validity period. An empty string indicates that the agent password never expires. The value ranges from 0 to 180 days.</p>

Triggered Event

If the **status** parameter is set to **3** (busy) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready

- AgentState_SetNotReady_Success

If the **status** parameter is set to **4** (idle) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready

If the **status** parameter is set to **5** (wrap-up) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready
- AgentState_Work

If phone linkage is enabled during sign-in, the following event is triggered:

- AgentEvent_linkageCapability

Error Code

- 100-001
- 100-002
- 100-003
- 100-004
- 100-007
- 100-012
- 100-015
- 100-016
- 110-016
- 999-001

Example

- Message header
Content-Type:application/json; charset=UTF-8

- Request parameter

```
{
  "password": "",
  "phonenum": "40038",
  "status": "4",
  "releasephone": "false",
  "agenttype": "4"
}
```

- Response parameter

```
{
  "result": {
    "workno": "49191",
    "loginTime": "1639623440728",
    "vdnid": 41,
    "serverName": "AgentGateway1",
    "timeRemaining": "89",
    "isForceChange": "false",
    "mediatype": "TTF"
  },
  "message": "success",
}
```

```
"retcode": "0"  
}
```

6.1.1.3 Maintaining the Heartbeat by an Agent

Prerequisites

The agent has signed in.

Description

When the event push mode is used after an agent signs in, the third-party system needs to periodically invoke the heartbeat interface to maintain the session. The recommended invoking interval is 30 seconds. If no heartbeat message is received within 2 minutes, the agent signs out.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/handshake`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-13 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

handShake

Request Description

- Message header

Table 6-14 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).
3	service_token	string	No	User-defined. The value contains a maximum of 50 characters and cannot contain special characters. Otherwise, 100-001 is returned. It is recommended that the page be dynamically refreshed every minute.

- Message body
None

Response Description

Table 6-15 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: <ul style="list-style-type: none"> • 0: success • Other values: failure For details, see 6.5.2 Error Codes .

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
service_token:*****
- Request parameter
None
- Response parameter
{
 "message": "success",
 "retcode": "0"
}

6.1.1.4 Sending Notes

Prerequisites

- The agent has signed in.

Description

This interface is used to send notes between agents.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/sendnoteletex

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-16 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

sendNoteletEx

Request Description

- Message header

Table 6-17 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-18 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	agentIds	int	Yes	ID of the agent who receives the note. A maximum of 100 agent IDs can be transferred.
2	content	string	Yes	Indicates the note content. The value contains 0 to 1023 bytes and supports Chinese characters.

Response Description

Table 6-19 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	Map	Object in the returned result after a successful query.

Triggered Event

If the agent who receives the note signs in, the following event is triggered:

- AgentOther_Note

Error Code

- 100-001
- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{
  "agentIds": [
    31002,
    31003
  ],
  "content": "hello"
}
```
- Response parameter

```
{
  "result": null,
  "message": "success",
  "retcode": "0"
}
```

6.1.1.5 Querying Configured Skill Queues

Prerequisites

The agent has signed in.

Description

This interface is used by an agent that has signed in to query configured skill queue information.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/agentskills

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-20 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryAgentSkills

Request Description

- Message header

Table 6-21 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-22 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: <ul style="list-style-type: none"> • 0: success • Other values: failure
3	result	array	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-23 .

Table 6-23 Parameter description of result

No.	Parameter	Value Type	Description
3.1	name	string	Skill name.
3.2	id	int	Indicates the ID of a skill.

No.	Parameter	Value Type	Description
3.3	mediatype	int	Media type. The options are as follows: <ul style="list-style-type: none"> • 1: text chat • 2: click-to-dial call • 4: callback request • 5: common voice or video call • 15: predicted outbound call • 16: previewed outbound call • 17: message call • 19: common video call • 51: multimedia web chat • 53: social chat

Triggered Event

None

Error Code

- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```

{
  "result": [
    {
      "name": "defaultMediaSkill",
      "id": 1,
      "mediatype": 53
    }
  ],
  "message": "success",
  "retcode": "0"
}

```

6.1.1.6 Querying Configured Skill Queues of Specified Agents

Prerequisites

The agent has signed in.

Description

This interface is used by an agent that has signed in to query configured skill queue information of specified agents.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/agentskillsbyworkno/{workno}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-24 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	workno	string	Yes	ID of the agent to be queried. The value ranges from 101 to 59999. The agent ID must belong to the same VDN as the value of agentid .

Method Name in Logs

queryAgentSkillsByWorkNo

Request Description

- Message header

Table 6-25 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-26 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: <ul style="list-style-type: none"> • 0: success • Other values: failure
3	result	array	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-27 .

Table 6-27 Parameter description of result

No.	Parameter	Value Type	Description
3.1	name	string	Skill name.
3.2	id	int	Indicates the ID of a skill.

No.	Parameter	Value Type	Description
3.3	mediatype	int	Media type. The options are as follows: <ul style="list-style-type: none"> • 1: text chat • 2: click-to-dial call • 4: callback request • 5: common voice or video call • 15: predicted outbound call • 16: previewed outbound call • 17: message call • 19: common video call • 51: multimedia web chat • 53: social chat

Triggered Event

None

Error Code

- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```

{
  "result": [
    {
      "name": "defaultMediaSkill",
      "id": 1,
      "mediatype": 53
    },
    {
      "name": "defaultAudioSkill",
      "id": 3,
      "mediatype": 5
    }
  ],
  "message": "success",
  "retcode": "0"
}

```

6.1.1.7 Setting Automatic Answering

Prerequisites

- The agent has signed in.

Description

This interface is used to set whether agent automatic answering is enabled.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/autoanswer/{isautoanswer}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-28 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	isautoanswer	string	Yes	Whether to automatically answer a call. The options are as follows: <ul style="list-style-type: none">• true: automatic answer• Value other than true: manual answer. The value contains a maximum of five characters.

Method Name in Logs

setAgentAutoAnswer

Request Description

- Message header

Table 6-29 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-30 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 000-002
- 100-006

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.8 Resetting Skill Queues

Prerequisites

- The agent has signed in.

Description

This interface is used to reset skill queues.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/resetskill/{autoflag}?skillid={skillid}&phonelinkage={phonelinkage}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-31 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
2	autoflag	boolean	Yes	<p>Whether to sign in to all skill queues. The options are as follows:</p> <ul style="list-style-type: none">• true: Automatically sign in to the skill configured for the agent.• false: Sign in to a specified skill queue. <p>Values other than true are processed as false.</p>
3	skillid	string	No	<p>Skill queue ID.</p> <p>When autoflag is set to false and skillid is left empty, the agent does not sign in to any skill queue. The value of skillid is a skill queue ID string group (for example, 1;2;3) and can contain a maximum of 4000 characters. The skill queue to which the agent logs in is the intersection of the skill queue specified by skillid and the configured skill queue.</p>

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
4	phonelinkage	int	No	Whether to enable phone linkage (connection and hardphone linkage control). The options are as follows: <ul style="list-style-type: none"> • 1: yes • 0: no Currently, only eSpace 7910 phones on the CC network are supported.

Method Name in Logs

resetSkill

Request Description

- Message header

Table 6-32 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-33 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 000-002
- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.9 Setting Idle

Prerequisites

- The agent has signed in.

Description

This interface is used to set the agent state to idle.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/sayfree

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-34 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

sayFree

Request Description

- Message header

Table 6-35 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-36 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- When the busy indicating state is changed to the idle state.
AgentState_CancelNotReady_Success
- When the adjust state is changed to idle state.
AgentState_CancelWork_Success

Error Code

- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.10 Setting Busy

Prerequisites

The agent has signed in.

Description

This interface is used to set the agent state to busy.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/saybusy?reason={reason}&prolong={false}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-37 Parameters in the URI

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	reason	int	No	Indicates the busy reason code. If this parameter is left empty or set to 0 , no busy reason code is available. The value is an integer ranging from 200 to 250. This parameter is mandatory when an agent in busy state shows busy again.

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
3	prolong	boolean	No	Indicates whether to reset the busy reason when the agent is busy. The options are true and false . The default value is false . This parameter is mandatory when an agent in busy state shows busy again.

Method Name in Logs

sayBusy

Request Description

- Message header

Table 6-38 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-39 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: <ul style="list-style-type: none"> ● 0: success ● Other values: failure
3	result	object	Reserved field.

Triggered Event

AgentState_SetNotReady_Success

Error Code

- 000-002
- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.11 Canceling the Busy State

Prerequisites

- The agent has signed in.
- The agent is in busy state.

Description

This interface is used to cancel the busy state of an agent.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/cancelbusy

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-40 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

cancelBusy

Request Description

- Message header

Table 6-41 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-42 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentState_CancelNotReady_Success

Error Code

- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.12 Applying for Rest

Prerequisites

- The agent has signed in.

Description

The agent requests for rest.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/rest/{time}/{restcause}?prolong={false}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-43 Parameters in the URI

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	time	long	Yes	Rest duration. The unit is second. The value ranges from 1 to 86399.
3	restcause	int	Yes	Rest cause code. Rest cause code configured on the platform. The value ranges from 0 to 255. The value 0 indicates no rest cause code.
4	prolong	boolean	No	Whether to reset the rest reason when the agent is in rest state. The options are true and false . The default value is false . This parameter is mandatory when an agent in rest state sets the state to rest again.

Method Name in Logs

rest

Request Description

- Message header

Table 6-44 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-45 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentState_SetRest_Success

- AgentState_Rest_Timeout

Error Code

- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{  
  "result": {},  
  "message": "success",  
  "retcode": "0"  
}
```

6.1.1.13 Canceling Rest

Prerequisites

- The agent has signed in.
- The agent is in rest state.

Description

This interface is used by an agent to cancel rest.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/cancelrest`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-46 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

cancelRest

Request Description

- Message header

Table 6-47 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-48 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentState_CancelRest_Success

Error Code

- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.14 Entering the Work State

Prerequisites

- The agent has signed in.

Description

This interface is used by an agent to enter the work state.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

<https://ip:port/agentgateway/resource/onlineagent/{agentid}/work>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-49 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

sayWork

Request Description

- Message header

Table 6-50 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-51 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentState_SetWork_Success

Error Code

- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.15 Quitting the Work State

Prerequisites

- The agent has signed in.
- The agent is in working state.

Description

This interface is used by an agent to quit the work state.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/cancelwork

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-52 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

cancelWork

Request Description

- Message header

Table 6-53 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-54 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentState_CancelWork_Success

Error Code

- 100-006
- 100-007
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.16 Changing the Password (Extended)

Prerequisites

- The agent has signed in.

Description

This interface is used by an agent to change the password.

 **NOTE**

1. The new password can contain 8 to 32 characters.
2. The new password cannot contain two or more consecutive identical characters.
3. The new password cannot contain three or more consecutive characters in **workno**.
4. The new password must contain three or more types of the following characters: uppercase letters, lowercase letters, digits, and special characters.
5. The new password must be different from the last five (the quantity is configurable on the WAS) passwords.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/modifyaccountpwdex

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-55 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

modifyAccountPwdEx

Request Description

- Message header

Table 6-56 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-57 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	oldPassword	string	Yes	Old password. The value is a string of 8 to 32 characters.
2	newPassword	string	Yes	New password. The value is a string of 8 to 32 characters.

Response Description

Table 6-58 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 000-002
- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{
  "oldPassword": "*****",
  "newPassword": "#####"}

```
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"}

```

6.1.1.17 Setting Whether to Enter the Idle State

Prerequisites

- The agent has signed in.

Description

This interface is used to set whether an agent enters the idle state after releasing a call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

<https://ip:port/agentgateway/resource/onlineagent/{agentid}/autoenteridle/{flag}>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-59 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
2	flag	string	Yes	<p>Whether to enter the idle state. The options are as follows:</p> <ul style="list-style-type: none"> • true: Automatically enter the idle state. • Value other than true: Enter the wrap-up state. Only a string of 1 to 5 characters can be entered. <p>NOTE In non-always-off-hook mode, the system must automatically enter the wrap-up state.</p>

Method Name in Logs

setAgentAutoEnterIdle

Request Description

- Message header

Table 6-60 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-61 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter
{
 "result": {},

```
"message": "success",
"retcode": "0"
}
```

6.1.1.18 Signing Out

Prerequisites

- The agent has signed in.

Description

This interface is used to sign out an agent.

NOTE

- When an agent is in talking or answering state, the agent will not be signed out if this interface is invoked.
- For an agent:
 - If the sign-out interface does not respond, the sign-in interface cannot be invoked.
 - If the sign-in interface does not respond, the sign-out interface cannot be invoked.

Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

URI

<https://ip:port/agentgateway/resource/onlineagent/{agentid}/logout>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-62 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

logout

Request Description

- Message header

Table 6-63 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-64 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentOther_ShutdownService

 **NOTE**

If the agent signs out, the event will not always be received. If the event is received, the agent has been signed out.

Error Code

- 100-005

- 100-006
- 100-007
- 100-008

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{  
  "result": {},  
  "message": "success",  
  "retcode": "0"  
}
```

6.1.1.19 Forcibly Signing Out

Prerequisites

The agent has signed in.

Description

This interface is invoked by an inspector to forcibly sign out an agent.

NOTE

For an agent:

- If the sign-out interface does not respond, the sign-in interface cannot be invoked.
- If the sign-in interface does not respond, the sign-out interface cannot be invoked.

Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/forcelogout`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-65 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

forceLogout

Request Description

- Message header

Table 6-66 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-67 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure

Triggered Event

- AgentOther_ShutdownService

NOTE

If the agent signs out, the event will not always be received. If the event is received, the agent has been signed out.

Error Code

- None

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "message": "success",
  "retcode": "0"
}
```

6.1.1.20 Forcibly Signing Out with a Cause Code

Prerequisites

- The agent has signed in.

Description

This interface is used to forcibly sign out an agent with a cause code.

Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/forcelogoutwithreason/{reason}`

In the URL, **ip** indicates the IP address of the CC-Gateway, **port** indicates the HTTPS port number of the CC-Gateway, **{agentid}** indicates the employee ID of the agent that has logged in, and **{reason}** indicates the cause code of agent sign-out (ranging from 1 to 255).

Table 6-68 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	reason	int	Yes	Agent sign-out reason code. The value ranges from 1 to 255.

Method Name in Logs

forceLogoutWithReason

Request Description

- Message header

Table 6-69 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-70 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure

Triggered Event

- AgentOther_ShutdownService

 **NOTE**

If the agent signs out, the event will not always be received. If the event is received, the agent has been signed out.

Error Code

100-005

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "message": "success",
  "retcode": "0"
}
```

6.1.1.21 Getting Agent Status

Prerequisites

- The agent has signed in.

Description

This interface is used to get the current status of the agent.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/agentstatus

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-71 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

getAgentStatus

Request Description

- Message header

Table 6-72 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-73 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	array	For details, see Table 6-74 .

Table 6-74 Agent Status Information

No.	Parameter	Value Type	Description
3.1	agentState	int	Agent status. For details, see Table 6-452 .
3.2	isWorking	boolean	false : The agent is not talking. true : The agent is talking.

Triggered Event

- None

Error Code

- 000-002

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "message": "",
  "retcode": "0",
  "result": {
    "agentState": 4,
    "isWorking": false
  }
}
```

6.1.1.22 Setting Whether to Answer Inbound Calls

Prerequisites

- The agent has signed in.

Description

This interface is used to set whether an agent answers inbound calls.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/settalkright?flag={flag}`

In the URL, *ip* indicates the IP address of the agent gateway, *port* indicates the HTTPS port number of the agent gateway, *{agentid}* indicates the agent ID, and *{flag}* indicates whether to answer inbound calls (**1**: yes; **0**: no).

Table 6-75 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	flag	int	Yes	Whether to answer an inbound call. The options are as follows: <ul style="list-style-type: none"> 1: Answer an inbound call. 0: Do not answer an inbound call.

Method Name in Logs

setTalkRight

Request Description

- Message header

Table 6-76 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-77 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 000-002
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.1.23 Signing In to the Platform by an Agent

NOTE

The agent only signs in to the CCS and does not sign in to the media server. Therefore, no license is occupied.

Prerequisites

None

Function

This interface is used by an agent to sign in to the platform. The agent only signs in to the CCS (the voice call function is enabled) and does not sign in to the media server. Therefore, no license is occupied.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

<https://ip:port/agentgateway/resource/onlineagent/{agentid}/loginex>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-78 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

loginEx

Request Description

- Message header

Table 6-79 Parameter in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

- Message body

Table 6-80 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	password	string	Yes	Agent password. The value can contain a maximum of 32 characters and can be empty.
2	phonenum	string	No	Agent phone number. The value can contain a maximum of 24 characters.
3	autoanswer	boolean	No	Whether to enable automatic answering. The default value is true .
4	autoenteridle	boolean	No	Whether to enter the idle state automatically. The default value is true .
5	releasephone	boolean	No	Whether an agent enters the non-always-off-hook state (the phone is hung up after the call ends) after the agent hangs up. The default value is true .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
6	agenttype	int	No	Type of the agent who signs in. The default value is 4 . The options are 4 (PC+phone agent) and 11 (PC+phone video agent).
7	status	int	No	Status after an agent signs in. The default value is 4 . 3 : busy 4 : idle 5 : wrap-up
8	ip	string	No	Agent IP address. The default value is 127.0.0.1 and can contain a maximum of 15 characters. IPv6 addresses are not supported.
9	entrylp	string	No	IP address of the gateway to which the agent client application connects.
10	phonelinkage	boolean	No	Whether to enable phone linkage (connection and hardphone linkage control). The default value is false .
11	checkInWebm	boolean	No	Whether to sign in to the WebM media server. The default value is true .
12	checkInMailm	boolean	No	Whether to sign in to the MailM server. The default value is false .
13	vcPhoneNumber	string	No	VC number. The value contains a maximum of 24 characters.
14	listenStatus	boolean	No	Whether an inspector listens to the sign-in and sign-out operations of an agent. The default value is false .

Response Description

Table 6-81 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: <ul style="list-style-type: none"> ● 0: success ● Other values: failure
3	result	Map	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-82 .

Table 6-82 Parameter description of result

No.	Parameter	Value Type	Description
3.1	vdnid	string	VDN ID.
3.2	workno	string	Agent ID.
3.3	mediatype	string	Whether the agent successfully signs in to the media server of a specific type. T indicates success and F indicates failure. The three characters indicate CTI Server, WebM, and MailM, respectively. The voice business can be processed only after the agent successfully signs in to the CTI Server. The text chat business can be processed only after the agent successfully signs in to the WebM. Currently, the agent cannot sign in to the MailM.
3.4	loginTime	string	Sign-in time.
3.5	isForceChange	string	Whether to forcibly change the password. If the parameter is set to true , the agent must change the password after sign-in. NOTE The value false may cause security risks. Exercise caution when using this value. The value true is recommended, indicating that the password must be changed upon the next login.

No.	Parameter	Value Type	Description
3.6	serverName	string	Cluster name of the CC-Gateway to which an agent signs in.
3.7	timeRemaining	string	Remaining password validity period. An empty string indicates that the agent password never expires. The value ranges from 0 to 180 days. NOTE An empty string may cause security risks. Exercise caution when using an empty string. A value within the value range is recommended to ensure that the password is changed periodically.

Triggered Event

If the **status** parameter is set to **3** (busy) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready
- AgentState_SetNotReady_Success

If the **status** parameter is set to **4** (idle) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready

If the **status** parameter is set to **5** (wrap-up) during sign-in, the following events are triggered:

- AgentOther_InService
- AgentState_Ready
- AgentState_Work

Error Code

- 100-001
- 100-002
- 100-003
- 100-004
- 100-007
- 100-012
- 100-015
- 100-016
- 110-016

- 999-001

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{
  "password": "",
  "phonenum": "40038",
  "status": "4",
  "releasephone": "false",
  "agenttype": "4"
}
```
- Response parameter

```
{
  "message": "",
  "retcode": "0",
  "result": {
    "vdnid": 1,
    "workno": "291",
    "mediatype": "TTF",
    "loginTime": "1471585949806",
    "isForceChange": "false",
    "serverName": "AgentGateway",
    "timeRemaining": "9"
  }
}
```

6.1.1.24 Actively Requesting to Update the GUID When the Agent Page Is Refreshed

Prerequisites

- The agent has signed in.

Description

This interface is used for an agent to actively request to update the GUID when the agent page is refreshed.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

<https://ip:port/agentgateway/resource/onlineagent/{agentid}/updateGuid>

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

Table 6-83 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

updateGuid

Request Description

- Message header

Table 6-84 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-85 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-86 .

Table 6-86 Parameter description of **result**

No.	Parameter	Value Type	Description
3.1	guid	string	Indicates the unique GUID after each configured user signs in.

Triggered Event

None

Error Code

- 100-006

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {
    "guid": "xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1"
  },
  "message": "success",
  "retcode": "0"
}
```

6.1.1.25 Synchronizing the Agent Status and Call Information When the Agent Page Is Refreshed

CAUTION

This interface is used only for status synchronization after the browser is refreshed. Invoking this interface will clear the event queue.

Prerequisites

- The agent has signed in.

Description

This interface is used to synchronize the agent status and call information when the agent page is refreshed.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/syncagentinfo

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

Table 6-87 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

syncagentinfo

Request Description

- Message header

Table 6-88 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-89 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-90 .

Table 6-90 Parameter description of **result**

No.	Parameter	Value Type	Description
3.1	callinfo	string	Indicates the call information.

No.	Parameter	Value Type	Description
3.2	agentStateInfo	object	Agent status information. Table 6-91 describes the parameters of this object.

Table 6-91 Parameter description of agentStateInfo

No.	Parameter	Value Type	Description
3.2.1	callFeature	int	Indicates the original call type. Feature ID. For details, see Table 6-92 .
3.2.2	callData	string	Indicates the call-related information
3.2.3	lastState	int	Indicates the last status of an agent.
3.2.4	preBusy	boolean	Indicates whether to show busy.
3.2.5	firsttalkingFlag	boolean	Indicates whether the call is the first call.
3.2.6	workNo	string	Agent ID.
3.2.7	qcWorkNo	string	Indicates the ID of an inspector.
3.2.8	callerNo	string	Calling number.
3.2.9	beginHoldTime	string	Start hold time. The value is a timestamp, in milliseconds.
3.2.10	state	int	Agent status. For details about the status code and its meaning, see Table 6-454 .
3.2.11	talkingCallfeature	int	Original call type. For details, see Table 6-92 .
3.2.12	releaseFlag	int	Indicates whether a session is released. This parameter is reserved.
3.2.13	calledNo	string	Called number.
3.2.14	mainCallId	string	Indicates the callid of the first call.

No.	Parameter	Value Type	Description
3.2.15	secondTalkingTime	string	Second call duration. The value is a timestamp, in milliseconds.
3.2.16	preRest	boolean	Indicates whether to take a rest.
3.2.17	recordID	string	Indicates the serial number of the recording.
3.2.18	currentTime	string	Current time. The value is a timestamp, in milliseconds.
3.2.19	beginTalkingTime	string	Start call duration. The value is a timestamp, in milliseconds.
3.2.20	partner	string	Indicates the partner.
3.2.21	holdCallId	string	Indicates the callid of the holding call.
3.2.22	agentStateBegin-Time	string	Start time of the agent state. The value is a timestamp, in milliseconds.
3.2.23	curCommand	int	Current command. For details, see Table 6-93 .
3.2.24	curCallId	string	Indicates the callid of the current call.
3.2.25	cmdBeginTime	string	Command start time. The value is a timestamp, in milliseconds.

Table 6-92 Call type information

State Value	Description
-1	Others.
0	Common inbound call.
6	Internal call.
7	Common call.
41	HPS preempted outbound call.
44	HPS predicted outbound call.
45	HPS reserved callback.
51	Internal two-party consultation.
52	Internal three-party consultation.

State Value	Description
53	Multi-party call.

Table 6-93 Operation command information

State Value	Description
0	None.
1	The agent hooks on a call.
2	The agent is disconnected.
3	The called party hangs up.
4	First outbound call.
5	Outbound call.
6	Hold state.
7	Unhold state.
8	Mute state.
9	Unmute state.
10	Blind transfer.
11	Release-after-transfer.
12	Talk forwarding.
13	Release-after-three-way-talk forwarding.
14	Hang-up transfer.
15	Special transfer.
16	Two-party help.
17	Three-party help.
18	Three-party call.
19	Playback state.
20	Insertion.
21	Listen.
22	Switch.
23	Intercept.
24	Whisper.

State Value	Description
30	Show busy.
31	Rest.

Triggered Event

None

Error Code

- 100-007
- 100-011

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1

- Request parameter

None

- Response parameter

}
```

6.1.1.26 Obtaining Token Information

Prerequisites

- The agent has signed in.

Description

After an agent signs in, a temporary token needs to be obtained as the password for softphone number registration in the multi-account unified authentication scenario.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/logininfo

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-94 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	String	True	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

loginInfo

Request Description

- Message header

Table 6-95 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	String	True	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	String	True	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-96 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	String	Description.
2	retcode	String	Error code. The options are as follows: <ul style="list-style-type: none"> • 0: success • Other values: failure For details, see 6.5.2 Error Codes .
3	result	object	Object in the returned result after a successful query. For details about the parameters of this object, see Table 6-97 .

Table 6-97 Parameter description of result

No.	Parameter	Value Type	Description
3.1	phonetoken	String	Temporary token.
3.2	phonenum	String	Softphone number used by an agent to sign in.

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {
    "phonenum": "88880001",
    "phonetoken": "XXX"
  },
  "message": "success",
  "retcode": "0"
}
```

6.1.1.27 Customizing Status by an Agent

Prerequisites

The agent has signed in.

Description

This interface is used by an agent to customize status.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/setcustomstate?customstate={customstate}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-98 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	customstate	integer	Yes	Customized agent status. The value ranges from 0 to 65534. NOTE The meaning is defined by the business side.

Method Name in Logs

setCustomState

Request Description

- Message header

Table 6-99 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-100 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Result returned after a successful query.

Triggered Event

None

Error Code

- 000-002
- 000-003
- 100-006
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{  
  "message": "success",  
  "retcode": "0",  
  "result": {}  
}
```

6.1.1.28 Querying Customized Status by an Agent

Prerequisites

The agent has signed in.

Description

This interface is used by an agent to query customized status.

Interface Method

The request method must be set to GET. This interface supports only the GET method.

URI

https://ip:port/agentgateway/resource/onlineagent/{agentid}/querycustomstate

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-101 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	True	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

queryCustomState

Request Description

- Message header

Table 6-102 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	True	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	True	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-103 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Customized agent status.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Result returned after a successful query.

Triggered Event

None

Error Code

- 000-003
- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{  
  "result": {  
    "agentcustomstate": "65535"  
  },  
  "message": "success",  
  "retcode": "0"  
}
```

6.1.1.29 Canceling Status Customization by an Agent

Prerequisites

- The agent has signed in.

- The agent has customized the status.

Description

This interface is used by an agent to cancel status customization.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/onlineagent/{agentid}/cancelsetcustomstate`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-104 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

cancelSetCustomState

Request Description

- Message header

Table 6-105 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-106 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Result returned after a successful query.

Triggered Event

None

Error Code

- 000-003
- 100-006
- 100-009

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None

- Response parameter

```
{
  "message": "success",
  "retcode": "0",
  "result": {}
}
```

6.1.2 Call Control Interfaces: voicecall

6.1.2.1 Making a Common Outbound Call

Prerequisites

- The agent has signed in.
- The agent is not answering any call (except a held call).

Description

This interface is used by an agent that has signed in to make an outbound call.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/callout`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-107 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

callout

Request Description

- Message header

Table 6-108 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-109 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	caller	string	No	Calling number. The value can be empty. If the value is empty, the default calling number of the platform is used. The value contains a maximum of 24 digits.
2	called	string	Yes	Called number. It cannot be left empty and must be a 1- to 24-digit number or * or #.
3	skillid	int	No	Skill ID. It is in numeral format and can be empty. If the value is empty, the default skill queue ID preconfigured by the platform is used.
4	callappdata	string	No	Call-associated data. It can be left empty. The maximum value is 16 KB.

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
5	mediaability	int	No	<p>Media capability. The default value is 0. The options are as follows: 0: audio; 1: video; 2: A default outbound call is made based on the negotiation between the host and the terminal.</p> <p>NOTE When a video call is switched to a voice call, the call will be directly disconnected after being answered because media negotiation fails. You are advised to set mediaability to 2 (call with the maximum capability) for video outbound calls.</p>

Response Description

Table 6-110 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	<p>Error code. The options are as follows:</p> <p>0: success</p> <p>Other values: failure</p>
3	result	string	<p>After a call is successful, the unique call ID is returned.</p> <p>This parameter is not returned when a call fails.</p>

Triggered Event

- AgentOther_PhoneAlerting
- AgentOther_PhoneOffhook
- AgentState_Busy
- AgentEvent_Customer_Alerting
- AgentEvent_Talking
- AgentEvent_Call_Out_Fail

- OUTBOUND_DETECT_EVENT

Error Code

- 000-002
- 100-006
- 100-007
- 200-001

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{  
  "caller": "40038",  
  "called": "40040",  
  "skillid": 25,  
  "callappdata": "",  
  "mediaability": 1  
}
```
- Response parameter

```
{  
  "message": "",  
  "retcode": "0",  
  "result": "1455885056-1095"  
}
```

6.1.2.2 Making a Previewed Outbound Call

Prerequisites

- The agent has signed in.
- The agent is not answering any call (except a held call).
- The agent has received a previewed outbound call event.

Description

After receiving a previewed outbound call event, the agent calls a subscriber using the previewed outbound call interface.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

`https://ip:port/agentgateway/resource/voicercall/{agentid}/previewCallout`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-111 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

previewCallout

Request Description

- Message header

Table 6-112 Parameter in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-113 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	called	string	Yes	Called number. The parameter must be contained in the dialeddigits field of a preview event. If the parameter is not contained in the dialeddigits field, a call cannot be made.
2	callcontrolid	long	Yes	Control block ID of a previewed outbound call. The value is the same as that of controlid in the previewed outbound call event.

Response Description

Table 6-114 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	string	After a call is successful, the unique call ID is returned. This parameter is not returned when a call fails.

Triggered Event

- AgentOther_PhoneAlerting
- AgentOther_PhoneOffhook
- AgentEvent_Talking
- AgentEvent_Call_Out_Fail

Error Code

- 000-002
- 100-006

- 100-007
- 200-001
- 200-036

Example

- **Message header**
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- **Request parameter**
{
 "called": "88889039",
 "callcontrolid": "11776"
}
- **Response parameter**
{
 "message": "",
 "retcode": "0",
 "result": "1455885056-1095"
}

6.1.2.3 Answering a Call

Prerequisites

- The agent has signed in.
- The agent has received the AgentEvent_Ringing event.

Description

This interface is used by an agent to answer a voice call.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

<https://ip:port/agentgateway/resource/voicecall/{agentid}/answer?{callid=XXXX}>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-115 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
2	callid	string	No	Call ID. During a multimedia call, multiple call IDs exist. The call ID must be carried in the call response.

Method Name in Logs

answer

Request Description

- Message header

Table 6-116 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-117 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentEvent_Talking

Error Code

- 100-006
- 100-007
- 200-002

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.2.4 Making an Internal Call

Prerequisites

- The agent has signed in.
- The agent is not answering any call (except a held call).

Description

This interface is used by an agent that has signed in to make an internal call.

Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

URI

<https://ip:port/agentgateway/resource/voicecall/{agentid}/callinner>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-118 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

callInner

Request Description

- Message header

Table 6-119 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-120 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	called	string	Yes	Employee ID of the called agent. It cannot be left empty and must be a 1- to 24-digit number or * or #.
2	caller	string	No	Calling number. It can be left empty. The default value is the calling number pre-configured by the platform. It must be a 0- to 24-digit number.
3	skillid	int	No	Indicates the ID of a skill. The value is a number and can be left empty. When the parameter is left empty, the default skill ID configured on the platform is used.
4	callappdata	string	No	Indicates call-associated data. It can be left empty. The maximum value is 16 KB.
5	mediaability	int	No	This parameter is invalid for internal calls. An internal call is initiated based on the intersection of the media type to which the agent signs in and the media capability of the default skill queue of the VDN. If an agent signs in to a video media and the default skill queue of the VDN supports the video service, the internal call is a video call. In other cases, internal calls are voice calls.

Response Description

Table 6-121 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	string	After a call is successful, the unique call ID is returned. This parameter is not returned when a call fails.

Triggered Event

- AgentOther_PhoneAlerting
- AgentOther_PhoneOffhook
- AgentState_Busy
- AgentEvent_Customer_Alerting
- AgentEvent_Talking
- AgentEvent_Inside_Call_Fail
- AgentEvent_Call_Out_Fail
- AgentEvent_Connect_Fail

Error Code

- 000-002
- 100-006
- 100-007
- 200-018

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
{
 "called": "40040"
}
- Response parameter
{
 "result": {},
 "message": "success",
 "retcode": "0"
}

6.1.2.5 Asking for Internal Help

Prerequisites

- The agent has signed in.

Description

This interface is used by an agent that has signed in to ask for internal help.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/voicerecall/{agentid}/innerhelp

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-122 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

innerHelp

Request Description

- Message header

Table 6-123 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-124 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	dstaddress	string	Yes	Indicates the help object. It can be the employee ID of an agent or skill queue ID.
2	devicetype	int	No	Indicates the help device type. The value 1 indicates the skill queue and the value 2 indicates the employee ID of the agent. The default value is 2 .
3	mode	int	No	Indicates the help mode. The value 1 indicates asking for help during two-party conversation and the value 2 indicates asking for help during three-party conversation.
4	callappdata	string	No	Indicates the call-associated data. It can be left empty. The maximum value is 16 KB.
5	holdflag	boolean	No	Whether to hold a call during release-after-three-way-talk forwarding. The options are false (no) and true (yes). The default value is true .

Response Description

Table 6-125 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	string	Unique call ID returned upon successful helping. It is not returned if the help fails.

Triggered Event

- Asking for help during two-party
 - AgentEvent_Hold
 - AgentEvent_Customer_Alerting
 - AgentEvent_Talking
- Asking for help during third-party conversion
 - AgentEvent_Customer_Alerting
 - AgentEvent_Conference
- Internal help failure
 - AgentEvent_Consult_Fail

Error Code

- 100-006
- 100-007
- 200-018

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{
  "dstaddress": 49997,
  "devicetype": 2,
  "mode": 1,
  "callappdata": "",
  "holdflag": "true"
}
```
- Response parameter

```
{
  "message": "",

```

```
"retcode": "0",
"result": "1455885056-1095"
}
```

6.1.2.6 Muting a Call

Prerequisites

- The agent has signed in.
- The agent is making a call.

Description

This interface is used by an agent to mute an ongoing call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/beginmute`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-126 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

beginMute

Request Description

- Message header

Table 6-127 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-128 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 100-006
- 100-007
- 200-003
- 200-004

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.2.7 Unmuting a Muted Call

Prerequisites

- The agent has signed in.
- The agent has muted an ongoing voice call.

Description

This interface is used by an agent to unmute a muted call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

<https://ip:port/agentgateway/resource/voicecall/{agentid}/endmute>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-129 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

endMute

Request Description

- Message header

Table 6-130 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-131 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 100-006
- 100-007

- 200-007
- 200-008

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.2.8 Holding a Call

Prerequisites

- The agent has signed in.
- The agent has an ongoing call.

Description

This interface is used by an agent to hold an ongoing call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

<https://ip:port/agentgateway/resource/voicecall/{agentid}/hold>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-132 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

hold

Request Description

- Message header

Table 6-133 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-134 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentEvent_Hold

Error Code

- 100-006
- 100-007
- 200-013
- 200-014

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{  
  "result": {},  
  "message": "success",  
  "retcode": "0"  
}
```

6.1.2.9 Holding a Call

Prerequisites

- The agent has signed in.
- The agent has established a call.
- The agent is holding a call.

Description

This interface is used by an agent to keep an ongoing call or a held call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/connecthold/{callid}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-135 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	callid	string	Yes	Unique ID of a call.

Method Name in Logs

connectHold

Request Description

- Message header

Table 6-136 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-137 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentEvent_Call_Release
- AgentEvent_Customer_Release
- AgentOther_PhoneRelease
- AgentMediaEvent_StopRecordDone

Error Code

- 100-006
- 100-007
- 200-013
- 200-014

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.2.10 Unholding a Call

Prerequisites

- The agent has signed in.
- The agent is holding a call.

Description

This interface is used by an agent to unhold a call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/gethold?callid={callid}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-138 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.
2	callid	string	No	Unique ID of a call.

Method Name in Logs

getHold

Request Description

- Message header

Table 6-139 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-140 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentEvent_Talking

Error Code

- 100-006
- 100-007
- 200-015
- 200-016

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None

- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.2.11 Transferring a Call

Prerequisites

- The agent has signed in.
- The agent is making a call.
- Blind transfer is not supported when an outbound call is transferred to an outbound number (**devicetype** is set to 5).
- When the agent transfers the inbound call in blind transfer mode, the transfer may fail because the call is transferred to the original calling number that may be restricted from making outbound calls by the carrier.

Description

This interface is used by an agent to transfer an established call.

NOTE

Video calls do not support the following scenario:
The call is transferred to an external number in blind transfer mode.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

<https://ip:port/agentgateway/resource/voicercall/{agentid}/transfer>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-141 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	String	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

transfer

Request Description

- Message header

Table 6-142 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	String	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	String	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-143 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	devicetype	Integer	Yes	Type of the device to which a call is transferred. The options are as follows: 1 : skill queue; 2 : agent; 3 : IVR; 4 : system access code; 5 : outbound number.

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
2	address	String	Yes	<p>Address to which a call is transferred. The value can contain a maximum of 24 characters. The options are as follows:</p> <ul style="list-style-type: none">• When devicetype is set to 1, set this parameter to the skill queue ID.• When devicetype is set to 2, set this parameter to the ID of the agent to whom the call is transferred.• When devicetype is set to 3, set this parameter to the IVR flow access code.• When devicetype is set to 4, set this parameter to the system access code.• When devicetype is set to 5, set this parameter to the outbound number.

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
3	mode	Integer	Yes	<p>Indicates the transfer mode.</p> <p>When devicetype is set to 1, the options are as follows:</p> <ul style="list-style-type: none"> 0: blind transfer 2: release-after-transfer <p>When devicetype is set to 2, the options are as follows:</p> <ul style="list-style-type: none"> 0: blind transfer 2: release-after-transfer <p>When devicetype is set to 3, the options are as follows:</p> <ul style="list-style-type: none"> 0: blind transfer 1: hang-up transfer <p>NOTE During hang-up transfer, a call can be transferred to a voice or video IVR flow but cannot be transferred to an agent.</p> <p>When devicetype is set to 4, the options are as follows:</p> <ul style="list-style-type: none"> 0: blind transfer 2: release-after-transfer <p>When devicetype is set to 5, the options are as follows:</p> <ul style="list-style-type: none"> 1: blind transfer (An outbound call cannot be transferred to a specified number in blind transfer mode.) 2: release-after-transfer 3: talk forwarding 4: three-party transfer
4	callappdata	String	No	<p>Call-associated data to be configured. It can be left empty. The maximum value is 16 KB.</p>

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
5	caller	String	No	Calling number. (The value can be empty. If the value is empty, the default calling number configured on the platform is used. The value is a string of 0 to 24 digits.) This parameter is valid when a call is forwarded to an external number. When the transfer mode is blind transfer, this parameter is invalid, that is, the specified calling number cannot be carried.
6	mediaability	Integer	No	Indicates the media capability. The default value is 0 . The options are 0 (voice), 1 (video), and 2 (call with the maximum capability, which is negotiated by the host with the terminal). This parameter is valid when a call is transferred to an external number. In other transfer modes, whether the media capability is carried is determined based on the agent type.
7	holdflag	Boolean	No	Whether to hold a call during three-party transfer. The options are false (no) and true (yes). The default value is true .
8	skillId	Integer	No	Skill ID. This parameter is valid only when devicetype is set to 2 .

Response Description

Table 6-144 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	String	Description.

No.	Parameter	Value Type	Description
2	retcode	String	Error code. The options are as follows: 0 : success Other values: failure
3	result	Object	Reserved field.

Triggered Event

- AgentEvent_Talking
- AgentEvent_Connect_Fail
- AgentEvent_Call_Release
- When the transfer mode is release-after-transfer, the following events are triggered:
AgentEvent_SuccTransResult
AgentMediaEvent_StopRecordDone
- When the transfer mode is three-party transfer, the following event is triggered:
AgentEvent_Conference
- When the transfer mode is hang-up transfer, the following event is triggered:
AgentEvent_ReturnFromIvr

Error Code

- 000-002
- 100-006
- 100-007
- 200-012

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{
  "devicetype": 2,
  "mode": 3,
  "address": "49998",
  "callappdata": "",
  "caller": "40040",
  "mediaability": 0,
  "holdflag": "true"
}
```
- Response parameter

```
{
  "result": {},
  "message": "success",
}
```

```
"retcode": "0"  
}
```

6.1.2.12 Canceling Transfer

Prerequisites

- The agent has signed in.
- The agent has a transferred call (the transfer mode is three-party transfer or talk forwarding, and the transfer device is an external number).

Description

This interface is used by the agent to retrieve the transferred call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/canceltransfer`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

Table 6-145 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

cancelTransfer

Request Description

- Message header

Table 6-146 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-147 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentEvent_Talking
- AgentEvent_Customer_Release

Error Code

- 100-006
- 100-007
- 200-012

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{
  "result": {},
  "message": "success",
  "retcode": "0"
}
```

6.1.2.13 Performing Two-Stage Dialing (Extended)

Prerequisites

- The agent has signed in.
- The agent has established a call.

Description

This interface is invoked by an agent to perform two-stage dialing (digit collection using the dial plate) on an ongoing call. Number signs (#) can be entered.

NOTE

Currently, video calls are not supported.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/seconddialex?number={number}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-148 Parameters in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
2	number	string	Yes	Two-stage dialing number. The value is a string of 1 to 24 digits, asterisks (*), or number signs (#).

Method Name in Logs

secondDialEx

Request Description

- Message header

Table 6-149 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body
None

Response Description

Table 6-150 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.

No.	Parameter	Value Type	Description
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- None

Error Code

- 000-002
- 100-006
- 100-007

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
None
- Response parameter

```
{  
  "result": {},  
  "message": "success",  
  "retcode": "0"  
}
```

6.1.2.14 Making a Three-Party Call

Prerequisites

- The agent has signed in.
- The agent has established a call.
- The agent is holding a call.

Description

This interface is used by an agent to make a three-party call based on an ongoing call or a held call.

Interface Method

The request method must be set to POST. This interface supports only the POST method.

URI

https://ip:port/agentgateway/resource/voicecall/{agentid}/confjoin

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

Table 6-151 Parameter in the URI

No.	Parameter	Data Type	Mandatory (Yes/No)	Description
1	agentid	string	Yes	Agent ID. The value ranges from 101 to 59999.

Method Name in Logs

confJoin

Request Description

- Message header

Table 6-152 Parameters in the request message header

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	Content-Type	string	Yes	Coding mode of the message body. The default value is application/json; charset=UTF-8 .
2	Guid	string	Yes	GUID returned by the sign-in interface during static authentication (AUTHMODE is set to 1) or GUID returned by the polling event query interface during dynamic authentication (AUTHMODE is set to 2).

- Message body

Table 6-153 Parameters in the message body

No.	Parameter	Value Type	Mandatory (Yes/No)	Description
1	callid	string	Yes	Indicates the ID of the call that the agent is holding. It cannot be blank.
2	callappdata	string	No	Call-associated data to be configured. It can be left empty. The maximum value is 16 KB.

Response Description

Table 6-154 Parameters in the message body

No.	Parameter	Value Type	Description
1	message	string	Description.
2	retcode	string	Error code. The options are as follows: 0 : success Other values: failure
3	result	object	Reserved field.

Triggered Event

- AgentEvent_Conference
- AgentEvent_Customer_Release

Error Code

- 100-006
- 100-007
- 200-010
- 200-011

Example

- Message header
Content-Type:application/json; charset=UTF-8
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter
{
 "callid": "1455885056-1095",

- ```
"callappdata": ""
}
```
- Response parameter
 

```
{
"result": {},

### 6.1.2.15 Disconnecting a Call of a Specified ID

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent to disconnect (hang up) the call with a specified call ID.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

https://ip:port/agentgateway/resource/voicerecall/{agentid}/dropcall/{callid}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-155** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |
| 2   | callid    | string    | Yes                | ID of the call to be disconnected.            |

#### Method Name in Logs

dropCall

#### Request Description

- Message header

**Table 6-156** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-157** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentEvent\_Call\_Release
- AgentEvent\_Customer\_Release
- AgentOther\_PhoneRelease

## Error Code

- 100-006
- 100-007
- 200-025

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.16 Dropping a Call

#### Prerequisites

- The agent has signed in.
- The agent has an ongoing call.

#### Description

This interface is invoked by an agent to hang up an ongoing call. Only the current call can be hung up. The call ID needs to be specified. For details, see [6.1.2.15 Disconnecting a Call of a Specified ID](#).

#### Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

#### URI

- 1.https://ip:port/agentgateway/resource/voicecall/{agentid}/release
- 2.https://ip:port/agentgateway/resource/voicecall/{agentid}

#### NOTE

The second interface is provided to be compatible with earlier versions and is not recommended.

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-158** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

1. Name of the method for the URL `https://ip:port/agentgateway/resource/voicecall/{agentid}/release`: release
2. Name of the method for the URL `https://ip:port/agentgateway/resource/voicecall/{agentid}`: releaseEx

## Request Description

- Message header

**Table 6-159** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-160** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentEvent\_Call\_Release
- AgentEvent\_Customer\_Release

## Error Code

- 100-006
- 100-007
- 200-017

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.17 Releasing a Connection of a Specified Number

#### Prerequisites

- The agent has signed in.
- The agent has an ongoing call.

#### Description

This interface is used by an agent to release the connection of a specified phone number. Generally, this interface is used in internal help calls and three-party calls.

#### NOTE

You can release only the connections of numbers in the last call. For example, when you make a two-party help call and the user is on hold, if you release the user on hold, an error (200-204) will be reported (currently, this processing mode is followed) because the user is not in the last call. However, when you make an outbound call and place the user on hold, you can normally release the user on hold because the user is in the last call.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/voicerecall/{agentid}/disconnect/{number}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-161** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|-----------|-----------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                                                                                                                                                                                                                                                                                               |
| 2   | number    | string    | Yes                | Phone number whose connection needs to be released. The value is a number of 1 to 24 digits.<br>During an internal help call, the current agent can release the requested agent (the value is the employee ID of the requested agent) or the current agent (the value is the softphone number of the current agent). The requested agent can release only the requested agent but cannot release the current agent or user. |

## Method Name in Logs

disconnect

## Request Description

- Message header

**Table 6-162** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

```

## 6.1.2.18 Switching Between Voice and Video Calls

### Prerequisites

- The agent has signed in.
- The agent has an ongoing voice call.  
Currently, the voice and video switchover is supported in the following scenarios:
  - An agent makes an audio call or a subscriber dials the called number to connect to the agent.
  - A call is held, unheld, muted, or unmuted.
  - A call is transferred to an agent or a skill queue.

### Description

A video agent can switch a voice call to a video call.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### URI

`https://ip:port/agentgateway/resource/voicercall/{agentid}/mediaswitch?mediaType=3`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-164** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                 |
|-----|-----------|-----------|--------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                               |
| 2   | mediaType | int       | No                 | Target media type. The options are as follows: <ul style="list-style-type: none"> <li>1: audio</li> <li>3: video</li> </ul> |

## Method Name in Logs

mediaSwitch

## Request Description

- Message header

**Table 6-165** Parameter in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

- Message body  
None

## Response Description

**Table 6-166** Parameters in the message body

| No. | Parameter | Value Type | Description  |
|-----|-----------|------------|--------------|
| 1   | message   | string     | Description. |

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentEvent\_MediaSwitth
- AgentMediaEvent\_StopRecordDone
- AgentEvent\_Call\_Release

## Error Code

- 200-027
- 200-028
- 200-029
- 200-030

## Example

- Message header  
Content-Type:application/json; charset=UTF-8
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.19 Controlling the Image Display Mode of a Three-Party Video Call

#### Prerequisites

- The agent has signed in.
  - The agent has an ongoing video call.
- The interface supports the following scenarios:
- Setting up three-party video calls
  - Initiating an internal help (a three-party video call)
  - Transferring a call to an external number by setting a three-party video call

## Description

A video agent changes the three-party video display mode.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/voicerecall/{agentid}/adjustvideomode

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-167** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

adjustVideoMode

## Request Description

- Request header

**Table 6-168** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Guid      | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-169** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                              |
|-----|-----------|------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | mode      | Integer    | Yes                | Display mode. The value ranges from 0 to 3. The value <b>0</b> indicates that images are the same size for all three parties. The value <b>1</b> indicates that the user's image is maximized. The value <b>2</b> indicates that the agent's image is maximized. The value <b>3</b> indicates that the third-party's image is maximized. |

## Response Description

**Table 6-170** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Error Code

- 200-031
- 200-032
- 200-033
- 200-034
- 200-035

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "mode": "0"
}
```
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.20 Requesting a Specified Call

#### Prerequisites

- The agent has signed in.

#### NOTE

- This interface cannot be invoked when an agent has no call but is performing self-recording.
- This interface cannot be invoked in the call holding scenario.

#### Description

An agent can invoke this interface to apply for a new call. After the application is successful, the call that meets the application conditions is allocated to the agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/requestcall/{callid}/{skilltype}?skillId={skillId}`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-171** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                            |
|-----|-----------|-----------|--------------------|------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                          |
| 2   | callid    | string    | Yes                | ID of a queuing call.                                                  |
| 3   | skilltype | int       | Yes                | Skill queue type. Only the value <b>0</b> (public queue) is supported. |
| 4   | skillid   | int       | Yes                | Skill queue ID. This parameter is valid only for public queues.        |

## Method Name in Logs

}
```

### 6.1.2.21 Picking Up a Call for Other Agents

#### Prerequisites

- The agent has signed in.
- The called agent is ringing.
- The pickup call cannot be an internal call.

- The current agent and the called agent must be in the same group.
- The current agent must have the group pickup permission.
- The current agent must be in idle state.

## Description

This interface is used by an agent to pick up the voice call of another agent.

## Interface Method

The request method must be set to PUT. This interface supports only the PUT method and does not support the DELETE, POST, or GET method.

## URI

`https://ip:port/agentgateway/resource/voicercall/{agentid}/snatchpickup?destWorkNo={destWorkNo}`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTP or HTTPS port number of the agent gateway server.

**Table 6-174** Parameters in the URI

| No. | Parameter  | Data Type | Mandatory (Yes/No) | Description                                                                                  |
|-----|------------|-----------|--------------------|----------------------------------------------------------------------------------------------|
| 1   | agentid    | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                |
| 2   | destWorkNo | int       | Yes                | ID of the agent who picks up the call.<br>The value is an integer ranging from 101 to 59999. |

## Request Description

- Message header

**Table 6-175** Parameter in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

- Message body  
None

## Response Description

**Table 6-176** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

After successful pickup, the agent receives the AgentOther\_PhoneAlerting event. After answering the call, the agent receives the AgentOther\_PhoneOffhook, AgentEvent\_Talking, AgentEvent\_Incoming\_CallInfo, AgentMediaEvent\_Record, and AgentOther\_PhoneRelease events.

## Error Code

- 000-002
- 100-006
- 100-007

## Example

- Message header  
Content-Type:application/json; charset=UTF-8
- Request parameter  
None

- Response parameter

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

## 6.1.2.22 Rejecting an Inbound Call

### Prerequisites

- The agent has signed in.
- The agent has received the AgentEvent\_Ringing event.

### Description

This interface is used by an agent to reject a call request.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### URI

`https://ip:port/agentgateway/resource/voicercall/{agentid}/reject`

In the URL, *ip* indicates the IP address of the CC-Gateway, *port* indicates the HTTPS port number of the CC-Gateway, and *{agentid}* indicates the ID of an agent.

**Table 6-177** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

### Method Name in Logs

reject

### Request Description

- Message header

**Table 6-178** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-179** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----|-----------|------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callid    | string     | No                 | Call ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2   | mode      | int        | Yes                | Call rejection mode. The options are as follows: <b>1</b> : The call is returned to the original queue and the agent is busy; <b>2</b> : The call is released and the agent is idle.<br><br>The call rejection mode applies to common scenarios (for example, an agent rejects an inbound call from a user). In complex scenarios, for example, internal help and call transfer, the call rejection effect needs to be determined based on the specific scenario. |

## Response Description

**Table 6-180** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

### Triggered Event

- AgentEvent\_No\_Answer
- AgentEvent\_SetNotReady\_Success (triggered only when **mode** is set to **1**)
- AgentOther\_PhoneRelease
- AgentState\_Ready (triggered only when **mode** is set to **2**)

### Error Code

- 100-006
- 100-007
- 200-002
- 200-037
- 200-038
- 200-039

### Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "callid": "1455885056-1095",
 "mode": "1"
}
```
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.23 Taking the Phone Off the Hook

#### Prerequisites

- The agent has signed in.
- An agent has enabled the phone linkage.
- An agent has received the AgentOther\_PhoneAlerting event.
- Currently, only eSpace 7910 IP phones are supported.

#### Description

After receiving the AgentOther\_PhoneAlerting event in phone linkage state, an agent can invoke this interface to take the phone off the hook.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

https://ip:port/agentgateway/resource/voicell/{agentid}/phonepickup

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-181** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

phonepickup

#### Request Description

- Message header

**Table 6-182** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-183** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.24 Rejecting a Call

#### Prerequisites

- The agent has signed in.
- An agent has enabled the phone linkage.
- An agent has received the AgentOther\_PhoneAlerting event.
- Currently, only eSpace 7910 IP phones are supported.

#### Description

After receiving the phone ringing event (AgentOther\_PhoneAlerting) in phone linkage state, an agent can invoke this interface to reject the call.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

<https://ip:port/agentgateway/resource/voicecall/{agentid}/phonehangup>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-184** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

phonehanguap

## Request Description

## Triggered Event

- AgentOther\_PhoneRelease

- AgentEvent\_No\_Answer

## Error Code

- 100-006
- 100-007

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.2.25 Passing Numbers in a Conference

#### Prerequisites

- The agent has signed in.
- The agent is in a three-party call with a customer and a third-party IVR.

#### Description

In a three-party call among an agent, a customer, and a third-party IVR, both the agent and customer can dial numbers for the third-party IVR to complete voice playback and digit collection. The customer's key presses need to be passed to the third-party IVR, and the number voices cannot be recorded on the agent side.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/voicecall/{agentid}/thirdPartyConfTransmitNum`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-187** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | String    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

thirdPartyConfTransmitNum

## Request Description

- Message header

**Table 6-188** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | String     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | String     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-189** Parameters in the message body

| Parameter | Value Type | Description  |
|-----------|------------|--------------|
| message   | String     | Description. |

| Parameter | Value Type | Description                                                                            |
|-----------|------------|----------------------------------------------------------------------------------------|

| No. | Parameter   | Type    | Mandatory or Not | Description                                                                                                |
|-----|-------------|---------|------------------|------------------------------------------------------------------------------------------------------------|
| 1.1 | returnCode  | String  | Yes              | Operation result. The value <b>0</b> indicates success, and other values indicates failure.                |
| 1.2 | description | String  | No               | Prompt message.                                                                                            |
| 1.3 | data        | Boolean | No               | Whether an agent answers calls on a mobile phone. The options are <b>true</b> (yes) and <b>false</b> (no). |

- **Status code: 401**  
Authentication failed.
- **Status code: 404**  
The requested resource does not exist.
- **Status code: 500**  
Internal server error.

## Error Codes

None

## Example

Request header:

```
Content-Type:application/json
X-APP-KEY:*****
Authorization:Bearer *****
```

Request parameters:

```
{"workNo":107}
```

Response parameters:

```
{
 "returnCode": "0",
 "data": false,
 "description": "success"
}
```

## 6.1.3 Call Data (calldata)

### NOTE

The application scenarios of the interfaces listed in this section are as follows:

The interfaces are used to query the information about agents and queues and the current call processing statistics of agents during agent transfer and help seeking.

To ensure system stability, overload control is performed at the system level and agent level of the interfaces of this type.

- The maximum number of query requests allowed by the system is 15,000 every 2 seconds by default.
- The maximum number of query requests allowed by an agent is 5 every 2 seconds by default.

Therefore, considering the overload control mechanism for using this type of interfaces, do not frequently invoke the interfaces in a short time. Otherwise, the system may break down.

### 6.1.3.1 Querying Call Information

#### Prerequisites

- The agent has signed in.

#### Description

This interface is used by a signed-in agent to query call information.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

https://ip:port/agentgateway/resource/calldata/{agentid}/callinfo?  
isNoContainLastCall={isNoContainLastCall}

In the URL, **ip** indicates the IP address of the agent gateway, **port** indicates the HTTPS port number of the agent gateway, and **{agentid}** indicates the ID of an agent. *{isNoContainLastCall}* indicates whether to query the last call when the current agent has no call. The value is of the boolean type.

**Table 6-199** Parameters in the URI

| No. | Parameter           | Data Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                           |
|-----|---------------------|-----------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid             | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                                                                                         |
| 2   | isNoContainLastCall | boolean   | No                 | Whether to query the information about the last call when the current agent has no call. The options are as follows: <ul style="list-style-type: none"> <li>• <b>true:</b> yes</li> <li>• <b>false:</b> no</li> </ul> |

**Table 6-204** Reason codes

| Reason Code | Description                                                            |
|-------------|------------------------------------------------------------------------|
| 0           | Common access or transfer.                                             |
| 1           | The call is transferred due to overflow.                               |
| 2           | The call is transferred due to timeout.                                |
| 3           | The call is transferred when no one is on duty.                        |
| 4           | The call is transferred when queuing is cancelled.                     |
| 5           | The call is transferred when an agent does not answer for a long time. |
| 6           | The suspended call is resumed.                                         |
| 7           | The held call is connected.                                            |
| 8           | Three-party help is initiated.                                         |
| 9           | The call is unheld.                                                    |
| 10          | The three-party call is initiated.                                     |
| 11          | The call is released by the party who sends the internal help request. |
| 12          | The call is intercepted.                                               |
| 13          | The call is picked up.                                                 |
| 14          | Called number analysis is not configured for a call.                   |
| 15          | The user releases the call.                                            |
| 16          | The agent releases the call.                                           |
| 17          | The call is transferred out.                                           |
| 18          | The call is held.                                                      |
| 19          | Internal processing error.                                             |
| 20          | The called party is busy.                                              |
| 21          | The line is busy.                                                      |
| 22          | The phone is powered off.                                              |

| Reason Code | Description                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------------------|
| 23          | The phone is out of service.                                                                                          |
| 24          | The number is invalid.                                                                                                |
| 25          | No resource is available on the ACD.                                                                                  |
| 26          | The user does not answer the call.                                                                                    |
| 27          | The called party rejects the call.                                                                                    |
| 28          | The connected call is transferred to a queue.                                                                         |
| 29          | The three-party call is transferred to a queue.                                                                       |
| 30          | The connected call times out when being transferred to a queue.                                                       |
| 31          | The three-party call times out when being transferred to a queue.                                                     |
| 34          | The failed network call queues due to timeout, overflow, or busy.                                                     |
| 35          | The network call queues at the original call center.                                                                  |
| 36          | The queuing call is rerouted.                                                                                         |
| 37          | The call enters the CDN through the inbound route.                                                                    |
| 38          | The call enters the CDN from agent consultation.                                                                      |
| 39          | The CDN returns the routing result.                                                                                   |
| 40          | CDN routing times out.                                                                                                |
| 41          | The agent cancels the call during consultation.                                                                       |
| 42          | The call enters the PGR from a timeout CDN route.                                                                     |
| 43          | The call enters the PGR from a normal CDN route.                                                                      |
| 44          | The call enters the PGR through the inbound route.                                                                    |
| 45          | The call enters the PGR from agent consultation.                                                                      |
| 46          | The CDN reroutes the call because the agent is unreachable.                                                           |
| 47          | The call queues in multiple queues.                                                                                   |
| 48          | The call in the master queue is answered from the slave queue.                                                        |
| 50          | The agent rejects the call.                                                                                           |
| 51          | A user call joins a conference.                                                                                       |
| 52          | The conference chairperson proactively releases the conference, or the conference is released due to a CSS exception. |
| 53          | The participant is removed from the conference.                                                                       |

| Reason Code | Description                                                                        |
|-------------|------------------------------------------------------------------------------------|
| 54          | The call is transferred when the call completion rate is lower than the threshold. |
| 88          | The user hangs up after the agent answers the call.                                |
| 89          | The user hooks on after the agent answers the call.                                |

### 6.1.3.2 Querying Call-Associated Data

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent that has signed in to query the call-associated data.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

`https://ip:port/agentgateway/resource/calldata/{agentid}/appdata?  
isEncodeResult={isEncodeResult}&callId={callId}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-205** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

| No. | Parameter      | Data Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 6.1.3.3 Configuring Call-Associated Data (Extended)

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent that is in a conversation after signing in to configure call-associated data.

#### Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

#### URI

<https://ip:port/agentgateway/resource/calldata/{agentid}/setcalldataex>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-208** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

setCallAppDataEx

### 6.1.3.4 Querying the List of Held Calls

#### Prerequisites

- The agent has signed in and the answering mode is non-automatic answering.
- The agent is in a call and holds the call.

#### Description

This interface is used by an agent that has signed in to query the list of held calls.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

`https://ip:port/agentgateway/resource/calldata/{agentid}/holdlist`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-212** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

### 6.1.3.5 Querying Call Information Before Answering a Call

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent that has signed in to query the call information before answering a call.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

<https://ip:port/agentgateway/resource/calldata/{agentid}/callinbeforeanswer>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-216** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Response Description

**Table 6-218** Parameters in the message body

| No. | Parameter | Value Type | Description  |
|-----|-----------|------------|--------------|
| 1   | message   | string     | Description. |

| No. | Parameter | Value Type | Description                                                                                                                               |
|-----|-----------|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure                                                    |
| 3   | result    | list       | Call information returned after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 6-219</a> . |

**Table 6-219** Parameter description of **result**

| No.  | Parameter     | Value Type | Description                                                     |
|------|---------------|------------|-----------------------------------------------------------------|
| 3.1  | callfeature   | int        | Call type. For details, see <a href="#">Table 6-455</a> .       |
| 3.2  | callid        | string     | Call ID.                                                        |
| 3.3  | caller        | int        | Calling number.                                                 |
| 3.4  | called        | int        | Called number.                                                  |
| 3.5  | callskill     | string     | Call skill description.                                         |
| 3.6  | callskillid   | int        | Call skill ID.                                                  |
| 3.7  | orgicallednum | string     | It is not used.                                                 |
| 3.8  | calldata      | string     | Call-associated data.                                           |
| 3.9  | begintime     | long       | Response start time, in milliseconds. The value is a timestamp. |
| 3.10 | endtime       | long       | It is not used.                                                 |
| 3.11 | userPriority  | int        | Customer priority.                                              |
| 3.12 | trunkNo       | int        | Trunk number.                                                   |
| 3.13 | logontimes    | int        | Total login duration, in seconds.                               |

| No.      | Parameter    | Value Type          | Description                                                                                                                                                                                                                                                                                                                                                                                                                |

### 6.1.3.6 Querying Call Information by Call ID

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent that has signed in to query call information by call ID.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

<https://ip:port/agentgateway/resource/calldata/{agentid}/callinfobycallid/{callid}>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-220** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |
| 2   | callid    | string    | Yes                | ID of the call to be queried.                 |

## Method Name in Logs

### 6.1.3.7 Querying Call IDs of a Specified Agent

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

## Description

This interface is used by an agent that has signed in to query call IDs of a specified agent.

## Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

https://ip:port/agentgateway/resource/calldata/{agentid}/allcallinfoEx/{workno}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-224** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                                     |
|-----|-----------|-----------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                   |
| 2   | workno    | string    | Yes                | ID of the agent to be queried. The value ranges from 101 to 59999.<br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

## Method Name in Logs

queryAllCallInfoByAgentWorkNoEx

## Request Description

- Message header

**Table 6-225** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-226** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                                                                       |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                                                                      |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure                                                            |
| 3   | result    | list       | Indicates the return result of a successful query, that is, a list of call IDs of a specified agent.<br>No result is returned if the query fails. |

## Triggered Event

Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "message": "",
 "retcode": "0",
 "result": [
 "1456297722-1253",
 "1456297463-1249"
]
}
```

### 6.1.3.8 Querying the Number of Current Calls of an Agent

#### Prerequisites

- The agent has signed in.

#### Description

This interface is used by an agent that has signed in to query the number of current calls.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

https://ip:port/agentgateway/resource/calldata/{agentid}/callnums

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-227** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

| No. | Parameter | Value Type | Description                                                                                                                                       |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                                                                      |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure                                                            |
| 3   | result    | string     | Indicates the return result of a successful query, that is, the number of current calls of an agent.<br>No result is returned if the query fails. |

## Triggered Event

- None

## Error Code

- 100-006

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "message": "",
 "retcode": "0",
 "result": 1
}
```

### 6.1.3.9 Querying Current Call Statistics Information About an Agent

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent that has signed in to query the current call statistics information about an agent.

Frequent invoking of this interface deteriorates performance.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

`https://ip:port/agentgateway/resource/calldata/{agentid}/statistics`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-230** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

queryCallStatisticsInfo

## Request Description

- Message header

**Table 6-231** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-232** Parameters in the message body

| No. | Parameter | Value Type | Description  |
|-----|-----------|------------|--------------|
| 1   | message   | string     | Description. |

| No. | Parameter | Value Type | Description                                                                                                                                                                           |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure                                                                                                |
| 3   | result    | object     | Current call statistics information about an agent, which is returned after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 6-233</a> . |

**Table 6-233** Parameter description of result

| No.      | Parameter       | Value Type | Description                                                   |
|----------|-----------------|------------|---------------------------------------------------------------|
| 3.1      | talktime        | long       | Total talking duration after sign-in, in seconds.             |
| 3.2      | answernums      | int        | Number of answered calls after sign-in.                       |
| 3.3      | noanswernums    | int        | Number of calls not answered for a long period after sign-in. |
| 3.4      | calloutnums     | int        | Number of outbound calls after sign-in.                       |
| 3.5      | intercallnums   | int        | Number of internal calls after sign-in.                       |
| 3.6      | interhelpnums   | int        | Number of internal help requests after sign-in.               |
| 3.7      | transfernums    | int        | Number of transferred-in calls after sign-in.                 |
| 3.8      | transferoutnums | int        | Number of transferred-out calls after sign-in.                |
| 3.9      | transferivrnums | int        | Number of calls transferred to IVR after sign-in.             |
| 3.1<br>0 | redirectnums    | int        | Number of redirected calls.                                   |
| 3.1<br>1 | keepnums        | int        | Number of held calls.                                         |
| 3.1<br>2 | busynums        | int        | Number of times an agent enters the busy state.               |

| No.      | Parameter    | Value Type | Description                                    |
|----------|--------------|------------|------------------------------------------------|
| 3.1<br>3 | restnums     | int        | Number of times an agent requests for a leave. |
| 3.1<br>4 | restoutnums  | int        | Number of times an agent overstays a leave.    |
| 3.1<br>5 | resttime     | long       | Leave duration, in seconds.                    |
| 3.1<br>6 | restouttime  | long       | Duration that exceeds the leave, in seconds.   |
| 3.1<br>7 | agentrelease | int        | Number of calls released by an agent.          |
| 3.1<br>8 | busytime     | long       | Busy duration, in seconds.                     |

### Triggered Event

### 6.1.3.10 Querying the Current Call Statistics of an Agent (Extended)

#### Prerequisites

- The agent has signed in.
- The agent is in a call.

#### Description

This interface is used by an agent that has signed in to query the current call statistics information about an agent.

The performance of this interface is better than that of the interface for querying the current call statistics of an agent.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

`https://ip:port/agentgateway/resource/calldata/{agentid}/statisticsEx`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-234** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

queryCallStatisticsInfoEx

#### Request Description

- Message header

**Table 6-235** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

## 6.1.3.11 Querying Information About Calls Waiting in a Specified Skill Queue

Querying Information About Calls Waiting in a Specified Skill Queue

### Prerequisites

- The agent has signed in.
- The agent is not idle, and the user who dials the access code is queuing.

### Description

This interface is used by an agent to query information about all calls waiting in a specified public skill queue after the agent signs in.

### Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

https://ip:port/agentgateway/resource/calldata/{agentid}/waitcallinfo/{skillid}

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-238** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |
| 2   | skillid   | int       | Yes                | ID of the skill queue to be queried.          |

## Method Name in Logs

queryWaitCallInfoBySkillId

## Request Description

- Message header

**Table 6-239** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-240** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                            |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                                                                                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows: <ul style="list-style-type: none"> <li>● 0: success</li> <li>● Other values: failure</li> </ul>                                                                                |

### 6.1.3.12 Querying All Calls Placed on Hold by a Specified Agent

#### Prerequisites

- The inspector and specified agent have signed in.
- The specified agent is in a call and holds the call.

#### Description

This interface is used by an inspector who has signed in to query the calls placed on hold by a specified agent in the same VDN.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

`https://ip:port/agentgateway/resource/calldata/{agentid}/holdlistex/{workno}`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-242** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                                     |
|-----|-----------|-----------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                   |
| 2   | workno    | string    | Yes                | ID of the agent to be queried. The value ranges from 101 to 59999.<br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

## Method Name in Logs

queryHoldListInfoEx

## Request Description

- Message header

**Table 6-243** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Guid      | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

]
}
```

## 6.1.4 Agent Event: agentevent

### 6.1.4.1 Obtaining Events of One Agent in Polling Mode

#### Prerequisites

- The agent has signed in successfully. If the agent has signed out, the interface invocation is stopped.

- This interface is designed for obtaining associated events of all agents that have signed in to a specific CC-gateway. Use HTTPS to obtain data in long polling mode.
- This mode allows users to obtain short-connection events of a single agent.
- The **serviceToken** or **callbackUri** parameter is not carried during agent sign-in.

## Description

This interface is used to obtain events of a single agent in polling mode.

### NOTE

If an agent has no event, the interface will return the response after 10 seconds. If the agent has events, the interface will return the response immediately. Modify configurations in the **agentgateway/WEB-INF/config/basic.properties** file as follows:

AGENT\_POLL\_WAIT\_FLAG = ON //Whether an event is a waiting event. The value **ON** indicates that the server returns a response after 10 seconds if the agent has no event.

AGENT\_POLL\_WAIT\_TIMES = 100 //Maximum number of waiting times when no event exists

AGENT\_POLL\_WAIT\_INTERVAL = 100 //Waiting duration each time when no event exists (unit: millisecond)

Note: After waiting for the response to the request, the service invokes the interface again to obtain the event after 200 ms to 500 ms.

## Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

https://ip:port/agentgateway/resource/agentevent/{agentid}?calldata=XXX

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                           |
|-----|-----------|------------|--------------------|-----------------------------------------------------------------------|
| 1   | agentid   | string     | Yes                | ID of the agent who signs in.                                         |
| 2   | calldata  | string     | No                 | Call data. This parameter is used when the connection bar is updated. |

## Method Name in Logs

getAgentEvent

## Request Description

- Message Header

**Table 6-246** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-247** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                                                                    |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                                                                   |
| 2   | retcode   | string     | Error code. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> |
| 3   | event     | object     | Indicates an agent event.<br>For details about the parameters of this object, see <a href="#">Table 6-248</a> .                                |

**Table 6-248** Parameter description of event

| No. | Parameter | Value Type | Description                                                               |
|-----|-----------|------------|---------------------------------------------------------------------------|
| 3.1 | eventType | string     | Indicates the event type. For details, see <a href="#">6.5.1 Events</a> . |
| 3.2 | workNo    | string     | Agent ID.                                                                 |
| 3.3 | content   | object     | Indicates the content of an event. The definition varies with the event.  |

## Triggered Event

None

## Error Code

- 000-001
- 000-003
- 100-006

### NOTE

If any of the preceding error codes is displayed, you need to sign out the agent (or set the agent to the sign-out state) and stop obtaining the polling event. Wait until the agent signs in again.

In addition, in the HTTPS response description, if non-200 OK error code is displayed in status codes, the polling interval must be greater than 1 second to prevent the infinite loop that affects the intermediate network device or causes interception.

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1

- Request parameter  
None

- Response parameter  

```
{
 "message": "",
 "retcode": "0",
 "event": {
 "eventType": "AgentOther_InService",
 "workNo": "291",
 "content": null
 }
}
```

### 6.1.4.2 Calling Back Pushed Events

#### Prerequisites

The agent has signed in.

## Description

When the event push mode is used after an agent signs in, the third-party system needs to develop an interface to receive pushed event messages.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

The following is a reference URL:

<https://ip:port/service-cloud/rest/cc-ai/v1/agentevent/pushresult>

In the URL, **ip** indicates the IP address of the third-party server, and **port** indicates the HTTPS port number of the third-party server.

## Method Name in Logs

None

## Request Description

**Table 6-250** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | workNo    | string     | Yes                | Agent ID.                                                                                                                                                                                                                  |
| 2   | eventList | array      | Yes                | Event list.<br>For details about the parameters of this object, see <a href="#">Table 6-251</a> .<br><b>NOTE</b><br>Events are listed from left to right by generation time. The latest events are displayed on the right. |

**Table 6-251** Parameter description of eventList

| No. | Parameter | Value Type | Description    |
|-----|-----------|------------|----------------|
| 2.1 | eventType | string     | Event type.    |
| 2.2 | workNo    | string     | Agent ID.      |
| 2.3 | content   | object     | Event content. |

## Response Description

**Table 6-252** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                                                             |
|-----|-----------|------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                                                            |
| 2   | retcode   | string     | Error code. The options are as follows: <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: failure</li> </ul> |

### Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1  
service\_token:\*\*\*\*\*
- Request parameter

```
{
 "workNo": "",
 "eventList": [
 {
 "eventType": "",
 "workNo": "",
 "content": ""
 },
 {
 "eventType": "",
 "workNo": "",
 "content": ""
 }
]
}
```
- Response parameter

```
{
 "message": "success",
 "retcode": "0"
}
```

## 6.1.5 Multimedia: mediaCall

### 6.1.5.1 Sending Messages: sendmessage

#### Description

The agent system can invoke this interface to send the message content entered by an agent to the channel application system. The channel application system then sends the message content to Internet users. Applications on the user side need to obtain the message content sent by the agent in polling mode.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/mediacall/{agentid}/sendmessage

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|------------|--------------------|-----------------------------------------------|
| 1   | agentid   | string     | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

sendMessage

## Request Description

- Message header

**Table 6-253** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-254** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----|-----------|------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callid    | string     | Yes                | Call ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2   | userid    | string     | No                 | User number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3   | data      | Object     | Yes                | <p>If the value is a string, it indicates the text content of the message to be sent.</p> <p>When platform encryption is selected during CC-Gateway installation (that is, the <b>MULTIMEDIA_SECM ODE</b> parameter in / <b>home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties</b> is set to <b>1</b>), the maximum size of the message content is 1.9 KB.</p> <p>When business-side encryption is selected during CC-Gateway installation (that is, the <b>MULTIMEDIA_SECM ODE</b> parameter in / <b>home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties</b> is set to <b>0</b>), the maximum size of the message content is 3.8 KB.</p> <p>In the public cloud scenario, the value is a string in JSON format. <a href="#">Table 6-255</a> describes the JSON format.</p> |

**Table 6-255** JSON format in data

| No. | Parameter   | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                      |
|-----|-------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | from        | string     | Yes                | Channel ID, which is the value of <b>Configuration ID</b> of the channel added by the enterprise on the <b>Configuration Center &gt; Access Configuration &gt; Channel Configuration</b> page of the tenant space.                                                                                                                                                               |
| 2   | to          | string     | Yes                | User number. The value is specified by the enterprise and is generally the recipient ID.                                                                                                                                                                                                                                                                                         |
| 3   | channel     | string     | Yes                | Message channel. The options are as follows: <ul style="list-style-type: none"><li>• <b>WEB</b></li><li>• <b>WECHAT</b></li><li>• <b>TWITTER</b></li><li>• <b>FACEBOOK</b></li><li>• <b>5G</b></li><li>• <b>EMAIL</b></li><li>• <b>VOICE</b></li><li>• <b>LINE</b></li><li>• <b>WHATSAPP</b></li><li>• <b>SMS</b></li><li>• <b>INSTAGRAM</b></li><li>• <b>TELEGRAM</b></li></ul> |
| 4   | controlType | string     | Yes                | Control type. The value is fixed to <b>CHAT</b> .                                                                                                                                                                                                                                                                                                                                |

| No. | Parameter      | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

- **Response parameter**

```
{
 "message": "success",
 "retcode": "0"
}
```

### 6.1.5.2 Agent Session Quantity Configuration: setcallnums

#### Description

The agent system can invoke this interface to adjust the maximum number of sessions of an agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

<https://ip:port/agentgateway/resource/mediacall/{agentid}/setcallnums>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-257** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

setCallNums

## Request Description

- Message header

**Table 6-258** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

| 2   | message   | string     | Description.                                                                                                                |

## Triggered Event

- None

## Error Code

- 106-003
- 106-008
- 106-012

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
{  
  "mediaType": "53",  
  "callnums": "1"  
}
- Response parameter  
{  
  "message": "success",  
  "retcode": "0"  
}

### 6.1.5.3 Session Transfer: transfer

## Description

The agent system can invoke this interface to transfer multimedia sessions of a specified call ID to other agents.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

<https://ip:port/agentgateway/resource/mediacall/{agentid}/transfer>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-261** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | String    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

transfer

## Request Description

- Message header

**Table 6-262** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | String     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | String     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-263** Parameters in the message body

| No. | Parameter  | Value Type | Man datory (Yes/ No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----|------------|------------|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callid     | String     | Yes                  | Call ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2   | caller     | String     | No                   | Calling number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3   | devicetype | Integer    | Yes                  | Type of a transfer-out device.<br><b>1:</b> skill queue<br><b>2:</b> agent<br><b>4:</b> system access code                                                                                                                                                                                                                                                                                                                                                                                         |
| 4   | mode       | Integer    | Yes                  | Transfer-out mode. For details, see <a href="#">Table 6-459</a> .<br>When <b>devicetype</b> is set to <b>1</b> , the options are as follows:<br><b>0:</b> blind transfer<br><b>2:</b> release-after-transfer<br>When <b>devicetype</b> is set to <b>2</b> , the options are as follows:<br><b>0:</b> blind transfer<br><b>2:</b> release-after-transfer<br>When <b>devicetype</b> is set to <b>4</b> , the options are as follows:<br><b>0:</b> blind transfer<br><b>2:</b> release-after-transfer |
| 5   | address    | String     | Yes                  | Address to which the call is transferred, that is, the device ID corresponding to the target device type. The value contains a maximum of 24 characters.<br>When <b>devicetype</b> is set to <b>1</b> , the value of this parameter is a skill queue ID. When <b>devicetype</b> is set to <b>2</b> , the value of this parameter is an agent ID. When <b>devicetype</b> is set to <b>4</b> , the value of this parameter is a system access code.                                                  |
| 6   | calldata   | String     | No                   | Data transferred to the target agent. The value can contain a maximum of 2048 bytes.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 7   | skillId    | Integer    | No                   | Skill ID. This parameter is valid only when <b>devicetype</b> is set to <b>2</b> .                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Response Description

**Table 6-264** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                                            |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------|
| 1   | retcode   | String     | Message sending result.<br><ul style="list-style-type: none"> <li>0: success</li> <li>Other values: failure</li> </ul> |
| 2   | message   | String     | Description.                                                                                                           |

## Triggered Event

- AgentEvent\_Connect\_Fail
- AgentEvent\_Talking
- AgentEvent\_Call\_Release

When the transfer mode is release-after-transfer, the following event is triggered:

- AgentEvent\_SuccTransResult

## Error Code

- 106-004
- 106-005
- 106-006
- 106-009
- 106-010
- 106-012

## Example

- Message header  
 Content-Type:application/json; charset=UTF-8  
 Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "callid": "1552524689-16797284",
 "caller": "88880021",
 "devicetype": 2,
 "mode": 2,
 "address": "205",
 "calldata": "help"
}
```
- Response parameter  

```
{
 "message": "success",
 "retcode": "0"
}
```

### 6.1.5.4 Obtaining Connection Information: getconnectinfo

#### Description

In the H5 video call scenario, an agent is disconnected unexpectedly. To join a video conference again, the agent needs to obtain the connection information.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

https://ip:port/agentgateway/resource/mediacall/{agentid}/getconnectinfo

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-265** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | String    | True               | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

getConnectInfo

#### Request Description

- Message header

**Table 6-266** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | String     | True               | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Guid      | String     | True               | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-267** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                  |
|-----|-----------|------------|--------------------|------------------------------------------------------------------------------|
| 1   | userType  | String     | True               | Subscriber type.<br>The default value is <b>agent</b> , indicating an agent. |
| 2   | callid    | String     | True               | Call ID.                                                                     |

## Response Description

### 6.1.5.5 Screenshot: imagecapture

#### Description

In the H5 video call scenario, this interface is invoked for agents to take a screenshot of users.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

<https://ip:port/agentgateway/resource/mediacall/{agentid}/imagecapture>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 6-270** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | String    | True               | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

imageCapture

## Request Description

}

## 6.1.6 Agent Conference: agentconf

### NOTICE

Agent conferences support only audio conferences.

### 6.1.6.1 Applying for an Agent Conference

#### Prerequisites

- The agent has signed in.

#### Description

This interface is used by an agent to apply for an agent conference. If the interface is successfully invoked, the agent needs to wait for the subsequent asynchronous event. After the application is successful, the agent who applies for the conference becomes the chairperson. The agent who applies for a conference receives the AgentConf\_SelfJoinResult event, indicating that the agent has joined the conference. The agent can perform chairperson operations only after the AgentConf\_RequestSuccess event is received. Before receiving the

AgentConf\_RequestSuccess event, the platform directly returns a failure message when the agent invokes conference-related interfaces.

#### NOTICE

- The current agent is in idle or talking state. If the agent is in a call, the call must be in stable state. Otherwise, the agent fails to apply for a conference. For example, if the agent performs operations such as voice playing, muting, call holding, or hang-up transfer during a call, the conference application fails.
- If there are two agents in a three-party conversation, the called agent cannot initiate an agent conference.
- The participant type can only be agent ID or phone number.
- The number of parties in a conference call must be less than or equal to the maximum number of concurrent voice calls set in the VDN.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

`https://ip:port/agentgateway/resource/agentconf/{agentid}/requestagentconf`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-274** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

```

### 6.1.6.2 Answering an Agent Conference Call

#### Prerequisites

- The agent has signed in.
- The agent has received the AgentConf\_Ringing event.

#### Description

This interface is used by an agent to answer the conference call after the agent receives the AgentConf\_Ringing event.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/agentconf/{agentid}/answeragentconf

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-278** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

### 6.1.6.3 Rejecting an Agent Conference Call

#### Prerequisites

- The agent has signed in.
- The agent has received the AgentConf\_Ringing event.

#### Description

This interface is used by an agent to reject a conference call after the agent receives the AgentConf\_Ringing event.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/agentconf/{agentid}/rejectagentconf`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-281** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

rejectAgentConf

#### Request Description

- Message header

**Table 6-282** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |

}
```

### 6.1.6.4 Leaving an Agent Conference

#### Prerequisites

- The agent has signed in.
- The agent has joined the conference.
- The current agent is not the chairperson. (The chairperson invokes the conference release interface to leave the conference.)

#### Description

This interface is used by an agent to leave a conference.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

<https://ip:port/agentgateway/resource/agentconf/{agentid}/requestleaveagentconf>

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-284** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

requestLeaveAgentConf

## Request Description

- Message header

**Table 6-285** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |

### 6.1.6.8 Applying for Extending a Conference

#### Prerequisites

- The agent has signed in.
- The current agent is the conference chairperson.

#### Description

This interface is used by a chairperson to extend a conference. The total conference duration cannot exceed 1440 minutes.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip.port/agentgateway/resource/agentconf/{agentid}/prolongtime`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-298** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | String    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

## Triggered Event

- AgentConf\_ParticipantChanged

## Error Code

- 000-002
- 100-006
- 100-007
- 101-001
- 101-002

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter

```
{
 "addresses": [
 {
 "address": "2002",
 "addressType": "9",
 "deviceCallType": 1,
 "deviceType": 66
 }
],
 "beepTone": false,
 "playMode": 2,
 "voicePath": "y:/conf/120/1136287.V3",
 "caller": "1111"
}
```
- Response parameter

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.6.11 Deleting Participants in Batches

#### Prerequisites

- The agent has signed in.
- The current agent is the conference chairperson.

#### Description

This interface is used by a chairperson to delete participants from a conference in batches.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

<https://ip:port/agentgateway/resource/agentconf/{agentid}/batchremoveparticipant>

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-312** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

batchRemoveParticipant

## Request Description

- Message header

**Table 6-313** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-314** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                              |

 },
 {
 "address": "2001",
 "addressType": "9"
 }
]
}
```
- Response parameter
 

```
{
 "message": "",
 "retcode": "0",
 "result": {
 "noExistParticipants": []
 }
}
```

```
}
}
```

### 6.1.6.12 Modifying Participant Attributes

#### Prerequisites

- The agent has signed in.
- The current agent is the conference chairperson.

#### Description

This interface is used by a chairperson to modify participant channel attributes. Only chairpersons have the permission to modify such attributes.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/agentconf/{agentid}/changeparticipantmode`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-319** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

`changeParticipantMode`

#### Request Description

- Message header

**Table 6-320** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-321** Parameters in the message body

| No. | Parameter   | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                              |
|-----|-------------|------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | attribute   | int        | Yes                | Participant attribute. The options are as follows:<br><b>1:</b> The participant can only listen but cannot speak.<br><b>2:</b> The participant can only speak but cannot listen.<br><b>3:</b> The participant can listen and speak.<br><b>4:</b> The participant cannot listen or speak. |
| 2   | addressType | String     | Yes                | Address type.<br><b>6:</b> phone number<br><b>9:</b> agent ID                                                                                                                                                                                                                            |
| 3   | address     | String     | Yes                | Address ID, that is, phone number or agent ID.<br>The maximum length is 24 bytes.                                                                                                                                                                                                        |

## Response Description

**Table 6-322** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

If the participant attribute value is set to **1** or **3**, the following event is received:

- AgentConf\_ParticipantChanged

If the participant attribute value is set to **2** or **4**, no event is received.

## Error Code

- 000-002
- 100-006
- 100-007
- 101-001
- 101-002

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "attribute": 3,
 "address": "88887744",
 "addressType": "6"
}
```
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.6.13 Playing an Announcement in an Agent Conference

#### Prerequisites

- The agent has signed in.
- The current agent is the conference chairperson.

#### Description

This interface is used by a chairperson to play an announcement in a conference. Only chairpersons have the permission to play an announcement in a conference.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/agentconf/{agentid}/playvoicetoconf`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-323** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

`playVoiceToConf`

#### Request Description

- Message header

**Table 6-324** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 6-325** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                               |
|-----|-----------|------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | playType  | int        | No                 | Announcement playing type. The options are as follows:<br><b>0</b> : The conference foreground announcement is played.<br><b>1</b> : The conference background announcement is played.<br>The default value is <b>0</b> . |
| 2   | playMode  | int        | No                 | Mode for playing an announcement.<br>The value <b>2</b> indicates that a specified announcement file is played.<br>The default value is <b>2</b> .                                                                        |
| 3   | voicePath | String     | Yes                | Absolute file path. The value is in the format of <i>Drive letter/conf/VDN ID/Announcement file name</i> , for example, <b>y:/conf/120/1136287.V3</b> .<br>The value can contain a maximum of 127 characters.             |

## Response Description

}
```

### 6.1.6.14 Stopping Conference Announcement Playing

#### Prerequisites

- The agent has signed in.

- The current agent is the conference chairperson.

## Description

This interface is used by a chairperson to stop conference announcement playing. Only chairpersons have the permission to stop conference announcement playing.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

`https://ip:port/agentgateway/resource/agentconf/{agentid}/stopvoicetoconf`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-327** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

stopVoiceToConf

## Request Description

- Message header

**Table 6-328** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Guid      | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 6-329** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                              |
|-----|-----------|------------|----------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                             |

### 6.1.6.15 Playing an Announcement in an Agent Conference Channel

#### Prerequisites

- The agent has signed in.
- The current agent is the conference chairperson.

#### Description

This interface is used to play voices in a conference call (that is, play voices to specified users). Only the chairperson has the permission to play voices in a conference call.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/agentconf/{agentid}/playvoicetoparticipant`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-331** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

playVoiceToParticipant

## Request Description

- Message header

**Table 6-332** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |

| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

None

## Error Code

- 000-002
- 100-006
- 100-007
- 101-001
- 101-002

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "modifyType": 0,
 "modifyNum": 3
}
```
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 6.1.6.18 Querying Conference Information in Batches

#### Prerequisites

- The agent has signed in.

#### Description

This interface is used to query conference information in batches.

**NOTICE**

- An inspector can query information about all conferences in the VDN to which the inspector belongs in batches.
- A common agent can query only the information about the conference to which the common agent belongs.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/agentconf/{agentid}/queryconfinfos

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-345** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

queryConfInfos

## Request Description

- Message header

**Table 6-346** Parameters in the message body

| No. | Parameter  | Value Type | Mandatory (Yes/No) | Description                                                           |
|-----|------------|------------|--------------------|-----------------------------------------------------------------------|
| 1   | modifyType | int        | Yes                | Type of a change request.<br><b>0:</b> increase<br><b>1:</b> decrease |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                              |
|-----|-----------|------------|--------------------|----------------------------------------------------------|
| 2   | modifyNum | int        | Yes                | Number to be changed.<br>The value ranges from 2 to 118. |

- Message body

**Table 6-347** Parameters in the message body

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                    |
|-----|-----------|------------|--------------------|----------------------------------------------------------------|
| 1   | conflds   | array      | Yes                | Conference ID array.<br>The maximum length of the array is 20. |

## Response Description

**Table 6-348** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | array      | For details, see <a href="#">Table 6-349</a> .                                         |

**Table 6-349** Conference information

| No. | Parameter | Value Type | Description                                                                                                                       |
|-----|-----------|------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 3.1 | confld    | long       | Conference ID.                                                                                                                    |
| 3.2 | confState | int        | Conference status. The options are as follows:<br><b>0</b> : normal conference call<br><b>1</b> : conference announcement playing |

| No. | Parameter        | Value Type | Description                                                       |
|-----|------------------|------------|-------------------------------------------------------------------|
| 3.3 | startTime        | long       | Conference start time. The value is a timestamp, in milliseconds. |
| 3.4 | applyConfTime    | int        | Applied conference duration, in minutes.                          |
| 3.5 | confHaveBeenTime | int        | Time elapsed since a conference starts, in minutes.               |
| 3.6 | addresses        | array      | Participant list. For details, see <a href="#">Table 6-350</a> .  |

**Table 6-350** Participant information

| No.   | Parameter      | Value Type | Description                                                                                                                                                                                |

### 6.1.6.19 Querying an Ongoing Conference ID in the VDN

#### Prerequisites

- The agent has signed in.
- The agent is an inspector.

#### Description

This interface is used to query the ID of an ongoing conference in the VDN.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

https://ip:port/agentgateway/resource/agentconf/{agentid}/queryvdnconfid

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 6-351** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

#### Method Name in Logs

queryAllConfIds

#### Request Description

- Message header

## 6.2 Agent Bidirectional Calls

### 6.2.1 Creating a Bidirectional Call (V1.0.0) (createCall)

#### Scenario

This interface is invoked to create a bidirectional call.

The bidirectional call interface supports bidirectional calls of the AICC and ITA. A tenant administrator can sign in to the AICC and choose **Configuration Center > Expansion Management > Bidirectional Call** to select a bidirectional call type.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CC-Management/v1/mobileAgent/createCall> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 6-355** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID.                                                                                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-356** Request body parameters

| No. | Parameter   | Type    | Mandatory or Not | Description                                                                                                                   |
|-----|-------------|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 1   | caller      | String  | Yes              | Calling number, that is, the mobile number or softphone number of the customer manager.<br>Length limit: string (32)          |
| 2   | called      | String  | Yes              | Called number.<br>Length limit: string (32)                                                                                   |
| 3   | agentWorkNo | Decimal | No               | ID of the agent who initiates a bidirectional call.<br>Length limit: decimal (5)                                              |
| 4   | callData    | String  | No               | Call data.<br>Length limit: string (1024)<br><b>NOTE</b><br>ITA bidirectional calls do not support the <b>callData</b> field. |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | callerPresent | String | No               | <p>Calling number displayed on the user side. If this parameter is not carried, the access code of the tenant space is used by default. If this parameter is carried, an access code must be transferred. If a non-access code number needs to be transferred, contact O&amp;M personnel to enable the calling number anonymization feature. After this feature is enabled, the number verification rule is as follows: The number must be an access code or a number of 11 to 14 digits.</p> <p><b>NOTE</b><br/>ITA bidirectional calls do not support the <b>callerPresent</b> field.</p> |

| No. | Parameter    | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----|--------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6   | agentPresent | String | No               | <p>Calling number displayed to the customer manager on the agent side. If this parameter is not carried, the access code of the tenant space is used by default. If this parameter is carried, an access code must be transferred. If a non-access code number needs to be transferred, contact O&amp;M personnel to enable the calling number anonymization feature. After this feature is enabled, the number verification rule is as follows: The number must be an access code or a number of 11 to 14 digits.</p> <p><b>NOTE</b><br/>ITA bidirectional calls do not support the <b>agentPresent</b> field.</p> |

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | callbackUrl | String | No               | <p>Encode the value using Base64.</p> <p>This field is used to configure the release callback URL for reporting the customer receiving status.</p> <p>The CEC platform pushes the call status information during service triggering to the server, and the client server determines the user status based on the call status information.</p> <p>The URL can be set to <b>https://IP address.Port number</b> or a domain name. The domain name is recommended. HTTP and HTTPS are supported. HTTP is an insecure protocol. Exercise caution when using it. The domain name can correspond to multiple servers to ensure that notifications can be received when a single point of failure occurs.</p> <p>The URL can contain only letters, digits, and the following special characters:<br/>-./_#?&amp;</p> <p>The IP address and port number, or domain name of the callback URL must have been added to the mobile agent callback URL trustlist</p> |

| No. | Parameter | Type | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                   |
|-----|-----------|------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     |           |      |                  | by the system administrator.<br><b>NOTICE</b><br>If the input parameter <b>callBackUrl</b> does not take effect, the interface in your AICC environment may not be upgraded properly. Contact the O&M administrator to check whether the name of the published API is <b>createCall_kugui</b> . If no, the input parameter <b>callBackUrl</b> cannot be used. |

 Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Create an outbound call.

Request header:

```
x-app-key:9*****3
Authorization:Bearer e*****e
Content-Type:application/json
```

Request parameters:

```
{
 "caller": "88889050",
 "called": "88889060",
 "agentWorkNo": "",
 "callerPresent": "640003",
 "agentPresent": "640060",
 "callData": "333333"
}
```

Response header:

```
{
 "connection": "keep-alive",
 "content-type": "application/json;charset=UTF-8"
}
```

Response parameters:

```
{
 "retMsg": "Add CallOutInfo in DB successfully",
 "retCode": "0"
}
```

## 6.2.2 Creating a Bidirectional Call (V3.0.0) (createCall)

### Scenario

This interface is invoked to create a bidirectional call.

The bidirectional call interface supports bidirectional calls of the AICC and ITA. A tenant administrator can sign in to the AICC and choose **Configuration Center > Expansion Management > Bidirectional Call** to select a bidirectional call type.

### Method

POST

### URI

<https://Domain name/apiaccess/CC-Management/v3/mobileAgent/createCall> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 6-359 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID.                                                                                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-360** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                   |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | caller    | String | No               | Calling number, that is, the mobile number or softphone number of the customer manager.<br>Length limit: string (32)          |
| 1.2 | softPhone | String | Yes              | Softphone number (corresponding to the agent).<br>Length limit: string (32)                                                   |
| 1.3 | called    | String | Yes              | Called number.<br>Length limit: string (32)                                                                                   |
| 1.4 | callData  | String | No               | Call data.<br>Length limit: string (1024)<br><b>NOTE</b><br>ITA bidirectional calls do not support the <b>callData</b> field. |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.5 | callerPresent | String | No               | <p>Calling number displayed on the user side. If this parameter is not carried, the access code of the tenant space is used by default. If this parameter is carried, an access code must be transferred. If a non-access code number needs to be transferred, contact O&amp;M personnel to enable the calling number anonymization feature. After this feature is enabled, the number verification rule is as follows: The number must be an access code or a number of 11 to 14 digits.</p> <p><b>NOTE</b><br/>ITA bidirectional calls do not support the <b>callerPresent</b> field.</p> |

**Table 6-361** Response body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----|-----------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | retCode   | String | No               | <p>Return code. The value <b>0</b> indicates success, and other values indicates failure.</p> <p><b>1:</b> Failed to add the outbound call task. The same outbound call task may exist in the outbound call database.</p> <p><b>2:</b> Call data information.</p> <p><b>3:</b> The call SN field is not queried.</p> <p><b>5:</b> The format of the calling number, called number, or CLIP number is incorrect.</p> <p><b>6:</b> The VDN is unavailable.</p> <p><b>8:</b> The calling number is not in the softphone number range used by the mobile agent assigned by the tenant.</p> <p><b>16:</b> The agent-side number of the trial tenant is not in the trustlist.</p> <p><b>21:</b> The number of one-click bidirectional calls of the trial tenant exceeds the upper limit 10 per day.</p> <p>For details about the return codes for ITA bidirectional calls, see <a href="#">Table 6-362</a>.</p> |
| 1.2 | retMsg    | String | No               | Failure cause.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1.3 | result    | Object | No               | Result content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| No.   | Parameter    | Type   | Mandatory or Not | Description |
|-------|--------------|--------|------------------|-------------|
| 1.3.1 | callSerialNo | String | No               | Call SN.    |

**Table 6-362** Return codes for ITA bidirectional calls

| retcode  | retMsg                              | Description                                                                             |
|----------|-------------------------------------|-----------------------------------------------------------------------------------------|
| 90100100 | Invalid Input Parameter             | The request message is incorrect. For example, a parameter is missing or not supported. |
| 90100200 | Auth Failed                         | The request source or signature does not pass the verification.                         |
| 90100300 | Bad Request                         | The request is incorrect.                                                               |
| 90100400 | Not found                           | The requested resource does not exist.                                                  |
| 90100600 | Internal Server Error               | Internal system error.                                                                  |
| 90102001 | Insufficient Balance                | Insufficient balance.                                                                   |
| 90102002 | Request Restriction                 | Request restriction.                                                                    |
| 90104001 | Insufficient Permission             | Insufficient permission.                                                                |
| 90104003 | Request Forbidden                   | Request forbidden.                                                                      |
| 90104004 | Service Unavailable                 | The business function is not supported or implemented.                                  |
| 90104008 | Service Process Failure             | The business processing times out or fails.                                             |
| 90104029 | Too Many Requests                   | Too many requests.                                                                      |
| 90106001 | Binding relationship already exists | The number binding relationship exists.                                                 |
| 90106002 | Binding relationship not exists     | The number binding relationship does not exist.                                         |
| 90106003 | Insufficient Number resources       | The number resource pool is insufficient.                                               |
| 90106004 | No corresponding number found       | No available number is found.                                                           |
| 90106005 | Inconsistent binding data           | The number binding data is inconsistent.                                                |
| 90106006 | Other Error                         | An error occurs due to other number reasons.                                            |

| retcode  | retMsg        | Description                       |
|----------|---------------|-----------------------------------|
| 90106010 | Policy Forbid | Forbidden by policies.            |
| 90106011 | Caller Forbid | The calling number is restricted. |
| 90106012 | Callee forbid | The called number is restricted.  |

- Status code: 400**  
 Incorrect request. Check the request path and parameters.
- Status code: 401**  
 Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- Status code: 404**  
 The requested content is not found. Check the request path.
- Status code: 500**  
 Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: example message  
 Request header:  

```
x-app-key:9*****3
Authorization:Bearer 9*****7
Content-Type:application/json
```

 Request parameters:  

```
{
 "caller": 8888888,
 "softPhone": 66666666 "called": 6666614
}
```

 Response parameters:  

```
{
 "retMsg": "Called is not configured",
 "retCode": "5"
}
```

## 6.2.3 Querying Call History Records (queryCallDetailRecord)

### Scenario

This interface is invoked to view history records.

### Method

POST

## URI

<https://Domain name/apiaccess/CC-Management/v1/mobileAgent/queryCallDetailRecord> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 6-363** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID.                                                                                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-364** Request body parameters

| No. | Parameter | Type        | Mandatory or Not | Description              |
|-----|-----------|-------------|------------------|--------------------------|
| 1   | Body      | <b>Body</b> | No               | Request body parameters. |

**Table 6-365** Body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                       |
|-----|-----------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Body      | Object | No               | Request body.                                                                                                                                     |
| 1.1 | endTime   | String | Yes              | End time. The interval between the start and the end time cannot exceed seven days. The value is a timestamp, for example, <b>1572794607000</b> . |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                    |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2 | offset    | String | No               | Pagination query offset. The default value is <b>0</b> , indicating no offset. This parameter is optional.                                                                                                                     |
| 1.3 | limit     | String | No               | Page size for pagination query. The default value is <b>100</b> , indicating that 100 records are displayed on each page. This parameter is optional.                                                                          |
| 1.4 | startTime | String | Yes              | Start time. The value is a timestamp, for example, <b>1572794607000</b> .                                                                                                                                                      |
| 1.5 | caller    | String | No               | Calling number, which is optional. If this parameter is not set, all calling numbers are queried by default.<br>Length limit: string (32)                                                                                      |
| 1.6 | taskType  | String | No               | <b>0</b> : all types of tasks (except ITA bidirectional call tasks)<br><b>1</b> : CEC bidirectional call task<br><b>2</b> : anonymous outbound call task<br><b>3</b> : voice notification<br><b>4</b> : ITA bidirectional call |

## Response Description

- Status code: 200

**Table 6-366** Response body parameters

| No.     | Parameter    | Type           | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                        |

**Table 6-367** Reason codes for ITA bidirectional calls

| retCode | Description                         |
|---------|-------------------------------------|
| 0       | N/A                                 |
| 1       | The number cannot be found.         |
| 2       | Failed to route to the network.     |
| 3       | Failed to route to the destination. |
| 4       | Special messages are sent.          |
| 5       | Incorrect trunk prefix.             |
| 6       | The channel cannot be accessed.     |
| 7       | A channel has been created.         |
| 8       | Preemption.                         |
| 9       | Preemption reservation.             |
| 16      | Normal call clearance.              |
| 17      | The user is busy.                   |
| 18      | No answer.                          |
| 19      | No user answers the call.           |
| 20      | The user is unreachable.            |

| retCode | Description                           |
|---------|---------------------------------------|
| 21      | Call rejected.                        |
| 22      | The number has been changed.          |
| 23      | Redirection.                          |
| 25      | The switching route is incorrect.     |
| 26      | No user permission.                   |
| 27      | The target is disordered.             |
| 28      | Invalid number format.                |
| 29      | Rejected by the device.               |
| 30      | Status query.                         |
| 31      | Normal.                               |
| 34      | Unreachable route.                    |
| 38      | Poor network quality.                 |
| 39      | Service out of connection.            |
| 40      | Connecting.                           |
| 41      | Temporarily failed.                   |
| 42      | The device is congested.              |
| 43      | Discarded information.                |

- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Example

- Scenario: Query the information about the corresponding outbound call task.

Request header:

```
x-app-key:9*****3
Authorization:Bearer e*****e
Content-Type:application/json
```

Request parameters:

```
{
 "startTime": "1562786332000",
 "endTime": "1563391072000",
 "taskType": "0",
 "offset": 0,
 "limit": 10
}
```

Response header:

```
{
 "connection": "keep-alive",
 "content-type": "application/json;charset=UTF-8"
}
```

Response parameters:

```
{
 "result": {
 "total": 11,
 "callInfo": [{
 "releaseTime": 1621577022000,
 "called": "88889060",
 "callerPresent": "640003",
 "agentAlertingTime": 1621576992000,
 "agentPresent": "640060",
 "talkingTime": 1621576995000,
 "alertingTime": 1621576994000,
 "caller": "88889050",
 "agentTalkingTime": 1621576994000,
 "agentReleaseTime": 1621577022000,
 "agentTalkDuration": 27,
 "callSerialNo": "1037058396471308289",
 "startTime": 1621576992000,
 "endTime": 1621577022000,
 "talkDuration": 26,
 "state": 3,
 "reasonCode": 1
 }]
 },
 "retCode": "0",
 "retMsg": "Query call detail record successfully"
}
```

## 6.2.4 Querying Call Status (queryCallState)

### Scenario

This interface is invoked to query the call status.

## Method

POST

## URI

https://*Domain name*/apiaccess/CC-Management/v1/mobileAgent/queryCallState  
(For example, the domain name is service.besclouds.com.)

## Request Description

**Table 6-368** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID.                                                                                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-369** Request body parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                           |
|-----|--------------|--------|------------------|---------------------------------------|
| 1   | callSerialNo | String | Yes              | Call SN.<br>Length limit: string (50) |

## Response Description

- Status code: 200

**Table 6-370** Response body parameters

| No.   | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                           |

## Error Codes

None

## Example

- Scenario: Query call status.

Request header:

```
x-app-key:9*****3
Authorization:Bearer e*****e
Content-Type:application/json
```

Request parameters:

```
{
 "callSerialNo": "645735364434067472"
}
```

Response header:

```
{
 "connection": "keep-alive",
 "content-type": "application/json;charset=UTF-8"
}
```

Response parameters:

```
{
 "retMsg": "Query call state successfully",
 "retCode": "0",
 "result": {
 "caller": "88889050",
 "called": "88889060",
 "callerPresent": "640003",
 "startTime": 1621823865000,
 "state": 3,
 "reasonCode": 0,
 "agentPresent": "640060",
 "endTime": 1621823872000
 }
}
```

## 6.2.5 Obtaining the Recording File URL (getRecordingAddress)

### Scenario

This interface is invoked to obtain the recording URL.

### Method

POST

### URI

<https://{Domain name}/apiaccess/CC-Management/v1/mobileAgent/getRecordingAddress>, where, *{Domain name}* can be **service.besclouds.com**.

## Request Description

**Table 6-372** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | User ID, which is the same as the value of <b>app_key</b> in the tokenByAkSk interface request.                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the tokenByAkSk interface}</i> . (A space is required after <b>Bearer</b> .) |

**Table 6-373** Request body parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                           |
|-----|--------------|--------|------------------|---------------------------------------|
| 1   | callSerialNo | String | Yes              | Call SN.<br>Length limit: string (50) |

## Response Description

- Status code: 200

**Table 6-374** Response body parameters

| No.   | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Error Codes

None

## Example

- Scenario: example message

Request header:

```
x-app-key:9*****3
Authorization:Bearer c*****f
Content-Type:application/json
```

Request parameters:

```
{
 "offset": 0,
 "limit": 3
}
```

Response header:

```
{
 "connection": "keep-alive",
 "content-type": "application/json;charset=UTF-8"
}
```

Response parameters:

```
{
 "retMsg": "successfully",
 "retCode": "0",
 "result": {
 "total": 6,
 "regPort": "5060",
 "phone": [{
 "phoneNum": "999000",
 "password": "*****"
 },
 {
 "phoneNum": "999001",
 "password": "*****"
 },
 {
 "phoneNum": "999002",
 "password": "*****"
 }
]
},
 "regIPAddress": "10.10.18.36"
}
```

## 6.2.7 Querying Allocated Softphone Numbers (V2.0.0) (queryPhone)

### Scenario

This interface is invoked to query allocated softphone numbers.

### Method

POST

### URI

<https://Domain name/apiaccess/CC-Management/v2/mobileAgent/queryPhone>  
(For example, the domain name is service.besclouds.com.)

### Request Description

**Table 6-378** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID.                                                                                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-379** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                           |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | limit     | String | No               | Page size for pagination query. The default value is <b>100</b> , indicating that 100 records are displayed on each page. This parameter is optional. |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                |
|-----|-----------|--------|------------------|------------------------------------------------------------------------------------------------------------|
| 1   | offset    | String | No               | Pagination query offset. The default value is <b>0</b> , indicating no offset. This parameter is optional. |

## Response Description

- Status code: 200

**Table 6-380** Response body parameters

| No.     | Parameter     | Type           | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                        |

None

## Example

- Scenario: example message

Request header:

```
x-app-key:2*****8
Authorization:Bearer e*****5
Content-Type:application/json
```

Request parameters:

```
{
 "offset": 0,
 "limit": 3
}
```

Response parameters:

```
{
 "retMsg": "successfully",
 "retCode": "0",
 "result": {
 "total": 2,
 "regPort": "5060",
 "phone": [{
 "phoneNum": "88881196",
 "password": "****"
 }, {
 "phoneNum": "88881197",
 "password": "****"
 }
],
 "regIPAddress": "10.162.98.43"
}
```

## 6.2.8 Obtaining the Information About the Destination Device of a Call (getCalledInfo)

### Scenario

This interface is invoked to obtain call data.

### Method

POST

### URI

<https://{Domain name}/apiaccess/CC-Management/v1/mobileAgent/getCalledInfo>, where, {Domain name} can be **service.besclouds.com**.

### Request Description

**Table 6-381** Request header parameters

| No. | Parameter | Type   | Mandato ry or Not | Description                    |
|-----|-----------|--------|-------------------|--------------------------------|
| 1   | X-APP-Key | String | No                | App key, which is the user ID. |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-382** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                  |
|-----|-----------|--------|------------------|----------------------------------------------|
| 1   | called    | String | Yes              | Called number.<br>Length limit: string (32)  |
| 1   | caller    | String | Yes              | Calling number.<br>Length limit: string (32) |

## Response Description

- **Status code: 200**

**Table 6-383** Response body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                   |

## Error Codes

None

## Example

Request header:

```
x-app-key:9*****3
Authorization:Bearer 9*****7
```

Request parameters:

```
{
 "called": "8899",
 "playlist": [{
 "voiceId": "100001",
 "templateParams": ["100","200"]
 }],
 "playTimes": 1,
 "callerPresent": "2222201",
 "callBackUrl": "http://xx.xx.xx.xx:8800/callbackTest"
}
```

Response parameters:

```
{
 "retMsg": "Created successfully.",
 "retCode": "0",
 "result": {"callSerialNo": "1308434073450058757"}
}
```

## 6.2.11 Querying Contact Records (queryUserContactLimit)

### Scenario

This interface is invoked to query contact records.

### Method

POST

### URI

<https://Domain name/apiaccess/rest/workbench/v1/queryUserContactLimit> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 6-390 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID.                                                                                                                                            |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

Table 6-391 Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description |
|-----|-----------|--------|------------------|-------------|
| 1   | callId    | String | Yes              | Call ID.    |
| 2   | userId    | String | Yes              | User ID.    |
| 3   | tenantId  | String | Yes              | Tenant ID.  |

}
```

## 6.2.13 Sending an ITA Bidirectional Call Result Notification (statusnotify)

### Scenario

This interface is invoked by the ITA to push bidirectional call CDR data to the AICC after a call ends.

### Method

POST

### URI

<https://Domain name/apiaccess/rest/cc-management/v1/ita/twopartiescall/statusnotify> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 6-396 Request header parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                    |
|-----|-----------|--------|------------------|------------------------------------------------|
| 1   | AppKey    | String | No               | App key on the ITA side, which is the user ID. |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Host          | String | Yes              | Internet host and port number of the requested resource. <ul style="list-style-type: none"> <li>• <b>hostname</b> indicates the IP address or domain name of the AXB service.</li> <li>• <b>port</b> indicates the port number.</li> </ul> |
| 3   | Content-Type  | String | Yes              | Media type of the request body sent to the recipient (server).                                                                                                                                                                             |
| 4   | X-Sdk-Date    | String | Yes              | Time when a request is initiated.                                                                                                                                                                                                          |
| 5   | Authorization | String | Yes              | Authentication field. For details, see ITA documents.                                                                                                                                                                                      |

**Table 6-397** Request body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                               |
|-----|------------|--------|------------------|-----------------------------------------------------------------------------------------------------------|
| 1   | callID     | String | Yes              | Unique call ID, which is used to download recording files.                                                |
| 2   | remark     | String | Yes              | Remark when a call is initiated. This is a reserved field. (Currently, the value is the tenant space ID.) |
| 3   | startTime  | String | No               | Time when a call is initiated, accurate to seconds.<br>The format is <i>YYYYMMDDHHmmss</i> .              |
| 4   | finishTime | String | No               | Call end time.                                                                                            |

| No. | Parameter        | Type   | Mandatory or Not | Description                                                                                                                                |
|-----|------------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | callDuration     | String | No               | Call duration, in seconds. This parameter is for reference only.<br>The call duration is calculated from the time when the call is set up. |
| 6   | callerAnswerTime | String | No               | Time when the calling party answers the call.                                                                                              |
| 7   | calledAnswerTime | String | No               | Time when the called party answers the call.                                                                                               |
| 8   | releaseCause     | String | No               | Cause value carried by the call end event.                                                                                                 |
| 9   | appKey           | String | No               | Customer resource allocation ID.                                                                                                           |
| 10  | telA             | String | No               | Original calling number.                                                                                                                   |
| 11  | telX             | String | No               | Terminated service number.                                                                                                                 |

| 13  | calledDisplay    | String | No               | CLIP called number.                                                                                                                        |

## Response Description

- Status code: 200**  
 After the message is received, the system returns a 200 OK message. Ensure that the value of **Content-Type** in the response is **application/json; charset=UTF-8**.
- Status code: 400**  
 Incorrect request. Check the request path and parameters.
- Status code: 401**  
 Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- Status code: 404**  
 The requested content is not found. Check the request path.
- Status code: 500**  
 Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

Request example:

```
POST /twopartiescall/statusnotify HTTP/1.1
Request:
AppKey: CMCCGX_0001
X-Sdk-Date: 20210512T115430Z
Content-Type: application/json;charset=UTF-8
Host: 10.10.10.10:9003
Authorization: SDK-HMAC-SHA256 Access=1*****2F4J8Q5T, SignedHeaders=appkey;content-type;host;x-sdk-date, Signature=77c4*****62f48bcb4873e1d9ad9c1acc34b9b

{
 "appKey": "CMCCGX_0001",
 "remark": "2022091800",
 "telA": "1580****001",
 "telX": "184****0497",
 "telB": "158****0002",
 "calleeDisplay": "158****0001",

 "callDuration": 8
}
```

Response example:

```
HTTP/1.1 200 OK
Date: Mon, 12 Nov 2007 15:55:01 GMT
Content-Length: xxx
Content-Type: application/json; charset=UTF-8
{
}
```

## 6.2.14 Callback Interface

The CEC can call back the URL provided by a third-party system to push the current call event to the third-party system.

This chapter describes the specifications of requests sent by the CEC to third-party systems and responses returned by third-party systems to the CEC. When the CEC connects to a third-party system, the third-party system needs to develop interfaces based on specifications described in this chapter.

### 6.2.14.1 Callback Interface Description

- The connection callback URL of agent bidirectional calls can be configured only on the GUI. A tenant administrator can choose **Configuration Center > Expansion Management > Bidirectional Call** to set **Connection Callback URL**.
- The release callback URL for agent bidirectional calls can be configured using either of the following methods:

- a. Configuration on the GUI: A tenant administrator chooses **Configuration Center > Expansion Management > Bidirectional Call** to set **Hang-up Callback URL**.
- b. Configuration using the call creation interface (V1.0.0): The request parameter **callbackUrl** can be transferred when the call creation interface (V1.0.0) is invoked.

 **NOTE**

- For configuration of the release callback URL on the GUI, no URL authentication is performed. No authentication may cause security risks. Exercise caution when using this mode.
- If the release callback URL is configured using both methods, the value of **callbackUrl** transferred using the call creation interface (V1.0.0) is used.

## Description of the Agent Bidirectional Call Callback Interface Signature Algorithm

- **Signature algorithm (authentication) prerequisites**

The release callback URL has been transferred using the call creation interface (V1.0.0), and **Callback URL Authentication Mode** has been set to **Shared Key** on the callback URL configuration page.

- **Authentication procedure**

- a. When the system calls back the release callback URL, if the signing conditions are met, the following parameters are added to the input parameters of the interface:

**timestamp**: current timestamp

**nonce**: random string

**signature**: authentication signature

- b. After the customer receives the callback request, an authentication signature is generated based on the signature algorithm and will be verified based on the input parameter **signature**. The verification passes upon consistency.

- **Signature string generation method**

- a. Sort all request parameters (except **timestamp**, **nonce**, and **signature**) in alphabetical order based on the parameter name and combine them into a string using commas (.). For example, the parameters in **{"b":"2", "a":1, "d":"null", "c":""}** are sorted and combined into the string **"a=1,b=2,c=,d=null"**.
- b. Generate the values of **timestamp** (timestamp) and **nonce** (random string) and combine them with the value of **appSecret** (shared key configured on the GUI) and the string generated in **a** using underscores (\_). The format is **{Value of appSecret}\_{Value of timestamp}\_{Value of nonce}\_{String generated in a}**.
- c. Encrypt the value into a byte array using the SHA256 algorithm and encode the array using Base64.

- **Reference code**

```
import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;
```

```
private String generateSinature(TreeMap<String, Object> callbackParameters, String nonce, long
timestamp, String appSecret) {
 // {Value of appSecret}_{Value of timestamp}_{Value of nonce}_Parameters
 // Sort the parameters in {"b":"2", "a":1, "d":"null", "c":""} and combine them into the string
 "a=1,b=2,c=d=null".
 String paramStr = callbackParameters.toString().replace(" ", "");
 String toSignString = appSecret + "_" + timestamp + "_" + nonce + "_" +
 paramStr.substring(1, paramStr.length() - 1);
 return
 Base64.encodeBase64String(tokenByHmacSha256(toSignString.getBytes(StandardCharsets.UTF_8),
appSecret));
}

public static byte[] tokenByHmacSha256(byte[] dataBytes, String appSecret) {
 try {
 Mac mac = Mac.getInstance("HmacSHA256");
 byte[] key = appSecret.getBytes(StandardCharsets.UTF_8);
 SecretKeySpec secretKey = new SecretKeySpec(key, "HmacSHA256");
 mac.init(secretKey);return mac.doFinal(dataBytes);
 } catch (Exception e) {
 LOGGER.error("tokenByHmacSha256 failed: ", e);throw new RuntimeException("HmacSha256
run failed.");
 }
}
```

### 6.2.14.2 Call Status Event Callback

#### Scenario

This interface is invoked to push a call status event.

#### Method

POST

#### URL

The URL is customized by the customer.

The connection callback URL of bidirectional calls can be configured only on the GUI. A tenant administrator can choose **Configuration Center > Expansion Management > Bidirectional Call** to set **Connection Callback URL**.

#### Request Description

- Request header parameters  
None
- Request body parameters

**Table 6-398** Request body parameters

| No. | Parameter    | Type   | Mandat<br>ory or<br>Not | Description                              |
|-----|--------------|--------|-------------------------|------------------------------------------|
| 1   | callSerialNo | String | Yes                     | Call SN.<br>Length limit: string<br>(50) |

| No. | Parameter | Type   | Mandatory or Not | Description            |
|-----|-----------|--------|------------------|------------------------|
| 2   | serviceNo | String | Yes              | Agent ID.              |
| 3   | called    | String | Yes              | Customer phone number. |
| 4   | callData  | String | No               | Call data.             |

## Response Description

**Response code: 200**

- Response message

**Table 6-399** Response body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                            |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------------|
| 1   | retCode   | String | Yes              | Result code. The value <b>0</b> indicates success, and other values indicates failure. |
| 2   | retMsg    | String | Yes              | Description of a failure cause.                                                        |

## Example

Request parameters:

```
{
 callSerialNo=1197235857187927062,
 serviceNo=,
 called=88880067,
 callData=
}
```

Response parameters:

```
{
 "retCode": "0",
 "retMsg": "success"
}
```

### 6.2.14.3 Release Event Callback

#### Scenario

This interface is invoked to push a call release event.

#### Method

POST

#### URL

The URL is customized by the customer.

The release callback URL for bidirectional calls can be configured using either of the following methods:

- Configuration on the GUI: A tenant administrator chooses **Configuration Center > Expansion Management > Bidirectional Call** to set **Hang-up Callback URL**.
- Configuration using the bidirectional call creation interface (V1.0.0): The request parameter **callBackUrl** can be transferred when the call creation interface (V1.0.0) is invoked.

#### Request Description

- Request header parameters  
None
- Request body parameters

**Table 6-400** Request body parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                             |
|-----|---------------|--------|------------------|---------------------------------------------------------|
| 1   | callSerialNo  | String | Yes              | Call SN.<br>Length limit: string (50)                   |
| 2   | serviceNo     | String | Yes              | Agent ID.                                               |
| 3   | called        | String | Yes              | Customer phone number.                                  |
| 4   | caller        | String | No               | Phone number bound to the agent who initiates the call. |
| 5   | callerPresent | String | No               | CLIP number.                                            |
| 6   | callData      | String | No               | Call data.                                              |

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|-------------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | createCallTime    | String | No               | Time when a call is initiated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 8   | alertingTime      | String | No               | Ringing time of a subscriber.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 9   | talkingTime       | String | No               | Call connection time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 10  | releaseTime       | String | No               | Call release time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 11  | talkDuration      | String | No               | Call duration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 12  | recordfile        | String | No               | Path to the voice recording file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

}
```

## 6.3 Voice Recognition Result Subscription Interfaces

### NOTE

Before invoking a voice recognition result subscription interface, you need to perform the following operations:

- Contact the system administrator to enable the intelligent agent feature for the tenant space. Sign in to the AICC as a tenant administrator and enable the **Intelligent Recognition** feature on the  > **Call Center Configuration** > **Basic Information** page.
- Set **IF\_SUB\_CONFIGURE** to **ON** in the `/home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties` file on all CC-Gateway servers.

### 6.3.1 Subscription

#### Description

This interface is used by a third-party business client to send a subscription task registration request to the CTI platform of the call center so that third-party business client can receive event notifications from the CTI platform of the call center.

### NOTE

- The CC-Gateway address needs to be configured on the **Manage Subscription Server** page of the web configuration console.
- After this interface is successfully invoked, that is, the value of **retcode** is **0**, the handshake interface can be invoked to remain the subscription status.

#### Interface Method

This interface supports only the POST method.

#### URI

`https://IP:Port/agentgateway/resource/config/subscribe/register`

#### Method Name in Logs

register

#### Request Message

- Message header

**Table 6-402** Parameters in the message header

| No. | Parameter    | Value Type | Mandatory | Description                                                                                                                                |
|-----|--------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | String     | Yes       | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                             |
| 2   | Guid         | String     | Yes       | The value of <b>Guid</b> is that returned through the interface in <a href="#">4.6 C5 Intelligent Auxiliary Interface Authentication</a> . |

- Message body

**Table 6-403** Parameters in the message body

| No. | Parameter     | Value Type | Mandatory | Description                                              |
|-----|---------------|------------|-----------|----------------------------------------------------------|
| 1   | subscribeType | String     | Yes       | Subscription type.<br>1: recognition<br>Others: reserved |

This parameter needs to be set only when <b>nlpFlag</b> is set to <b>true</b>.</p>                                                                                                                                                                                             |

## Response Message

**Table 6-404** Parameters in the message body

| No. | Parameter | Value Type | Description       |
|-----|-----------|------------|-------------------|
| 1   | message   | String     | Returned message. |

| No. | Parameter | Value Type | Description                                                                                                                                                                                             |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | retcode   | String     | Result cause code.<br>The value is an integer. <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Others: failure. For details, see <a href="#">6.3.7 Error Code Definition</a>.</li> </ul> |
| 3   | result    | Object     | Returned result. For details about the parameters of this object, see <a href="#">Table 6-405</a> .                                                                                                     |

**Table 6-405** Parameter of the result object

| No. | Parameter | Value Type | Description                                                                                                                                                                   |
|-----|-----------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.1 | serverId  | String     | Subscription task ID returned by the CTI platform upon successful subscription based on the subscription request sent from a third-party business client to the CTI platform. |

## Example

- **Message header**  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- **Request parameter**  

```
{
 "subscribeType": "1",
 "serviceToken": "3320EA1E*****8E336ED638",
 "serviceCallBackUri": "https://10.10.10.1:8080/rest/cc-ai/nlrresult",
 "nlpFlag": "true",
 "flowAccessCode": "801166010768953344"
}
```
- **Response parameter**  

```
{
 "result": {
 "serverId": "20140414172508-001-00101"
 },
 "message": "success",
 "retcode": "0"
}
```

## 6.3.2 Subscription Modification

### Description

This interface is used by a third-party business client to modify a subscription task.

### Interface Method

This interface supports only the POST method.

### URI

https://IP:Port/agentgateway/resource/config/subscribe/modify?serverId=xxx

**Table 6-406** Parameter in the URI

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                       |
|-----|-----------|------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | serverId  | string     | Yes       | ID of an existing subscription task on the CTI platform, that is, subscription task ID returned by the CTI platform to a third-party business client upon successful subscription.<br>This parameter cannot be left empty or set to <b>null</b> . |

### Method Name in Logs

modify

### Request Message

| No. | Parameter          | Value Type | Mandatory | Description                                                                          |
|-----|--------------------|------------|-----------|--------------------------------------------------------------------------------------|
| 1   | serviceCallBackUri | string     | Yes       | Event notification callback address. The value contains a maximum of 200 characters. |
| 2   | nlpFlag            | boolean    | Mandatory | Whether Natural Language Processing (NLP) is used.                                   |
| 3   | flowAccessCode     | string     | Optional  | Flow access code.                                                                    |

## Response Message

**Table 6-409** Parameters in the message body

| No. | Parameter | Value Type | Description       |
|-----|-----------|------------|-------------------|
| 1   | message   | string     | Returned message. |

| No. | Parameter | Value Type | Description                                                                                                                                                                                             |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | retcode   | string     | Result cause code.<br>The value is an integer. <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Others: failure. For details, see <a href="#">6.3.7 Error Code Definition</a>.</li> </ul> |
| 3   | result    | object     | Returned result. For details about the parameters of this object, see <a href="#">Table 6-410</a> .                                                                                                     |

**Table 6-410** Parameter of result

| No. | Parameter | Value Type | Description                                                                                                                                                                   |
|-----|-----------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.1 | serverId  | string     | Subscription task ID returned by the CTI platform upon successful subscription based on the subscription request sent from a third-party business client to the CTI platform. |

## Example

- **Message header**  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- **Request parameter**  

```
{
 "serviceCallBackUri": "https://10.10.10.1:8080/rest/cc-ai/nlrresult",
 "nlpFlag": "true",
 "flowAccessCode": "801166010768953344"
}
```
- **Response parameter**  

```
{
 "message": "success",
 "retcode": "0"
}
```

## 6.3.3 Unsubscription

### Description

This interface is used by a third-party business client to unregister a subscription task.

### Interface Method

This interface supports only the PUT method.

### URI

https://IP:Port/agentgateway/resource/config/subscribe/unregister

### Method Name in Logs

unregister

### Request Message

- Message header

**Table 6-411** Parameters in the message header

| No. | Parameter    | Value Type | Mandatory | Description                                                                                                                                |
|-----|--------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes       | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                             |
| 2   | Guid         | string     | Yes       | The value of <b>Guid</b> is that returned through the interface in <a href="#">4.6 C5 Intelligent Auxiliary Interface Authentication</a> . |

- Message body

**Table 6-412** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                           |
|-----|-----------|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
{  
  "serverId": "20140414172508-001-00101"  
}
- Response parameter  
{  
  "message": "success",

```
"retcode": "0"
}
```

## 6.3.4 Handshake

### Description

This interface is used by a third-party client to send heartbeat messages to the CTI platform of the call center to remain the validity of a subscription task. If the CTI platform of the call center does not detect any heartbeat message within five minutes, it invalids the subscription task. Then the client needs to send a subscription request to the CTI platform of the call center again.

It is recommended that a third-party business client send a heartbeat message to the CTI platform of the call center every two minutes.

### Interface Method

This interface supports only the GET method.

### URI

<https://IP:Port/agentgateway/resource/config/subscribe/handshake/{serviceid}>

**Table 6-414** Parameter in the URI

 "retcode": "0"
}
```

## 6.3.5 Handshake (Extended)

### Description

This interface is used by a third-party client to send heartbeat messages to the CTI platform of the call center to remain the validity of a subscription task. If the CTI platform of the call center does not detect any heartbeat message within five minutes, it invalids the subscription task. Then the client needs to send a subscription request to the CTI platform of the call center again.

It is recommended that a third-party business client send a heartbeat message to the CTI platform of the call center every two minutes.

The handshake interface contains the `service_token` header field and is changed to support the POST method. Other information is the same as that in the handshake.

### Interface Method

This interface supports only the POST method.

### URI

`https://IP:Port/agentgateway/resource/config/subscribe/handshake/{serviceid}`

**Table 6-417** Parameter in the URI

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                           |
|-----|-----------|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| No. | Parameter | Value Type | Description                                                                                                                                                                                                    |
|-----|-----------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Returned message.                                                                                                                                                                                              |
| 2   | retcode   | string     | Result cause code.<br>The value is an integer. <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Others: failure. For details, see <a href="#">6.3.7 Error Code Definition</a>.</li> </ul> |

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None

- Response parameter

```
{
 "message": "success",
 "retcode": "0"
}
```

## 6.3.6 Recognition Result Notification

### Description

After a third-party business client registers a subscription task with the CTI platform, this interface is used by the CTI platform to report recognition results to the third-party business client. The invoking party is the OpenProxy of the CTI platform, and the receiving party is the CC-AI of the AICC.

### Interface Method

This interface supports only the POST method.

### URI

The format of the URI for the CTI platform of the call center to invoke the recognition result notification interface is as follows:

{servicecallbackuri}/v100/subscribe/asrevent/asresult (In the format, **servicecallbackuri** indicates the event notification callback address during registration.)

Example: https://10.21.117.9:8043/agentgateway/resource/asresult/v100/subscribe/asrevent/asresult

A third-party business client needs to enable the function of receiving messages from this address.

### Request Message

- Message header

**Table 6-420** Parameters in the message header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                                                               |
|-----|---------------|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                            |
| 2   | service_token | String     | Yes       | Authentication token, which is generated in <a href="#">6.3.1 Subscription</a> , for example, <b>3320EA1E5E*****7112A68E336ED638</b> .<br>The value contains a maximum of 256 characters. |

- Message body

**Table 6-421** Parameters for sending the recognition result notification

| No. | Parameter      | Value Type | Mandatory | Description                                                                                                                                                                                     |
|-----|----------------|------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | serverid       | String     | Yes       | Subscription task ID reported by the CTI platform to a third-party business client.                                                                                                             |
| 2   | subscribetype  | String     | Yes       | Type of the reported subscription event. <ul style="list-style-type: none"> <li>• <b>1:</b> recognition</li> <li>• Others: reserved</li> </ul> Currently, only the value <b>1</b> is supported. |
| 3   | initialagentid | String     | Yes       | Agent ID of the control party, that is, ID of the agent to whom an inbound call is made or ID the agent who initiates an outbound call.                                                         |
| 4   | ccid           | String     | Yes       | ID of the CTI platform of the call center to which the current agent belongs.                                                                                                                   |
| 5   | vdnid          | String     | Yes       | ID of the VDN to which the current agent belongs.                                                                                                                                               |
| 6   | curcallid      | String     | Yes       | ID of the current call.                                                                                                                                                                         |

| No. | Parameter  | Value Type | Mandatory | Description                                                                                                                                                                                                                                       |
|-----|------------|------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | curuserdn  | String     | Yes       | Phone number of the subscriber who is talking with the current agent. If the call is made between agents, leave this parameter empty.                                                                                                             |
| 8   | talkertype | String     | Yes       | Current speaker type. <ul style="list-style-type: none"> <li>• 1: agent</li> <li>• 2: subscriber</li> </ul>                                                                                                                                       |
| 9   | talkerid   | String     | Yes       | Current speaker ID. <ul style="list-style-type: none"> <li>• When <b>talkertype</b> is set to 1, this parameter indicates the agent ID.</li> <li>• When <b>talkertype</b> is set to 2, this parameter indicates the subscriber number.</li> </ul> |
| 10  | nlpResult  | Object     | No        | Analysis results. For details about the parameters of this object, see <a href="#">Table 6-422</a> .                                                                                                                                              |

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----|-----------|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11  | result    | Array      | Yes       | <p>Recognition result content. The value is an array. The parameters of this array are described as follows:</p> <ul style="list-style-type: none"> <li>• <b>confidence:</b> credibility of a valid recognition result.</li> <li>• <b>content:</b> content of a recognition result.</li> <li>• <b>iscontentenc:</b> indicates whether to encrypt a recognition result. <ul style="list-style-type: none"> <li>- <b>0:</b> no</li> <li>- <b>1:</b> yes</li> </ul> </li> </ul> |

| No. | Parameter   | Value Type | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 107-040              | Failed to delete the IVR service process.                                     |
| 107-041              | Failed to add the system VDN.                                                 |
| 107-042              | Failed to modify the system VDN.                                              |
| 107-043              | Failed to query the system VDN.                                               |
| 107-044              | Failed to delete the system VDN.                                              |
| 107-045              | Failed to delete the system VDN because the VDN ID and VDN name do not match. |
| 107-107 –<br>107-109 | Used by ConfigProxy of the ipccbase.                                          |
| 107-064              | Failed to add UAP multimedia users.                                           |
| 107-065              | Failed to query UAP multimedia users.                                         |
| 107-066              | UAP configuration exception.                                                  |
| 107-067              | Failed to change UAP multimedia user passwords.                               |
| 107-068              | Failed to delete UAP multimedia users.                                        |
| 107-069              | Failed to query the UAP user registration status.                             |
| 107-070              | Failed to deregister UAP users.                                               |
| 107-071              | The UAP user number is left blank.                                            |
| 107-072              | The UAP user number is invalid.                                               |
| 107-073              | The IP address is left blank.                                                 |
| 107-074              | The password is left blank.                                                   |
| 107-075              | The password length is out of range.                                          |
| 107-076              | The password is different from the confirm password                           |
| 107-077              | The IP address type is not supported.                                         |
| 107-078              | The length of the start number is different from that of the end number.      |
| 107-079              | The end number is smaller than the start number.                              |

| Error Code | Description                                                                           |
|------------|---------------------------------------------------------------------------------------|
| 107-080    | The number quantity exceeds the upper limit.                                          |
| 107-081    | Failed to verify the VDN permission, or the user number is not included in the VDN.   |
| 107-082    | Failed to sign in to the UAP, or disconnection from the UAP.                          |
| 107-083    | Failed to send MML commands.                                                          |
| 107-084    | Failed to obtain the product type.                                                    |
| 107-085    | The product type cannot be identified.                                                |
| 107-086    | Call prefixes are not configured for some numbers.                                    |
| 107-087    | The number you want to deregister is not registered.                                  |
| 107-088    | Failed to add the rest reason code.                                                   |
| 107-089    | Failed to modify the rest reason code.                                                |
| 107-090    | Failed to query the rest reason code.                                                 |
| 107-091    | Failed to delete the rest reason code.                                                |
| 107-092    | Either the intelligent recognition or dual-channel recording function can be enabled. |
| 107-093    | The parameter for adding or modifying a skill queue is invalid.                       |
| 107-094    | The value of <b>authFlag</b> is abnormal.                                             |
| 107-095    | The input parameter is invalid and exceeds the value range.                           |

 NOTE

For error codes returned by the CTI platform, see the following sections.

### 6.3.7.2 Common Voice Recognition Result Subscription Interface Error Codes

| Error Code | Description                                                                                 |
|------------|---------------------------------------------------------------------------------------------|
| 0          | The configuration interface is invoked successfully.                                        |
| 107-000    | Failed to cache sign-in information and sign-in authentication needs to be performed again. |
| 107-001    | An exception occurs when the configuration interface is invoked.                            |
| 107-002    | Invalid input parameter. Mandatory parameters are empty.                                    |
| 107-003    | The administrator password is incorrect and the account is locked after multiple retries.   |
| 107-004    | Invalid administrator account.                                                              |

| Error Code | Description                                                               |
|------------|---------------------------------------------------------------------------|
| 107-005    | Failed to invoke the configuration interface.                             |
| 107-007    | Authentication fails before interface configuration.                      |
| 107-026    | Subscription failed.                                                      |
| 107-027    | Subscription registration failed.                                         |
| 107-028    | Subscription request failed.                                              |
| 107-029    | The subscription request times out.                                       |
| 107-030    | Subscription exception.                                                   |
| 107-031    | Failed to deregister the subscription.                                    |
| 107-032    | Subscription handshake failed.                                            |
| 107-049    | Failed to obtain the flow access code for sending the recognition result. |
| 107-050    | Failed to obtain the service token for sending the recognition result.    |
| 107-051    | Invalid service token for sending the recognition result.                 |
| 107-052    | Failed to send the recognition result.                                    |
| 107-053    | Invalid request for sending the recognition result.                       |
| 107-054    | The recognition result sending request times out.                         |
| 107-055    | ODFS session initialization exception.                                    |
| 107-056    | ODFS session interaction exception.                                       |
| 107-057    | ODFS disconnection.                                                       |

### 6.3.7.3 Common Error Codes Returned by the CTI Platform

**Table 6-428** Common error codes returned by the CTI platform

| Error Code | Description                                     |
|------------|-------------------------------------------------|
| 120000     | Interface error.                                |
| 120001     | The maximum number for batch processing is 500. |
| 120002     | The configuration already exists.               |
| 120003     | The configuration does not exist.               |
| 120004     | Reached the upper limit.                        |
| 120005     | Configuration item authentication failed.       |

|        |                                                |
|--------|------------------------------------------------|
| 120006 | The number of threads has reached the maximum. |
|--------|------------------------------------------------|

### 6.3.7.4 VDN Configuration Interface Error Codes Returned by the CTI Platform

Table 6-429 Agent

| Error Code | Description                                                                       |
|------------|-----------------------------------------------------------------------------------|
| 120601     | The username of the default VDN administrator cannot be changed.                  |
| 120602     | The password of the default VDN administrator cannot be changed.                  |
| 120603     | The role of the default VDN administrator cannot be changed.                      |
| 120604     | The agent is the default VDN administrator and cannot be deleted.                 |
| 120605     | The agent is a group leader and cannot be deleted.                                |
| 120606     | The agent is referenced by a flow and cannot be deleted.                          |
| 120607     | The agent is referenced by the default private skill queue and cannot be deleted. |
| 120608     | The agent is referenced by a skill queue and cannot be deleted.                   |
| 120609     | The agent is referenced by another agent and cannot be deleted.                   |
| 120610     | The agent group referenced by the agent does not exist.                           |
| 120611     | The skill queue referenced by the agent does not exist.                           |
| 120612     | The skill group referenced by the agent does not exist.                           |
| 120613     | The agent role referenced by the agent does not exist.                            |
| 120614     | Another agent referenced by the agent does not exist.                             |
| 120615     | The flow referenced by the agent does not exist.                                  |
| 120616     | The called party configuration referenced by the agent does not exist.            |
| 120617     | The disk referenced by the agent does not exist.                                  |
| 120618     | The agent ID cannot be the same as the group leader ID.                           |
| 120619     | The agent ID must be unique.                                                      |
| 120620     | The agent password is shorter than the minimum password length {0}.               |

| Error Code | Description                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 120621     | The password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, and other characters. In addition, the password cannot be the same as the username or its reverse. |
| 120622     | The agent is a group leader and cannot switch to another group.                                                                                                                                                              |
| 120627     | Either the ASR or dual-channel recording function can be enabled.                                                                                                                                                            |

**Table 6-430** Role

| Error Code | Description                                                     |
|------------|-----------------------------------------------------------------|
| 123051     | The agent role name must be unique.                             |
| 123052     | The agent role is referenced by an agent and cannot be deleted. |
| 123053     | The agent role is the default role and cannot be changed.       |

**Table 6-431** Skill Queue

| Error Code | Description                                                                             |
|------------|-----------------------------------------------------------------------------------------|
| 120952     | The media type of the skill queue is email, which is not allowed.                       |
| 120953     | The skill element of the skill queue must be unique.                                    |
| 120954     | The business type referenced by the skill queue does not exist.                         |
| 120955     | Another skill queue referenced by the skill queue does not exist.                       |
| 120956     | The agent referenced by the skill queue does not exist.                                 |
| 120957     | The flow referenced by the skill queue does not exist.                                  |
| 120958     | The called party configuration referenced by the skill queue does not exist.            |
| 120959     | The skill queue is referenced by the default private skill queue and cannot be deleted. |
| 120960     | The skill queue is referenced by another skill queue and cannot be deleted.             |
| 120961     | The skill queue is referenced by a CDN and cannot be deleted.                           |
| 120962     | The skill queue is referenced by a customer group and cannot be deleted.                |
| 120963     | The skill queue is referenced by an agent and cannot be deleted.                        |

| Error Code | Description                                                                                          |
|------------|------------------------------------------------------------------------------------------------------|
| 120964     | The skill queue is referenced by a flow and cannot be deleted.                                       |
| 120965     | The skill queue is referenced by a called party configuration and cannot be deleted.                 |
| 120966     | The disk referenced by the skill queue does not exist.                                               |
| 120967     | No email address or mailbox user is configured for the skill queue media of the fax call type.       |
| 120968     | The minimum call completion rate of the skill queue cannot exceed the expected call completion rate. |
| 120969     | The skill queue is referenced by an ACDDN and cannot be deleted.                                     |
| 120970     | The skill queue is referenced by a shared device and cannot be deleted.                              |
| 120971     | The skill queue is referenced by a skill group and cannot be deleted.                                |
| 120972     | The sub-media type referenced by the skill queue does not exist.                                     |
| 123001     | The name of the skill element must be unique.                                                        |
| 123002     | The skill element does not exist.                                                                    |
| 123003     | The skill element is referenced by a skill queue and cannot be deleted.                              |
| 123004     | The skill element is referenced by a skill queue and cannot be renamed.                              |
| 120901     | The description of the business type must be unique.                                                 |
| 120902     | The business type is referenced by a flow and cannot be deleted.                                     |
| 120903     | The business type is referenced by a skill queue and cannot be deleted.                              |
| 120904     | The business type is referenced by the standard working time and cannot be deleted.                  |
| 120905     | The disk referenced by the business type does not exist.                                             |

**Table 6-432** Called Party Configuration

| Error Code | Description                                                                          |
|------------|--------------------------------------------------------------------------------------|
| 120651     | The system access code contained in the called party configuration is not allocated. |

| Error Code | Description                                                                                                                      |
|------------|----------------------------------------------------------------------------------------------------------------------------------|
| 120652     | The combination of the system access code and subsequent access code contained in the called party configuration must be unique. |
| 120655     | The access code referenced by the called party configuration does not exist.                                                     |
| 120656     | The skill queue referenced by the called party configuration does not exist.                                                     |
| 120658     | The media type of the access code of an IVR device can only be click-to-dial (CTD), callback request, or common call.            |
| 120659     | The routing script referenced by the called party configuration does not exist.                                                  |
| 120660     | The system access code contained in the called party configuration does not match the media type of the called party device.     |
| 120661     | The called party configuration is referenced by the default private skill queue and cannot be deleted.                           |
| 120662     | The called party configuration is referenced by a skill queue and cannot be deleted.                                             |
| 120663     | The called party configuration is referenced by an agent and cannot be deleted.                                                  |

**Table 6-433** IVR

| Error Code | Description                                                 |
|------------|-------------------------------------------------------------|
| 120216     | The IVR and CCIVR cannot be changed to each other.          |
| 120217     | One IP address can be configured for a maximum of 20 IVRs.  |
| 120219     | The IVR is referenced by a VDN and cannot be deleted.       |
| 120220     | The IVR is referenced by a VDN group and cannot be deleted. |
| 120221     | The parameter group referenced by the IVR does not exist.   |
| 120222     | The CTI node referenced by the IVR does not exist.          |
| 120763     | The access code of the flow is duplicate.                   |
| 120764     | The flow description is duplicate.                          |

### 6.3.7.5 System Configuration Interface Error Codes Returned by the CTI Platform

**Table 6-434** VDN

| Error Code | Description                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 120501     | The number of agents who concurrently sign in exceeds the maximum.                                                                               |
| 120502     | The number of concurrent voice calls exceeds the maximum.                                                                                        |
| 120503     | The number of concurrent web calls exceeds the maximum.                                                                                          |
| 120504     | The number of concurrent outbound calls exceeds the maximum.                                                                                     |
| 120505     | The number of CP conference participants exceeds the maximum.                                                                                    |
| 120506     | The number of video agents who concurrently sign in exceeds the maximum.                                                                         |
| 120507     | The calling number cannot have any inclusion relationship.                                                                                       |
| 120508     | The calling number prefix cannot be empty.                                                                                                       |
| 120509     | By default, the calling number starts with the restricted prefix.                                                                                |
| 120510     | The VDN name must be unique.                                                                                                                     |
| 120511     | The VDN name cannot be the same as the VDN group name.                                                                                           |
| 120512     | The agent ID range of the VDN cannot be the same as that of another VDN.                                                                         |
| 120513     | The OBS referenced by the VDN does not exist.                                                                                                    |
| 120514     | The distributed resource referenced by the VDN does not exist.                                                                                   |
| 120515     | The data source referenced by the VDN does not exist.                                                                                            |
| 120516     | The IVR referenced by the VDN does not exist.                                                                                                    |
| 120517     | If no recording system is specified in the basic RMS information configuration, only Huawei ACD recording can be configured for the current VDN. |
| 120519     | The distributed node used for VDN forcible self-recording is not allocated to the VDN.                                                           |
| 120520     | The system access code referenced by the VDN does not exist.                                                                                     |

| Error Code | Description                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 120521     | The VDN does not support the email and fax call types, but system access codes of the email or fax call type are allocated to the VDN.                                    |
| 120522     | The VDN does not support the web call type, but system access codes of the web call type are allocated to the VDN.                                                        |
| 120523     | The system access code allocated to the VDN has been allocated to another VDN.                                                                                            |
| 120524     | The system access code allocated to the VDN has been allocated to a VDN group.                                                                                            |
| 120525     | The IVR data source is not any VDN or third-party data source allocated to the VDN.                                                                                       |
| 120526     | The default IVR data source is not any VDN or third-party data source allocated to the VDN.                                                                               |
| 120527     | The VDN is referenced by the local CCP client and cannot be deleted.                                                                                                      |
| 120528     | After agent hang-up transfer is enabled, a prompt tone needs to be played after a call is transferred back to an agent. Therefore, the prompt tone parameter must be set. |
| 120529     | The VDN administrator ID must be within the configured agent ID range.                                                                                                    |
| 120530     | The drive letter referenced by the VDN does not exist.                                                                                                                    |
| 120531     | The access code in the basic VDN information is not allocated to the VDN.                                                                                                 |
| 120533     | The agent ID range of the VDN must be unique.                                                                                                                             |
| 120534     | The CCS resource group referenced by the VDN does not exist.                                                                                                              |
| 120535     | The agent ID range is in use and cannot be canceled.                                                                                                                      |
| 120536     | The length of the available VDN cannot be 0.                                                                                                                              |
| 120537     | The available VDNs cannot contain transferred-to VDNs.                                                                                                                    |
| 120538     | The number of transferable agent IDs is insufficient.                                                                                                                     |
| 120539     | Invalid multimedia license type.                                                                                                                                          |
| 120540     | The multimedia license value is out of range.                                                                                                                             |
| 120541     | The maximum number of concurrent calls that can be handled by an agent ranges from 1 to 60.                                                                               |
| 120624     | The new VDN interconnection password is the same as the old password.                                                                                                     |

**Table 6-435** Access code

| Error Code | Description                                                                     |
|------------|---------------------------------------------------------------------------------|
| 120201     | The system access code must be unique.                                          |
| 120202     | The system access code is the same as a special routing access code.            |
| 120203     | The system access code is the same as the network call access code of the NIRC. |
| 120204     | The system access code is referenced by a VDN and cannot be deleted.            |
| 120205     | The system access code is referenced by a VDN group and cannot be deleted.      |

### 6.3.7.6 Error Code Returned by UAP

**Table 6-436** Error code returned by UAP

| Error Code | Description                                                     |
|------------|-----------------------------------------------------------------|
| 500-100    | The format of the softphone number is incorrect.                |
| 500-101    | The signaling IP address or password is invalid.                |
| 500-102    | The signaling IP address does not exist                         |
| 500-103    | The password does not meet complexity requirements.             |
| 500-104    | The subscriber already exists.                                  |
| 500-105    | An internal error occurs when the UAP executes the MML command. |
| 500-106    | The subscriber number is not created.                           |
| 500-107    | The subscriber number is not found.                             |

### 6.3.8 Role Permission Bit Description

The agent role permission bits are described as follows:

- 1: busy showing or idle showing
- 2: muting or unmuting
- 3: call holding or call holding cancellation
- 4: connection holding

- 5: common outbound call
- 6: internal call
- 7: internal transfer
- 8: transferred call answering
- 9: three-party call
- 10: transfer-out
- 11: manual-to-automatic
- 12: no answer
- 13: call listening or break in
- 14: call interception
- 15: forcible sign-out, busy showing, or idle showing
- 16: QC inspection recording or voice playback
- 17: QC inspection monitoring
- 18: appraisal administrator
- 19: common appraiser
- 20: alarm console
- 21: report processing personnel
- 22: discarded
- 23: monitoring console
- 24: configuration administrator
- 25: report administrator
- 26: national outbound toll call
- 27: international outbound toll call
- 28: outbound call initiated from the local call center access code
- 29: full-screen QC inspection
- 30: call pick-up by agents in a same group
- 31: discarded
- 32: configuration agent
- 33: configuration skill
- 34: input of the calling number of an outbound call not allowed
- 35: configuration audit

## 6.4 App Personal Settings

### 6.4.1 Creating App Personal Settings (create)

#### Scenario

This interface provided by the AICC is invoked to create app personal settings for the AppCube.

## Method

POST

## URI

https://{Domain name}/apiaccess/CC-Management/v1/openapp/agentsettings/create, where, *Domain name* can be **service.besclouds.com**.

## Request Description

**Table 6-437** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                      |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | Yes              | App key, which is the user ID.                                                                                                                                                   |
| 2   | Authorization | String | No               | Authentication field. The format is <b>Bearer</b> (space){Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-438** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                           |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------------------------------|
| 1   | callType  | String | No               | Call type.<br><b>0</b> : direct call<br><b>1</b> : bidirectional call<br><b>2</b> : pass-through call |
| 2   | userId    | String | Yes              | User ID.<br>Value of <b>USER_ID</b> in the <b>t_aicc_pub_appcube_user</b> table.                      |

| No. | Parameter            | Type     | Mandatory or Not | Description                                                                                                                                                              |
|-----|----------------------|----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | callerPresent        | String[] | No               | Display number of the called party.<br>A maximum of five numbers are displayed. Use commas (,) to separate multiple numbers.<br>Length limit of each number: string (15) |
| 4   | callNumber           | String[] | No               | Agent softphone number.<br>A maximum of five numbers are displayed. Use commas (,) to separate multiple numbers.<br>Length limit of each number: string (15)             |
| 5   | callNumberDefault    | String   | No               | Default softphone number bound to the agent.<br>Length limit: string (15)                                                                                                |
| 6   | callerPresentDefault | String   | No               | Default display number of the called party.<br>Length limit: string (15)                                                                                                 |

## Response Description

- Status code: 200

**Table 6-439** Response body parameters

| No. | Parameter | Type   | Mandatory or Not | Description     |
|-----|-----------|--------|------------------|-----------------|
| 1   | id        | String | No               | Primary key ID. |

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                     |
|-----|------------|--------|------------------|-------------------------------------------------------------------------------------------------|
| 2   | returnCode | String | Yes              | <ul style="list-style-type: none"> <li>● 0: success</li> <li>● Other values: failure</li> </ul> |
| 3   | returnDesc | String | No               | Response result description.                                                                    |

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

Request header:

```
x-app-key:9*****3
Authorization:Bearer e*****e
Content-Type:application/json
```

Request parameters:

```
{
 "callType": "1",
 "userId": "1660270845627002401",
 "callerPresent": ["12323", "232232", "12323", "12323"],
 "callNumber": ["12323", "232343", "233", "232343"],
 "callNumberDefault": "23232323",
 "callerPresentDefault": "1212121212"
}
```

Response header:

```
{
 "connection": "keep-alive",
 "content-type": "application/json;charset=UTF-8"
}
```

Response parameters:

```
{
 "returnCode": "0",
 "returnDesc": "The AgentSettings created successfully.",
 "id": "1307145259662215169"
}
```

## 6.4.2 Updating App Personal Settings (update)

### Scenario

This interface provided by the AICC is invoked to update app personal settings for the AppCube.

### Method

POST

### URI

https://{Domain name}/apiaccess/CC-Management/v1/openapp/agentsettings/update, where, {Domain name} can be **service.besclouds.com**.

### Request Description

**Table 6-440** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                      |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | Yes              | App key, which is the user ID.                                                                                                                                                   |
| 2   | Authorization | String | No               | Authentication field. The format is <b>Bearer</b> (space){Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-441** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 1   | id        | String | Yes              | Primary key ID. Value of the response body parameter ID in <a href="#">6.4.1 Creating App Personal Settings (create)</a> . |

| No. | Parameter            | Type     | Mandatory or Not | Description                                                                                                                                                              |

## 6.4.3 Querying App Personal Settings (query)

### Scenario

This interface provided by the AICC is invoked to query app personal settings for the AppCube.

### Method

POST

### URI

<https://{Domain name}/apiaccess/CC-Management/v1/openapp/agentsettings/query>, where, *{Domain name}* can be **service.besclouds.com**.

### Request Description

**Table 6-443** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                               |
|-----|---------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | Yes              | App key, which is the user ID.                                                                                                                                                            |
| 2   | Authorization | String | No               | Authentication field. The format is <b>Bearer</b> (space) <i>{Value of <b>AccessToken</b> returned by the <b>tokenByAkSk</b> interface}</i> . (A space is required after <b>Bearer</b> .) |

**Table 6-444** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                      |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------|
| 1   | userId    | String | Yes              | User ID.<br>Value of <b>USER_ID</b> in the <b>t_aicc_pub_appcube_user</b> table. |

## Response Description

- **Status code: 200**

**Table 6-445** Response body parameters

| No. | Parameter     | Type     | Mandatory or Not | Description                                                                                                                                                              |
|-----|---------------|----------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | id            | String   | No               | Primary key ID.                                                                                                                                                          |
| 2   | callType      | String   | No               | Call type.<br><b>0</b> : direct call<br><b>1</b> : bidirectional call<br><b>2</b> : pass-through call                                                                    |
| 3   | callerPresent | String[] | No               | Display number of the called party.<br>A maximum of five numbers are displayed. Use commas (,) to separate multiple numbers.<br>Length limit of each number: string (15) |
| 4   | callNumber    | String[] | No               | Agent softphone number.<br>A maximum of five numbers are displayed. Use commas (,) to separate multiple numbers.<br>Length limit of each number: string (15)             |

| No. | Parameter            | Type   | Mandatory or Not | Description                                                                                            |
|-----|----------------------|--------|------------------|--------------------------------------------------------------------------------------------------------|
| 5   | userId               | String | No               | User ID<br>Value of <b>SUM_USER_ID</b> in the <b>t_aicc_pub_appcube_user</b> table.                    |
| 6   | callNumberDefault    | String | No               | Default softphone number bound to the agent.<br>Length limit: string (15)                              |
| 7   | callerPresentDefault | String | No               | Default display number of the called party.<br>Length limit: string (15)                               |
| 8   | agentName            | String | No               | Business account bound to an agent.                                                                    |
| 9   | returnCode           | String | Yes              | <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> |
| 10  | returnDesc           | String | No               | Response result description.                                                                           |

 "returnDesc": "query success",
 "callType": "1"
}
```

## 6.4.4 Deleting App Personal Settings (delete)

### Scenario

This interface provided by the AICC is invoked to delete app personal settings for the AppCube.

### Method

POST

### URI

<https://{Domain name}/apiaccess/CC-Management/v1/openapp/agentsettings/delete>, where, *{Domain name}* can be **service.besclouds.com**.

### Request Description

**Table 6-446** Request header parameters

| No. | Parameter | Type   | Mandato ry or Not | Description                    |
|-----|-----------|--------|-------------------|--------------------------------|
| 1   | X-APP-Key | String | Yes               | App key, which is the user ID. |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                      |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | No               | Authentication field. The format is <b>Bearer</b> (space){Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 6-447** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                   |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------|
| 1   | userId    | String | Yes              | User ID. Value of <b>USER_ID</b> in the <b>t_aicc_pub_appcube_user</b> table. |

## Response Description

- **Status code: 200**

**Table 6-448** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                            |
|-----|------------|--------|------------------|--------------------------------------------------------------------------------------------------------|
| 1   | returnCode | String | Yes              | <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> |
| 2   | returnDesc | String | No               | Response result description.                                                                           |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.

}
```

Response parameters:

```
{
 "returnCode": "0",
 "returnDesc": "The AgentSettings delete successfully."
}
```

## 6.5 Appendix

### 6.5.1 Events

#### 6.5.1.1 Events Related to Agent State

##### 6.5.1.1.1 Busy

- Identifier:  
AgentState\_Busy
- Function:  
This event indicates that an agent is making a call.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentState_Busy","workNo":"49997","content":null}}
```

### 6.5.1.1.2 Working

- Identifier:  
AgentState\_Work
- Function:  
This event indicates that an agent enters the Working state.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentState_Work",
"workNo":"49997","content":null}}
```

### 6.5.1.1.3 Idle

- Identifier:  
AgentState\_Ready
- Function:  
This event indicates that an agent becomes idle.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentState_Ready",
"workNo":"49997","content":null}}
```

### 6.5.1.1.4 Entering the Busy State Successfully

- Identifier  
AgentState\_SetNotReady\_Success
- Function  
This event indicates that an agent enters the busy state successfully.
- Additional information  
**reason** indicates the busy reason code transferred when the request for entering the busy state is sent. If there is no busy reason code, the value **0** is returned. The value **7** indicates that the agent releases the call.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_SetNotReady_Success","workNo":"49997","content":
{"reason":"200"}}}
```

### 6.5.1.1.5 Quitting the Busy State Successfully

- Identifier:  
AgentState\_CancelNotReady\_Success
- Function:  
This event indicates that an agent quits the Busy state successfully.
- Additional information:

None

- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_CancelNotReady_Success","workNo":"49997",
"content":null}}
```

#### 6.5.1.1.6 Requesting Rest Successfully

- Identifier:  
AgentState\_SetRest\_Success
- Function:  
This event indicates that an agent successfully requests a rest.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_SetRest_Success","workNo":"49999","content":
{"reason":"200"}}}
```

#### 6.5.1.1.7 Quitting the Rest State Successfully

- Identifier:  
AgentState\_CancelRest\_Success
- Function:  
This event indicates that an agent quits the Rest state successfully.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_CancelRest_Success","workNo":"49999",
"content":null}}
```

#### 6.5.1.1.8 Rest Timeout Reminder

- Identifier:  
AgentState\_Rest\_Timeout
- Function:  
This event indicates that the system notifies the agent that rest times out.  
(This event does not indicate that the agent exits theReststate.)
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_Rest_Timeout","workNo":"49999","content":null}}
```

### 6.5.1.1.9 Turning to the Working State

- Identifier:  
AgentState\_SetWork\_Success
- Function:  
This event indicates that an agent successfully requests to turn to the Working state.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_SetWork_Success","workNo":"49999",
"content":null}}
```

### 6.5.1.1.10 Quitting the Working State

- Identifier:  
AgentState\_CancelWork\_Success
- Function:  
This event indicates that an agent successfully requests to quit the Working state.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentState_CancelWork_Success","workNo":"49999",
"content":null}}
```

### 6.5.1.1.11 Receiving Notes

- Identifier:  
AgentOther\_Note
- Function:  
This event indicates that an agent receives a note.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":
"AgentOther_Note","content": null,"workNo": "31001"}}
```

## 6.5.1.2 Audio and Video Call Event

### 6.5.1.2.1 Entering the Talking State

- Identifier  
AgentEvent\_Talking

- Function  
This event indicates that an agent enters the **Talking** state.
- Additional information  
**called**: called number.  
**caller**: calling number.  
**callid**: call ID.  
**type**: media type of the call, either assistant call or main call.  
**feature**: call type. For details, see [6.5.4 Call Type](#).  
**mediaAbility**: media capability, where **1** indicates voice, **3** indicates voice and video, **5** indicates text, and **6** indicates H5 video.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Talking","workNo":"49999","content":
{"caller":"10086","callid":"1456401416-3","called":"70092","feature":"7","type":
:"main","mediaAbility":"1"}}}
```

### 6.5.1.2.2 Customer Ringing

- Identifier:  
AgentEvent\_Customer\_Alerting
- Function:  
This event indicates that the phone of the customer associated with the agent is ringing.
- Additional information:  
**otherPhone**: character string, either the phone number of the party whose phone is ringing or the work ID of the agent whose phone is ringing.  
**callid**: call ID  
**type**: media type of the call, either assistant call or main call
- Triggering condition  
The other side of the call is ringing.
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Customer_Alerting","workNo":"49999","content":
{"callid":"1456401416-3","otherPhoneWorkno":"","otherPhone":"70092",
"type":"main"}}}
```

### 6.5.1.2.3 Holding Success

- Identifier  
AgentEvent\_Hold
- Function  
This interface indicates that the current agent is in the hold state.
- Additional information  
**content**: ID of the call in text format.
- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Hold","workNo":"49999","content":"1456402370-7"
}}
```

#### 6.5.1.2.4 Entering Three-Party Conversation Successfully

- Identifier:  
AgentEvent\_Conference
- Function:  
This event indicates that the agent enters three-party conversation successfully.
- Additional information:  
**partner:** character string, which is the phone numbers of other parties of the call, such as **7101,7102**  
**callid:** call ID
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentEvent_Conference",
"workNo":"49999","content":{"callid":"1456403570-17","partner":"49997,
70093"}}
```

#### 6.5.1.2.5 Making an Outgoing Call Unsuccessfully

- Identifier:  
AgentEvent\_Call\_Out\_Fail
- Function:  
This event indicates that the agent's outgoing call fails. This may occur when the called number is incorrect.
- Additional information:  
Character string: call ID
- Triggering condition  
The outgoing call initiated by an agent fails.
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Call_Out_Fail","workNo":"49999",
"content":"1456403661-19"}}
```

#### 6.5.1.2.6 Outbound Call Failure Cause Detected

- Identifier  
OUTBOUND\_DETECT\_EVENT
- Function  
The agent receives the outbound call failure cause code and failure cause.
- Additional information  
**callid:** call ID.  
**detect:** outbound call failure cause code. The accuracy depends on the cause code in the signaling returned by the core network or gateway. For details, see [Table 6-451](#).

**desc:** description of the outbound call failure cause.

- Example  

```
{"message":"success","event":
{"eventType":"OUTBOUND_DETECT_EVENT","workNo":"464","content":
{"callId":"1589167025-134428","detect":1552,"desc":"The calling number is
not allowed to make a call."},"retcode":"0"}
```

#### 6.5.1.2.7 Making an Internal Call Unsuccessfully

- Identifier:  
AgentEvent\_Inside\_Call\_Fail
- Function:  
This event indicates that the internal call initiated by the agent fails.
- Additional information:  
Character string: call ID
- Triggering condition  
The internal call initiated by an agent fails.
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Inside_Call_Fail","workNo":"49999",
"content":"1456403699-21"}}
```

#### 6.5.1.2.8 No Answer from an Agent for a Long Time

- Identifier:  
AgentEvent\_No\_Answer
- Function:  
This event indicates that the agent does not answer a call for a long time and the system notifies the agent that the call is hung up.
- Additional information:  
Character string: call ID
- Triggering condition  
The system notifies the agent that a call that must be answered manually is hung up.
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentEvent_No_Answer",
"workNo":"49999","content":"1456403745-23"}}
```

#### 6.5.1.2.9 Agent Exiting a Call

- Identifier:  
AgentEvent\_Call\_Release
- Function:  
This event indicates that an agent exits a call with the specified callId.
- Additional information:  
Character string: call ID

- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentEvent_Call_Release",
"workNo":"49999","content":"1456403549-15"}}
```

#### 6.5.1.2.10 User Exiting a Call

- Identifier:  
AgentEvent\_Customer\_Release
- Function:  
This event indicates that a user exits a call with the specified callId.
- Additional information:  
**callid**: call ID  
**number**: phone number of the party who releases the call
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Customer_Release","workNo":"49999","content":
{"callid":"1456404171-43","number":"70093"}}
```

#### 6.5.1.2.11 Automatically Answering a Call

- Identifier  
AgentEvent\_Auto\_Answer
- Function  
This event indicates that an agent automatically answers a call.
- Additional information  
**caller**: calling number in text format.  
**called**: called number in text format.  
**callid**: ID of the call in text format.  
**type**: media type of the call, either assistant call or main call.  
**feature**: call type, where **0** indicates a common inbound call, **7** indicates a common outbound call, and **43** indicates a predicted outbound call. **feature** is associated with **callid** and does not change with actions such as call transfer.  
**mediaAbility**: media capability, where **1** indicates voice, **2** indicates video, **3** indicates voice and video, **5** indicates text, and **6** indicates H5 video.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Auto_Answer","workNo":"49999","content":
{"caller":"70093","transfer":"no","callid":"1456404171-43","transfrom":"","calle
d":"6048","type":"main","mediaAbility":"1","feature":"0"}}
```

#### 6.5.1.2.12 Notifying the Agent of an Inbound Call

- Identifier:  
AgentEvent\_Ringing
- Function:  
This event indicates that the agent is asked to manually answer a call.

- Additional information:
  - caller:** calling number in text format. If the number belongs to an agent, the number starts with **a** or **A**.
  - called:** called number in text format. If the number belongs to an agent, the number starts with **a** or **A**.
  - callid:** ID of the call in text format.
  - type:** media type of the call, either assistant call or main call.
  - feature:** call type, where **0** indicates a common inbound call and **7** indicates a common outboundcall.
  - mediaAbility:** media capability, where **1** indicates voice, **2** indicates video, **3** indicates voice and video, **5** indicates text, and **6** indicates H5 video.
- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Ringing","workNo":"49999","content":
{"caller":"49997","transfer":"no","callid":"1456404043-37","transfrom":"","called":"49999","type":"main","mediaAbility":"1","feature":"0"}}
```

#### 6.5.1.2.13 Connection Failure

- Identifier  
AgentEvent\_Connect\_Fail
- Function  
This interface indicates that the agent fails to be connected.
- Additional information  
**content:** ID of the call in text format.
- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Connect_Fail","workNo":"49999","content":"145640
4043-38"}}
```

#### 6.5.1.2.14 Consultation Failure

- Identifier  
AgentEvent\_Consult\_Fail
- Function  
The agent fails to seek internal help.
- Additional information  
**content:** ID of the call in text format.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_Consult_Fail","workNo":"49999","content":"145640
4043-39"}}
```

#### 6.5.1.2.15 Notifying the Transfer Success Result

- Identifier  
AgentEvent\_SuccTransResult

- Function  
In the audio/video call or text transfer scenario, when an agent successfully invokes the transfer interface to transfer a call, the agent receives this event, indicating whether the call is successfully transferred.
- Additional information  
**callId** indicates the unique ID of the call.  
**result** indicates the success transfer result. The value **0** indicates success and other values indicate failure.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_SuccTransResult","workNo":"20011","content":
{"result":1,"callId":"1477467960-16777237"}}}
```

#### 6.5.1.2.16 Returning from IVR

- Identifier  
AgentEvent\_ReturnFromIvr
- Function  
In the audio and video call transfer scenario, an agent invokes the transfer interface, selects the IVR as a transfer device, and sets the transfer mode to the hang-up transfer mode. When the call is transferred from the IVR to the agent, the agent receives the event indicating that the call is successfully transferred from the IVR.
- Additional information  
**content**: ID of the call in text format.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_ReturnFromIvr","workNo":"108","content":"152957
1145-1187"}}}
```

#### 6.5.1.2.17 Switching Between Audio and Video Calls

- Identifier  
AgentEvent\_MediaSwitth
- Function  
In the scenario where an audio call is switched to a video call, the agent invokes the audio and video switchover interface and sets the media type to video. After the interface is successfully invoked, the agent receives the event that an audio call is switched to a video call. If **reason** is set to **0**, the IVR returns an event successfully.
- Additional information  
**reason** indicates the switchover reason code. The value **0** indicates success, and other values indicate failure.  
**caller** indicates the calling number.  
**called** indicates the called number.  
**callId** indicates the unique ID of the call.  
**mediaType** indicates the media type.

- Example

```
{"eventType":"AgentEvent_MediaSwitH","workNo":"111","content":
{"callid":"1603286369-16773","reason":0,"caller":"","mediaType":3,"called":"88
022","jsonKey":["callid","reason","caller","mediaType","called"],"jsonKey":
["eventType","workNo","content"]}
```

### 6.5.1.2.18 Media Capability Check

- Identifier:  
AgentEvent\_UserMediaAbility
- Function:  
In the scenario where an agent calls a user, when the agent calls the user, the agent receives this event and determines whether the user's mobile phone supports the video capability.
- Additional information:  
**userAbility**: call capability, where **1** indicates that the mobile phone supports audio, and **3** indicates that the mobile phone supports audio and video.  
**callId**: unique ID of the call.
- Example:

```
{"eventType":"AgentEvent_UserMediaAbility","workNo":"20011","content":
{"userAbility":"1","callid":"1456403745-23"}}
```

#### NOTE

1. For the CTI, choose **web configuration console** > **system configuration** > **software parameters** and set **P10** to **1**.
2. For the UAP, set bit 14 of software parameter 955 to **0**.

### 6.5.1.2.19 Inbound Call Notification

- Identifier  
AgentEvent\_Incoming\_CallInfo
- Function  
This event notifies an agent of an inbound call.
- Additional information  
**callId**: unique call ID.  
**skillName**: skill queue name.  
**skillId**: skill queue ID.  
**caller**: calling number.  
**called**: called number.  
**lastReleaseAgentId**: ID of the agent who released the call last time.  
**mediaType**: media type.  
**releaseAndReQueueCount**: number of times the call is released by an agent and rerouted.  
**releaseAndReQueueCallFlag**: whether the call is rerouted after being released by an agent. The options are **0** (no) and **1** (yes).
- Example

```
{"eventType": "AgentEvent_Incoming_CallInfo", "workNo": "56020", "content":
{"callId": "1669951418-12166", "skillName": "defaultVideoSkill", "skillId": 1,
"caller": "88880165", "called": "310300", "lastReleaseAgentId":
65535, "mediaType": 19, "releaseAndReQueueCount":
0, "releaseAndReQueueCallFlag": 0}}
```

### 6.5.1.3 Events Related to Outgoing Call

#### 6.5.1.3.1 Previewed Outbound Call Released

- Identifier  
AgentEvent\_Release\_Preview
- Function  
This event indicates that the previewed call is released.
- Additional information  
None
- Example  

```
{"message": "", "retcode": "0", "event":
{"eventType": "AgentEvent_Release_Preview", "workNo": "49999", "content": null}
}
```

#### 6.5.1.3.2 Agent Preoccupied

- Identifier:  
AgentEvent\_Agent\_Occupied
- Function:  
This event indicates that the agent is preoccupied.
- Additional information:  
None
- Example:  

```
{"message": "", "retcode": "0", "event":
{"eventType": "AgentEvent_Agent_Occupied", "workNo": "49999",
"content": null}}
```

#### 6.5.1.3.3 Previewed Outgoing Call Initiated

- Identifier:  
AgentEvent\_Preview
- Function:  
This event indicates that the agent receives a previewed outgoing call initiating event.
- Additional information:  
**controlid**: control block ID of the previewed outgoing call  
**dialeddigits**: called number of the previewed outgoing call
- Example:  

```
{"message": "", "retcode": "0", "event": {"eventType": "AgentEvent_Preview",
"workNo": "49999", "content": {"controlid": "1456404043", "dialeddigits": ""}}}
```

#### 6.5.1.3.4 Previewed Outbound Call

- Identifier  
AgentEvent\_Preview\_CallOut
- Function  
The agent receives a previewed outbound call. The length of the previewed outbound number is 24 digits.
- Additional information  
**controlid**: control block ID of the previewed outbound call.  
**dialeddigits**: called number of the previewed outbound call.  
**callData**: call-associated data. The maximum length is 16 KB.
- Example

```
{
 "message": "",
 "retcode": "0",
 "event": {
 "eventType": "AgentEvent_Preview_CallOut",
 "workNo": "49999",
 "content": {
 "controlid": "0",
 "dialeddigits": "1456404043",
 "callData": "xxxxxx"
 }
 }
}
```

#### 6.5.1.3.5 New Previewed Outbound Call

- Identifier  
AgentEvent\_Preview\_CallOut\_Ex
- Function  
The agent receives a new previewed outbound call. The length of the previewed outbound number is 120.
- Additional information  
**controlid**: control block ID of the previewed outbound call.  
**dialeddigits**: called number of the previewed outbound call.  
**callData**: call-associated data. The maximum length is 16 KB.
- Example

```
{
 "message": "",
 "retcode": "0",
 "event": {
 "eventType": "AgentEvent_Preview_CallOut_Ex",
```

```
"workNo": "49999",
content: {
 "dialeddigits": "100,101,103,105",
 "controlid": "1536",
 "callData": "4"
}
}
}
```

## 6.5.1.4 Recording Events

### 6.5.1.4.1 Recording Started

- Identifier  
AgentMediaEvent\_Record
- Function  
This event indicates that the recording of the current agent starts.
- Additional information  
**taskId**: recording task ID in the platform.  
**caller**: calling number.  
**called**: called number.  
**locationId**: ID of the central node corresponding to the recording.  
**recordID**: serial number of a recording.  
**fileName**: address of a recording file.  
**callId**: unique ID of the call.  
**fileMediaType**: media type. The options are **1** (audio) and **2** (video).
- Example  
Audio:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentMediaEvent_Record","workNo":"20011","content":
{"taskId":"5206","caller":"70006","recordID":"Yc1v6a20011d20161025t1902050",
"called":"60015","locationId":"256","fileName":"Y:/6/0/20161025/20011/19020
50.V3","fileMediaType":"1","callId":"1477393325-164"}}}
```

  
RSE video recording:  

```
{"eventType":"AgentMediaEvent_Record","workNo":"25002","content":
{"recordID":"0a08082d-df1e-4c06-9a97-
c7c6f7a4724e","callId":"1606459553-176","fileName":"conferenceId=7a00830
7-34ad-435b-bccd-222be5ac5385;recordId0=0a08082d-df1e-4c06-9a97-
c7c6f7a4724e;","caller":"25002","called":"22061","locationId":"255","taskId":50
65,"fileMediaType":2,"jsonKey":
["recordID","callId","fileName","caller","called","locationId","taskId","fileMedia
Type"]},"jsonKey":["eventType","workNo","content"]}
```

  
Third-party video recording:  

```
{"eventType":"AgentMediaEvent_Record","workNo":"503","content":
{"recordID":"Yc1v1a503d20201202t1714442","callId":"1606900483-31","fileNa
```

```
me": "Y:/1/0/20201202/503/1714442.mp4", "caller": "83110091", "called": "94865001", "locationId": "65535", "taskId": "5007", "fileMediaType": "2", "jsonKey": [{"recordID", "callId", "fileName", "caller", "called", "locationId", "taskId", "fileMediaType"}], "jsonKey": ["eventType", "workNo", "content"]}]}
```

#### 6.5.1.4.2 Recording Startup Failed

- Identifier  
AgentMediaEvent\_Record\_Fail
- Function  
This event indicates that the recording of the current agent fails to be started.
- Additional information  
**taskId**: recording task ID in the platform.  
**caller**: calling number.  
**called**: called number.  
**locationId**: ID of the central node corresponding to the recording.  
**recordID**: serial number of a recording.  
**fileName**: address of a recording file.  
**callId**: unique ID of the call.  
**fileMediaType**: media type. The options are **1** (audio) and **2** (video).
- Example  

```
{"message": "", "retcode": "0", "event": {"eventType": "AgentMediaEvent_Record_Fail", "workNo": "20011", "content": {"taskId": "5255", "caller": "70006", "recordID": "Cc1v6a20011d20161025t1930326", "called": "60015", "locationId": "65535", "fileName": "C:/6/0/20161025/20011/1930326.V3", "fileMediaType": "1", "callId": "1477395030-183"}}}
```

#### 6.5.1.4.3 Recording Stopped

- Identifier  
AgentMediaEvent\_StopRecordDone
- Function  
This event indicates that the recording of an agent is stopped.
- Additional information  
**beginTime**: recording start time.  
**endTime**: recording end time.  
**taskId**: recording task ID in the platform.  
**fileMediaType**: media type. The options are **1** (audio) and **2** (video).
- Example  

```
{"eventType": "AgentMediaEvent_StopRecordDone", "workNo": "1115", "content": {"beginTime": "1566867437000", "endTime": "1566867472000", "fileMediaType": "1", "taskId": "5451", "jsonKey": ["beginTime", "endTime", "taskId"]}, "jsonKey": ["eventType", "workNo", "content"]}]}
```

## 6.5.1.5 Events Related to Voice Playback by Quality Checks

### 6.5.1.5.1 Recording Playback Started

- Identifier:  
AgentMediaEvent\_Play
- Function:  
This event indicates that recording playback is started.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentMediaEvent_Play","workNo":"49999","content":null}}
```

### 6.5.1.5.2 Recording Playback Succeeded

- Identifier:  
AgentMediaEvent\_Play\_Succ
- Function:  
This event indicates that recording playback is successful.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentMediaEvent_Play_Succ","workNo":"49999","content":null}}
```

### 6.5.1.5.3 Recording Playback Failed

- Identifier:  
AgentMediaEvent\_Play\_Fail
- Function:  
This event indicates that recording playback has failed.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":{"eventType":"AgentMediaEvent_Play_Fail","workNo":"49999","content":null}}
```

### 6.5.1.5.4 Stopping Playing the Recording

- Identifier  
AgentMediaEvent\_StopPlayDone
- Function  
This interface indicates that the recording is stopped.

- Additional information  
**Cause** indicates the reason for stopping the recording. **0**: The playback is complete. **1**: The agent stops playing the recording. **2**: The recording fails to be played and therefore stops.
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentMediaEvent_StopPlayDone","workNo":"49999","content":
{"cause":0}}
```

#### 6.5.1.5.5 Recording Playback Paused

- Identifier:  
AgentMediaEvent\_PausePlayDone
- Function:  
This event indicates that recording playback is paused.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentMediaEvent_PausePlayDone","workNo":"49999",
"content":null}}
```

#### 6.5.1.5.6 Recording Playback Resumed

- Identifier:  
AgentMediaEvent\_ResumePlayDone
- Function:  
This event indicates that recording playback is resumed.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentMediaEvent_ResumePlayDone","workNo":"49999",
"content":null}}
```

#### 6.5.1.5.7 Recording Playback Fast-Forwarded

- Identifier  
AgentMediaEvent\_JumpPlayDone
- Function  
This event indicates that recording playback is fast-forwarded.
- Additional information  
None
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentMediaEvent_JumpPlayDone","workNo":"49999","content":
null}}
```

## 6.5.1.6 Events Related to Real-time Quality Control

### 6.5.1.6.1 Agent Monitoring

- Identifier  
QC\_AgentState\_Notify
- Function  
Indicates the monitoring (inspection) event of an agent.
- Additional information  
**agentname**: employee ID or user name of an agent.  
**subtype**: state or operation of the agent that is monitored.
- Example  

```
{"eventType":"QC_AgentState_Notify","workNo":"107","content":
{"subtype":"QC_AgentState_Login","monitoredagent":"108","agentname":"108
","mediaserver":"CtiServer","jsonKey":
["subtype","monitoredagent","agentname","mediaserver"]},"jsonKey":
["eventType","workNo","content"]}
```

Values of **subtype** are as follows:  
**QC\_AgentState\_Login**: sign-in event of the agent that is monitored  
**QC\_AgentState\_Logout**: sign-out event of the agent that is monitored

## 6.5.1.7 Events Related to Physical Phone

### 6.5.1.7.1 Phone State Unknown

- Identifier:  
AgentOther\_PhoneUnknow
- Function:  
This event indicates that the phone state of an agent is unknown.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentOther_PhoneUnknow","workNo":"49999",
"content":null}}
```

### 6.5.1.7.2 Phone in On-Hook State

- Identifier:  
AgentOther\_PhoneRelease
- Function:  
This event indicates that the phone of an agent is in the on-hook state.
- Additional information:  
**phoneState**: release cause. 3 indicates on-hook by the platform, and 2 indicates on-hook by the agent.

- Example:  

```
{"eventType":"AgentOther_PhoneRelease","workNo":"20012","content":
{"phoneState":3}}
```

### 6.5.1.7.3 Phone in Off-Hook State

- Identifier  
AgentOther\_PhoneOffhook
- Function  
This event indicates that the phone of an agent is in off-hook state.
- Additional information  
**type** indicates the event call type. The options are **unknown** (unknown call), **main** (main call), and **assistant** (assistant call).
- Example  

```
{"message":"","retcode":"0","event":{"eventType":
"AgentOther_PhoneOffhook","workNo": "56020","content": {"type": "main"}}
```

### 6.5.1.7.4 Phone in Ringing State

- Identifier:  
AgentOther\_PhoneAlerting
- Function:  
This event indicates that the phone of an agent is ringing.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0", "event":
{"eventType":"AgentOther_PhoneAlerting", "workNo":"49999",
"content":null}}
```

### 6.5.1.7.5 Phone in Busy State

- Identifier  
AgentOther\_PhoneBusy
- Function  
This event indicates that the phone of an agent cannot answer calls.
- Additional information  
None
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentOther_PhoneBusy","workNo":"49999","content":null}}
```

### 6.5.1.8 Other Agent-Related Events

### 6.5.1.8.1 Agent Starting to Sign In

- Identifier  
AgentOther\_InService
- Function  
This event indicates that an agent starts to sign in.
- Additional information  
None
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentOther_InService","workNo":"49999","content":null}}
```

### 6.5.1.8.2 Agent Successfully Signed Out

- Identifier  
AgentOther\_ShutdownService
- Function  
This interface indicates that an agent signs out successfully.
- Additional information  
**loginTime**: sign-in time
- Example  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentOther_ShutdownService","workNo":"49999","content":
{"loginTime":"1471585949806"}}}
```

### 6.5.1.8.3 All Agents in Busy State

- Identifier:  
AgentOther\_All\_Agent\_Busy
- Function:  
This event indicates that all agents are in the Busy state.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentOther_All_Agent_Busy","workNo":"49999",
"content":null}}
```

## 6.5.1.9 Events Related to Multimedia

### 6.5.1.9.1 Multimedia Message

- Identifier:  
AgentEvent\_MessageData
- Function:  
This event indicates that an agent receives a multimedia session message.

- Additional information:
  - workNo**: agent ID.
  - content**: message object in JSON format. The following fields are contained:
    - callid**: call ID.
    - caller**: calling number.
    - called**: called number.
    - feature**: call type, where **0** indicates a common inbound call and **7** indicates a common outbound call.
    - type**: media type of the call, either assistant call or main call.
    - message**: content of the message to be sent.
    - mediaAbility**: media capability, where **1** indicates voice, **2** indicates video, **3** indicates audio and video, **5** indicates text, and **6** indicates H5 video.
- Example:

```
{"eventType":"AgentEvent_MessageData","workNo":"211","content":
{"callid":"1552038964-16797222","caller":"88880022","called":"20012","feature":0,
"type":"main","message":"testmessage","mediaAbility":"5","jsonKey":
["callid","caller","called","feature","type","message","mediaAbility"]},"jsonKey":
["eventType","workNo","content"]}
```

#### 6.5.1.9.2 HTML5 Access Information Event

- Identifier:  
AgentEvent\_RequestConnect
- Function:  
This event indicates that the H5 access information event is reported.
- Additional information:
  - workNo**: agent ID.
  - content**: message object in JSON format. The following fields are contained:
    - callid**: call ID.
    - userId**: agent ID.
    - ctime**: expiration time.
    - channelId**: channel ID (room ID).
    - role**: role.
    - ip**: IP address of the media server access point.
    - port**: port number of the access point of the media server.
    - signalingDomainIn**: internal-side signaling domain.
    - signalingDomainOut**: external signaling domain.
    - locationId**: node.
    - signature**: signature.
    - apId**: user ID.
- Example:

```
{"message":"","retcode":"0","event":{"eventType":"
AgentEvent_RequestConnect","workNo":"49999","content":{"userId":"Agent
```

```
ID',"ctime": "Expiration time","channelId": "15945185-345","appld":
"8345234631", "ip": "xxx.xxx.xxx.xxx","port": "6500","role":
"0","signalingDomainIn": "https://in.isdpdomain.com","signalingDomainOut":
"https://out.isdpdomain.com","locationId": "65535","signature": "xxx","appld":
"sdcP0BPcVGymItWppGX6XqrZGTCYa13d"}}}
```

### 6.5.1.9.3 HTML5 Screenshot Event

- Identifier:  
AgentEvent\_ImageCapture
- Function:  
This event indicates the H5 screenshot result event.
- Additional information:  
**workNo**: agent ID.  
**content**: message object in JSON format. The following fields are contained:  
**callid**: call ID.  
**filename**: address of the recording file.  
**locationId**: ID of the node corresponding to the screenshot file.  
**result**: screenshot result, where **0** indicates success, **1** indicates failure, and **2** indicates user rejection.
- Example:  

```
{"eventType": "AgentEvent_ImageCapture","workNo": "1002","content": {"callid":
"1654917192-17845843","result": 0,"filename":
"F:/5/1/20220611/1002/1113201.jpg","locationId": 256}}
```

### 6.5.1.10 Agent Conference Event

#### 6.5.1.10.1 Successful Conference Application

- Identifier  
AgentConf\_RequestSuccess
- Function  
This event indicates that the conference is successfully applied for and the chairperson has joined the conference.
- Additional information  
**confId**: conference ID.
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_RequestSuccess","workNo":"153","content":
{"confId":1030400}}}
```

#### 6.5.1.10.2 Failed Conference Application

- Identifier  
AgentConf\_RequestFailed
- Function

This event indicates that the conference application fails.

- Additional information

**cause:** failure cause code.

- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_RequestFailed","workNo":"153","content":
{"cause":21234}}}
```

### 6.5.1.10.3 Joining a Conference

- Identifier

AgentConf\_SelfJoinResult

- Function

This event indicates that the current agent has joined the conference.

- Additional information

**confId:** conference ID.

- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_SelfJoinResult","workNo":"153","content":
{"confId":1030400}}}
```

### 6.5.1.10.4 Conference Timeout Notification

- Identifier

AgentConf\_Timeout

- Function

The timing starts when a conference is successfully applied for. When the remaining conference time reaches the configured notification time point, this event will be triggered.

After receiving this event, an agent determines whether to extend the conference. If the agent does not extend the conference, the conference will be released when the end time arrives.

- Additional information

**confId:** conference ID.

- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_Timeout","workNo":"153","content":
{"confId":1030656}}}
```

### 6.5.1.10.5 Conference Ringing

- Identifier

AgentConf\_Ringing

- Function

An invited agent receives this event.

- Additional information

**confId:** conference ID.

- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_Ringing","workNo":"154","content":
{"confId":1031168}}}
```

### 6.5.1.10.6 Participant Change

- Identifier  
AgentConf\_ParticipantChanged
- Function  
An invited agent receives this event.
- Additional information  
**result**: change result.  
The value **0** indicates success and other values indicates failure.  
**changeType**: change type.  
The options are as follows: **0**: A participant joins a conference. **1**: A participant leaves a conference. **2**: A chairperson is changed. **3**: A participant is muted. **4**: A participant is unmuted. **5**: A participant is held. **6**: A participant is unheld.  
**changeReason**: change reason.  
If **ChangeType** is set to **1**, this parameter is valid. If **ChangeType** is set to other values, this parameter is invalid. The options are as follows: **0**: A participant proactively leaves a conference. **1**: A chairperson forcibly removes a participant from a conference. **2**: A participant hangs up. **3**: A conference ends. **4**: A participant signs out of the conference. **6**: A participant is forcibly removed from the conference due to other reasons.  
**confId**: conference ID.  
**participant**: participant ID.  
**participantType**: participant type.  
The options are as follows: **6**: phone number and **9**: agent ID.  
**deviceCallType**: user-defined device call type.  
**deviceType**: user-defined device type.
- Example:

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_ParticipantChanged","workNo":"154","content":
{"result":0,"changeReason":255,"changeType":3,"confId":1031168,"participant":
:"154","participantType":9,"deviceCallType":0,"deviceType":0}}}
```

### 6.5.1.10.7 Leaving a Conference

- Identifier  
AgentConf\_SelfLeaveResult
- Function  
This event indicates that the current agent leaves the conference.
- Additional information  
**confId**: conference ID.

- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_SelfLeaveResult","workNo":"153","content":
{"confId":1030400}}}
```

#### 6.5.1.10.8 Chairperson Change

- Identifier  
AgentConf\_PresidentChanged
- Function  
This event indicates that the current agent becomes the conference chairperson.
- Additional information  
**confId**: conference ID.
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_PresidentChanged","workNo":"154","content":
{"confId":1031168}}}
```

#### 6.5.1.10.9 Stopping Conference Announcement Playing

- Identifier  
AgentConf\_StopVoice
- Function  
This event indicates that the conference announcement is stopped.
- Additional information  
**result**: result of stopping conference announcement playing. The options are as follows: **0** (success) and **1** (failure).
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_StopVoice","workNo":"154","content":{"result":0}}}
```

#### 6.5.1.10.10 Stopping Announcement Playing in a Conference Channel

- Identifier  
AgentConf\_StopParticipantVoice
- Function  
This event indicates that the announcement playing in a conference channel is stopped.
- Additional information  
**result**: result of stopping conference announcement playing. The options are as follows: **0** (success) and **1** (failure).
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"AgentConf_StopParticipantVoice","workNo":"154","content":
{"result":0}}}
```

### 6.5.1.11 Events Related to Disaster Recovery

- Identifier:  
Agent\_Recover
- Function:  
This event indicates that the CC-Gateway is recovered after being restarted for the current agent.
- Additional information:  
None
- Example:  

```
{"message":"","retcode":"0","event":
{"eventType":"Agent_Recover","workNo":"49999","content":
{"agentStatus":"4"}}}
```

#### NOTE

If this event is received, an abnormal switchover occurs in the CC-Gateway. During the switchover, some interface invoking operations and events of the current call are affected, and the next call is not affected.

The scenarios that may be affected are as follows:

1. In scenarios such as the two-party help-seeking and three-party help-seeking (help-seeking from a skill queue, an agent, or an external number), some events such as AgentEvent\_Call\_Release, AgentEvent\_Customer\_Release, and AgentEvent\_Talking are missing.
2. In scenarios such as success transfer, talk transfer, and three-party transfer, some events such as AgentEvent\_Call\_Release, AgentEvent\_Customer\_Release, AgentEvent\_Talking, and AgentEvent\_Call\_Release are missing.

The rectification method is as follows:

1. Hang up the phone of the agent (such as the softphone, fixed-line phone, or mobile phone).
2. Sign out of the system manually and then sign in again as the agent.

### 6.5.1.12 Phone Linkage Events

#### NOTE

Currently, the phone linkage capability supports only eSpace 7910 phones on the CC network.

#### 6.5.1.12.1 Linkage Capability

- Identifier  
AgentEvent\_linkageCapability
- Function  
Whether an agent phone is successfully linked.
- Additional information  
**result** indicates the linkage result. The value **0** indicates success, and other values indicate failure.
- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkageCapability","workNo":"120","content":
{"result":0}}}
```

### 6.5.1.12.2 Linkage Status

- Identifier

AgentEvent\_linkagePhoneStatus

- Function

Status of an agent phone.

- Additional information

**result** indicates phone status events. **0**: off-hook; **1**: on-hook; **2**: talking; **3**: phone online; **4**: phone offline; **5**: ringing.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneStatus","workNo":"120","content":
{"result":2}}}
```

### 6.5.1.12.3 Muting a Call

- Identifier

AgentEvent\_linkagePhoneMute

- Function

A call is muted.

- Additional information

**callId**: unique ID of a muted call.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneMute","workNo":"120","content":
{"callId":"1474269843-24"}}}
```

### 6.5.1.12.4 Unmuting a Call

- Identifier

AgentEvent\_linkagePhoneUnMute

- Function

A call is unmuted.

- Additional information

**callId**: unique ID of an unmuted call.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneUnMute","workNo":"120","content":
{"callId":"1474269843-24"}}}
```

### 6.5.1.12.5 Transfer-out Notification

- Identifier

AgentEvent\_linkagePhoneTransferOut

- Function

An agent is transferring the current call out with a phone.

- Additional information

**addrOut:** phone number to which a call is transferred out.

**addrSelf:** phone number of an agent.

**address:** address ID.

**addressType:** address type. Currently, the value is **6**, indicating the phone number.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneTransferOut","workNo":"120","content":
{"addrOut":{"address":"70002","addressType":6},"addrSelf":
{"address":"70001","addressType":6}}}
```

### 6.5.1.12.6 Transfer-out Result Notification

- Identifier

AgentEvent\_linkagePhoneTransferOut\_Result

- Function

Phone linkage transfer-out result.

- Additional information

**result:** The value **0** indicates that the transfer-out is successful, and other values indicate that the transfer-out fails.

**callId:** unique ID of a call that is transferred out.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneTransferOut_Result","workNo":"130","cont
ent":{"result":1138,"callId":"1481881644-21"}}}
```

### 6.5.1.12.7 Holding a Call

- Identifier

AgentEvent\_linkagePhoneHold

- Function

A call is held by a phone.

- Additional information

**callId**: unique ID of a held call.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneHold","workNo":"120","content":
{"callId":"1474269843-24"}}}
```

### 6.5.1.12.8 Unholding a Call

- Identifier

AgentEvent\_linkagePhoneUnHold

- Function

A call is unheld by a phone.

- Additional information

**callId**: unique ID of an unheld call.

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneUnHold","workNo":"120","content":
{"callId":"1474269843-24"}}}
```

### 6.5.1.12.9 Making an Outbound Call

- Identifier

AgentEvent\_linkagePhoneCallOut

- Function

An agent is making an outbound call with a phone.

- Additional information

**addrCalled**: called number.

**addrCaller**: phone number of an agent.

**address**: address ID.

**addressType**: address type. Currently, the value is **6**, indicating the phone number.

**callId**: unique call ID. (This parameter is not used because it is not the call ID returned after the actual call is connected.)

- Example

```
{"message":"","retcode":"0","event":
{"eventType":"AgentEvent_linkagePhoneCallOut","workNo":"120","content":
{"addrCalled":{"address":"70002","addressType":6},"addrCaller":
{"address":"70001","addressType":6},"skillId":0,"callId":"1475051437-34"}}}
```

## 6.5.2 Error Codes

**Table 6-449** CC-Gateway error codes

| Error Code | Description                                                                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 000-001    | The method of obtaining the agent event is incorrect.                                                                                                            |
| 000-002    | The parameter or address transferred by the agent through the URL is incorrect, or the interface parameter is invalid.                                           |
| 000-003    | No permission to invoke the interface. The agent authentication may have expired.                                                                                |
| 000-004    | The agent is being switched over.                                                                                                                                |
| 000-005    | The agent to be inspected is the inspector.                                                                                                                      |
| 000-006    | Message parameter error.                                                                                                                                         |
| 100-001    | The sign-in parameter is left empty or is invalid.                                                                                                               |
| 100-002    | The agent has signed in.                                                                                                                                         |
| 100-003    | The ResourceUnavailableException or ProviderUnavailableException error is reported when the agent signs in to the system.                                        |
| 100-004    | The username or password entered for sign-in is incorrect.                                                                                                       |
| 100-005    | The sign-out parameter is invalid.                                                                                                                               |
| 100-006    | The agent does not sign in.                                                                                                                                      |
| 100-007    | An exception occurs during the agent's operation. The possible cause is that the WAS resource is incorrect and fails to be accessed or an internal error occurs. |
| 100-008    | The agent has signed out.                                                                                                                                        |
| 100-009    | The agent status is incorrect.                                                                                                                                   |
| 100-010    | A state error occurs during sign-out.                                                                                                                            |
| 100-011    | The parameter is invalid when the agent signs in.                                                                                                                |
| 100-012    | The agent type is incorrect during sign-in.                                                                                                                      |
| 100-013    | The phone number bound to the agent is invalid.                                                                                                                  |

| Error Code | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| 100-014    | The phone number used for the agent to sign in is not within the configured range. |
| 100-015    | The agent has signed in and cannot be forcibly signed out.                         |
| 100-016    | When the agent signs in, the IP address is invalid.                                |
| 100-017    | The uPortal authentication fails.                                                  |
| 100-018    | The VDN ID for agent sign-in is different from that for voice playing.             |
| 110-016    | The account is locked.                                                             |
| 101-001    | The agent does not have a conference call.                                         |
| 101-002    | The agent is not the chairperson of the current conference call.                   |
| 101-003    | The agent is in a conference.                                                      |
| 101-004    | A non-inspector does not have the permission to query VDN conferences.             |
| 101-005    | The permission of a chairperson cannot be transferred to itself.                   |
| 101-006    | A chairperson cannot delete itself.                                                |
| 101-007    | The chairperson cannot leave the conference.                                       |
| 104-001    | The recording download function is not enabled.                                    |
| 104-002    | The user does not have the recording inspection or playback permission.            |
| 104-003    | Failed to download the recording file because the file name is invalid.            |
| 104-004    | Failed to download the recording file because no drive mapping is configured.      |
| 104-005    | Failed to download the recording file because the recording file does not exist.   |
| 104-006    | Failed to download the recording file due to insufficient space.                   |
| 104-007    | The recording file format is not supported.                                        |
| 104-008    | The recording format is not set.                                                   |
| 104-009    | Failed to convert the recording file.                                              |

| Error Code | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| 104-010    | <b>locationId</b> is not configured in pool mode.                                                       |
| 105-001    | Agent information is not cached in the Redis.                                                           |
| 105-002    | The current agent is in DR state.                                                                       |
| 105-003    | DR has been completed.                                                                                  |
| 105-004    | Failed to add the agent to the DR queue.                                                                |
| 105-005    | The DR times out. The agent needs to sign in again.                                                     |
| 105-006    | The GUID for DR does not match. The agent needs to sign in again to obtain the GUID.                    |
| 105-007    | The DR function is disabled. The agent needs to sign in again.                                          |
| 106-001    | The multimedia function is disabled.                                                                    |
| 106-002    | An empty message is sent.                                                                               |
| 106-003    | The number of sessions exceeds the maximum value (60).                                                  |
| 106-004    | The session transfer device type is not supported.                                                      |
| 106-005    | An internal error occurs in session transfer, or the transfer-out mode or device type is not supported. |
| 106-006    | The agent information is empty during session transfer.                                                 |
| 106-007    | The message content length exceeds the upper limit (2048 bytes).                                        |
| 106-008    | The channel type is incorrect.                                                                          |
| 106-009    | The maximum size of data that can be carried during session transfer is 2048 bytes.                     |
| 106-010    | The transfer-out mode is not supported during session transfer.                                         |
| 106-011    | The parameter is empty.                                                                                 |
| 106-012    | The value is beyond the short range.                                                                    |
| 106-013    | When an agent sends a multimedia message, the call ID is empty.                                         |

| Error Code | Description                                                                                              |
|------------|----------------------------------------------------------------------------------------------------------|
| 106-014    | When an agent sends a multimedia message, the call ID is invalid (not the call ID of the current agent). |
| 106-015    | Invalid user type.                                                                                       |
| 108-001    | The video download function is not enabled.                                                              |
| 108-002    | The VDN corresponding to the video ID is different from the current VDN.                                 |

| 900-003    | The ResourceUnavailableException error occurs during quality check.                                              |
| 900-004    | No agent information is found during quality check monitoring.                                                   |
| 900-005    | The status is abnormal during quality check.                                                                     |

| Error Code | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| 900-006    | The time parameter of screen recording is incorrect during quality check.          |
| 900-007    | The license for screen recording is not loaded during quality check.               |
| 900-008    | An unknown error occurs on the platform for screen recording during quality check. |
| 900-009    | Failed to find the quality check task to be deleted.                               |
| 900-010    | The inspected agent cannot be an inspector.                                        |
| 999-001    | The WAS URL in the configuration file on the server is incorrect.                  |
| 999-002    | Message query overload.                                                            |
| 999-003    | The number of sign-in agents exceeds the maximum.                                  |

**Table 6-450** CTI error codes

| Error Code | Description                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 21201      | The number of participants exceeds the upper limit (120).                                                                                       |
| 21202      | The number of conferences exceeds the default value.                                                                                            |
| 21203      | The conference creation is not allowed because the number of available PSTN calls of the current VDN is less than 3 during conference creation. |
| 21204      | An agent who has joined a conference cannot join other conferences.                                                                             |
| 21205      | Only an idle agent or agent in a call is allowed to initiate a conference.                                                                      |
| 21207      | Internal error. No call control block can be allocated to the conference during conference creation.                                            |
| 21208      | Internal error. No VISIT can be allocated to the conference during conference creation.                                                         |

| Error Code | Description                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 21209      | Internal error. No CALL object can be allocated to the conference during conference creation.                                            |
| 21210      | Internal error. Failed to bind VISIT to the call during conference creation.                                                             |
| 21211      | Internal error. A conference call does not exist.                                                                                        |
| 21212      | Failed to occupy the agent.                                                                                                              |
| 21213      | Conference occupation times out.                                                                                                         |
| 21214      | The conference does not exist.                                                                                                           |
| 21215      | The chairperson is not in a conference when the conference is released.                                                                  |
| 21216      | When the chairperson modifies a participant attribute, the current attribute of the participant must be the same as that to be modified. |
| 21217      | The chairperson is in the list of participants to be deleted in batches.                                                                 |
| 21218      | Failed to transfer the chairperson permission because the chairperson transfer the permission to the chairperson.                        |
| 21219      | The number of available PSTN calls for the current VDN is 0 when an agent joins a conference.                                            |
| 21220      | When an idle agent applies for a conference, the agent forcibly signs out. As a result, the conference is released.                      |
| 21221      | The chairperson is in the list of participants to be added during batch participant adding.                                              |
| 21222      | The applied conference duration is less than 4 minutes.                                                                                  |
| 21223      | The applied conference duration exceeds 24 hours.                                                                                        |
| 21224      | The number of participants to be added to a conference exceeds the number of remaining resources of the conference.                      |

| Error Code | Description                                                                                                                                                          |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 21225      | No operation can be performed on a conference by invoking an interface when the conference is applied for or released.                                               |
| 21226      | Internal error. An error occurs when creating the conference object.                                                                                                 |
| 21227      | The applied number of participants is 0 during conference creation.                                                                                                  |
| 21228      | Zero participant is added during batch addition.                                                                                                                     |
| 21229      | Zero participant is deleted during batch deletion.                                                                                                                   |
| 21230      | The operator is not the chairperson when the conference is released, the chairperson permission is transferred, a participant is added, or a participant is deleted. |
| 21231      | The CTIS does not respond (no ACK message is returned).                                                                                                              |
| 21232      | After an active/standby switchover, the conference fails to be created and is released.                                                                              |
| 21233      | The conference is abnormally released during conference creation.                                                                                                    |
| 21234      | A participant leaves the conference before the conference is created successfully.                                                                                   |
| 21235      | The number of members exceeds the upper limit.                                                                                                                       |
| 21236      | Conference handshake times out.                                                                                                                                      |
| 21237      | The agent on which an operation is performed is not in the conference.                                                                                               |
| 21238      | The number of participants is increased and exceeds 120 during the change for the number of participants.                                                            |
| 21239      | The number of participants to be decreased exceeds the number of remaining participants during the change for the number of participants.                            |
| 21240      | The operation type is incorrect during the change for the number of participants.                                                                                    |

| Error Code | Description                                                                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 21241      | The number of participants to be changed is less than 2 during the change for the number of participants.                                                                                                   |
| 21242      | The number of participants to be changed exceeds 118 during the change for the number of participants.                                                                                                      |
| 21243      | The number of VDNs is incorrect during the query for ongoing conference IDs.                                                                                                                                |
| 21244      | The number of conferences to be queried is greater than the number that can be queried during batch conference query.                                                                                       |
| 21245      | The conference duration to be extended is less than 1 minute.                                                                                                                                               |
| 21246      | The conference duration to be extended is greater than 1440 minutes.                                                                                                                                        |
| 21247      | When the chairperson plays the announcement in the conference, the announcement is being played in the conference. The announcement can be played only when the conference is in talking state.             |
| 21248      | When the chairperson stops playing the announcement in the conference, the announcement is not being played in the conference.                                                                              |
| 21249      | When the chairperson plays the announcement in the conference channel, the announcement is being played in the channel. The announcement can be played only when the channel is in talking or hold state.   |
| 21250      | When the chairperson stops playing the announcement in the conference channel, the announcement is not being played in the channel. The announcement can be stopped only when it is playing in the channel. |
| 21251      | When the chairperson holds a channel, the channel has been held. The channel can be held only when it is in non-hold state.                                                                                 |

| Error Code | Description                                                                                                                              |
|------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 21252      | When the chairperson unholds a channel, the channel has been in non-hold state. The channel can be unheld only when it is in hold state. |

 **NOTE**

The reason why the same reason corresponds to different reason codes is that the version iteration needs to be compatible with historical versions. When locating a fault, you need to consider the reason and reason code.

**Table 6-451** CTI error cause codes

| Cause Code | Description                                                                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3          | No resources, such as control blocks and circuit resources, are available in the ACD. The called party is not reached.                                                                                                  |
| 4          | The called party is changing and the call is forwarded.                                                                                                                                                                 |
| 5          | Call waiting. When user A is talking with user B, user C attempts to set up a call connection with user A. In this case, user A receives a call waiting indication, indicating that another user is waiting for a call. |
| 6          | The call is being forwarded on busy.                                                                                                                                                                                    |
| 7          | The call is being forwarded on no reply.                                                                                                                                                                                |
| 8          | The call is being forwarded unconditionally. In this case, the call is forwarded to a specified number regardless of the status of the called party.                                                                    |
| 9          | The Do-not-Disturb service is also called the Temporary Refusal of Call service. The cause is no disturbance. Generally, the called office disconnects the call.                                                        |
| 10         | The call is being forwarded during ringing.                                                                                                                                                                             |
| 11         | The call is being forwarded on immediate response before ringing.                                                                                                                                                       |

| 182        | Special information tone (SIT) is defined in ITU-T E.181 and ITU-T E.182. It refers to the do-not-disturb (DND) tone. Currently, SIT is used on DND devices, generally, it is a small device connected to a telephone. When an inbound call exists, the device automatically answers the call and plays a SIT tone consisting of three fixed frequencies. The SIT tone is used to make the calling party consider that the called party is an automatic device and hang up the call (actually a device that blocks the outbound call system). The calling party considers that the called party is an automatic device and hangs up. |

| 549        | The phone is out of service.                                                                                                           |
| 551        | The ACD disconnects the call abnormally.                                                                                               |
| 601        | The called party hangs up before the call is answered.                                                                                 |
| 602        | No resource is available on the ACD.                                                                                                   |
| 603        | The call is disconnected on no reply.                                                                                                  |
| 604        | The call is rejected.                                                                                                                  |
| 605        | The ACD is busy.                                                                                                                       |
| 606        | The ACD times out.                                                                                                                     |
| 701        | The called party hangs up when the call is in a queue.                                                                                 |
| 702        | The queue times out and the platform releases the call (if the call is configured to be released due to queuing timeout).              |
| 703        | Call data times out (in API mode).                                                                                                     |
| 1040       | The ringing times out and the platform releases the call. (The called party does not answer the phone within the preset ringing time.) |
| 1041       | The agent occupation times out.                                                                                                        |

| Cause Code | Description                                                                                                                                                                                                                                                                                |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1043       | Waiting for outbound call results times out on the platform.                                                                                                                                                                                                                               |
| 1046       | Failed to occupy an agent.                                                                                                                                                                                                                                                                 |
| 1048       | The number of OBS calls reaches the upper limit.                                                                                                                                                                                                                                           |
| 1049       | The outbound call detection result after ACD offhooking times out.                                                                                                                                                                                                                         |
| 1056       | Failed to set up a voice channel between an agent and a subscriber.                                                                                                                                                                                                                        |
| 1281       | Before a voice channel is set up, an agent releases a call using the agent bar control.                                                                                                                                                                                                    |
| 1288       | When a voice channel is set up, an agent releases a call using the agent bar control.                                                                                                                                                                                                      |
| 1333       | When an agent answers a call using the agent bar control, the agent's phone is disconnected.                                                                                                                                                                                               |
| 23000      | A call queue overflows.                                                                                                                                                                                                                                                                    |
| 34601      | No outbound call task available.                                                                                                                                                                                                                                                           |
| 34602      | Cannot suspend the task because it is already in the suspended state.                                                                                                                                                                                                                      |
| 34603      | Cannot recover the task because the task is not in the suspended state.                                                                                                                                                                                                                    |
| 34605      | The outbound number is empty.                                                                                                                                                                                                                                                              |
| 34606      | The call attempt fails. That is, the outbound call interface fails to be invoked. The common cause is that the number of concurrent outbound calls reaches the number of outbound calls set on the system configuration console. You can view OBS logs to know the detailed failure cause. |
| 34607      | Failed records are written back when the OBS exits (or a task is deleted).                                                                                                                                                                                                                 |
| 34608      | Outbound call data is written back when no result is obtained after the call times out.                                                                                                                                                                                                    |
| 34609      | When the OBS changes to the standby state, if no agent is available for secure exit or preempted outbound calls, failed records are canceled.                                                                                                                                              |
| 34610      | When the OBS changes to the standby state, ongoing records are canceled.                                                                                                                                                                                                                   |
| 34611      | When the OBS exits, unanswered ongoing records are canceled and written back.                                                                                                                                                                                                              |
| 35027      | Incorrect called number in the preview.                                                                                                                                                                                                                                                    |

| Cause Code | Description                    |
|------------|--------------------------------|
| 714        | Failed to route the call.      |
| 715        | The call times out.            |
| 1138       | The called party hangs up.     |
| 1153       | The agent hangs up.            |
| 1154       | The agent cancels the call.    |
| 1155       | Timeout.                       |
| 1156       | The agent is disconnected.     |
| 1162       | Resource overload.             |
| 1163       | Unreachable or wrong number.   |
| 1164       | The called party is busy.      |
| 1165       | The phone is powered off.      |
| 1166       | The phone is out of service.   |
| 1167       | Insufficient resources.        |
| 1168       | The user does not respond.     |
| 1169       | The call is rejected.          |
| 1170       | The ACD is busy.               |
| 1171       | Timeout.                       |
| 20301      | Invalid user.                  |
| 20302      | Invalid device.                |
| 20303      | No answering device available. |
| 20304      | Exception.                     |
| 20305      | Invalid routing device.        |
| 20306      | Unreachable or wrong number.   |
| 20307      | The called party is busy.      |
| 20308      | The switch restarted.          |
| 20309      | The user does not respond.     |
| 20310      | Unknown error.                 |
| 20920      | Insufficient call resources.   |
| 20921      | No valid VDN available.        |
| 20922      | The call fails.                |

| Cause Code | Description                                                        |
|------------|--------------------------------------------------------------------|
| 20923      | Failed to route the call to the agent.                             |
| 20924      | Invalid skill queue.                                               |
| 20925      | Failed to route the skill queue.                                   |
| 20926      | Failed to transfer the call to the manual service through routing. |

### 6.5.3 Agent Status

**Table 6-452** CC-Gateway status

| Status Value | Description                                                                |
|--------------|----------------------------------------------------------------------------|
| 0            | Unknown, corresponding to state 9 on the CTI platform.                     |
| 1            | Sign-in state. This value is reserved.                                     |
| 2            | Sign-out state, corresponding to state 0 on the CTI platform.              |
| 3            | Busy state, corresponding to state 7 on the CTI platform.                  |
| 4            | Idle state, corresponding to state 1 on the CTI platform.                  |
| 5            | Wrap-up state, corresponding to state 6 on the CTI platform.               |
| 6            | Same as the idle state. This value is reserved.                            |
| 7            | Talking state, corresponding to states 2, 3, 4, and 5 on the CTI platform. |
| 8            | Rest state, corresponding to state 8 on the CTI platform.                  |
| 9            | Pre-rest state.                                                            |

**Table 6-453** CTI platform status

| Status Value | Description               |
|--------------|---------------------------|
| 0            | Not signed in.            |
| 1            | Idle state.               |
| 2            | Preoccupied state.        |
| 3            | Occupied state.           |
| 4            | Answering state.          |
| 5            | Talking state.            |
| 6            | Post-event wrap-up state. |

| Status Value | Description  |
|--------------|--------------|
| 7            | Busy state.  |
| 8            | Rest state.  |
| 9            | Study state. |

**Table 6-454** Agent status

| Status Value | Description          |
|--------------|----------------------|
| 1            | Idle state.          |
| 2            | Wrap-up state.       |
| 3            | Rest state.          |
| 4            | Busy state.          |
| 5            | Playback state.      |
| 6            | Outbound call state. |
| 7            | Occupied state.      |
| 8            | Request response.    |
| 9            | Talking state.       |
| 10           | Three-party call.    |
| 11           | Hold state.          |
| 12           | Mute state.          |
| 13           | Help seeking state.  |
| 14           | Talk transfer state. |
| 15           | Inserting state.     |
| 16           | Listening state.     |
| 17           | Whispering state.    |
| 255          | Abnormal state.      |

## 6.5.4 Call Type

Table 6-455 Call type

| Value | Description                        |
|-------|------------------------------------|
| 0     | Common incoming call.              |
| 6     | Internal call.                     |
| 7     | Common outgoing call.              |
| 40    | Reserved outgoing call.            |
| 41    | Presold outgoing call.             |
| 43    | Predicted outgoing call.           |
| 44    | Previewed outgoing call.           |
| 45    | Reserved callback.                 |
| 51    | Internal two-party consultation.   |
| 52    | Internal three-party consultation. |
| 53    | Multi-party call.                  |

## 6.5.5 Device Type

Table 6-456 Device type

| ID | Description  |
|----|--------------|
| 1  | Skill queue. |
| 2  | Agent ID.    |
| 3  | IVR          |

Table 6-457 User-defined device types

| ID | Description                 |
|----|-----------------------------|
| 0  | Unknown.                    |
| 1  | Ordinary phone.             |
| 2  | Wireless digital equipment. |
| 3  | Wireless analog device.     |
| 4  | Shortwave.                  |

| ID | Description   |
|----|---------------|
| 5  | Mobile phone. |
| 6  | Agent.        |
| 7  | eLTE.         |

**Table 6-458** User-defined device call types

| ID | Description                                |
|----|--------------------------------------------|
| 0  | Normal call.                               |
| 1  | Group call.                                |
| 2  | Secret call, that is, point-to-point call. |

**Table 6-459** Transfer modes

| Name                                    | Description                                                                                                                                                           |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blind transfer                          | An agent releases a call no matter whether the call is successfully transferred or transferred out.                                                                   |
| Release-after-transfer                  | The system monitors the call transfer/transfer-out process. The business agent releases the call only after the call is successfully transferred.                     |
| Talk forwarding                         | The system monitors the call transfer-out process. After answering the call, the called party talks with the agent. The agent then releases the call.                 |
| Release-after-three-way-talk forwarding | The system monitors the transfer-out process. After the called party answers the call, the three-party conversation is implemented. The agent then releases the call. |
| Hang-up transfer                        | A call is transferred to an automatic flow. After processing the call, the automatic flow transfers the call back to the original agent.                              |

## 6.5.6 Interface Parameters

The parameters such as the skill queue ID, access code, VDN ID, agent ID, agent group ID, and call ID must be transferred to the interface. The CC-Gateway has restrictions on interface parameter validation. The restrictions are reflected in user validity check. The CTI checks the validity of interface parameters when the CC-Gateway invokes the CTI interface.

Unless otherwise specified, the time parameters in the interface return values and input parameters are in the timestamp format and of the long type by default. The unit is ms.

Query interfaces:

- `/resource/queuedevice/*` (querying queue sign-in and number of queuing users)
- `/resource/agentgroup/*` (querying skill queue information)
- `/resource/calldata/*` (querying associated data and call information)
- `/resource/onlineagent/{agentid}/agentskills` (querying the configured skill queues)
- `/resource/onlineagent/{agentid}/agentskillsbyworkno/{workno}` (querying the skill queue configured for a specified agent)
- `/resource/onlineagent/{agentid}/agentstatus` (obtaining the current agent status)
- `/resource/onlineagent/{agentid}/syncagentinfo` (synchronizing the agent status and call information during the agent page refreshing)
- `/resource/onlineagent/{agentid}/updateGuid` (proactively requesting to update the GUID during the agent page refreshing)

These interfaces are used to query the information about agents and queues and the current call processing information of agents during call transfer and help seeking in the agent integrated connection application. To prevent abnormal development of the multi-tenant third-party system from affecting system stability, flow control is performed at the system level and agent level, which cannot be invoked frequently.

## 7.1 Outbound Campaign Management Interfaces

### 7.1.1 Adding an Outbound Campaign (V1)

#### Scenario

This interface is invoked to add a predicted, intelligent, automatic, previewed, or preempted outbound campaign.

#### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - For intelligent outbound calls, the customer needs to develop the IVR. For details, see [Configuring Intelligent IVR](#) in *User Guide* on Huawei Cloud.

- Restrictions
  - Only 20 outbound campaign tasks whose device type is skill queue can be created.
  - Only 20 outbound campaign tasks whose device type is IVR can be created.

 **NOTE**

The number of active outbound campaign tasks of the same type of a tenant cannot be greater than a specified value. The value is specified by **max.liveliest.taskCount**. The default value is 20.

- After an outbound campaign is created, the device type cannot be changed.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-1** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-2** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-3** Request body parameters

| No. | Parameter    | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----|--------------|---------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | name         | String  | Yes                         | Name of an outbound campaign.<br>The name must be unique.<br>The value can contain a maximum of 32 characters.                                                                                                                                                                                                                                                                                                                                                                     |

| 6   | callerNo     | String  | Yes                         | Calling number.<br>Number displayed on the phone of a customer after a call is connected.<br>The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).                                                                                                                                                                                                                                                                         |

| No. | Parameter       | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                   |
|-----|-----------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | maxAlertingTime | Integer | Yes              | Maximum ringing duration for no answer. If the ringing duration exceeds the value of this parameter, the call is released.<br><br>For previewed outbound calls, the value ranges from 9 to 120, in seconds. For other types of outbound calls, the value ranges from 5 to 120, in seconds.    |
| 8   | scheduleParam   | Object  | Yes              | Outbound call time segment.<br>For details about the parameters of this object, see <a href="#">Table 7-4</a> .                                                                                                                                                                               |
| 9   | ivrParam        | Object  | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>1</b> or <b>3</b> (IVR).<br>For details about the parameters of this object, see <a href="#">Table 7-5</a> .                                                                                                                  |
| 10  | skillParam      | Object  | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>2</b> , <b>5</b> , or <b>6</b> (skill queue).<br>For details about the parameters of this object, see <a href="#">Table 7-6</a> .                                                                                             |
| 11  | initStatus      | Integer | No               | Campaign status after addition. The default value is <b>0</b> .<br>The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: The campaign is in started status after being added.</li> <li>• <b>1</b>: The campaign is in suspended status after being added.</li> </ul> |
| 12  | callbackUrl     | String  | Yes              | Callback notification URL of the outbound call result.<br>The URL must start with <b>https://</b> or <b>http://</b> .<br><b>NOTE</b><br>HTTP is an insecure protocol, which may bring risks to the system. Therefore, it is not recommended. The secure HTTPS protocol is recommended.        |

| No. | Parameter | Type    | Mandatory or Not          | Description                                                                                 |
|-----|-----------|---------|---------------------------|---------------------------------------------------------------------------------------------|
| 13  | cclId     | Integer | Yes in the OP environment | Center ID. This parameter can be used to identify a center when there are multiple centers. |

**Table 7-4** Parameter description of scheduleParam

| No.  | Parameter         | Type   | Mandatory or Not | Description                                                                     |
|------|-------------------|--------|------------------|---------------------------------------------------------------------------------|
| 8.1  | workdayBeginTime1 | String | No               | Start time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format. |
| 8.2  | workdayEndTime1   | String | No               | End time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format.   |
| 8.3  | workdayBeginTime2 | String | No               | Start time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format. |
| 8.4  | workdayEndTime2   | String | No               | End time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format.   |
| 8.5  | workdayBeginTime3 | String | No               | Start time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format. |
| 8.6  | workdayEndTime3   | String | No               | End time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format.   |
| 8.7  | holidayBeginTime1 | String | No               | Start time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format. |
| 8.8  | holidayEndTime1   | String | No               | End time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format.   |
| 8.9  | holidayBeginTime2 | String | No               | Start time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format. |
| 8.10 | holidayEndTime2   | String | No               | End time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format.   |
| 8.11 | holidayBeginTime3 | String | No               | Start time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format. |

| No.      | Parameter           | Type   | Man<br>dato<br>ry or<br>Not | Description                                                                   |
|----------|---------------------|--------|-----------------------------|-------------------------------------------------------------------------------|
| 8.1<br>2 | holidayEnd<br>Time3 | String | No                          | End time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format. |

 **NOTE**

1. Among the outbound call time segments 1, 2, and 3 on workdays, at least one segment must be specified.
2. The start time and end time must be specified or left empty at the same time.
3. The start time must be earlier than the end time.
4. Outbound calls are made by workday unless a date or a day in a week is specified as a holiday.
5. **After the holiday time segment is configured, to be compatible with the AICC-sales page, the interface of 6.2 (Adding an Outbound Call Campaign Holiday) must be invoked to specify the relationship between the outbound call campaign and the holiday. Otherwise, the interface is incompatible with the page.**

**Table 7-5** Parameter description of ivrParam

| No. | Parameter    | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 9.1 | deviceSign   | String  | Yes                         | <p>When <b>deviceType</b> is set to <b>1</b>, the value is an intelligent IVR flow code (<b>oifde-flowcode</b>). To obtain the flow code, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Flow Management &gt; Flow Orchestration</b>.</p> <p>When <b>deviceType</b> is set to <b>3</b>, the value is the flow access code of a common IVR or the chatbot access code of an intelligent IVR.</p> <p>To obtain the flow access code of a common IVR, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Flow Management</b>.</p> <p>To obtain the chatbot access code of an intelligent IVR, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Chatbot Management</b>.</p> |
| 9.2 | callCount    | Integer | Yes                         | <p>Number of outbound calls that are made in an outbound task each time.</p> <p>The value ranges from 1 to 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 9.3 | callInterval | Integer | Yes                         | <p>Interval for executing an outbound campaign task.</p> <p>The value ranges from 1 to 9999, in seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

 **NOTE**

For example, if an outbound campaign task requires 60 outbound calls in one minute, you are advised to set **callInterval** to **3** and **callCount** to **3**.

The IVR is used after outbound calls are made. The number of outbound calls is calculated as follows: The value of  $(\text{callCount}/\text{callInterval}) \times \text{Interval}$  rounded up to 3 (only when the number of outbound calls is greater than 1). If the outbound call interval is greater than **3**, outbound calls are made every 3 seconds. If the outbound call interval is less than **3**, the configured outbound call interval is used.

**Table 7-6** Parameter description of skillParam

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                                   |
|------|--------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.1 | skillId      | Integer | Yes              | ID of a skill queue.<br>The value ranges from 1 to 1000.                                                                                                                                                      |
| 10.2 | skillName    | String  | No               | Skill queue name.<br>The value can contain a maximum of 100 characters.                                                                                                                                       |
| 10.3 | outBoundType | Integer | Yes              | Outbound call mode.<br>The options are as follows: <ul style="list-style-type: none"> <li>• 2: predicted outbound call</li> <li>• 5: previewed outbound call</li> <li>• 6: preempted outbound call</li> </ul> |
| 10.4 | predictParam | Object  | No               | Parameter settings for predicted outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 2.<br>For details about the parameters of this object, see <a href="#">Table 7-8</a> .        |
| 10.5 | previewParam | Object  | No               | Parameter settings for previewed outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 5.<br>For details about the parameters of this object, see <a href="#">Table 7-7</a> .        |

**Table 7-7** Parameter description of previewParam

| No.    | Parameter    | Type    | Mandatory or Not | Description                                                                                                                |
|--------|--------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 10.5.1 | failInterval | Integer | Yes              | Outbound call interval, in seconds. The value ranges from 3 to 60.                                                         |
| 10.5.2 | obCallCount  | Integer | Yes              | Number of outbound calls each time. The value ranges from 1 to 100.                                                        |
| 10.5.3 | autoCallTime | Integer | Yes              | Duration of a previewed outbound call, in seconds. The value ranges from 5 to the value of <b>maxAlertingTime</b> minus 3. |

**Table 7-8** Parameter description of predictParam

| No.    | Parameter           | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                       |

 }
 }
},
"initStatus": 0,
"callBackUrl": "https://10.10.10.10/xxx/xxx/xxx"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": "",
 "returnObject": {
 "id": 46
 }
}
```

## 7.1.2 Adding an Outbound Campaign (V2)

### Scenario

This interface is invoked to add a predicted, intelligent, automatic, previewed, or preempted outbound campaign.

The V2 version is recommended. It supports the adding of the outbound call retry policy, call policy, and business result policy. Only one interface is required to add the data related to an outbound campaign task. The interface for setting the outbound campaign retry policy does not need to be invoked.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - For intelligent outbound calls, the customer needs to develop the IVR. For details, see [Configuring Intelligent IVR](#).
- Restrictions
  - Only 20 outbound campaign tasks whose device type is skill queue can be created.

- Only 20 outbound campaign tasks whose device type is IVR can be created.

 **NOTE**

The number of active outbound campaign tasks of the same type of a tenant cannot be greater than a specified value. The value is specified by **max.liveliest.taskCount**. The default value is 20.

- After an outbound campaign is created, the device type cannot be changed.

## Method

This interface supports only the POST method.

## URI

https://ip:port/rest/isales/v2/openapi/campaigns/{vdnId}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-16** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-17** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-18** Request body parameters

| No. | Parameter       | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 2   | description     | String  | No                          | Description of an outbound campaign.<br>The value can contain a maximum of 200 characters, excluding the following special characters: "[ ] = ; < >                                                                                                                                                                                                                                                                                                                                     |
| 3   | strBeginTime    | String  | Yes                         | Time when an outbound campaign starts.<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .<br>The time cannot be earlier than 00:00 of the current day.                                                                                                                                                                                                                                                                                                                                       |
| 4   | strEndTime      | String  | Yes                         | Time when an outbound campaign ends.<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| 5   | deviceType      | Integer | Yes                         | Type of an outbound device.<br>The options are as follows: <ul style="list-style-type: none"> <li>• <b>1:</b> IVR for intelligent outbound calls (available in the SaaS environment when the intelligent feature is enabled)</li> <li>• <b>2:</b> skill queue for predicted outbound calls</li> <li>• <b>3:</b> IVR for automatic outbound calls</li> <li>• <b>5:</b> skill queue for previewed outbound calls</li> <li>• <b>6:</b> skill queue for preempted outbound calls</li> </ul> |
| 6   | callerNo        | List    | Yes                         | Multiple calling numbers are supported.<br>For details about the parameters of this object, see <a href="#">Table 7-28</a> .                                                                                                                                                                                                                                                                                                                                                            |
| 7   | maxAlertingTime | Integer | Yes                         | Maximum ringing duration for no answer.<br>If the ringing duration exceeds the value of this parameter, the call is released.<br>For previewed outbound calls, the value ranges from 9 to 120, in seconds. For other types of outbound calls, the value ranges from 5 to 120, in seconds.                                                                                                                                                                                               |

| No. | Parameter     | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                   |
|-----|---------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8   | priority      | Integer | No               | Task priority.<br>The value ranges from 1 to 5. A smaller value indicates a higher priority.                                                                                                                                                                                                  |
| 9   | scheduleParam | Object  | Yes              | Outbound call time segment.<br>For details about the parameters of this object, see <a href="#">Table 7-19</a> .                                                                                                                                                                              |
| 10  | ivrParam      | Object  | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>1</b> or <b>3</b> (IVR).<br>For details about the parameters of this object, see <a href="#">Table 7-20</a> .                                                                                                                 |
| 11  | skillParam    | Object  | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>2</b> , <b>5</b> , or <b>6</b> (skill queue).<br>For details about the parameters of this object, see <a href="#">Table 7-21</a> .                                                                                            |
| 12  | initStatus    | Integer | No               | Campaign status after addition. The default value is <b>0</b> .<br>The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: The campaign is in started status after being added.</li> <li>• <b>1</b>: The campaign is in suspended status after being added.</li> </ul> |
| 13  | callbackUrl   | String  | Yes              | Callback notification address of the outbound call result.<br>The URL must start with https:// or http.<br><b>NOTE</b><br>HTTP is an insecure protocol, which may bring risks to the system. Therefore, it is not recommended. The secure HTTPS protocol is recommended.                      |
| 14  | retryPolicy   | Object  | Yes              | Outbound call result policy.<br>For details about the parameters of this object, see <a href="#">Table 7-29</a> .                                                                                                                                                                             |
| 15  | callPolicy    | Object  | No               | Call policy.<br>For details about the parameters of this object, see <a href="#">Table 7-34</a> .                                                                                                                                                                                             |

| No. | Parameter | Type    | Mandatory or Not          | Description                                                                                 |
|-----|-----------|---------|---------------------------|---------------------------------------------------------------------------------------------|
| 16  | cclId     | Integer | Yes in the OP environment | Center ID. This parameter can be used to identify a center when there are multiple centers. |

 NOTE

If the value of **callPolicy** is not empty and the value of **callType** is **1** (round call), the value of **policyType** in the outbound call result policy **retryPolicy** can only be **1**, that is, the number type policy.

**Table 7-19** Parameter description of scheduleParam

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                     |
|-----|-------------------|--------|------------------|---------------------------------------------------------------------------------|
| 9.1 | workdayBeginTime1 | String | No               | Start time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format. |
| 9.2 | workdayEndTime1   | String | No               | End time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format.   |
| 9.3 | workdayBeginTime2 | String | No               | Start time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format. |
| 9.4 | workdayEndTime2   | String | No               | End time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format.   |
| 9.5 | workdayBeginTime3 | String | No               | Start time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format. |
| 9.6 | workdayEndTime3   | String | No               | End time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format.   |
| 9.7 | holidayBeginTime1 | String | No               | Start time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format. |
| 9.8 | holidayEndTime1   | String | No               | End time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format.   |
| 9.9 | holidayBeginTime2 | String | No               | Start time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format. |

| No.  | Parameter         | Type   | Mandatory or Not | Description                                                                     |
|------|-------------------|--------|------------------|---------------------------------------------------------------------------------|
| 9.10 | holidayEndTime2   | String | No               | End time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format.   |
| 9.11 | holidayBeginTime3 | String | No               | Start time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format. |
| 9.12 | holidayEndTime3   | String | No               | End time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format.   |

 NOTE

1. Among the outbound call time segments 1, 2, and 3 on workdays, at least one segment must be specified.
2. The start time and end time must be specified or left empty at the same time.
3. The start time must be earlier than the end time.
4. Outbound calls are made by workday unless a date or a day in a week is specified as a holiday.
5. **For the compatibility with the CC-iSales page, after the holiday time segment is configured, the interface in "Adding a Holiday for an Outbound Campaign" must be invoked to specify the relationship between the outbound campaign and the holiday. Otherwise, the interface is incompatible with the page.**

**Table 7-20** Parameter description of ivrParam

| No.  | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------|------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.1 | deviceSign | String | Yes              | <p>When <b>deviceType</b> is set to <b>1</b>, the value is an intelligent IVR flow code (<b>oifd-flowcode</b>). To obtain the flow code, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Flow Management &gt; Flow Orchestration</b>.</p> <p>When <b>deviceType</b> is set to <b>3</b>, the value is a common IVR flow access code. To obtain the flow access code, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Flow Management</b>.</p> |

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                              |
|------|--------------|---------|------------------|----------------------------------------------------------------------------------------------------------|
| 10.2 | callCount    | Integer | Yes              | Number of outbound calls that are made in an outbound task each time.<br>The value ranges from 1 to 100. |
| 10.3 | callInterval | Integer | Yes              | Interval for executing an outbound campaign task.<br>The value ranges from 1 to 9999, in seconds.        |

 NOTE

For example, if an outbound campaign task requires 60 outbound calls in one minute, you are advised to set **callInterval** to **3** and **callCount** to **3**.

When the device type is IVR and outbound calls are made, the number of outbound calls is calculated as follows: (Value of **callCount**/Value of **callInterval**) x 3, rounded up. Outbound calls are made only when the result is greater than 1. If the value of **callInterval** is greater than **3**, **3** is used for calculation. If the value of **callInterval** is less than **3**, the actual value is used.

**Table 7-21** Parameter description of skillParam

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                                     |
|------|--------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.1 | skillId      | Integer | Yes              | ID of a skill queue.<br>The value ranges from 1 to 1000.                                                                                                                                                        |
| 11.2 | skillName    | String  | Yes              | Skill queue name.<br>The value can contain a maximum of 100 characters.                                                                                                                                         |
| 11.3 | outBoundType | Integer | Yes              | Outbound call mode.<br>The options are as follows: <ul style="list-style-type: none"> <li>• 2: predicted outbound call</li> <li>• 5: previewed outbound call</li> <li>• 6: preempted outbound call</li> </ul>   |
| 11.4 | predictParam | Object  | No               | Parameter settings for predicted outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to <b>2</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-23</a> . |

| No.  | Parameter    | Type   | Mandatory or Not | Description                                                                                                                                                                                                     |
|------|--------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.5 | previewParam | Object | No               | Parameter settings for previewed outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to <b>5</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-22</a> . |

**Table 7-22** Parameter description of previewParam

| No.    | Parameter    | Type    | Mandatory or Not | Description                                                                                                                |
|--------|--------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 11.5.1 | failInterval | Integer | Yes              | Outbound call interval, in seconds. The value ranges from 3 to 60.                                                         |
| 11.5.2 | obCallCount  | Integer | Yes              | Number of outbound calls each time. The value ranges from 1 to 100.                                                        |
| 11.5.3 | autoCallTime | Integer | Yes              | Duration of a previewed outbound call, in seconds. The value ranges from 5 to the value of <b>maxAlertingTime</b> minus 3. |

**Table 7-23** Parameter description of predictParam

| No.    | Parameter     | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                       |
|--------|---------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4.1 | predictMethod | Integer | Yes              | Algorithm for predicted outbound calls. The options are as follows:<br><b>1:</b> Algorithm for empirical prediction<br><b>2:</b> Algorithm for agent usage prediction<br><b>3:</b> Algorithm for predicting the outbound call completion rate<br><b>5:</b> Algorithm for off-hook rate prediction |

| No.    | Parameter           | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                           |
|--------|---------------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4.2 | expPredictParam     | Object | No               | Parameter settings of the algorithm for empirical prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>1</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-24</a> .                         |
| 11.4.3 | agentPredictParam   | Object | No               | Parameter settings of the algorithm for agent usage prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>2</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-25</a> .                       |
| 11.4.4 | connectPredictParam | Object | No               | Parameter settings of the algorithm for predicting the outbound call completion rate. This parameter is mandatory when <b>predictMethod</b> is set to <b>3</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-26</a> . |
| 11.4.5 | offhookPredictParam | Object | No               | Parameter settings of the algorithm for off-hook rate prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>5</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-27</a> .                     |

**Table 7-24** Parameter description of expPredictParam

| No.      | Parameter      | Type    | Mandatory or Not | Description                                                                                                                                                                               |
|----------|----------------|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4.2.1 | maxAvgCallTime | Integer | Yes              | Maximum average call duration, in seconds. The value is a positive integer. The value ranges from 50 to 200.                                                                              |
| 11.4.2.2 | minAvgCallTime | Integer | Yes              | Minimum average call duration, in seconds. The value is a positive integer. The value ranges from 50 to 200. The value must be less than or equal to the value of <b>maxAvgCallTime</b> . |

| No.      | Parameter    | Type    | Mandatory or Not | Description                                                                             |
|----------|--------------|---------|------------------|-----------------------------------------------------------------------------------------|
| 11.4.2.3 | outBoundRate | Integer | Yes              | Outbound call rate.<br>The value ranges from 0 to 100. The default value is <b>70</b> . |

**Table 7-25** Parameter description of agentPredictParam

| No.      | Parameter      | Type    | Mandatory or Not | Description                                                                                                                                                                                                               |
|----------|----------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4.3.1 | maxAvgCallTime | Integer | Yes              | Maximum average call duration, in seconds. The value is a positive integer. The value ranges from 50 to 200.                                                                                                              |
| 11.4.3.2 | minAvgCallTime | Integer | Yes              | Minimum average call duration, in seconds. The value is a positive integer. The value ranges from 50 to 200. The value must be less than or equal to the value of <b>maxAvgCallTime</b> .                                 |
| 11.4.3.3 | lossRate       | Integer | Yes              | Minimum call loss rate.<br>The value ranges from 0 to 100. The default value is <b>3</b> .                                                                                                                                |
| 11.4.3.4 | utilRate       | Integer | Yes              | Agent usage.<br>The value ranges from 0 to 100. The default value is <b>70</b> .                                                                                                                                          |
| 11.4.3.5 | utilRateMethod | Integer | Yes              | Algorithm for agent usage.<br>The options are as follows:<br><b>1:</b> Agent usage = Total call duration/Total login duration<br><b>2:</b> Agent usage = (Total call duration + Work state duration)/Total login duration |

**Table 7-26** Parameter description of connectPredictParam

| No.              | Parameter          | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                               |

**Table 7-28** Parameter description of callerNo

| No. | Parameter  | Type    | Mandatory or Not | Description                                                                                                                                                           |
|-----|------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.1 | accessCode | String  | Yes              | Calling number.<br>Number displayed on the phone of a customer after a call is connected.<br>The value can contain a maximum of 32 characters, including only digits. |
| 6.2 | priority   | Integer | Yes              | Calling number priority.<br>The value ranges from 1 to 5. A smaller value indicates a higher priority.                                                                |

**Table 7-29** Parameter description of retryPolicy

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                        |
|------|--------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.1 | policyType   | Integer | Yes              | Retry policy type.<br><b>0</b> : global policy; <b>1</b> : number type matching policy.                                                                                                            |
| 14.2 | retryDay     | Integer | --               | Maximum number of days for call attempts.<br>This parameter is mandatory for common policies under the global policy.<br>The value ranges from 1 to 5.                                             |
| 14.3 | retryTimes   | Integer | --               | Maximum number of call attempts per day.<br>This parameter is mandatory for common policies under the global policy.<br>The value ranges from 1 to 6.                                              |
| 14.4 | callInterval | Integer | --               | Outbound call interval, in seconds.<br>This parameter is mandatory for common policies under the global policy.<br>The value ranges from 1 to 86400.                                               |
| 14.5 | resultRetry  | String  | --               | JSON string of the result policy.<br>This parameter is mandatory for result policies under the global policy.<br>For details about the parameters of this object, see <a href="#">Table 7-30</a> . |

| No.  | Parameter     | Type             | Mandatory or Not                                                         | Description                                                                                                                                                                                            |
|------|---------------|------------------|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.6 | policyJson    | String           | --                                                                       | JSON string of the number type matching policy.<br>This parameter is mandatory for number type matching policies.<br>For details about the parameters of this object, see <a href="#">Table 7-31</a> . |
| 14.7 | busiPolicy    | String           | No                                                                       | JSON string of the business result policy.<br>For details about the parameters of this object, see <a href="#">Table 7-33</a> .                                                                        |
| 14.8 | noRetryPolicy | List<br><String> | No<br>(This parameter cannot be set when <b>policyType</b> is set to 1.) | Result codes for which no retry policy is configured. The result codes come from the <b>resultCode</b> field in the <b>data</b> attribute in <a href="#">7.5.1 Querying Outbound Call Results</a> .    |

 NOTE

If the value of **policyType** is 0 and the policy is a common policy, set **retryDay**, **retryTimes**, and **callInterval**, for example, "**retryDay**": 2,"**retryTimes**": 2,"**callInterval**": 2. For a result-based policy, set only **resultRetry**, for example, "[{"**result**": "2", "**retryNumber**": "1", "**callInterval**": "600"}]".

When the value of **policyType** is 1, set only **policyJson**.

For a common policy, an example of **policyJson** is as follows: **policyJson**: [{"**dataType**": "ST", "**type**": "0", "**policy**": {"**retryDay**": "2", "**retryTimes**": "2"}}].

For a result-based policy, an example of **policyJson** is as follows: "**policyJson**": [{"**dataType**": "SI", "**type**": "1", "**policy**": [{"**result**": "4", "**retryNumber**": "3", "**callInterval**": "600"}]}].

**Table 7-30** Parameter description of resultRetry

| No.    | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                       |
|--------|--------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.5.1 | result       | Integer | --               | Result type.<br>This parameter is mandatory for result policies under the global policy. The value ranges from 1 to 9.                            |
| 14.5.2 | callInterval | Integer | --               | Outbound call interval, in seconds.<br>This parameter is mandatory for result policies under the global policy. The value ranges from 1 to 86400. |
| 14.5.3 | retryNumber  | Integer | --               | Number of retry times.<br>This parameter is mandatory for result policies under the global policy. The value ranges from 0 to 9.                  |

**Table 7-31** Parameter description of policyJson

| No.    | Parameter | Type    | Mandatory or Not | Description                                                                                                               |
|--------|-----------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------|
| 14.6.1 | dataType  | String  | Yes              | Number type.<br>The value can contain a maximum of 20 characters, excluding special characters.                           |
| 14.6.2 | type      | Integer | Yes              | Retry logic policy type. <ul style="list-style-type: none"> <li>● 0: common policy</li> <li>● 1: result policy</li> </ul> |
| 14.6.3 | policy    | String  | Yes              | Policy configuration information.<br>For details about the parameters of this object, see <a href="#">Table 7-32</a> .    |

**Table 7-32** Parameter description of policy

| No.      | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|--------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.6.3.1 | retryDay     | Integer | --               | Maximum number of days for call attempts.<br>This parameter is mandatory for common policies that are matched based on the number type. The value ranges from 1 to 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 14.6.3.2 | retryTimes   | Integer | --               | Maximum number of call attempts per day.<br>This parameter is mandatory for common policies that are matched based on the number type. The value ranges from 1 to 6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 14.6.3.3 | result       | Integer | --               | Result type.<br>This parameter is mandatory for result policies that are matched based on the number type. The value ranges from 0 to 9.<br>The options are as follows: <b>1</b> : The customer is busy. <b>2</b> : The customer does not answer the call. <b>3</b> : The customer rejects the call. <b>4</b> : The number does not exist. <b>5</b> : The customer's phone is powered off. <b>6</b> : The customer is out of the service area. <b>7</b> : Fax or switchboard. <b>8</b> : The call times out. <b>9</b> : The call fails. <b>0</b> : Others.<br>The retry policy is also determined based on the specific failure code ( <b>failCode</b> ).<br>For details about failure codes, see <a href="#">Table 7-295</a> . |
| 14.6.3.4 | callInterval | Integer | --               | Outbound call interval, in seconds.<br>This parameter is mandatory for result policies that are matched based on the number type. The value ranges from 1 to 86400.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 14.6.3.5 | retryNumber  | Integer | --               | Number of retry times.<br>This parameter is mandatory for result policies that are matched based on the number type. The value ranges from 0 to 9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 7-33** Parameter description of busiPolicy

| No.    | Parameter         | Type    | Mandatory or Not | Description                                                                                                                                                                                    |
|--------|-------------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.7.1 | busiResultCode    | String  | Yes              | Business result code.                                                                                                                                                                          |
| 14.7.2 | busiResultSubCode | String  | --               | Business result subcode. (This parameter is associated with the business result code.)                                                                                                         |
| 14.7.3 | busiResultPolicy  | Integer | Yes              | Call policy for a business result.<br><b>0</b> : Stop calling. <b>1</b> : Call the next number.<br><b>2</b> : Call the current number.                                                         |
| 14.7.4 | callInterval      | Integer | --               | Outbound call interval, in seconds.<br>If the call policy is set to <b>0</b> , you do not need to set this parameter. Otherwise, this parameter is mandatory. The value ranges from 1 to 3600. |

**Table 7-34** Parameter description of callPolicy

| No.  | Parameter  | Type    | Mandatory or Not | Description                                                                                                                                                            |
|------|------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.1 | callType   | Integer | No               | Call mode.<br><b>0</b> : by sequence; <b>1</b> : by round. The default value is <b>0</b> .                                                                             |
| 15.2 | chooseType | Integer | --               | Round mode.<br><b>0</b> : by number category; <b>1</b> : by number sequence. This parameter is mandatory when the call mode is by round.                               |
| 15.3 | turns      | List    | --               | Round information.<br>This parameter is mandatory when the call mode is by round.<br>For details about the parameters of this object, see <a href="#">Table 7-35</a> . |

**Table 7-35** Parameter description of turns

| No.    | Parameter | Type    | Mandatory or Not | Description                                                                                                                                                               |
|--------|-----------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.3.1 | turnType  | String  | --               | Number type.<br>The value can contain a maximum of 20 characters, excluding special characters.<br>This parameter is mandatory when the round mode is by number category. |
| 15.3.2 | turnOrder | Integer | --               | Number sequence.<br>The value ranges from 1 to 10. This parameter is mandatory when the round mode is by number sequence.                                                 |

## Response Description

**Table 7-36** Response body parameters

| No. | Parameter    | Type   | Description                                                                                                                                 |
|-----|--------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-38</a> . |
| 2   | resultDesc   | String | Description.                                                                                                                                |
| 3   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-38</a> . |
| 4   | returnDesc   | String | Description.                                                                                                                                |
| 5   | returnObject | Object | For details, see <a href="#">Table 7-37</a> .                                                                                               |

**Table 7-37** Parameter description of returnObject

| No. | Parameter | Type    | Description                 |
|-----|-----------|---------|-----------------------------|
| 5.1 | id        | Integer | ID of an outbound campaign. |

## Triggered Event

None

## Error Codes

**Table 7-38** Error code description

| No. | Error Code   | Description                                                                                                                                                                                      |
|-----|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .                                                                                                                            |
| 2   | 020000<br>2  | The start time of an outbound campaign is earlier than the early morning of the current day.                                                                                                     |
| 3   | 020000<br>3  | The number of outbound campaigns whose device type is skill queue has reached the upper limit. To add more outbound campaigns, delete other outbound campaigns whose device type is skill queue. |
| 4   | 020000<br>4  | The number of outbound campaigns whose device type is IVR has reached the upper limit. To add more outbound campaigns, delete other outbound campaigns whose device type is IVR.                 |
| 5   | 020000<br>5  | The outbound campaign name must be unique.                                                                                                                                                       |
| 6   | 020001<br>7  | The skill queue ID does not exist.                                                                                                                                                               |
| 7   | 020000<br>01 | Empty parameter.                                                                                                                                                                                 |
| 8   | 020000<br>02 | The parameter contains invalid characters.                                                                                                                                                       |
| 9   | 020000<br>03 | The parameter length cannot exceed the maximum length.                                                                                                                                           |
| 10  | 020000<br>04 | The parameter length cannot be less than the minimum length.                                                                                                                                     |
| 11  | 020000<br>05 | The parameter length must be within the specified range.                                                                                                                                         |
| 12  | 020000<br>06 | Incorrect parameter type.                                                                                                                                                                        |

 }
}
```

## 7.1.3 Modifying an Outbound Campaign (V1)

### Scenario

This interface is invoked to modify the configurations of an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The ID of the outbound campaign to be modified has been obtained.
  - The outbound campaign task must exist and is not complete.
- Restrictions
  - After an outbound campaign is created, the device type cannot be changed.

### Method

This interface supports only the PUT method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-39** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | Outbound campaign task ID.                                 |

## Request Description

**Table 7-40** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-41** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                                   |
|-----|-------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | name        | String | Yes              | Name of an outbound campaign.<br>The name must be unique.<br>The value can contain a maximum of 32 characters.                                |
| 2   | description | String | No               | Description of an outbound campaign.<br>The value can contain a maximum of 200 characters, excluding the following special characters: "[]=<> |

| No. | Parameter       | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----|-----------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | strBeginTime    | String  | No               | Time when an outbound campaign starts. The format is <i>yyyy-MM-dd HH:mm:ss</i> . The time cannot be earlier than 00:00 of the current day.                                                                                                                                                                                                                                                                                                                                                                                                               |
| 4   | strEndTime      | String  | No               | Time when an outbound campaign ends. The format is <i>yyyy-MM-ddHH:mm:ss</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 5   | deviceType      | Integer | Yes              | Type of an outbound device. The options are as follows: <ul style="list-style-type: none"> <li>• <b>1:</b> IVR in intelligent outbound calls (available in the SaaS environment when the intelligent feature is enabled)</li> <li>• <b>2:</b> skill queue in predicted outbound calls</li> <li>• <b>3:</b> IVR in automatic outbound calls</li> <li>• <b>5:</b> skill queue in previewed outbound calls</li> <li>• <b>6:</b> skill queue in preempted outbound calls</li> </ul> The default value is the value set during creation and cannot be changed. |
| 6   | callerNo        | String  | Yes              | Calling number. Number displayed on the phone of a customer after a call is connected. The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).                                                                                                                                                                                                                                                                                                                                                      |
| 7   | maxAlertingTime | Integer | Yes              | Maximum ringing duration for no answer. If the ringing duration exceeds the value of this parameter, the call is released. For previewed outbound calls, the value ranges from 9 to 120, in seconds. For other types of outbound calls, the value ranges from 5 to 120, in seconds.                                                                                                                                                                                                                                                                       |
| 8   | scheduleParam   | Object  | Yes              | Outbound call time segment. For details about the parameters of this object, see <a href="#">Table 7-42</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                            |
|-----|-------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9   | ivrParam    | Object | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>1</b> or <b>3</b> (IVR).<br>For details about the parameters of this object, see <a href="#">Table 7-43</a> .                                                                                                          |
| 10  | skillParam  | Object | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>2</b> , <b>5</b> , or <b>6</b> (skill queue).<br>For details about the parameters of this object, see <a href="#">Table 7-44</a> .                                                                                     |
| 11  | callbackUrl | String | Yes              | Callback notification URL of the outbound call result.<br>The URL must start with <b>https://</b> or <b>http://</b> .<br><b>NOTE</b><br>HTTP is an insecure protocol, which may bring risks to the system. Therefore, it is not recommended. The secure HTTPS protocol is recommended. |

 **NOTE**

The start time and end time of an outbound campaign are optional but must meet the following rules:

1. If one of the parameters is set, the other parameter must also be set.
2. The start time cannot be later than the end time.
3. The end time cannot be earlier than the current time.

**Table 7-42** Parameter description of scheduleParam

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                     |
|-----|-------------------|--------|------------------|---------------------------------------------------------------------------------|
| 8.1 | workdayBeginTime1 | String | No               | Start time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format. |
| 8.2 | workdayEndTime1   | String | No               | End time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format.   |
| 8.3 | workdayBeginTime2 | String | No               | Start time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format. |

| No.  | Parameter         | Type   | Mandatory or Not | Description                                                                     |
|------|-------------------|--------|------------------|---------------------------------------------------------------------------------|
| 8.4  | workdayEndTime2   | String | No               | End time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format.   |
| 8.5  | workdayBeginTime3 | String | No               | Start time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format. |
| 8.6  | workdayEndTime3   | String | No               | End time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format.   |
| 8.7  | holidayBeginTime1 | String | No               | Start time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format. |
| 8.8  | holidayEndTime1   | String | No               | End time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format.   |
| 8.9  | holidayBeginTime2 | String | No               | Start time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format. |
| 8.10 | holidayEndTime2   | String | No               | End time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format.   |
| 8.11 | holidayBeginTime3 | String | No               | Start time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format. |
| 8.12 | holidayEndTime3   | String | No               | End time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format.   |

 NOTE

1. Among the outbound call time segments 1, 2, and 3 on workdays, at least one segment must be specified.
2. The start time and end time must be specified or left empty at the same time.
3. The start time must be earlier than the end time.
4. Outbound calls are made by workday unless a date or a day in a week is specified as a holiday.
5. **After the holiday time segment is configured, to be compatible with the AICC-sales page, the interface of 6.2 (Adding an Outbound Call Campaign Holiday) must be invoked to specify the relationship between the outbound call campaign and the holiday. Otherwise, the interface is incompatible with the page.**

**Table 7-43** Parameter description of ivrParam

| No. | Parameter    | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|--------------|---------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9.1 | deviceSign   | String  | Yes                         | <p>When <b>deviceType</b> is set to <b>1</b>, the value is an intelligent IVR flow code (<b>oifde-flowcode</b>). To obtain the flow code, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Flow Management &gt; Flow Orchestration</b>.</p> <p>When <b>deviceType</b> is set to <b>3</b>, the value is the flow access code of a common IVR or the chatbot access code of an intelligent IVR.</p> <p>To obtain the flow access code of a common IVR, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Flow Management</b>.</p> <p>To obtain the chatbot access code of an intelligent IVR, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Chatbot Management</b>.</p> |
| 9.2 | callCount    | Integer | Yes                         | <p>Number of outbound calls that are made in an outbound task each time.</p> <p>The value ranges from 1 to 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 9.3 | callInterval | Integer | Yes                         | <p>Interval for executing an outbound campaign task.</p> <p>The value ranges from 1 to 9999, in seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

 **NOTE**

For example, if an outbound campaign task requires 60 outbound calls in one minute, you are advised to set **callInterval** to **3** and **callCount** to **3**.

The IVR is used after outbound calls are made. The number of outbound calls is calculated as follows: The value of  $(\text{callCount}/\text{callInterval}) \times \text{Interval}$  rounded up to 3 (only when the number of outbound calls is greater than 1). If the outbound call interval is greater than **3**, outbound calls are made every 3 seconds. If the outbound call interval is less than **3**, the configured outbound call interval is used.

**Table 7-44** Parameter description of skillParam

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                                   |
|------|--------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.1 | skillId      | Integer | Yes              | ID of a skill queue.<br>The value ranges from 1 to 1000.                                                                                                                                                      |
| 10.2 | skillName    | String  | No               | Skill queue name.<br>The value can contain a maximum of 100 characters.                                                                                                                                       |
| 10.3 | outBoundType | Integer | Yes              | Outbound call mode.<br>The options are as follows: <ul style="list-style-type: none"> <li>• 2: predicted outbound call</li> <li>• 5: previewed outbound call</li> <li>• 6: preempted outbound call</li> </ul> |
| 10.4 | predictParam | Object  | No               | Parameter settings for predicted outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 2.<br>For details about the parameters of this object, see <a href="#">Table 7-46</a> .       |
| 10.5 | previewParam | Object  | No               | Parameter settings for previewed outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 5.<br>For details about the parameters of this object, see <a href="#">Table 7-45</a> .       |

**Table 7-45** Parameter description of previewParam

| No.    | Parameter    | Type    | Mandatory or Not | Description                                                                                                                |
|--------|--------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 10.5.1 | failInterval | Integer | Yes              | Outbound call interval, in seconds. The value ranges from 3 to 60.                                                         |
| 10.5.2 | obCallCount  | Integer | Yes              | Number of outbound calls each time. The value ranges from 1 to 100.                                                        |
| 10.5.3 | autoCallTime | Integer | Yes              | Duration of a previewed outbound call, in seconds. The value ranges from 5 to the value of <b>maxAlertingTime</b> minus 3. |

**Table 7-46** Parameter description of predictParam

| No.    | Parameter           | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                       |
|--------|---------------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.4.1 | predictMethod       | Integer | Yes              | Algorithm for predicted outbound calls. The options are as follows:<br><b>1:</b> Algorithm for empirical prediction<br><b>2:</b> Algorithm for agent usage prediction<br><b>3:</b> Algorithm for predicting the outbound call completion rate<br><b>5:</b> Algorithm for off-hook rate prediction |
| 10.4.2 | expPredictParam     | Object  | No               | Parameter settings of the algorithm for empirical prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>1</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-47</a> .                                                                     |
| 10.4.3 | agentPredictParam   | Object  | No               | Parameter settings of the algorithm for agent usage prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>2</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-48</a> .                                                                   |
| 10.4.4 | connectPredictParam | Object  | No               | Parameter settings of the algorithm for predicting the outbound call completion rate. This parameter is mandatory when <b>predictMethod</b> is set to <b>3</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-49</a> .                                             |
| 10.4.5 | offhookPredictParam | Object  | No               | Parameter settings of the algorithm for off-hook rate prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>5</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-50</a> .                                                                 |

**Table 7-47** Parameter description of expPredictParam

| No.              | Parameter          | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                  |

| No.      | Parameter      | Type    | Mandatory or Not | Description                                                                                                                                                                                  |
|----------|----------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.4.4.1 | maxAvgCallTime | Integer | Yes              | Maximum average call duration, in seconds. The value is a positive integer. The value ranges from 50 to 200.                                                                                 |
| 10.4.4.2 | minAvgCallTime | Integer | Yes              | Minimum average call duration, in seconds. The value is a positive integer. The value ranges from 50 to 200. The value must be smaller than or equal to the value of <b>maxAvgCallTime</b> . |
| 10.4.4.3 | lossRate       | Integer | Yes              | Minimum call loss rate.<br>The value ranges from 0 to 100. The default value is <b>3</b> .                                                                                                   |
| 10.4.4.4 | waitTime       | Integer | Yes              | Called party's waiting time.<br>The value ranges from 0 to 16, in seconds. The default value is <b>5</b> .                                                                                   |
| 10.4.4.5 | connRate       | Integer | Yes              | Outbound call connection rate.<br>The value ranges from 0 to 100.                                                                                                                            |

**Table 7-50** Parameter description of offhookPredictParam

| No.      | Parameter   | Type    | Mandatory or Not | Description                                                                          |
|----------|-------------|---------|------------------|--------------------------------------------------------------------------------------|
| 10.4.5.1 | offHookRate | Integer | Yes              | Off-hook rate.<br>The value ranges from 50 to 200. The default value is <b>100</b> . |

## Response Description

**Table 7-51** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                             |
|-----|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-52</a> . |
| 2   | resultDesc | String | Description.                                                                                                                            |
| 3   | returnCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-52</a> . |
| 4   | returnDesc | String | Description.                                                                                                                            |

## Triggered Event

None

## Error Codes

**Table 7-52** Error code description

| No. | Error Code | Description                                                           |
|-----|------------|-----------------------------------------------------------------------|
| 1   | 0200001    | Parameter error. For details about the error, see <b>resultDesc</b> . |

| No. | Error Code   | Description                                                                                  |
|-----|--------------|----------------------------------------------------------------------------------------------|
| 2   | 020000<br>2  | The start time of an outbound campaign is earlier than the early morning of the current day. |
| 3   | 020000<br>5  | The outbound campaign name must be unique.                                                   |
| 4   | 020000<br>7  | The outbound campaign does not exist.                                                        |
| 5   | 020001<br>6  | The outbound campaign has expired.                                                           |
| 6   | 020001<br>7  | The skill queue ID does not exist.                                                           |
| 7   | 020000<br>01 | Empty parameter.                                                                             |
| 8   | 020000<br>02 | The parameter contains invalid characters.                                                   |
| 9   | 020000<br>03 | The parameter length cannot exceed the maximum length.                                       |
| 10  | 020000<br>04 | The parameter length cannot be less than the minimum length.                                 |
| 11  | 020000<br>05 | The parameter length must be within the specified range.                                     |
| 12  | 020000<br>06 | Incorrect parameter type.                                                                    |
| 13  | 020000<br>07 | Incorrect parameter value.                                                                   |
| 14  | 020000<br>08 | Parameter conversion error. Check the request parameters.                                    |
| 15  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.                               |
| 16  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time.                   |
| 17  | 020000<br>11 | The number of parameters cannot exceed the specified number.                                 |

## Example

- The following provides an example of the request body of this interface:

```
{

 }
 }
}
},
"callBackUrl": "https://10.10.10.xxx/xxx/xxx"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": ""
}
```

## 7.1.4 Modifying an Outbound Campaign (V2)

### Scenario

This interface is invoked to modify the configurations of an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The ID of the outbound campaign to be modified has been obtained.
  - The outbound campaign task must exist and is not complete.
- Restrictions
  - After an outbound campaign is created, the device type cannot be changed.

### Method

This interface supports only the PUT method.

## URI

https://ip:port/rest/isales/v2/openapi/campaigns/{vdnId}/{campaignId}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-53** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | Outbound campaign task ID.                                 |

## Request Description

**Table 7-54** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-55** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                    |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------------|
| 1   | name      | String | Yes              | Name of an outbound campaign.<br>The name must be unique.<br>The value can contain a maximum of 32 characters. |

| No. | Parameter       | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 6   | callerNo        | List    | Yes                         | Multiple calling numbers are supported.<br>For details about the parameters of this object, see <a href="#">Table 7-65</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 7   | maxAlertingTime | Integer | Yes                         | Maximum ringing duration for no answer.<br>If the ringing duration exceeds the value of this parameter, the call is released.<br>The value ranges from 5 to 60, in seconds.                                                                                                                                                                                                                                                                                                                                                                                  |
| 8   | priority        | Integer | No                          | Task priority.<br>The value ranges from 1 to 5. A smaller value indicates a higher priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| No. | Parameter     | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                   |
|-----|---------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9   | scheduleParam | Object  | Yes              | Outbound call time segment.<br>For details about the parameters of this object, see <a href="#">Table 7-56</a> .                                                                                                                                                                              |
| 10  | ivrParam      | Object  | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>1</b> or <b>3</b> (IVR).<br>For details about the parameters of this object, see <a href="#">Table 7-57</a> .                                                                                                                 |
| 11  | skillParam    | Object  | No               | This parameter is mandatory when <b>deviceType</b> is set to <b>2</b> , <b>5</b> , or <b>6</b> (skill queue).<br>For details about the parameters of this object, see <a href="#">Table 7-58</a> .                                                                                            |
| 12  | initStatus    | Integer | No               | Campaign status after addition. The default value is <b>0</b> .<br>The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: The campaign is in started status after being added.</li> <li>• <b>1</b>: The campaign is in suspended status after being added.</li> </ul> |
| 13  | callbackUrl   | String  | Yes              | Callback notification address of the outbound call result.<br>The URL must start with https:// or http.<br><b>NOTE</b><br>HTTP is an insecure protocol, which may bring risks to the system. Therefore, it is not recommended. The secure HTTPS protocol is recommended.                      |
| 14  | retryPolicy   | Object  | Yes              | Outbound call result policy.<br>For details about the parameters of this object, see <a href="#">Table 7-66</a> .                                                                                                                                                                             |
| 15  | callPolicy    | Object  | No               | Call policy.<br>For details about the parameters of this object, see <a href="#">Table 7-71</a> .                                                                                                                                                                                             |

 **NOTE**

If the value of **callPolciy** is not empty and the value of **callType** is **1** (round call), the value of **policyType** in the outbound call result policy **retryPolicy** can only be **1**, that is, the number type policy.

**Table 7-56** Parameter description of scheduleParam

| No.  | Parameter             | Type   | Man<br>dato<br>ry or<br>Not | Description                                                                     |
|------|-----------------------|--------|-----------------------------|---------------------------------------------------------------------------------|
| 9.1  | workdayBe<br>ginTime1 | String | No                          | Start time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format. |
| 9.2  | workdayEn<br>dTime1   | String | No                          | End time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format.   |
| 9.3  | workdayBe<br>ginTime2 | String | No                          | Start time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format. |
| 9.4  | workdayEn<br>dTime2   | String | No                          | End time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format.   |
| 9.5  | workdayBe<br>ginTime3 | String | No                          | Start time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format. |
| 9.6  | workdayEn<br>dTime3   | String | No                          | End time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format.   |
| 9.7  | holidayBegi<br>nTime1 | String | No                          | Start time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format. |
| 9.8  | holidayEnd<br>Time1   | String | No                          | End time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format.   |
| 9.9  | holidayBegi<br>nTime2 | String | No                          | Start time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format. |
| 9.10 | holidayEnd<br>Time2   | String | No                          | End time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format.   |
| 9.11 | holidayBegi<br>nTime3 | String | No                          | Start time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format. |
| 9.12 | holidayEnd<br>Time3   | String | No                          | End time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format.   |

 **NOTE**

1. Among the outbound call time segments 1, 2, and 3 on workdays, at least one segment must be specified.
2. The start time and end time must be specified or left empty at the same time.
3. The start time must be earlier than the end time.
4. Outbound calls are made by workday unless a date or a day in a week is specified as a holiday.
5. **For the compatibility with the AICC-isales page, after the holiday time segment is configured, the interface in "6.2 Adding a Holiday for an Outbound Campaign" must be invoked to specify the relationship between the outbound call campaign and the holiday. Otherwise, the interface is incompatible with the page.**

**Table 7-57** Parameter description of ivrParam

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------|--------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10.1 | deviceSign   | String  | Yes              | <p>When <b>deviceType</b> is set to <b>1</b>, the value is an intelligent IVR flow code (<b>oifde-flowcode</b>).</p> <p>To obtain the flow code, sign in to the AICC as a tenant administrator and choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Flow Management &gt; Flow Orchestration</b>.</p> <p>When <b>deviceType</b> is set to <b>3</b>, the value is a common IVR flow access code.</p> <p>To obtain the flow access code, choose <b>Configuration Center &gt; Flow Configuration &gt; Intelligent IVR &gt; Chatbot Management</b>.</p> |
| 10.2 | callCount    | Integer | Yes              | <p>Number of outbound calls that are made in an outbound task each time.</p> <p>The value ranges from 1 to 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 10.3 | callInterval | Integer | Yes              | <p>Interval for executing an outbound campaign task.</p> <p>The value ranges from 1 to 9999, in seconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

 **NOTE**

For example, if an outbound campaign task requires 60 outbound calls in one minute, you are advised to set **callInterval** to **3** and **callCount** to **3**.

When the device type is IVR and outbound calls are made, the number of outbound calls is calculated as follows:  $(\text{Value of callCount} / \text{Value of callInterval}) \times 3$ , rounded up. Outbound calls are made only when the result is greater than 1. If the value of **callInterval** is greater than **3**, **3** is used for calculation. If the value of **callInterval** is less than **3**, the actual value is used.

**Table 7-58** Parameter description of skillParam

| No.  | Parameter | Type    | Mandatory or Not | Description                                                         |
|------|-----------|---------|------------------|---------------------------------------------------------------------|
| 11.1 | skillId   | Integer | Yes              | <p>ID of a skill queue.</p> <p>The value ranges from 1 to 1000.</p> |

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                                                                   |
|------|--------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.2 | skillName    | String  | No               | Skill queue name.<br>The value can contain a maximum of 100 characters.                                                                                                                                       |
| 11.3 | outBoundType | Integer | Yes              | Outbound call mode.<br>The options are as follows: <ul style="list-style-type: none"> <li>• 2: predicted outbound call</li> <li>• 5: previewed outbound call</li> <li>• 6: preempted outbound call</li> </ul> |
| 11.4 | predictParam | Object  | No               | Parameter settings for predicted outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 2.<br>For details about the parameters of this object, see <a href="#">Table 7-60</a> .       |
| 11.5 | previewParam | Object  | No               | Parameter settings for previewed outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 5.<br>For details about the parameters of this object, see <a href="#">Table 7-59</a> .       |

**Table 7-59** Parameter description of previewParam

| No.    | Parameter    | Type    | Mandatory or Not | Description                                                                                                                |
|--------|--------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 11.5.1 | failInterval | Integer | Yes              | Outbound call interval, in seconds. The value ranges from 3 to 60.                                                         |
| 11.5.2 | obCallCount  | Integer | Yes              | Number of outbound calls each time. The value ranges from 1 to 100.                                                        |
| 11.5.3 | autoCallTime | Integer | Yes              | Duration of a previewed outbound call, in seconds. The value ranges from 5 to the value of <b>maxAlertingTime</b> minus 3. |

**Table 7-60** Parameter description of predictParam

| No.    | Parameter           | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                       |
|--------|---------------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4.1 | predictMethod       | Integer | Yes              | Algorithm for predicted outbound calls. The options are as follows:<br><b>1:</b> Algorithm for empirical prediction<br><b>2:</b> Algorithm for agent usage prediction<br><b>3:</b> Algorithm for predicting the outbound call completion rate<br><b>5:</b> Algorithm for off-hook rate prediction |
| 11.4.2 | expPredictParam     | Object  | No               | Parameter settings of the algorithm for empirical prediction. The value ranges from 1 to 5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 14.7.3.2 | retryTimes   | Integer | --               | Maximum number of call attempts per day.<br>This parameter is mandatory for common policies that are matched based on the number type. The value ranges from 1 to 6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 14.7.3.3 | result       | Integer | --               | Result type.<br>This parameter is mandatory for result policies that are matched based on the number type. The value ranges from 0 to 9.<br>The options are as follows: <b>1</b> : The customer is busy. <b>2</b> : The customer does not answer the call. <b>3</b> : The customer rejects the call. <b>4</b> : The number does not exist. <b>5</b> : The customer's phone is powered off. <b>6</b> : The customer is out of the service area. <b>7</b> : Fax or switchboard. <b>8</b> : The call times out. <b>9</b> : The call fails. <b>0</b> : Others.<br>The retry policy is also determined based on the specific failure code ( <b>failCode</b> ).<br>For details about failure codes, see <a href="#">Table 7-295</a> . |
| 14.7.3.4 | callInterval | Integer | --               | Outbound call interval, in seconds.<br>This parameter is mandatory for common policies and result policies that are matched based on the number type. The value ranges from 1 to 86400.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 14.7.3.5 | retryNumber  | Integer | --               | Number of retry times.<br>This parameter is mandatory for result policies that are matched based on the number type. The value ranges from 0 to 9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 7-70** Parameter description of resultRetry

| No.    | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                       |
|--------|--------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.6.1 | result       | Integer | --               | Result type.<br>This parameter is mandatory for result policies under the global policy. The value ranges from 0 to 9.                            |
| 14.6.2 | callInterval | Integer | --               | Outbound call interval, in seconds.<br>This parameter is mandatory for result policies under the global policy. The value ranges from 1 to 86400. |
| 14.6.3 | retryNumber  | Integer | --               | Number of retry times.<br>This parameter is mandatory for result policies under the global policy. The value ranges from 0 to 9.                  |

**Table 7-71** Parameter description of callPolicy

| No.  | Parameter    | Type    | Mandatory or Not | Description                                                                                                                                                            |
|------|--------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.1 | callPolicyId | String  | --               | ID of a call policy.<br>This parameter is mandatory for modifying a call policy.                                                                                       |
| 15.2 | callType     | Integer | No               | Call mode.<br>The options are <b>0</b> (by sequence) and <b>1</b> (by round). The default value is <b>0</b> .                                                          |
| 15.3 | chooseType   | Integer | --               | Round mode.<br>The options are <b>0</b> (by number category) and <b>1</b> (by number sequence). This parameter is mandatory when the call mode is by round.            |
| 15.4 | turns        | List    | --               | Round information.<br>This parameter is mandatory when the call mode is by round.<br>For details about the parameters of this object, see <a href="#">Table 7-72</a> . |

**Table 7-72** Parameter description of turns

| No.    | Parameter | Type    | Mandatory or Not | Description                                                                                                                                                               |
|--------|-----------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15.4.1 | turnType  | String  | --               | Number type.<br>The value can contain a maximum of 20 characters, excluding special characters.<br>This parameter is mandatory when the round mode is by number category. |
| 15.4.2 | turnOrder | Integer | --               | Number sequence.<br>The value ranges from 1 to 10. This parameter is mandatory when the round mode is by number sequence.                                                 |

## Response Description

**Table 7-73** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                 |
|-----|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-74</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-74</a> . |
| 4   | returnDesc | String | Description.                                                                                                                                |

## Triggered Event

None

## Error Codes

**Table 7-74** Error code description

| No. | Error Code   | Description                                                                                  |
|-----|--------------|----------------------------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .                        |
| 2   | 020000<br>2  | The start time of an outbound campaign is earlier than the early morning of the current day. |
| 3   | 020000<br>5  | The outbound campaign name must be unique.                                                   |
| 4   | 020000<br>7  | The outbound campaign does not exist.                                                        |
| 5   | 020001<br>6  | The outbound campaign has expired.                                                           |
| 6   | 020001<br>7  | The skill queue ID does not exist.                                                           |
| 7   | 020000<br>01 | Empty parameter.                                                                             |
| 8   | 020000<br>02 | The parameter contains invalid characters.                                                   |
| 9   | 020000<br>03 | The parameter length cannot exceed the maximum length.                                       |
| 10  | 020000<br>04 | The parameter length cannot be less than the minimum length.                                 |
| 11  | 020000<br>05 | The parameter length must be within the specified range.                                     |
| 12  | 020000<br>06 | Incorrect parameter type.                                                                    |
| 13  | 020000<br>07 | Incorrect parameter value.                                                                   |
| 14  | 020000<br>08 | Parameter conversion error. Check the request parameters.                                    |
| 15  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.                               |
| 16  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time.                   |
| 17  | 020000<br>11 | The number of parameters cannot exceed the specified number.                                 |

## 7.1.5 Deleting an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign to be deleted has been obtained.
- The outbound campaign task must exist and is not started. If the value of **status** is not **2**, the outbound campaign task can be deleted.

### Scenario

This interface is invoked to delete an outbound campaign.

### Method

This interface supports only the DELETE method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-75** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | Outbound campaign task ID.                                 |

## Request Description

**Table 7-76** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-77** Request body parameters

| No. | Parameter      | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                         |
|-----|----------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | archiveHistory | Integer | No               | Whether to move the outbound campaign task to the history table.<br>The options are <b>0</b> and <b>1</b> .<br>The value <b>0</b> indicates that the outbound campaign task is deleted without being moving to the history table.<br>The value <b>1</b> indicates that the outbound campaign task is moved to the history table.<br>The default value is <b>0</b> . |

## Response Description

**Table 7-78** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                 |
|-----|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-79</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-79</a> . |
| 4   | returnDesc | String | Description.                                                                                                                                |

## Triggered Event

None

## Error Codes

**Table 7-79** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>6  | The database is abnormal.                                             |
| 3   | 020000<br>7  | The outbound campaign does not exist.                                 |
| 4   | 020000<br>9  | The outbound campaign task is running.                                |
| 5   | 020000<br>01 | Empty parameter.                                                      |
| 6   | 020000<br>02 | The parameter contains invalid characters.                            |
| 7   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 8   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 9   | 02000005   | The parameter length must be within the specified range.                   |
| 10  | 02000006   | Incorrect parameter type.                                                  |
| 11  | 02000007   | Incorrect parameter value.                                                 |
| 12  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 13  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 14  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 15  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "archiveHistory":1
}
```

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "delete task success",
 "returnDesc": "delete task success"
}
```

## 7.1.6 Querying Details About an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- An outbound campaign has been created.

### Scenario

This interface is invoked to query the configuration details about a specified outbound campaign.

## Method

This interface supports only the GET method.

## URI

https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{campaignId}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-80** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-81** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-82** Response body parameters

| No. | Parameter    | Type   | Description                                                                                                                                  |
|-----|--------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-100</a> . |
| 2   | resultDesc   | String | Description.                                                                                                                                 |
| 3   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-100</a> . |
| 4   | returnDesc   | String | Description.                                                                                                                                 |
| 5   | returnObject | Object | For details, see <a href="#">Table 7-83</a> .                                                                                                |

**Table 7-83** Parameter description of returnObject

| No. | Parameter    | Type    | Description                                                                                                                          |
|-----|--------------|---------|--------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 | name         | String  | Name of an outbound campaign.                                                                                                        |
| 5.2 | description  | String  | Description of an outbound campaign.                                                                                                 |
| 5.3 | status       | Integer | Status of an outbound campaign.<br>The options are as follows:<br><b>2</b> : started<br><b>3</b> : suspended<br><b>4</b> : completed |
| 5.4 | strBeginTime | String  | Time when an outbound campaign starts.                                                                                               |
| 5.5 | strEndTime   | String  | Time when an outbound campaign ends.                                                                                                 |

| No.  | Parameter       | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------|-----------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.6  | deviceType      | Integer | Type of an outbound device.<br>The options are as follows: <ul style="list-style-type: none"> <li>• <b>1</b>: IVR in intelligent outbound calls (available in the SaaS environment when the intelligent feature is enabled)</li> <li>• <b>2</b>: skill queue in predicted outbound calls</li> <li>• <b>3</b>: IVR in automatic outbound calls</li> <li>• <b>5</b>: skill queue in previewed outbound calls</li> <li>• <b>6</b>: skill queue in preempted outbound calls</li> </ul> |
| 5.7  | callerNo        | String  | Calling number.<br>Number displayed on the phone of a customer after a call is connected.                                                                                                                                                                                                                                                                                                                                                                                          |
| 5.8  | maxAlertingTime | Integer | Maximum ringing duration for no answer. If the ringing duration exceeds the value of this parameter, the call is released.                                                                                                                                                                                                                                                                                                                                                         |
| 5.9  | scheduleParam   | Object  | Outbound call time segment.<br>For details about the parameters of this object, see <a href="#">Table 7-84</a> .                                                                                                                                                                                                                                                                                                                                                                   |
| 5.10 | ivrParam        | Object  | This parameter is mandatory when <b>deviceType</b> is set to <b>1</b> or <b>3</b> (IVR).<br>For details about the parameters of this object, see <a href="#">Table 7-85</a> .                                                                                                                                                                                                                                                                                                      |
| 5.11 | skillParam      | Object  | This parameter is mandatory when <b>deviceType</b> is set to <b>2</b> , <b>5</b> , or <b>6</b> (skill queue).<br>For details about the parameters of this object, see <a href="#">Table 7-86</a> .                                                                                                                                                                                                                                                                                 |
| 5.12 | callbackUrl     | String  | Callback notification address of the outbound call result.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 5.13 | retryPolicy     | Object  | Outbound call result policy.<br>For details about the parameters of this object, see <a href="#">Table 7-93</a> .                                                                                                                                                                                                                                                                                                                                                                  |
| 5.14 | callPolicy      | Object  | Call policy.<br>For details about the parameters of this object, see <a href="#">Table 7-95</a> .                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 7-84** Parameter description of scheduleParam

| No.    | Parameter         | Type   | Description                                                                     |
|--------|-------------------|--------|---------------------------------------------------------------------------------|
| 5.9.1  | workdayBeginTime1 | String | Start time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format. |
| 5.9.2  | workdayEndTime1   | String | End time of outbound call time segment 1 on workdays, in <i>HH:mm</i> format.   |
| 5.9.3  | workdayBeginTime2 | String | Start time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format. |
| 5.9.4  | workdayEndTime2   | String | End time of outbound call time segment 2 on workdays, in <i>HH:mm</i> format.   |
| 5.9.5  | workdayBeginTime3 | String | Start time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format. |
| 5.9.6  | workdayEndTime3   | String | End time of outbound call time segment 3 on workdays, in <i>HH:mm</i> format.   |
| 5.9.7  | holidayBeginTime1 | String | Start time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format. |
| 5.9.8  | holidayEndTime1   | String | End time of outbound call time segment 1 on holidays, in <i>HH:mm</i> format.   |
| 5.9.9  | holidayBeginTime2 | String | Start time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format. |
| 5.9.10 | holidayEndTime2   | String | End time of outbound call time segment 2 on holidays, in <i>HH:mm</i> format.   |
| 5.9.11 | holidayBeginTime3 | String | Start time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format. |
| 5.9.12 | holidayEndTime3   | String | End time of outbound call time segment 3 on holidays, in <i>HH:mm</i> format.   |

**Table 7-85** Parameter description of ivrParam

| No.    | Parameter    | Type    | Description                                                           |
|--------|--------------|---------|-----------------------------------------------------------------------|
| 5.10.1 | deviceSign   | String  | Access code of an IVR flow.                                           |
| 5.10.2 | callCount    | Integer | Number of outbound calls that are made in an outbound task each time. |
| 5.10.3 | callInterval | Integer | Interval for executing an outbound campaign task, in seconds.         |

**Table 7-86** Parameter description of skillParam

| No.        | Parameter    | Type    | Description                                                                                                                                                                                                   |
|------------|--------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1<br>1.1 | skillId      | Integer | ID of a skill queue.                                                                                                                                                                                          |
| 5.1<br>1.2 | skillName    | String  | Skill queue name.                                                                                                                                                                                             |
| 5.1<br>1.3 | outBoundType | Integer | Outbound call mode.<br>The options are as follows: <ul style="list-style-type: none"> <li>• 2: predicted outbound call</li> <li>• 5: previewed outbound call</li> <li>• 6: preempted outbound call</li> </ul> |
| 5.1<br>1.4 | predictParam | Object  | Parameter settings for predicted outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 2.<br>For details about the parameters of this object, see <a href="#">Table 7-88</a> .       |
| 5.1<br>1.5 | previewParam | Object  | Parameter settings for previewed outbound calls. This parameter is mandatory when <b>outBoundType</b> is set to 5.<br>For details about the parameters of this object, see <a href="#">Table 7-87</a> .       |

**Table 7-87** Parameter description of previewParam

| No.          | Parameter    | Type    | Mandatory or Not | Description                                                                     |
|--------------|--------------|---------|------------------|---------------------------------------------------------------------------------|
| 5.1<br>1.5.1 | failInterval | Integer | Yes              | Outbound call interval, in seconds. The value is a positive integer.            |
| 5.1<br>1.5.2 | obCallCount  | Integer | Yes              | Number of outbound calls each time. The value is a positive integer.            |
| 5.1<br>1.5.3 | autoCallTime | Integer | Yes              | Previewed automatic call duration, in seconds. The value is a positive integer. |

**Table 7-88** Parameter description of predictParam

| No.              | Parameter           | Type    | Description                                                                                                                                                                                                                                                                                          |
|------------------|---------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1<br>1.4.<br>1 | predictMethod       | Integer | Algorithm for predicted outbound calls.<br>The options are as follows:<br><b>1:</b> Algorithm for empirical prediction<br><b>2:</b> Algorithm for agent usage prediction<br><b>3:</b> Algorithm for predicting the outbound call completion rate<br><b>5:</b> Algorithm for off-hook rate prediction |
| 5.1<br>1.4.<br>2 | expPredictParam     | Object  | Parameter settings of the algorithm for empirical prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>1</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-89</a> .                                                                        |
| 5.1<br>1.4.<br>3 | agentPredictParam   | Object  | Parameter settings of the algorithm for agent usage prediction. This parameter is mandatory when <b>predictMethod</b> is set to <b>2</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-90</a> .                                                                      |
| 5.1<br>1.4.<br>4 | connectPredictParam | Object  | Parameter settings of the algorithm for predicting the outbound call completion rate. This parameter is mandatory when <b>predictMethod</b> is set to <b>3</b> .<br>For details about the parameters of this object, see <a href="#">Table 7-91</a> .                                                |

## 7.1.7 Querying All Outbound Campaigns

### Scenario

This interface is invoked to query all outbound campaigns based on specified conditions.

### Method

This interface supports only the GET method.

### URI

```
https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}?
name={name}&status={status}&deviceType={deviceType}&beginTime={beginTime}
&endTime={endTime}&curPage={curPage}&rowsPerPage={rowsPerPage}
```

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-101** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----|------------|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999.                                                                                                                                                                                                                                                                                                                                                                                |
| 2   | name       | String  | No               | Name of an outbound campaign.<br>The value is a string of 0 to 30 characters.<br>By default, this parameter is left blank.                                                                                                                                                                                                                                                                                                                |
| 3   | status     | Integer | Yes              | Status of an outbound campaign.<br>The options are as follows:<br><b>2:</b> started<br><b>3:</b> suspended<br><b>4:</b> completed<br>If this parameter is set to <b>0</b> , outbound campaigns in all statuses are queried by default.                                                                                                                                                                                                    |
| 4   | deviceType | Integer | Yes              | Type of an outbound device.<br>The options are as follows: <ul style="list-style-type: none"><li>• <b>2:</b> skill queue in predicted outbound calls</li><li>• <b>3:</b> IVR in automatic outbound calls</li><li>• <b>5:</b> skill queue in previewed outbound calls</li><li>• <b>6:</b> skill queue in preempted outbound calls</li></ul> If this parameter is set to <b>0</b> , outbound campaigns of all types are queried by default. |
| 5   | beginTime  | String  | No               | Minimum start time of an outbound campaign, in <i>yyyy-MM-dd HH:mm:ss</i> format.                                                                                                                                                                                                                                                                                                                                                         |
| 6   | endTime    | String  | No               | Maximum end time of an outbound campaign, in <i>yyyy-MM-dd HH:mm:ss</i> format.                                                                                                                                                                                                                                                                                                                                                           |

| No. | Parameter   | Type    | Mandatory or Not | Description                                                                                                                                     |
|-----|-------------|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | curPage     | Integer | Yes              | Current page.<br>The default value is <b>1</b> . If the input value is less than 1, the system automatically changes the value to <b>1</b> .    |
| 8   | rowsPerPage | Integer | Yes              | Number of records on each page.<br>If this parameter is not specified, 10 records are queried by default, and the maximum value is <b>100</b> . |
| 9   | cclId       | Integer | No               | If this parameter is set, data is filtered based on the specified call center ID. If this parameter is left blank, data is not filtered.        |

## Request Description

**Table 7-102** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-103** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                 |
|-----|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success and other values indicate failure.<br>For details, see <a href="#">Table 7-105</a> . |

## 7.1.8 Suspending an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign to be suspended has been obtained.
- The outbound campaign is running.

### Scenario

This interface is invoked to change the status of a specified outbound campaign to **suspended**.

### Method

This interface supports only the PUT method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{campaignId}/pause`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-106** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | Outbound campaign task ID.                                 |

### Request Description

**Table 7-107** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-108** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                              |
|-----|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success and other values indicate failure. For details, see <a href="#">Table 7-109</a> . |
| 2   | resultDesc | String | Description.                                                                                                                             |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success and other values indicate failure. For details, see <a href="#">Table 7-109</a> . |
| 4   | returnDesc | String | Description.                                                                                                                             |

## Example

- The following provides an example of the request body of this interface:  
None
- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": ""
}
```

## 7.1.9 Resuming an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign to be resumed has been obtained.
- The outbound campaign is suspended.

### Scenario

This interface is invoked to resume an outbound campaign.

### Method

This interface supports only the PUT method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{campaignId}/resume`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-110** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | Outbound campaign task ID.                                 |

### Request Description

**Table 7-111** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

| 14  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 15  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:  
None
- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": ""
}
```

## 7.1.10 Setting the Retry Policy of an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- For intelligent outbound calls, the customer needs to develop the IVR. For details, see [Configuring Intelligent IVR](#).

### Scenario

This interface is invoked to set the retry policy of a specified outbound campaign.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/retryPolicy/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-114** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

### Request Description

**Table 7-115** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-116** Request body parameters

| No. | Parameter  | Type    | Description                                                                                                                       |
|-----|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1   | policyJson | String  | JSON string of the policy.<br>For details about the parameters of this object, see <a href="#">Table 7-117</a> .                  |
| 2   | policyType | Integer | Retry policy type. <ul style="list-style-type: none"> <li>• 0: global policy</li> <li>• 1: number type matching policy</li> </ul> |

**Table 7-117** Parameter description of policyJson

| No. | Parameter  | Type    | Mandatory or Not | Description                                                                                                                                          |
|-----|------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | dataType   | String  | -                | Number type.                                                                                                                                         |
| 1.2 | policy     | String  | -                | JSON string of the policy that is matched based on the result.<br>For details about the parameters of this object, see <a href="#">Table 7-118</a> . |
| 1.3 | retryDay   | Integer | -                | Number of call attempt days in a common policy.                                                                                                      |
| 1.4 | retryTimes | Integer | -                | Number of call attempts per day in a common policy.                                                                                                  |

| No. | Parameter     | Type          | Mandatory or Not                                                              | Description                                                                                                                                                                                                       |
|-----|---------------|---------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.5 | type          | Integer       | -                                                                             | Retry logic policy type.<br><ul style="list-style-type: none"> <li>• <b>0</b>: common policy</li> <li>• <b>1</b>: result policy</li> </ul>                                                                        |
| 1.6 | noRetryPolicy | List <String> | No (This parameter cannot be set when <b>policyType</b> is set to <b>1</b> .) | Result codes for which no retry policy is configured. The result codes come from the <b>resultCode</b> field in the <b>data</b> attribute of the interface for querying the definitions of outbound call results. |

**Table 7-118** Parameter description of policy

| No.   | Parameter    | Type    | Mandatory or Not | Description            |
|-------|--------------|---------|------------------|------------------------|
| 1.2.1 | callInterval | Integer | -                | Delay time.            |
| 1.2.2 | result       | Integer | -                | Result type.           |
| 1.2.3 | retryNumber  | Integer | -                | Number of retry times. |

## Response Description

**Table 7-119** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-120</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-120</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-120** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 0200-0<br>1  | The outbound campaign does not exist.                                 |
| 3   | 020000<br>01 | Empty parameter.                                                      |
| 4   | 020000<br>02 | The parameter contains invalid characters.                            |
| 5   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 6   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |
| 7   | 020000<br>05 | The parameter length must be within the specified range.              |
| 8   | 020000<br>06 | Incorrect parameter type.                                             |
| 9   | 020000<br>07 | Incorrect parameter value.                                            |
| 10  | 020000<br>08 | Parameter conversion error. Check the request parameters.             |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 11  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 12  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides examples of the request body of this interface:  
You can select different policy combinations based on business requirements.
  - Global policy+normal policy (**policyType=0; type=0**)
 

```
{
 "policyJson": "{ 'type':0,'retryTimes':1,'retryDay':1 }",
 "policyType": 0
}
```
  - Global policy+result policy (**policyType=0; type=1**)
 

```
{
 "policyJson": "{ 'type':1,'policy':{ 'result':4,'retryNumber':3,'callInterval':60 } }",
 "policyType": 0
}
```
  - Number type matching policy+common policy (**policyType=1; type=0**)
 

```
{
 "policyJson": "{ 'dataType':'ST','type':0,'policy':{ 'retryTimes':2,'retryDay':1 } }",
 "policyType": 1
}
```
  - Number type matching policy+result policy (**policyType=1; type=1**)
 

```
{
 "policyJson": "{ 'dataType':'ST','type':1,'policy':{ 'result':4,'retryNumber':3,'callInterval':60 } }",
 "policyType": 1
}
```
- The following provides an example of the response body of this interface:
 

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": ""
}
```

## 7.1.11 Querying the Retry Policy of an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- For intelligent outbound calls, the customer needs to develop the IVR. For details, see *IVR IDE User Guide*.

## Scenario

This interface is invoked to query the retry policy of a specified outbound campaign.

## Method

This interface supports only the GET method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/retryPolicy/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-121** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-122** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-123** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-128</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |
| 3   | data       | Object | Outbound call retry policy. For details, see <a href="#">Table 7-124</a> .                                                                   |
| 4   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-128</a> . |
| 5   | returnDesc | String | Description.                                                                                                                                 |

**Table 7-124** Parameter description of data

| No. | Parameter     | Type    | Description                                                                                                                                      |
|-----|---------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.1 | retryPolicyId | String  | Retry policy ID.                                                                                                                                 |
| 3.2 | policyType    | Integer | Retry policy type. <ul style="list-style-type: none"> <li>• <b>0</b>: global policy</li> <li>• <b>1</b>: number classification policy</li> </ul> |
| 3.3 | policyJson    | String  | Retry policy parameters. For details, see <a href="#">Table 7-125</a> .                                                                          |

| No. | Parameter     | Type   | Description                                                                                                                                                                                                       |
|-----|---------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.4 | noRetryPolicy | String | Result codes for which no retry policy is configured. The result codes come from the <b>resultCode</b> field in the <b>data</b> attribute of the interface for querying the definitions of outbound call results. |
| 3.5 | busiPolicy    | String | False<br>JSON string of the business result policy.<br>For details about the parameters of this object, see <a href="#">Table 7-126</a> .                                                                         |

**Table 7-125** Parameter description of policyJson

| No.   | Parameter  | Type    | Description                                                                                                                                          |
|-------|------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.3.1 | dataType   | String  | Number type.                                                                                                                                         |
| 3.3.2 | policy     | String  | JSON string of the policy that is matched based on the result.<br>For details about the parameters of this object, see <a href="#">Table 7-127</a> . |
| 3.3.3 | retryDay   | Integer | Number of call attempt days in a common policy.                                                                                                      |
| 3.3.4 | retryTimes | Integer | Number of call attempts per day in a common policy.                                                                                                  |
| 3.3.5 | type       | Integer | Retry logic policy type. <ul style="list-style-type: none"> <li>● <b>0</b>: common policy</li> <li>● <b>1</b>: result policy</li> </ul>              |

**Table 7-126** Parameter description of busiPolicy

| No.    | Parameter         | Type    | Mandatory or Not | Description                                                                                                                                                                                    |
|--------|-------------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14.7.1 | busiResultCode    | String  | Yes              | Business result code.                                                                                                                                                                          |
| 14.7.2 | busiResultSubCode | String  | --               | Business result subcode. (This parameter is associated with the business result code.)                                                                                                         |
| 14.7.3 | busiResultPolicy  | Integer | Yes              | Call policy for a business result.<br><b>0</b> : Stop calling. <b>1</b> : Call the next number.<br><b>2</b> : Call the current number.                                                         |
| 14.7.4 | callInterval      | Integer | --               | Outbound call interval, in seconds.<br>If the call policy is set to <b>0</b> , you do not need to set this parameter. Otherwise, this parameter is mandatory. The value ranges from 1 to 3600. |

**Table 7-127** Parameter description of policy

| No.     | Parameter    | Type    | Description            |
|---------|--------------|---------|------------------------|
| 3.3.2.1 | callInterval | Integer | Delay time.            |
| 3.3.2.2 | result       | Integer | Result type.           |
| 3.3.2.3 | retryNumber  | Integer | Number of retry times. |

## Triggered Event

None

## Error Codes

**Table 7-128** Error code description

| No. | Error Code | Description                                                           |
|-----|------------|-----------------------------------------------------------------------|
| 1   | 0200001    | Parameter error. For details about the error, see <b>resultDesc</b> . |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 2   | 02000001   | Empty parameter.                                                           |
| 3   | 02000002   | The parameter contains invalid characters.                                 |
| 4   | 02000003   | The parameter length cannot exceed the maximum length.                     |
| 5   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 6   | 02000005   | The parameter length must be within the specified range.                   |
| 7   | 02000006   | Incorrect parameter type.                                                  |
| 8   | 02000007   | Incorrect parameter value.                                                 |
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

None

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "02000000",
 "data": {
 "retryPolicyId": "1871694313",
 "policyType": 0,
 "policyJson": "[{'retryTimes':1,'retryDay':2,'type':0,'policy':[]}]"
 },
 "returnDesc": null
}
```

## 7.1.12 Adding the Definition of an Outbound Call Business Result

### Scenario

This interface is invoked to add the definition of an outbound call business result for a specified VDN ID.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
- Restrictions
  - After the addition, no modification interface is provided.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/addBusinessResult`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-129** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

### Request Description

**Table 7-130** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-131** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                |
|-----|-------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 1   | name        | String | Yes              | Business result name.<br>The value can contain a maximum of 50 characters, excluding special characters.                   |
| 2   | code        | String | No               | Business result code.<br>The value can contain a maximum of 50 characters, including only digits, letters, and hyphens (-) |
| 3   | description | String | No               | Business result description.<br>The value can contain a maximum of 200 characters, excluding special characters.           |
| 4   | children    | List   | No               | Subbusiness result.<br>For details about the parameters of this object, see <a href="#">Table 7-132</a> .                  |

**Table 7-132** Parameter description of children

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                   |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 4.1 | name      | String | Yes              | Subbusiness result name.<br>The value can contain a maximum of 50 characters, excluding special characters.                   |
| 4.2 | code      | String | No               | Subbusiness result code.<br>The value can contain a maximum of 50 characters, including only digits, letters, and hyphens (-) |

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                         |
|-----|-------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------|
| 4.3 | description | String | No               | Subbusiness result description.<br>The value can contain a maximum of 200 characters, excluding special characters. |

## Response Description

**Table 7-133** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                 |
|-----|------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-134</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                |
| 3   | returnCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-134</a> . |
| 4   | returnDesc | String | Description.                                                                                                                                |

## Triggered Event

None

## Error Codes

**Table 7-134** Error code description

| No. | Error Code  | Description                                                           |
|-----|-------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1 | Parameter error. For details about the error, see <b>resultDesc</b> . |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 2   | 02000006   | Database operation error.                                                  |
| 3   | 02000001   | Empty parameter.                                                           |
| 4   | 02000002   | The parameter contains invalid characters.                                 |
| 5   | 02000003   | The parameter length cannot exceed the maximum length.                     |
| 6   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 7   | 02000005   | The parameter length must be within the specified range.                   |
| 8   | 02000006   | Incorrect parameter type.                                                  |
| 9   | 02000007   | Incorrect parameter value.                                                 |
| 10  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 11  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 12  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "name": "Call failure",
 "code": "123456",
 "description": "Call failure",
 "children": [
 {
 "name": "The customer directly hangs up.",
 "code": "100001",
 "description": "The customer directly hangs up."
 },
 {
 "name": "The customer turns off the phone."
 "code": "100002",
 "description": "The customer turns off the phone."
 }
]
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "addBusinessResult success",
 "returnCode": "0200000",
 "returnDesc": "addBusinessResult success"
}
```

## 7.1.13 Querying the Definitions of Outbound Call Business Results

### Prerequisites

You have applied for a developer account.

### Scenario

This interface is invoked to query the definitions of outbound call business results in a specified VDN.

### Method

This interface supports only the GET method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/queryBusinessResults?pageSize={pageSize}&pageNum={pageNum}>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-135** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                                                           |
|-----|-----------|---------|------------------|-------------------------------------------------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999.                                            |
| 2   | pageSize  | Integer | Yes              | Number of data records on each page in the pagination query result.<br>The value ranges from 1 to 50. |

| No. | Parameter | Type    | Mandatory or Not | Description                                              |
|-----|-----------|---------|------------------|----------------------------------------------------------|
| 3   | pageNum   | Integer | Yes              | Current page number.<br>The value is a positive integer. |

## Request Description

**Table 7-136** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-137** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-140</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-140</a> . |

| No. | Parameter  | Type      | Description                                                           |
|-----|------------|-----------|-----------------------------------------------------------------------|
| 4   | returnDesc | String    | Description.                                                          |
| 5   | data       | JSONArray | Result in JSON format. For details, see <a href="#">Table 7-138</a> . |
| 6   | totalCount | Long      | Total number of records in the returned list.                         |

**Table 7-138** Parameter description of data

| No. | Parameter | Type   | Description                                                                                                                             |
|-----|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 | name      | String | Business result name.                                                                                                                   |
| 5.2 | code      | String | Business result code.                                                                                                                   |
| 5.3 | defLevel  | String | Business result level. The value <b>1</b> indicates the parent business result and the value <b>2</b> indicates the subbusiness result. |
| 5.4 | children  | List   | Subbusiness result. For details about the parameters of this object, see <a href="#">Table 7-139</a> .                                  |

**Table 7-139** Parameter description of children

| No.   | Parameter | Type   | Description                                                                                                                             |

## 7.1.14 Collecting Outbound Call Exception Statistics

### Prerequisites

You have applied for a developer account.

### Scenario

This interface is invoked to collect outbound call exception statistics on the current day.

## Method

This interface supports only the GET method.

## URI

https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/failcategorystatistics?campaignId={campaignId}&startDate={startDate}&endDate={endDate}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-141** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not                                              | Description                                                                                                                        |
|-----|------------|---------|---------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes                                                           | VDN ID.<br>The value is an integer ranging from 1 to 9999.                                                                         |
| 2   | campaignId | String  | Yes                                                           | Outbound call data ID.                                                                                                             |
| 3   | startDate  | String  | No (If this parameter is set, <b>endDate</b> is mandatory.)   | Start time for the query.<br>Format:<br><i>yyyy-MM-dd</i>                                                                          |
| 4   | endDate    | String  | No (If this parameter is set, <b>startDate</b> is mandatory.) | End time for the query.<br>Format:<br><i>yyyy-MM-dd</i><br>The interval between the end time and start time cannot exceed 30 days. |

## Request Description

**Table 7-142** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 7-143** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-145</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-145</a> . |
| 4   | returnDesc | String | Description.                                                                                                                                 |
| 5   | data       | Array  | Query result list.<br>For details, see <a href="#">Table 7-144</a> .                                                                         |

**Table 7-144** Parameter description of data

```

## 7.1.15 Adding Calling Numbers

### Scenario

This interface is invoked to add calling numbers to an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The outbound campaign has been created.
- Restrictions
  - For the same outbound campaign task, a maximum of 100 calling numbers can be added at a time. The total number of calling numbers cannot exceed the configured system parameter.
  - The calling numbers added each time must be unique.
  - Calling numbers cannot be added randomly in the OP scenario where **Restrict VDN Calling Number** is set to **No** on the web configuration console or in the SaaS scenario.

### Method

This interface supports only the POST method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callerNo/{campaignId}>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-146** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-147** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |

| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>7  | The outbound campaign does not exist.                                      |
| 3   | 020000<br>01 | Empty parameter.                                                           |
| 4   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 5   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 6   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 7   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 8   | 020000<br>06 | Incorrect parameter type.                                                  |
| 9   | 020000<br>07 | Incorrect parameter value.                                                 |
| 10  | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 11  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 12  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```

{"callerNo":[
 {"accessCode":"12345678901234","priority":1},
 {"accessCode":"525245","priority":2}
]}

```
- The following provides an example of the response body of this interface:

```

{
 "resultCode": "0200000",
 "resultDesc": "create callerNo success",
}

```

```
"returnCode": "0200000",
"returnDesc": "create callerNo success"
}
```

## 7.1.16 Deleting Calling Numbers

### Scenario

This interface is invoked to delete calling numbers from an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The outbound campaign has been created.
- Restrictions
  - For the same outbound campaign task, a maximum of 100 calling numbers can be deleted at a time. At least one calling number must be reserved for a task.

### Method

This interface supports only the DELETE method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callerNo/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-152** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-153** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-154** Request body parameters

| No. | Parameter | Type | Mandatory or Not | Description                                                                                                                                                                      |
|-----|-----------|------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callerNo  | List | Yes              | Multiple calling numbers are supported. A maximum of 100 numbers can be deleted at a time.<br>For details about the parameters of this object, see <a href="#">Table 7-155</a> . |

**Table 7-155** Parameter description of callerNo

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                           |
|-----|------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | accessCode | String | Yes              | Calling number.<br>Number displayed on the phone of a customer after a call is connected.<br>The value can contain a maximum of 24 characters, including only digits. |

## Response Description

**Table 7-156** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                              |
|-----|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-157</a> . |
| 2   | resultDesc | String | Description.                                                                                                                             |
| 3   | returnCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-157</a> . |
| 4   | returnDesc | String | Description.                                                                                                                             |

## Triggered Event

None

## Error Codes

**Table 7-157** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>7  | The outbound campaign does not exist.                                 |
| 3   | 020000<br>01 | Empty parameter.                                                      |
| 4   | 020000<br>02 | The parameter contains invalid characters.                            |
| 5   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 6   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 7   | 02000005   | The parameter length must be within the specified range.                   |
| 8   | 02000006   | Incorrect parameter type.                                                  |
| 9   | 02000007   | Incorrect parameter value.                                                 |
| 10  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 11  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 12  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "callerNo": [
 {
 "accessCode": "5245241"
 }
]
}
```
- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "delete callerNo success.num:1",
 "returnCode": "0200000",
 "returnDesc": "delete callerNo success.num:1"
}
```

## 7.2 Interfaces for Managing Outbound Campaign Holidays

### 7.2.1 Querying the Holiday List of an Outbound Campaign

#### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign has been obtained.

#### Scenario

This interface is invoked to query holidays of a specified outbound campaign.

## Method

This interface supports only the GET method.

## URI

https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/holiday/{campaignId}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-158** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-159** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-160** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-162</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | data       | List   | Holidays that are returned after the query is successful. For details, see <a href="#">Table 7-161</a> .                                  |
| 4   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-162</a> . |
| 5   | returnDesc | String | Description.                                                                                                                              |

**Table 7-161** Parameter description of data

| No. | Parameter | Type    | Description                                                                                                                |
|-----|-----------|---------|----------------------------------------------------------------------------------------------------------------------------|
| 3.1 | id        | Integer | Holiday ID.                                                                                                                |
| 3.2 | name      | String  | Holiday name.                                                                                                              |
| 3.3 | type      | Integer | Holiday type.<br>The options are as follows:<br><b>1:</b> set by week<br><b>2:</b> set by date<br><b>3:</b> repeat by date |

| No. | Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.4 | week      | String | Day of week. This parameter is mandatory when <b>type</b> is set to <b>1</b> .<br>The options are as follows:<br><b>1</b> : Monday<br><b>2</b> : Tuesday<br><b>3</b> : Wednesday<br><b>4</b> : Thursday<br><b>5</b> : Friday<br><b>6</b> : Saturday<br><b>7</b> : Sunday<br>If multiple days are selected, separate them with commas (,). For example, <b>6,7</b> indicates Saturday and Sunday. |
| 3.5 | beginTime | String | Start time.<br>When <b>type</b> is <b>2</b> , the data format is <i>yyyy-MM-dd</i> .<br>When <b>type</b> is <b>3</b> , the data format is <i>MM-dd</i> .                                                                                                                                                                                                                                         |
| 3.6 | endTime   | String | End time.<br>When <b>type</b> is <b>2</b> , the data format is <i>yyyy-MM-dd</i> .<br>When <b>type</b> is <b>3</b> , the data format is <i>MM-dd</i> .                                                                                                                                                                                                                                           |

]
}
```

## 7.2.2 Adding a Holiday for an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign has been obtained.
- The number of created holidays in the outbound campaign is less than 20.

### Scenario

This interface is invoked to add a holiday for a specified outbound campaign.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/holiday/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-163** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

### Request Description

**Table 7-164** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-165** Request body parameters

| No. | Parameter | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|-----------|---------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | name      | String  | Yes              | Holiday name.<br>The name must be unique and can contain a maximum of 30 characters.                                                                                                                                                                                                                                                                                                             |
| 2   | type      | Integer | Yes              | Holiday type.<br>The options are as follows:<br><b>1</b> : set by week<br><b>2</b> : set by date<br><b>3</b> : repeat by date                                                                                                                                                                                                                                                                    |
| 3   | week      | String  | No               | Day of week. This parameter is mandatory when <b>type</b> is set to <b>1</b> .<br>The options are as follows:<br><b>1</b> : Monday<br><b>2</b> : Tuesday<br><b>3</b> : Wednesday<br><b>4</b> : Thursday<br><b>5</b> : Friday<br><b>6</b> : Saturday<br><b>7</b> : Sunday<br>If multiple days are selected, separate them with commas (.). For example, <b>6,7</b> indicates Saturday and Sunday. |
| 4   | beginTime | String  | No               | Start time. This parameter is mandatory when <b>type</b> is set to <b>2</b> or <b>3</b> .<br><ul style="list-style-type: none"> <li>When <b>type</b> is <b>2</b>, the data format is <i>yyyy-MM-dd</i>.</li> <li>When <b>type</b> is <b>3</b>, the data format is <i>MM-dd</i>.</li> </ul>                                                                                                       |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                 |
|-----|-----------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | endTime   | String | No               | <p>End time. ## Response Description

**Table 7-166** Response body parameters

| No. | Parameter    | Type   | Description                                                                                                                               |
|-----|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-168</a> . |
| 2   | resultDesc   | String | Description.                                                                                                                              |
| 3   | returnObject | Object | For details, see <a href="#">Table 7-167</a> .                                                                                            |
| 4   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-168</a> . |
| 5   | returnDesc   | String | Description.                                                                                                                              |

**Table 7-167** Parameter description of returnObject

| No. | Parameter | Type    | Description |
|-----|-----------|---------|-------------|
| 1   | id        | Integer | Holiday ID. |

## Triggered Event

None

## Error Codes

**Table 7-168** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>7  | The outbound campaign does not exist.                                      |
| 3   | 020001<br>3  | The holiday name already exists.                                           |
| 4   | 020001<br>5  | The number of holidays in the outbound campaign reaches the upper limit.   |
| 5   | 020003<br>0  | The time format is incorrect.                                              |
| 6   | 020000<br>01 | Empty parameter.                                                           |
| 7   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 8   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 9   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 10  | 020000<br>05 | The parameter length must be within the specified range.                   |
| 11  | 020000<br>06 | Incorrect parameter type.                                                  |
| 12  | 020000<br>07 | Incorrect parameter value.                                                 |
| 13  | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 14  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 15  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 16  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "name": "Mid-Autumn Festival",
 "type": 2,
 "week": null,
 "beginTime": "2018-09-22",
 "endTime": "2018-09-24"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": "",
 "returnObject": {
 "id": 1318795089
 }
}
```

## 7.2.3 Modifying a Holiday for an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign to be modified has been obtained.
- The ID of the holiday to be modified has been obtained.

### Scenario

This interface is invoked to modify a holiday for a specified outbound campaign.

### Method

This interface supports only the PUT method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/holiday/{campaignId}>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-169** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

| No. | Parameter  | Type    | Mandatory or Not | Description                 |
|-----|------------|---------|------------------|-----------------------------|
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign. |

## Request Description

**Table 7-170** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-171** Request body parameters

| No. | Parameter | Type    | Mandatory or Not | Description                                                                                                                |
|-----|-----------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 1   | id        | Integer | Yes              | Holiday ID.                                                                                                                |
| 2   | name      | String  | Yes              | Holiday name.<br>The name must be unique and can contain a maximum of 30 characters.                                       |
| 3   | type      | Integer | Yes              | Holiday type.<br>The options are as follows:<br><b>1:</b> set by week<br><b>2:</b> set by date<br><b>3:</b> repeat by date |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | week      | String | No               | Day of week. This parameter is mandatory when <b>type</b> is set to <b>1</b> .<br>The options are as follows:<br><b>1</b> : Monday<br><b>2</b> : Tuesday<br><b>3</b> : Wednesday<br><b>4</b> : Thursday<br><b>5</b> : Friday<br><b>6</b> : Saturday<br><b>7</b> : Sunday<br>If multiple days are selected, separate them with commas (.). For example, <b>6,7</b> indicates Saturday and Sunday. |
| 5   | beginTime | String | No               | Start time. This parameter is mandatory when <b>type</b> is set to <b>2</b> or <b>3</b> .<br>When <b>type</b> is <b>2</b> , the data format is <i>yyyy-MM-dd</i> .<br>When <b>type</b> is <b>3</b> , the data format is <i>MM-dd</i> .                                                                                                                                                           |
| 6   | endTime   | String | No               | End time. This parameter is mandatory when <b>type</b> is set to <b>2</b> or <b>3</b> .<br>When <b>type</b> is <b>2</b> , the data format is <i>yyyy-MM-dd</i> .<br>When <b>type</b> is <b>3</b> , the data format is <i>MM-dd</i> .                                                                                                                                                             |

## Response Description

Table 7-172 Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-173</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-173</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

| 15  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 16  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "id": 1318795089,
 "name": "Mid-Autumn Festival",
 "type": 2,
 "week": null,
 "beginTime": "2018-09-22",
 "endTime": "2018-09-24"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "02000000",
 "resultDesc": ""
}
```

## 7.2.4 Deleting a Holiday for an Outbound Campaign

### Prerequisites

- You have applied for a developer account.
- The ID of the outbound campaign has been obtained.
- The ID of the holiday to be deleted has been obtained.

### Scenario

This interface is invoked to delete a holiday for a specified outbound campaign.

### Method

This interface supports only the DELETE method.

## URI

https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/holiday/{campaignId}/  
{holidayId}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-174** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |
| 3   | holidayId  | Integer | Yes              | Holiday ID.                                                |

## Request Description

**Table 7-175** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-176** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-177</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-177</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-177** Error code description

| No. | Error Code | Description                                                           |
|-----|------------|-----------------------------------------------------------------------|
| 1   | 0200001    | Parameter error. For details about the error, see <b>resultDesc</b> . |

## 7.3 Interface for Outbound Blacklist Management

### 7.3.1 Adding Outbound Numbers to the Blacklist

#### Scenario

This interface is invoked to add outbound numbers to the blacklist in batches for a specified outbound campaign.

#### Usage Description

- Prerequisites
  - You have applied for a developer account.
- Restrictions
  - A blacklisted number can contain a maximum of 24 characters.
  - A blacklisted number can contain only digits, asterisks (\*), and number signs (#).

- A maximum of 20 numbers can be added to the blacklist at a time. Otherwise, the system displays a message indicating that the maximum number of blacklisted numbers that can be added at a time is exceeded, and no number is added to the blacklist.
- The blacklisted number to be added each time cannot be duplicate. Otherwise, the system displays a message indicating that the number is duplicate, and no number is added to the blacklist.
- The numbers to be added to the blacklist each time are not in the blacklist.
- When both the validity period and expiration time are transferred, the specified time (**validityexpirationtime**) is used.
- The maximum number of calls must be less than the number of call attempts set for the retry policy.

## Method

This interface supports only the POST method.

## URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/blocklist/add>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-182** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-183** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-184** Request body parameters

| No. | Parameter              | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                         |
|-----|------------------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | blocklist              | List    | Yes              | A maximum of 20 numbers can be added to the blacklist.<br>A number can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).                                                                              |
| 2   | validityExpirationTime | String  | No               | Expiration time. Expiration time = Time when the number is added + Validity period. For example, if two numbers are added to the blacklist at 2020-12-31 10:06:25 and the validity period is 120 hours, the expiration time is 2021-01-05 10:06:25. |
| 3   | validityTime           | Integer | No               | Validity period, in hours. The value ranges from 1 to 120.                                                                                                                                                                                          |
| 4   | restrictTimes          | Integer | No               | Maximum number of calls. This parameter must be set or left empty together with <b>restrictPeriod</b> . The value ranges from 1 to 100.                                                                                                             |

| No. | Parameter      | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----|----------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | restrictPeriod | String | No               | <p>Restriction period. The options are <b>0</b> (every hour) and <b>1</b> (every day).</p> <p>Example 1:<br/> <b>"restrictTimes":1,"restrictPeriod":"0"</b><br/> indicates that if an outbound call is made at 10:06:25 on December 30, 2020, another outbound call cannot be made until 11:00:00 on December 30, 2020.</p> <p>Example 2:<br/> <b>"restrictTimes":1,"restrictPeriod":"1"</b><br/> indicates that if an outbound call is made at 10:06:25 on December 30, 2020, another outbound call cannot be made until 00:00:00 on December 31, 2020.</p> |

## Response Description

**Table 7-185** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                            |
|-----|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | <p>Error code. The value <b>0200000</b> indicates success, and other values indicate failure.</p> <p>For details, see <a href="#">Table 7-186</a>.</p> |
| 2   | resultDesc | String | Description.                                                                                                                                           |
| 3   | returnCode | String | <p>Error code. The value <b>0200000</b> indicates success, and other values indicate failure.</p> <p>For details, see <a href="#">Table 7-186</a>.</p> |
| 4   | returnDesc | String | Description.                                                                                                                                           |

## Triggered Event

## Error Codes

**Table 7-186** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>6  | Database operation error.                                                  |
| 3   | 020000<br>7  | The number already exists in the blacklist.                                |
| 4   | 020001<br>8  | Duplicate numbers exist.                                                   |
| 5   | 020002<br>9  | The maximum number of numbers that can be added each time is exceeded.     |
| 6   | 020000<br>01 | Empty parameter.                                                           |
| 7   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 8   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 9   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 10  | 020000<br>05 | The parameter length must be within the specified range.                   |
| 11  | 020000<br>06 | Incorrect parameter type.                                                  |
| 12  | 020000<br>07 | Incorrect parameter value.                                                 |
| 13  | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 14  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 15  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 16  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "blocklist": [
 "13100000000",
 "13100000001",
 "13100000002",
 "13100000003"
],
 "validityExpirationTime": "2020-12-31 10:06:25",
 "restrictTimes": 3,
 "restrictPeriod": "0"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "The blacklist is added successfully"
}
```

## 7.3.2 Deleting an Outbound Number from the Blacklist

### Prerequisites

You have applied for a developer account.

### Scenario

This interface is invoked to delete a number from the blacklist.

### Method

This interface supports only the POST method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/blocklist/delete>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-187** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-188** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-189** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|-------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | blocklistNo | String | Yes              | Number to be deleted from the blacklist. The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#). |

## Response Description

**Table 7-190** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-191</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-191</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-191** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |

## 7.3.4 Querying Blacklisted Outbound Numbers

### Scenario

This interface is invoked to query blacklisted numbers in a specified VDN.

### Usage Description

- Prerequisites
  - You have applied for a developer account.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/blocklist/query`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-196** Parameters in the URL

| No. | Parameter | Type | Mandatory or Not | Description                                                |
|-----|-----------|------|------------------|------------------------------------------------------------|
| 1   | vdnId     | int  | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-197** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-198** Request body parameters

| No. | Parameter | Type | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----|-----------|------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | blocklist | List | No               | <p>A maximum of 20 blacklisted numbers can be queried.</p> <p>A number can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).</p> <p><b>CAUTION</b></p> <p>If this parameter is transferred, only the transferred blacklisted numbers are returned. That is, the response is the information (such as the expiration time and validity period) about the transferred blacklisted numbers if the numbers are in the blacklist.</p> |

| No. | Parameter | Type    | Mandatory or Not | Description                                                                                                                                                                                       |
|-----|-----------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | offset    | Integer | No               | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1)<br><b>page</b> indicates the start page to be queried.      |
| 3   | limit     | Integer | No               | Number of query records on each page.<br>The value ranges from 1 to 100.<br><b>CAUTION</b><br>Either the <b>limit</b> and <b>offset</b> parameters or the <b>blocklist</b> parameter must be set. |

## Response Description

**Table 7-199** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Error Codes</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Error Codes</a> . |
| 4   | returnDesc | String | Description.                                                                                                                                 |
| 5   | data       | Object | For details, see <a href="#">Table 7-200</a> .                                                                                               |

**Table 7-200** Parameter description of data

| No. | Parameter              | Type    | Description                                                                                                                                                                                          |
|-----|------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 | validityExpirationTime | String  | Expiration time.                                                                                                                                                                                     |
| 5.2 | blockNum               | String  | Blacklisted number.                                                                                                                                                                                  |
| 5.3 | flag                   | Boolean | Whether a blacklisted number is valid. The options are <b>true</b> (valid) and <b>false</b> (invalid).<br><br><b>NOTICE</b><br>This parameter is returned only when <b>blocklist</b> is transferred. |

## Triggered Event

None

## Error Codes

**Table 7-201** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>6  | Database operation error.                                             |
| 3   | 020000<br>01 | Empty parameter.                                                      |
| 4   | 020000<br>02 | The parameter contains invalid characters.                            |
| 5   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 6   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |
| 7   | 020000<br>05 | The parameter length must be within the specified range.              |
| 8   | 020000<br>06 | Incorrect parameter type.                                             |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 9   | 02000007   | Incorrect parameter value.                                                 |
| 10  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 11  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 12  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:  
`{"limit":10,"offset":0}`
- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "data": [
 {
 "validityExpirationTime": "2022-02-18T17:56:14.000+00:00",
 "blockNum": "111"
 },
 {
 "validityExpirationTime": "2022-02-23T09:10:07.000+00:00",
 "blockNum": "34234"
 },
 {
 "validityExpirationTime": "2022-02-23T09:11:13.000+00:00",
 "blockNum": "321"
 },
 {
 "validityExpirationTime": "2022-03-03T02:01:40.000+00:00",
 "blockNum": "321"
 }
],
 "resultCode": "0200000",
 "resultDesc": "query BlockList Success",
 "returnDesc": "query BlockList Success"
}
```

## 7.3.5 Importing a Blacklist Data File from the Server

### Scenario

This interface is invoked to import a blacklist data file from the server.

### Blacklist Template

Create an Excel template based on [Table 7-202](#).

**Table 7-202** Blacklist template

| Blacklisted Number (Mandatory) | Expiration Time (Optional) | Validity Period (Hour) (Optional) | Maximum Number of Calls | Restriction Period |
|--------------------------------|----------------------------|-----------------------------------|-------------------------|--------------------|
| 65676950                       | -                          | -                                 | 1                       | 1                  |
| 88888888                       | 2022-05-27 23:06:25        | -                                 | -                       | -                  |
| 88888888                       | 2022-06-24 10:06:25        | -                                 | -                       | -                  |
| 12345678                       | 2022-06-24 10:06:25        | -                                 | -                       | -                  |

**Table 7-203** Parameters in the blacklist template

| No. | Parameter                         | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                               |
|-----|-----------------------------------|---------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Blacklisted Number (Mandatory)    | String  | Yes              | A number can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).                                                                                                                                              |
| 2   | Expiration Time (Optional)        | String  | No               | Expiration time. The value is the time when the number is added plus the validity period. For example, if two numbers are added to the blacklist at 2020-12-31 10:06:25 and the validity period is 120 hours, the expiration time is 2021-01-05 10:06:25. |
| 3   | Validity Period (Hour) (Optional) | Integer | No               | Validity period, in hours. The value ranges from 1 to 120.                                                                                                                                                                                                |
| 4   | Maximum Number of Calls           | Integer | No               | Maximum number of calls. This parameter must be set or left empty together with <b>restrictPeriod</b> . The value ranges from 1 to 100.                                                                                                                   |

| No. | Parameter          | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|--------------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | Restriction Period | String | No               | Restriction period. The options are <b>0</b> (every hour) and <b>1</b> (every day).<br>Example 1:<br><b>"restrictTimes":1,"restrictPeriod":"0"</b> indicates that if an outbound call is made at 10:06:25 on December 30, 2020, another outbound call cannot be made until 11:00:00 on December 30, 2020.<br>Example 2:<br><b>"restrictTimes":1,"restrictPeriod":"1"</b> indicates that if an outbound call is made at 10:06:25 on December 30, 2020, another outbound call cannot be made until 00:00:00 on December 31, 2020. |

## Usage Description

- Prerequisites
  - You have applied for a developer account.
  - A file server is available and supports SFTP.
- Restrictions
  - A maximum of 500,000 records can be imported using a file at a time.

## Method

This interface supports only the POST method.

## URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/blackfile/uploadFileServer>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-204** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-205** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-206** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                  |
|-----|-----------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | serverId  | String | Yes              | File server ID.                                                                                                                                                                                                                                                                                                                                                              |
| 2   | filePath  | String | No               | File storage path. This parameter is optional. If the blacklist data file is stored in the default path of the file server, you do not need to set this parameter. If the file is stored in a folder in the default path of the file server, set this parameter to the file path relative to the default path of the file server.<br>An example is <b>/isales/20220310</b> . |
| 3   | fileName  | String | Yes              | File name, for example, <b>demo.xlsx</b> .                                                                                                                                                                                                                                                                                                                                   |
| 4   | hour      | String | No               | Hour, in 24-hour format. This parameter is mandatory when a scheduled task is used for the import. The value ranges from 0 to 23. If <b>minute</b> is set, <b>hour</b> is mandatory.                                                                                                                                                                                         |
| 5   | minute    | String | No               | Minute. This parameter is mandatory when a scheduled task is used for the import. The options are <b>00</b> and <b>30</b> . If <b>hour</b> is set, <b>minute</b> is mandatory.                                                                                                                                                                                               |

## Response Description

**Table 7-207** Response body parameters

| No. | Parameter    | Type   | Description                                                                                                                               |
|-----|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-239</a> . |
| 2   | resultDesc   | String | Description.                                                                                                                              |
| 3   | importTaskId | String | File import task ID.                                                                                                                      |
| 4   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-208</a> . |
| 5   | returnDesc   | String | Description.                                                                                                                              |

## Triggered Event

## Error Codes

**Table 7-208** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>01 | Empty parameter.                                                      |
| 3   | 020000<br>02 | The parameter contains invalid characters.                            |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 02000005   | The parameter length must be within the specified range.                   |
| 7   | 02000006   | Incorrect parameter type.                                                  |
| 8   | 02000007   | Incorrect parameter value.                                                 |
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "serverId":"164690088271159234793429225848",
 "filePath":"/isales/upload",
 "fileName":"demoBlack.xlsx",
 "hour":"11",
 "minute":"00"
}
```

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "importTaskId": "164757251098048478018607266946",
 "resultCode": "0200000",
 "resultDesc": "Exporting data... View details in Import Result.",
 "returnDesc": "Exporting data... View details in Import Result."
}
```

## 7.3.6 Querying Blacklist Data File Import Results

### Scenario

This interface is invoked to query blacklist data import results, including the results of importing a local file and importing a file from the file server.

### Usage Description

- Prerequisites
  - You have applied for a developer account.

- A valid import task exists.

## Method

This interface supports only the POST method.

## URI

https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/blackfile/  
queryDataImportTask

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-209** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-210** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-211** Request body parameters

| No. | Parameter | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                  |
|-----|-----------|---------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | offset    | Integer | Yes                         | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1)<br><b>page</b> indicates the start page to be queried. |
| 2   | limit     | Integer | Yes                         | Number of query records on each page.<br>The value ranges from 1 to 100.                                                                                                                     |

## Response Description

**Table 7-212** Response body parameters

| No. | Parameter  | Type                  | Description                                                                                                                                  |
|-----|------------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String                | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-239</a> . |
| 2   | resultDesc | String                | Description.                                                                                                                                 |
| 3   | result     | List <DataImportTask> | File import tasks of the current outbound campaign.                                                                                          |
| 4   | count      | Integer               | Total number of results.                                                                                                                     |
| 5   | returnCode | String                | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-214</a> . |
| 6   | returnDesc | String                | Description.                                                                                                                                 |

**Table 7-213** File import task parameters

| No. | Parameter | Type    | Description                                                                                                                            |
|-----|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------|
| 1   | id        | String  | File import task ID.                                                                                                                   |
| 2   | beginTime | String  | Import start time.                                                                                                                     |
| 3   | endTime   | String  | Import end time.                                                                                                                       |
| 4   | status    | String  | Task status. The options are <b>0</b> (preparing for import), <b>1</b> (importing), <b>2</b> (imported), and <b>3</b> (import failed). |
| 5   | succNum   | Integer | Number of successful records.                                                                                                          |
| 6   | repeatNum | Integer | Number of duplicate records.                                                                                                           |
| 7   | failNum   | Integer | Number of failed records.                                                                                                              |
| 8   | errMsg    | Integer | Exception cause.                                                                                                                       |

 "status": "2"
 }
],
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "success",
 "returnDesc": "success"
}
```

## 7.4 Outbound Call Data Interfaces

## 7.4.1 Adding Outbound Numbers

### Scenario

This interface is invoked to add outbound numbers to an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The outbound campaign has been created.
- Restrictions
  - The number of incomplete outbound calls in an outbound campaign cannot exceed 200,000.
  - A maximum of 20 numbers can be added to an outbound campaign task at a time, and the interface invoking time cannot be less than 1 second.
  - The called numbers added each time must be unique.
  - The called numbers added each time are not in the blacklist, or they are in the blacklist but the restriction period and maximum number of calls are set for them and not exceeded.
  - Outbound numbers cannot be added to complete tasks.
  - Outbound numbers cannot be added to ongoing tasks.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/calldata/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-215** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-216** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-217** Request body parameters

| No. | Parameter    | Type | Mandatory or Not | Description                                                                                                                                                 |
|-----|--------------|------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callDataList | List | Yes              | List of data to be added. A maximum of 20 data records are supported.<br>For details about the parameters of this object, see <a href="#">Table 7-218</a> . |

**Table 7-218** Parameter description of callDataList

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | sessionId | String | No               | ID of a subscriber, which is sent back to the subscriber in the outbound call result.<br>The value can contain a maximum of 32 characters. |
| 1.2 | called    | String | Yes              | Called number.<br>The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).            |
| 1.3 | caller    | String | No               | Calling number.<br>The number can contain a maximum of 24 characters.                                                                      |

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|-------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.4 | customField | String | No               | User-defined field. The value can contain a maximum of 200 characters and cannot contain the following special characters: `~!@#%&*()+= {}";<>/?.\[]¥-,`                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1.5 | recycleTime | String | No               | Recycling time, in <i>yyyy-mm-dd hh:mm:ss</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1.6 | callData    | String | No               | <p>Call-associated data. The value can contain a maximum of 1024 characters.</p> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>If an automatic outbound call involves an intelligent IVR flow, the value of this parameter must be in JSON format. The intelligent IVR flow invokes the <b>JSON Data Invoking</b> diagram element to parse and assign values to the call-associated data in JSON format. For details about the implementation and usage of the diagram element, see <a href="#">JSON Data Invoking</a>.</li> <li>The following is a JSON format example. Customize the information in italics and retain other information.<br/> <pre>"callData": "{\n  \"fullName\": \"<i>Lin Zihang</i>\",\n  \"date\": \"<i>March 31, 2022</i>\",\n  \"riskName\": \"<i>Compulsory traffic insurance</i>\"}"</pre> </li> </ul> |

## Response Description

**Table 7-219** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-221</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |

| No. | Parameter    | Type   | Description                                                                                                                               |
|-----|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-221</a> . |
| 4   | returnDesc   | String | Description.                                                                                                                              |
| 5   | returnObject | Object | For details, see <a href="#">Table 7-220</a> .                                                                                            |

**Table 7-220** Parameter description of returnObject

| No. | Parameter | Type    | Description                                                   |
|-----|-----------|---------|---------------------------------------------------------------|
| 5.1 | totalSize | Integer | Total number of outbound calls that the system needs to make. |

## Triggered Event

None

## Error Codes

**Table 7-221** Error code description

| No. | Error Code  | Description                                                           |
|-----|-------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1 | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>6 | Database operation error.                                             |
| 3   | 020000<br>7 | The outbound campaign does not exist.                                 |
| 4   | 020001<br>8 | Duplicate numbers exist.                                              |
| 5   | 020001<br>9 | The number cannot be added in the current state.                      |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 0200020    | The number quantity exceeds the upper limit 200,000.                       |
| 7   | 0200022    | The interface invoking time is short.                                      |
| 8   | 0200024    | The number to be added is in the blacklist.                                |
| 9   | 0200029    | The maximum number of numbers that can be added each time is exceeded.     |
| 10  | 0200030    | The time format is incorrect.                                              |
| 11  | 02000001   | Empty parameter.                                                           |
| 12  | 02000002   | The parameter contains invalid characters.                                 |
| 13  | 02000003   | The parameter length cannot exceed the maximum length.                     |
| 14  | 02000004   | The parameter length cannot be less than the minimum length.               |
| 15  | 02000005   | The parameter length must be within the specified range.                   |
| 16  | 02000006   | Incorrect parameter type.                                                  |
| 17  | 02000007   | Incorrect parameter value.                                                 |
| 18  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 19  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 20  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 21  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "callDataList": [
 {
```

```
 "sessionId": "00750",
 "called": "80021"
 },
 {
 "sessionId": "00850",
 "called": "80022"
 },
 {
 "sessionId": "00950",
 "called": "80023"
 },
 {
 "sessionId": "01050",
 "called": "80024"
 }
]
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": "",
 "returnObject": {
 "totalSize": 46
 }
}
```

## 7.4.2 Adding Outbound Numbers (V2)

### Scenario

This interface is invoked to add outbound numbers to an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The outbound campaign has been created.
- Restrictions
  - The number of incomplete outbound calls in an outbound campaign cannot exceed 200,000.
  - For the same outbound campaign task, 20 records are added each time by default. You can change the value of **isales.api.calldata.max** to change the number of records added each time. The interface invoking time cannot be less than 1 second. It is recommended that the value be less than or equal to 2000 and the value of **isales.api.uncomplate.count** be set to **false**. Otherwise, the interface invoking may take more than 1 second.
  - The called numbers to be added each time under the same session ID must be unique.
  - The called numbers added each time are not in the blacklist, or they are in the blacklist but the restriction period and maximum number of calls are set for them and not exceeded.
  - Outbound numbers cannot be added to complete tasks.
  - Outbound numbers cannot be added to ongoing tasks.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v2/openapi/campaigns/{vdnId}/calldata/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-222** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-223** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-224** Request body parameters

| No. | Parameter    | Type | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                 |
|-----|--------------|------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callDataList | List | Yes                         | List of data to be added. A maximum of 20 data records are supported.<br>For details about the parameters of this object, see <a href="#">Table 7-225</a> . |

**Table 7-225** Parameter description of callDataList

| No. | Parameter   | Type   | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                  |
|-----|-------------|--------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | sessionId   | String | No                          | ID of a subscriber, which is sent back to the subscriber in the outbound call result. The value can contain a maximum of 32 characters.                      |
| 1.2 | called      | List   | Yes                         | Customer number information.                                                                                                                                 |
| 1.3 | caller      | String | No                          | Calling number.<br>The number can contain a maximum of 24 characters.                                                                                        |
| 1.4 | customField | String | No                          | User-defined field. The value can contain a maximum of 200 characters and cannot contain the following special characters: `~!@#\$\$%^&*()+={}'";<>/?.\[]¥-, |
| 1.5 | recycleTime | String | No                          | Recycling time, in <i>yyyy-mm-dd hh:mm:ss</i> format.                                                                                                        |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----|-----------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.6 | callData  | String | No               | <p>Call-associated data. The value can contain a maximum number of 1024 characters. The JSON format is recommended.</p> <p><b>CAUTION</b></p> <ul style="list-style-type: none"> <li>If an automatic outbound call involves an intelligent IVR flow, the value of this parameter must be in JSON format. The intelligent IVR flow invokes the <b>JSON Data Invoking</b> diagram element to parse and assign values to the call-associated data in JSON format. For details about the implementation and usage of the diagram element, see <a href="#">JSON Data Invoking</a>.</li> <li>The following is a JSON format example. Customize the information in italics and retain other information.<br/> <pre>"callData": "{\n  \"fullName\": \"<i>Lin Zihang</i>\",\n  \"date\": \"<i>March 31, 2022</i>\",\n  \"riskName\": \"<i>Compulsory traffic insurance</i>\"}"</pre> </li> </ul> |

**Table 7-226** Parameter description of called

| No.   | Parameter | Type   | Mandatory or Not | Description                                                                                                                                              |
|-------|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2.1 | calledNo  | String | Yes              | <p>Called number of a customer.</p> <p>The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).</p> |
| 1.2.2 | delayTime | String | No               | <p>Call interval of each customer number, in seconds. The value ranges from 0 to 86400, and the default value is <b>0</b>.</p>                           |

| No.   | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2.3 | type      | String | No               | <p>Customer number type.</p> <ul style="list-style-type: none"> <li>This parameter is mandatory when <b>Policy Type</b> under <b>OUTBOUND CALL RESULT POLICY</b> is set to <b>Contact Policy</b> during outbound campaign addition.</li> <li>This parameter is mandatory when <b>Call Mode</b> under <b>CALL POLICY</b> is set to <b>By round</b> during outbound campaign addition.</li> </ul> <p>The value is customized and can contain a maximum of 20 characters, excluding special characters.</p> |

## Response Description

Table 7-227 Response body parameters

| No. | Parameter    | Type   | Description                                                                                                                               |
|-----|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-229</a> . |
| 2   | resultDesc   | String | Description.                                                                                                                              |
| 3   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-229</a> . |
| 4   | returnDesc   | String | Description.                                                                                                                              |
| 5   | returnObject | Object | For details, see <a href="#">Table 7-228</a> .                                                                                            |

**Table 7-228** Parameter description of responseObject

| No. | Parameter | Type    | Description                                                   |
|-----|-----------|---------|---------------------------------------------------------------|
| 5.1 | totalSize | Integer | Total number of outbound calls that the system needs to make. |

## Triggered Event

None

## Error Codes

**Table 7-229** Error code description

| No. | Error Code   | Description                                                            |
|-----|--------------|------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .  |
| 2   | 020000<br>6  | Database operation error.                                              |
| 3   | 020000<br>7  | The outbound campaign does not exist.                                  |
| 4   | 020001<br>8  | Duplicate numbers exist.                                               |
| 5   | 020001<br>9  | The number cannot be added in the current state.                       |
| 6   | 020002<br>0  | The number quantity exceeds the upper limit 200,000.                   |
| 7   | 020002<br>2  | The interface invoking time is short.                                  |
| 8   | 020002<br>4  | The number to be added is in the blacklist.                            |
| 9   | 020002<br>9  | The maximum number of numbers that can be added each time is exceeded. |
| 10  | 020003<br>0  | The time format is incorrect.                                          |
| 11  | 020000<br>01 | Empty parameter.                                                       |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 12  | 02000002   | The parameter contains invalid characters.                                 |
| 13  | 02000003   | The parameter length cannot exceed the maximum length.                     |
| 14  | 02000004   | The parameter length cannot be less than the minimum length.               |
| 15  | 02000005   | The parameter length must be within the specified range.                   |
| 16  | 02000006   | Incorrect parameter type.                                                  |
| 17  | 02000007   | Incorrect parameter value.                                                 |
| 18  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 19  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 20  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 21  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "callDataList": [
 {
 "sessionId": "00750",
 "called": [
 {"calledNo": "88880088", "delayTime": "0", "type": "ST"},
 {"calledNo": "88880089", "delayTime": "1", "type": "SA"}
]
 },
 {
 "sessionId": "00850",
 "called": [
 {"calledNo": "88880080", "delayTime": "0", "type": "ST"}
]
 }
]
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "02000000",
 "resultDesc": "",
 "returnCode": "02000000",
 "returnDesc": ""
}
```

```
"returnObject": {
 "totalSize": 46
}
```

## 7.4.3 Deleting an Outbound Number

### Scenario

This interface is invoked to delete an outbound number for an outbound campaign.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - The ID of the outbound campaign has been obtained.
- Restrictions
  - An outbound number for which a call is ongoing cannot be deleted.
  - An outbound number for which a call has been completed cannot be deleted.
  - An outbound number in an ongoing task cannot be deleted.

### Method

This interface supports only the POST method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/calldata/{campaignId}/delete>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-230** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |

## Request Description

**Table 7-231** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-232** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                          |
|-----|-------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1   | sessionId   | String | No               | ID of a subscriber, which is sent back to the subscriber in the outbound call result. The ID can contain a maximum of 32 characters. |
| 2   | called      | String | No               | Called number. The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#).         |
| 3   | customField | String | No               | User-defined field. You can delete numbers in batches based on this field. The value can contain a maximum of 200 characters.        |
| 4   | recycleTime | String | No               | Recycling time, in <i>yyyy-mm-dd hh:mm:ss</i> format.                                                                                |

| No. | Parameter      | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|----------------|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | recycleType    | String  | No               | <p>Recycling type. This parameter is valid only when <b>recycleTime</b> is set.</p> <p>The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>1</b>: The system deletes the outbound numbers whose <b>recycleTime</b> is earlier than the time specified by <b>recycleTime</b> (accurate to day) in the request.<br/>For example, if <b>recycleTime</b> is set to <b>2020-12-04 17:57:00</b> in the request, the system deletes all outbound numbers whose <b>recycleTime</b> is on December 4 or earlier in a specified outbound campaign.</li> <li>• <b>2</b>: The system deletes the outbound numbers on the day specified by <b>recycleTime</b>.<br/>For example, if <b>recycleTime</b> is set to <b>2020-12-04 17:57:00</b> in the request, the system deletes the outbound numbers whose <b>recycleTime</b> is between 2020-12-04 00:00:00 and 2020-12-04 23:59:59 in a specified outbound campaign.</li> <li>• <b>3</b>: The system deletes the outbound numbers whose <b>recycleTime</b> is the same as the value of <b>recycleTime</b> in the request.</li> </ul> |
| 6   | archiveHistory | Integer | No               | <p>Whether to move outbound numbers to the history table.</p> <p>The options are <b>0</b> and <b>1</b>.</p> <p>The value <b>0</b> indicates that outbound numbers are deleted without being moving to the history table. The value <b>1</b> indicates that outbound numbers are moved to the history table. The default value is <b>0</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Response Description

**Table 7-233** Response body parameters

| No. | Parameter    | Type    | Description                                                                                                                               |
|-----|--------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-234</a> . |
| 2   | resultDesc   | String  | Description.                                                                                                                              |
| 3   | returnCode   | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-234</a> . |
| 4   | returnDesc   | String  | Description.                                                                                                                              |
| 5   | successCount | Integer | Number of successful operations.                                                                                                          |

## Error Codes

**Table 7-234** Error code description

| No. | Error Code | Description                                                           |
|-----|------------|-----------------------------------------------------------------------|
| 1   | 0200001    | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 0200006    | Database operation error.                                             |
| 3   | 0200007    | The outbound campaign does not exist.                                 |
| 4   | 0200028    | The number cannot be deleted in the current state.                    |
| 5   | 0200030    | The time format is incorrect.                                         |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 02000001   | Empty parameter.                                                           |
| 7   | 02000002   | The parameter contains invalid characters.                                 |
| 8   | 02000003   | The parameter length cannot exceed the maximum length.                     |
| 9   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 10  | 02000005   | The parameter length must be within the specified range.                   |
| 11  | 02000006   | Incorrect parameter type.                                                  |
| 12  | 02000007   | Incorrect parameter value.                                                 |
| 13  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 14  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 15  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 16  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "sessionId": "1"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "",
 "returnCode": "0200000",
 "returnDesc": "",
 "successCount": 1
}
```

## 7.4.4 Adding Number Types

### Scenario

This interface is invoked to add number types for a specified VDN.

## Usage Description

- Prerequisites
  - You have applied for a developer account.
- Restrictions
  - To add multiple number types at a time, ensure that the names of the number types are unique.
  - A maximum of 20 number types can be added at a time.
  - The name of a number type cannot contain special characters.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callNoType/add`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-235** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-236** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-237** Request body parameters

| No. | Parameter   | Type | Mandatory or Not | Description                                                                                                                                                             |
|-----|-------------|------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callNoTypes | List | Yes              | Number type set. A maximum of 20 number types are supported.<br>The value can contain a maximum of 20 characters.<br>Only digits, letters, and hyphens (-) are allowed. |

## Response Description

**Table 7-238** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-239</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-239</a> . |
| 4   | returnDesc | String | Description.                                                                                                                                 |

## Triggered Event

| 11  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "callNoTypes": [
 "ST",
 "SI",
]
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": 0,
 "resultDesc": ""
}
```

## 7.4.5 Querying Number Types

### Prerequisites

You have applied for a developer account.

### Scenario

This interface is invoked to query all number types in a specified VDN.

### Method

This interface supports only the GET method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callNoType/query`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-240** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

### Request Description

**Table 7-241** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-242** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                              |
|-----|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-243</a> . |
| 2   | resultDesc | String | Description.                                                                                                                             |
| 3   | data       | List   | <b>callNoType</b> set added to the VDN.                                                                                                  |
| 4   | returnCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-243</a> . |

```

## 7.4.6 Querying Outbound Numbers

### Prerequisites

You have applied for a developer account.

### Scenario

This interface is invoked to query numbers and their attributes in outbound call data of a specified task.

### Method

This interface supports only the GET method.

## URI

/rest/isales/v1/openapi/campaigns/{vdnId}/calldata/{campaignId}/{dataId}

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-244** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign.                                |
| 3   | dataId     | Integer | Yes              | Outbound call data ID.                                     |

## Request Description

**Table 7-245** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Description

**Table 7-246** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-250</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-250</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |
| 5   | data       | Object | Numbers and attributes of the data record. For details, see <a href="#">Table 7-247</a> .                                                 |

**Table 7-247** Parameter description of data

| No. | Parameter  | Type   | Description                                                        |
|-----|------------|--------|--------------------------------------------------------------------|
| 5.1 | dataId     | String | Outbound call data ID.                                             |
| 5.2 | properties | List   | Business attribute. For details, see <a href="#">Table 7-248</a> . |

## 7.4.7 Collecting Outbound Call Statistics on the Current Day

### Prerequisites

You have applied for a developer account.

### Scenario

This interface is invoked to collect outbound call statistics on the current day.

### Method

This interface supports only the GET method.

### URI

`https://ip:port/rest/isales/v2/openapi/campaigns/{vdnId}/statistics?campaignId={campaignId}&batchId={batchId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-251** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not                                               | Description                                                                                                                                                                                                                                                                                                  |
|-----|------------|---------|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes                                                            | VDN ID.<br>The value is an integer ranging from 1 to 9999.                                                                                                                                                                                                                                                   |
| 2   | campaignId | String  | No                                                             | Outbound call data ID.<br><ul style="list-style-type: none"> <li>If this parameter is set, all statistics and the statistics in all batches of the current task are queried.</li> <li>If this parameter is left empty, all statistics and the statistics in all batches of all tasks are queried.</li> </ul> |
| 3   | batchId    | String  | No (If this parameter is set, <b>campaignId</b> is mandatory.) | Batch number. This parameter is mapped to <b>customField</b> in the <b>t_isl_data</b> table.<br>If this parameter is set, all statistics and the statistics in the specified batch of the current task are queried.                                                                                          |

## Request Description

## Error Codes

**Table 7-256** Error code description

| No. | Error Code | Description                                                           |
|-----|------------|-----------------------------------------------------------------------|
| 1   | 0200001    | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 02000001   | Empty parameter.                                                      |
| 3   | 02000002   | The parameter contains invalid characters.                            |
| 4   | 02000003   | The parameter length cannot exceed the maximum length.                |
| 5   | 02000004   | The parameter length cannot be less than the minimum length.          |
| 6   | 02000005   | The parameter length must be within the specified range.              |
| 7   | 02000006   | Incorrect parameter type.                                             |
| 8   | 02000007   | Incorrect parameter value.                                            |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

 CAUTION

Flow control is configured for this interface and is performed every five minutes. If operations are frequently performed, the system reports the status code 429 and the message "Do not perform this operation frequently. Please try again later.". The ValidateExceptionHandler is handling the exception.

## 7.4.8 Importing an Outbound Call Data File from the Server

### Scenario

This interface is invoked to import an outbound call data file from the server.

### Outbound Call Data Template

Create an Excel template based on [Table 7-257](#).

**Table 7-257** Outbound call data template

| sessionId (Optional) | called (Mandatory)    | caller (Optional) | callData (Optional) | customField (Optional) | recycleTime (Optional) |
|----------------------|-----------------------|-------------------|---------------------|------------------------|------------------------|
| -                    | ['calledNo':1234566}] | -                 | -                   | -                      | -                      |

**Table 7-258** Parameters in the outbound call data template

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                             |
|-----|-----------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | sessionId | String | No               | ID of a subscriber, which is sent back to the subscriber in the outbound call result. The value can contain a maximum of 32 characters. |

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|-------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2 | called      | String | Yes              | The value is a JSON array.<br>Customer number information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1.3 | caller      | String | No               | Calling number.<br>The value can contain a maximum of 24 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1.4 | customField | String | No               | User-defined field. The value can contain a maximum of 200 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1.5 | recycleTime | String | No               | Recycling time, in <i>yyyy-mm-dd hh:mm:ss</i> format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1.6 | callData    | String | No               | <p>Call-associated data. The value can contain a maximum number of 1024 characters. The JSON format is recommended.</p> <p><b>CAUTION</b></p> <p>If an automatic outbound call involves an intelligent IVR flow, the value of this parameter must be in JSON format.</p> <p>The intelligent IVR flow invokes the <b>JSON Data Invoking</b> diagram element to parse and assign values to the call-associated data in JSON format. For details about the implementation and usage of the diagram element, see <a href="#">JSON Data Invoking</a>.</p> <p>A JSON format example is as follows:</p> <pre>{\\"iSales\\":{\\"ServiceID\\":\\"1164541685\\",\\"fullName\\":\\"Lin Zihang\\",\\"date\\":\\"March 31, 2022\\",\\"riskName\\":\\"Compulsory traffic insurance\\"}}</pre> |

**Table 7-259** Parameter description of called

| No.   | Parameter | Type   | Mandatory or Not | Description                                                                                                                                   |
|-------|-----------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2.1 | calledNo  | String | Yes              | Called number of a customer.<br>The value can contain a maximum of 24 characters, including only digits, asterisks (*), and number signs (#). |

| No.   | Parameter | Type   | Mandatory or Not | Description                                                                                              |
|-------|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------|
| 1.2.2 | delayTime | String | No               | Call interval of a customer number, in seconds. The value ranges from 0 to 7200. The default value is 0. |
| 1.2.3 | type      | String | No               | Type of a customer number.                                                                               |

## Usage Description

- Prerequisites
  - You have applied for a developer account.
  - An outbound campaign has been created.
  - A file server is available and supports SFTP.
- Restrictions
  - A maximum of 500,000 records can be imported using a file at a time.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/calldatafile/uploadFileServer/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-260** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | String  | Yes              | Outbound campaign task ID.                                 |

## Request Description

**Table 7-261** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-262** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                  |
|-----|-----------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | serverId  | String | Yes              | File server ID.                                                                                                                                                                                                                                                                                                                                                              |
| 2   | filePath  | String | No               | File storage path. This parameter is optional. If the outbound call data file is stored in the default path of the file server, you do not need to set this parameter. If the file is stored in a folder in the default path of the file server, set this parameter to the file path relative to the default path of the file server. An example is <b>/sales/20220310</b> . |
| 3   | fileName  | String | Yes              | File name, for example, <b>demo.xlsx</b> .                                                                                                                                                                                                                                                                                                                                   |
| 4   | hour      | String | No               | Hour, in 24-hour format. This parameter is mandatory when a scheduled task is used for the import. The value ranges from 0 to 23. If <b>minute</b> is set, <b>hour</b> is mandatory.                                                                                                                                                                                         |
| 5   | minute    | String | No               | Minute. This parameter is mandatory when a scheduled task is used for the import. Examples are <b>00</b> and <b>30</b> . If <b>hour</b> is set, <b>minute</b> is mandatory.                                                                                                                                                                                                  |

## Response Description

**Table 7-263** Response body parameters

| No. | Parameter    | Type   | Description                                                                                                                               |
|-----|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-239</a> . |
| 2   | resultDesc   | String | Description.                                                                                                                              |
| 3   | importTaskId | String | File import task ID.                                                                                                                      |
| 4   | returnCode   | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-264</a> . |
| 5   | returnDesc   | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-264** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>01 | Empty parameter.                                                      |
| 3   | 020000<br>02 | The parameter contains invalid characters.                            |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 02000005   | The parameter length must be within the specified range.                   |
| 7   | 02000006   | Incorrect parameter type.                                                  |
| 8   | 02000007   | Incorrect parameter value.                                                 |
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "serverId":"164690088271159234793429225848",
 "filePath":"/isales/upload",
 "fileName":"demogl50w.xlsx"
}
```

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "importTaskId": "164870990605164487770867067540",
 "resultCode": "0200000",
 "resultDesc": "Exporting data... View details in Import Result.",
 "returnDesc": "Exporting data... View details in Import Result."
}
```

## 7.4.9 Querying Outbound Call Data File Import Results

### Scenario

This interface is invoked to query outbound call data import results, including the results of importing a local file and importing a file from the file server.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - A valid import task exists.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/calldatafile/  
queryDataImportTask/{campaignId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-265** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | String  | Yes              | Outbound campaign task ID.                                 |

## Request Description

**Table 7-266** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-267** Request body parameters

| No. | Parameter | Type    | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                  |
|-----|-----------|---------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | offset    | Integer | Yes                         | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1)<br><b>page</b> indicates the start page to be queried. |
| 2   | limit     | Integer | Yes                         | Number of query records on each page.<br>The value ranges from 1 to 100.                                                                                                                     |

## Response Description

**Table 7-268** Response body parameters

| No. | Parameter  | Type                                   | Description                                                                                                                                  |
|-----|------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String                                 | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-239</a> . |
| 2   | resultDesc | String                                 | Description.                                                                                                                                 |
| 3   | result     | List< <a href="#">DataImportTask</a> > | File import tasks of the current outbound campaign.                                                                                          |
| 4   | count      | Integer                                | Total number of results.                                                                                                                     |
| 5   | returnCode | String                                 | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-270</a> . |
| 6   | returnDesc | String                                 | Description.                                                                                                                                 |

**Table 7-269** Parameter description of DataImportTask

| No. | Parameter | Type    | Description                                                                                                                            |
|-----|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------|
| 1   | id        | String  | File import task ID.                                                                                                                   |
| 2   | beginTime | String  | Import start time.                                                                                                                     |
| 3   | endTime   | String  | Import end time.                                                                                                                       |
| 4   | status    | String  | Task status. The options are <b>0</b> (preparing for import), <b>1</b> (importing), <b>2</b> (imported), and <b>3</b> (import failed). |
| 5   | succNum   | Integer | Number of successful records.                                                                                                          |
| 6   | repeatNum | Integer | Number of duplicate records.                                                                                                           |
| 7   | failNum   | Integer | Number of failed records.                                                                                                              |
| 8   | errMsg    | Integer | Exception cause.                                                                                                                       |

## Triggered Event

None

## Error Codes

**Table 7-270** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>6  | The parameter contains invalid characters.                            |
| 3   | 020000<br>01 | Empty parameter.                                                      |
| 4   | 020000<br>02 | The parameter contains invalid characters.                            |
| 5   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 7   | 02000005   | The parameter length must be within the specified range.                   |
| 8   | 02000006   | Incorrect parameter type.                                                  |
| 9   | 02000007   | Incorrect parameter value.                                                 |
| 10  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 11  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 12  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "limit":10,
 "offset":0,
 "importTaskIds":["164698362894300182038011895728"]
}
```

## 7.5 Outbound Result Interface

## 7.5.1 Querying Outbound Call Results

### Scenario

This interface is invoked to query the result of a specified outbound campaign task in a specified VDN.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
- Restrictions
  - **vdnId** must be correctly set for query.
  - The VDN ID (**vdnId**) is correctly associated with the outbound campaign task ID (**campaignId**).
  - Only the results of complete outbound calls can be queried.

---

 **CAUTION**

1. You are advised to preferentially use the interface for calling back outbound call results.
  2. It is recommended that the number of concurrent requests be less than or equal to 10 and the interval between concurrent batches be greater than 1 second.
- 

### Method

This interface supports only the POST method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callresult/{campaignId}>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-271** Parameters in the URL

| No. | Parameter  | Type    | Mandatory or Not | Description                                                |
|-----|------------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId      | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | campaignId | Integer | Yes              | ID of an outbound campaign task.                           |

## Request Description

**Table 7-272** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-273** Request body parameters

| No. | Parameter   | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                |
|-----|-------------|---------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | sessionId   | String  | No               | ID of a subscriber, which is sent back to the subscriber in the outbound call result. The value can contain a maximum of 32 characters.                                                                                                                                                                                                                    |
| 2   | customField | String  | No               | User-defined field.                                                                                                                                                                                                                                                                                                                                        |
| 3   | pageSize    | Integer | No               | Number of data records on each page in the pagination query result.<br>Value range: <ul style="list-style-type: none"> <li>When <b>showDetail</b> is set to <b>1</b>, the value of <b>pageSize</b> is less than or equal to 100.</li> <li>When <b>showDetail</b> is set to <b>0</b>, the value of <b>pageSize</b> is less than or equal to 500.</li> </ul> |
| 4   | pageNum     | Integer | No               | Current page number.                                                                                                                                                                                                                                                                                                                                       |

| No. | Parameter  | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                               |
|-----|------------|---------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | showDetail | Integer | No               | Whether to display details. <ul style="list-style-type: none"> <li>• <b>0</b>: The final call result of outbound call data is displayed.</li> <li>• <b>1</b>: The detailed call result of the outbound call data is displayed.</li> </ul> The default value is <b>0</b> . |
| 6   | beginTime  | String  | No               | Start time. The format is <i>YYYY-MM-DD</i> . The start time must be earlier than the end time, and the interval between the start time and end time cannot exceed 30 days.<br>When <b>beginTime</b> is specified, <b>endTime</b> must be specified.                      |
| 7   | endTime    | String  | No               | End time. The format is <i>YYYY-MM-DD</i> . The start time must be earlier than the end time, and the interval between the start time and end time cannot exceed 30 days.<br>When <b>endTime</b> is specified, <b>beginTime</b> must be specified.                        |

## Response Description

**Table 7-274** Response body parameters

| No. | Parameter  | Type    | Description                                                                                |
|-----|------------|---------|--------------------------------------------------------------------------------------------|
| 1   | resultCode | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. |
| 2   | resultDesc | String  | Description.                                                                               |
| 3   | returnCode | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. |
| 4   | returnDesc | String  | Description.                                                                               |
| 5   | totalCount | Integer | Total number of outbound call results.                                                     |

| No. | Parameter | Type      | Description                                                           |
|-----|-----------|-----------|-----------------------------------------------------------------------|
| 6   | data      | JSONArray | Result in JSON format. For details, see <a href="#">Table 7-275</a> . |

**Table 7-275** Parameter description of data

| No. | Parameter   | Type    | Description                                                                                                                                                                   |
|-----|-------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.1 | campaignId  | String  | ID of an outbound campaign task.                                                                                                                                              |
| 6.2 | sessionId   | String  | ID of a subscriber.                                                                                                                                                           |
| 6.3 | called      | String  | Called number.                                                                                                                                                                |
| 6.4 | callTimeStr | String  | Call time, in <i>yyyy-mm-dd hh:mm:ss</i> format.                                                                                                                              |
| 6.5 | callStatus  | Integer | Call result. The value <b>5</b> indicates that the call fails, and the value <b>6</b> indicates that the call is successful.                                                  |
| 6.6 | failCode    | String  | Failure error code.                                                                                                                                                           |
| 6.7 | resultCode  | String  | External result code corresponding to the failure cause code. The external result code can be customized. The failure cause code is associated with the external result code. |
| 6.8 | vdnId       | Integer | ID of the VDN to which an outbound number belongs.                                                                                                                            |
| 6.9 | callId      | String  | Call record ID, which is used to associate with call data such as CDRs on the CTI platform.                                                                                   |

| No.  | Parameter  | Type   | Description                                                                                                                                                                          |
|------|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.10 | recordPath | String | Path of call recording files.<br><b>NOTE</b><br>The value of this field is returned only when the connection is used (in SaaS networking). In other cases, this field is left empty. |

## Triggered Event

None

## Error Codes

**Table 7-276** Error code description

| No. | Error Code | Description                                                                   |
|-----|------------|-------------------------------------------------------------------------------|
| 1   | 0200001    | Parameter error. For details about the error, see <b>resultDesc</b> .         |
| 2   | 0200007    | The outbound campaign does not exist.                                         |
| 3   | 0200008    | The start time and end time must be specified or left empty at the same time. |
| 4   | 0200009    | The format of the start time or end time is incorrect.                        |
| 5   | 0200010    | The start time is later than or equal to the end time.                        |
| 6   | 0200011    | The interval between the start time and end time exceeds 30 days.             |
| 7   | 0200001    | Empty parameter.                                                              |
| 8   | 0200002    | The parameter contains invalid characters.                                    |
| 9   | 0200003    | The parameter length cannot exceed the maximum length.                        |
| 10  | 0200004    | The parameter length cannot be less than the minimum length.                  |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 11  | 02000005   | The parameter length must be within the specified range.                   |
| 12  | 02000006   | Incorrect parameter type.                                                  |
| 13  | 02000007   | Incorrect parameter value.                                                 |
| 14  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 15  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 16  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 17  | 02000011   | The number of parameters cannot exceed the specified number.               |

```

## 7.5.2 Querying Details About a Single Outbound Call Result

### Function

This interface is invoked to query the outbound call result details of a specified call in a specified VDN.

### Usage Description

1. Prerequisites  
You have applied for a developer account.
2. Restrictions  
**vdnId** must be correctly set for query.  
The VDN ID (**vdnId**) is correctly associated with the call ID (**callId**).

### Request Method

This interface supports only the GET method.

### Request URL

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callresultdetail/{callId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-277** Parameters in the URL

| Parameter | Type    | Mandatory or Not | Description                                                |
|-----------|---------|------------------|------------------------------------------------------------|
| vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

| Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                  |
|-----------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| callId    | String | Yes              | Call record ID. The value is obtained from the <b>callId</b> field returned by the interface described in <a href="#">7.5.1 Querying Outbound Call Results</a> or <a href="#">7.6.1 Calling Back Outbound Call Results</a> . |

## Request

**Table 7-278** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response

The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",

}
```

**Table 7-279** describes the parameters in the response body of this interface.

**Table 7-279** Response body parameters

| Parameter  | Type        | Description                                                                                |
|------------|-------------|--------------------------------------------------------------------------------------------|
| resultCode | String      | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. |
| resultDesc | String      | Description.                                                                               |
| returnCode | String      | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. |
| returnDesc | String      | Description.                                                                               |
| data       | JSON object | Result in JSON format. For details, see <a href="#">Table 7-280</a> .                      |

**Table 7-280** Parameter description of data

| Parameter     | Type   | Description                                                                                                    |
|---------------|--------|----------------------------------------------------------------------------------------------------------------|
| called        | String | Called number.                                                                                                 |
| ackBeginTime  | String | Start time of an outbound call, which is the start time of ringing. The format is <i>yyyy-mm-dd hh:mm:ss</i> . |
| callBeginTime | String | Call start time, which is the time when the call is connected. The format is <i>yyyy-mm-dd hh:mm:ss</i> .      |
| callEndTime   | String | Call end time, which is the time when the call is released. The format is <i>yyyy-mm-dd hh:mm:ss</i> .         |

| Parameter  | Type    | Description                                                                                                                                                                                     |
|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| callStatus | Integer | Call result. The value <b>5</b> indicates that the call fails, and the value <b>6</b> indicates that the call is successful.                                                                    |
| failCode   | String  | Failure cause code.                                                                                                                                                                             |
| resultCode | String  | External result code corresponding to the failure cause code. The external result code can be customized. The failure cause code is associated with the external result code.                   |
| vdnId      | Integer | ID of the VDN to which an outbound number belongs.                                                                                                                                              |
| callId     | String  | Call record ID, which is used to associate with call data such as CDRs on the CTI.                                                                                                              |
| recordPath | String  | URL of a call recording file in the OBS.<br><b>NOTE</b><br>The value of this field is returned only when the connection is used (in SaaS networking). In other cases, this field is left empty. |

**Table 7-281** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>7  | The call record ID does not exist.                                    |
| 3   | 020000<br>01 | Empty parameter.                                                      |
| 4   | 020000<br>02 | The parameter contains invalid characters.                            |
| 5   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 7   | 02000005   | The parameter length must be within the specified range.                   |
| 8   | 02000006   | Incorrect parameter type.                                                  |
| 9   | 02000007   | Incorrect parameter value.                                                 |
| 10  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 11  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 12  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 13  | 02000011   | The number of parameters cannot exceed the specified number.               |

## 7.5.3 Querying Call Records of Automatic and Intelligent Outbound Calls (V1.0.0)

### Scenario

This interface is invoked to query call records of automatic and intelligent outbound calls.

#### NOTE

This interface can be invoked to query only call records generated in AICC 22.100.0 and later versions.

### Method

POST

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callRecord>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-282** Parameters in the URL

| Parameter | Type    | Mandatory or Not | Description                                                |
|-----------|---------|------------------|------------------------------------------------------------|
| vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-283** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |
| 2   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |

**Table 7-284** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                     |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callId    | String | Yes              | Call record ID, which is used to associate with call data such as CDRs on the CTI. The value is obtained from the <b>callId</b> field returned by the interface described in <a href="#">7.5.1 Querying Outbound Call Results</a> or <a href="#">7.6.1 Calling Back Outbound Call Results</a> . |

## Response Description

- Status code: 200

**Table 7-285** Response body parameters

| No. | Parameter       | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                       |
|-----|-----------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode      | String | Yes              | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br><br>For details about error codes, see <a href="#">Table 7-286</a> .                                                                                                                                                                                                |
| 2   | recordList      | List   | No               | Call records.                                                                                                                                                                                                                                                                                                                                                     |
| 2.1 | interNo         | String | Yes              | Internal number.                                                                                                                                                                                                                                                                                                                                                  |
| 2.2 | systemReply     | String | Yes              | System reply.<br><br>If the system reply is a voice file in an IVR flow or intelligent IVR flow and the voice file contains noise or music, the voice file cannot be converted into text information accurately.<br><br>Even if a voice or TTS file is interrupted during a call and is not completely played, the queried system reply is a complete voice file. |
| 2.3 | userSaying      | String | Yes              | Subscriber reply.                                                                                                                                                                                                                                                                                                                                                 |
| 2.4 | intention       | String | Yes              | Subscriber intention.                                                                                                                                                                                                                                                                                                                                             |
| 2.5 | systemReplyTime | String | Yes              | System reply time.                                                                                                                                                                                                                                                                                                                                                |
| 2.6 | requestTime     | String | Yes              | Subscriber request time.                                                                                                                                                                                                                                                                                                                                          |

| No. | Parameter      | Type   | Mandatory or Not | Description                                                                                                                    |
|-----|----------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------|

Business failure. Check the values of parameters in the request.

## Error Codes

**Table 7-286** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>01 | Empty parameter.                                                      |
| 3   | 020000<br>02 | The parameter contains invalid characters.                            |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |
| 6   | 020000<br>05 | The parameter length must be within the specified range.              |
| 7   | 020000<br>06 | Incorrect parameter type.                                             |
| 8   | 020000<br>07 | Incorrect parameter value.                                            |
| 9   | 020000<br>08 | Parameter conversion error. Check the request parameters.             |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

Request header:

```
Content-Type:application/json;charset=UTF-8
Authorization:XXXXXXXXXXXXXXXXXXXXXXXXXXXX
```

Request parameters:

```
{
 "callId": "1688028889-836",
}
```

Response parameters:

```
{
 "returnCode": "0200000",
 "recordList": [
 {
 "interNo": "1",
 "userSaying": null,
 "systemReply": "May I ask my colleague in charge to briefly introduce the highlights of the exhibition to you? Enterprises related to foreign trade will be interested in the exhibition.",
 "intention": null,
 "systemReplyTime": "2022-05-31 20:13:08",
 "requestTime": "2022-05-31 20:13:10",
 "responseSource": "0"
 },
 {
 "interNo": "2",
 "userSaying": "null",
 "systemReply": "Hello, welcome to use the intelligent chatbot.",
 "intention": null,
 "systemReplyTime": "2022-05-31 20:13:08",
 "requestTime": "2022-05-31 20:13:08",
 "responseSource": "0"
 }
],
 "resultCode": "0200000",
 "resultDesc": "success",
 "returnDesc": "success"
}
```

## 7.5.4 Querying Call Records of Automatic and Intelligent Outbound Calls (V2.0.0)

### Scenario

This interface is invoked to query call records of automatic and intelligent outbound calls. Compared with the V1 interface, the V2 interface has the mandatory parameters **page** and **limit** and supports pagination query.

#### NOTE

This interface can be invoked to query only call records generated in AICC 22.100.0 and later versions.

### Method

POST

### URI

https://ip:port/rest/isales/v2/openapi/campaigns/{vdnId}/callRecord

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-287** Parameters in the URL

| Parameter | Type    | Mandatory or Not | Description                                                |
|-----------|---------|------------------|------------------------------------------------------------|
| vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

### Request Description

**Table 7-288** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 2   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

**Table 7-289** Request body parameters

| No. | Parameter | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                     |
|-----|-----------|---------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callId    | String  | Yes              | Call record ID, which is used to associate with call data such as CDRs on the CTI. The value is obtained from the <b>callId</b> field returned by the interface described in <a href="#">7.5.1 Querying Outbound Call Results</a> or <a href="#">7.6.1 Calling Back Outbound Call Results</a> . |
| 2   | page      | Integer | Yes              | <b>page</b> indicates the start page to be queried.<br>The value ranges from 1 to 1000.                                                                                                                                                                                                         |
| 3   | limit     | Integer | Yes              | Number of query records on each page.<br>The value ranges from 1 to 100.                                                                                                                                                                                                                        |

## Response Description

- Status code: 200

**Table 7-290** Response body parameters

| No. | Parameter       | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                       |
|-----|-----------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode      | String | Yes              | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br><br>For details about error codes, see <a href="#">Table 7-291</a> .                                                                                                                                                                                                |
| 2   | recordList      | List   | No               | Call records.                                                                                                                                                                                                                                                                                                                                                     |
| 2.1 | interNo         | String | Yes              | Internal number.                                                                                                                                                                                                                                                                                                                                                  |
| 2.2 | systemReply     | String | Yes              | System reply.<br><br>If the system reply is a voice file in an IVR flow or intelligent IVR flow and the voice file contains noise or music, the voice file cannot be converted into text information accurately.<br><br>Even if a voice or TTS file is interrupted during a call and is not completely played, the queried system reply is a complete voice file. |
| 2.3 | userSaying      | String | Yes              | Subscriber reply.                                                                                                                                                                                                                                                                                                                                                 |
| 2.4 | intention       | String | Yes              | Subscriber intention.                                                                                                                                                                                                                                                                                                                                             |
| 2.5 | systemReplyTime | String | Yes              | System reply time.                                                                                                                                                                                                                                                                                                                                                |
| 2.6 | requestTime     | String | Yes              | Subscriber request time.                                                                                                                                                                                                                                                                                                                                          |

| No. | Parameter      | Type   | Mandatory or Not | Description                                                                                                                    |
|-----|----------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| 2.7 | responseSource | String | Yes              | Whether the reply comes from the chatbot or a silent agent.<br>The options are <b>0</b> (chatbot) and <b>1</b> (silent agent). |
| 3   | resultDesc     | String | Yes              | Returned description.                                                                                                          |

 "resultDesc": "success",
 "returnDesc": "success"
}
```

## 7.6 Outbound Callback

## 7.6.1 Calling Back Outbound Call Results

### Scenario

This interface is invoked to push outbound call results to a specified URL.

### Usage Description

- Prerequisites
  - You have applied for a developer account.
  - An outbound campaign has been created, and outbound call data has been added.
- Precautions
  - After a request is received, the server needs to return a 200 response. Other responses indicate that the push fails.
  - After a non-200 response is received, the server immediately pushes the result again. If a non-200 response is received again, the push fails.
- Restrictions
  - Each call data record can be pushed for a maximum of six times.
  - If the push fails, the system pushes the result again 10 minutes later.

### Method

This interface supports only the POST method.

### URI

When creating an outbound campaign, you can specify the value of **callBackUrl**.

### Request Description

There is no request header.

**Table 7-292** Request body parameters

| No. | Parameter      | Type | Description                                                                                                                                             |
|-----|----------------|------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | callResultList | List | Outbound call result list. The entity object does not exist. The response directly returns <b>List</b> . For details, see <a href="#">Table 7-293</a> . |

**Table 7-293** Parameter description of callDataList

| No. | Parameter  | Type   | Description                 |
|-----|------------|--------|-----------------------------|
| 1   | campaignId | String | ID of an outbound campaign. |
| 2   | sessionId  | String | ID of a subscriber.         |

| No. | Parameter   | Type    | Description                                                                                                                                                                          |
|-----|-------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | called      | String  | Called number.                                                                                                                                                                       |
| 4   | callTimeStr | String  | Call time, in <i>yyyy-mm-dd hh:mm:ss</i> format.                                                                                                                                     |
| 5   | callStatus  | Integer | Call result. The value <b>5</b> indicates that the call fails, and the value <b>6</b> indicates that the call is successful.                                                         |
| 6   | failCode    | String  | Failure cause code. For details, see <a href="#">Table 7-295</a> .                                                                                                                   |
| 7   | vdnId       | Integer | ID of the VDN to which an outbound number belongs.                                                                                                                                   |
| 8   | callId      | String  | Call record ID, which is used to associate with call data such as CDRs on the CTI platform.                                                                                          |
| 9   | customField | String  | User-defined field.                                                                                                                                                                  |
| 10  | recordPath  | String  | Path of call recording files.<br><b>NOTE</b><br>The value of this field is returned only when the connection is used (in SaaS networking). In other cases, this field is left empty. |

## Response Description

Response code: 200

Table 7-294 Response parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                            |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------------|
| 1   | retCode   | string | True             | Result code. The value <b>0</b> indicates success, and other values indicates failure. |
| 2   | retMsg    | string | True             | Description of a failure cause.                                                        |

## Triggered Event

None

## Error Codes

|                                                                    | 34611      |                                                                                                |
|                                                                    | Others     |                                                                                                |

## Example

- The following provides an example of the request body of this interface:

```
[
 {
 "campaignId": "3",
 "sessionId": "1202_test013",
 "called": "60584",
 "callTimeStr": "2020-08-30 20:00:00",
 "callStatus": 6,
 "failCode": "0",
 "vdnId": 11,
 "callId": "0023-134864174",
 "recordPath": "Y:/1/11/20200830/3408/0949218.V3"
 }
]
```

- The following provides an example of the response body of this interface:

```
{
 "retCode": "0",
 "retMsg": "success"
}
```

## 7.7 Business Result Writeback

### 7.7.1 Writing Back Business Results

#### Scenario

This interface is invoked to write back business results to the outbound call data table **t\_isl\_data** and the outbound call data result table **t\_isl\_data\_result** to record the outbound call data and the business result. If the callback result matches the business result and the retry policy based on the business result set in the outbound campaign task, the system retries the call.

## Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - An outbound campaign has been created, and outbound call data has been added.
  - The outbound call is successful.
  - The result of the outbound call business is added.
- Precautions
  - After a request is received, the server needs to return a 200 response. Other responses indicate that the writeback fails.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/callBusiResult/{dataId}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-296** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | dataId    | Integer | Yes              | Outbound call data ID.                                     |

## Request Description

**Table 7-297** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-298** Request body parameters

| No. | Parameter       | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                 |
|-----|-----------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | busiResult      | String | Yes              | Business result code, which can contain a maximum of 50 characters.                                                                                                                                                                         |
| 2   | subStatus       | String | No               | Subbusiness status code, which can contain a maximum of 50 characters.                                                                                                                                                                      |
| 3   | busiResult Desc | String | No               | Business result description.                                                                                                                                                                                                                |
| 4   | workNo          | String | No               | Platform work ID of the agent who makes a call.<br>If the same outbound call data is required, the call is always routed to the same agent. This parameter is mandatory. If this parameter is not set, the call is routed to another agent. |

## Response Description

**Table 7-299** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-300</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-300** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020003<br>3  | The outbound call data does not exist.                                     |
| 3   | 020003<br>4  | The substatus does not match the business result.                          |
| 4   | 020099<br>9  | Failed to write back the business result.                                  |
| 5   | 020000<br>01 | Empty parameter.                                                           |
| 6   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 7   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 8   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 9   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 10  | 020000<br>06 | Incorrect parameter type.                                                  |
| 11  | 020000<br>07 | Incorrect parameter value.                                                 |
| 12  | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 13  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 14  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 15  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "busiResult": "1621474513",
 "subStatus": "1048856206",
 "busiResultDesc": "1",
 "workNo": "2033"
}
```

- The following provides an example of the response body of this interface:

```
{
 "resultCode": "0200000",
 "resultDesc": "The business result is written back successfully."
}
```

## 7.8 File Server Management Interfaces

### 7.8.1 Adding a File Server

#### Scenario

This interface is invoked to add a file server. It can be used before importing an outbound call data file from the server.

#### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.
- Precautions
  - After a request is received, the server needs to return a 200 response. Other responses indicate that the writeback fails.
  - The server information must be unique in the same tenant space.
  - The username can contain a maximum of 30 characters and cannot contain the following special characters: `~!@#\$%^&\*()+={}|'";<>/?.\[]!
  - The password must be a string of 8 to 80 characters.
  - Only the SFTP file server is supported.

#### Method

This interface supports only the POST method.

#### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/file/addServer>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-301** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-302** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-303** Request body parameters

| No. | Parameter  | Type        | Mandatory or Not | Description                                                                                  |
|-----|------------|-------------|------------------|----------------------------------------------------------------------------------------------|
| 1   | serverInfo | JSON object | Yes              | File server information.                                                                     |
| 2   | userName   | String      | Yes              | Username.                                                                                    |
| 3   | serverPwd  | String      | Yes              | Service password, which is transferred in plaintext and stored in ciphertext on the backend. |

serverInfo

| No. | Parameter | Type   | Mandatory or Not | Description                                                 |
|-----|-----------|--------|------------------|-------------------------------------------------------------|
| 1   | ip        | String | Yes              | File server IP address.                                     |
| 2   | port      | String | Yes              | port                                                        |
| 3   | filePath  | String | Yes              | Default file server path, for example, / <b>home/sftp</b> . |

## Response Description

**Table 7-304** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-300</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | serverId   | String | File service ID, which is globally unique.                                                                                                |
| 4   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-305</a> . |
| 5   | returnDesc | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-305** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020003<br>3  | The outbound call data does not exist.                                     |
| 3   | 020003<br>4  | The substatus does not match the business result.                          |
| 4   | 020000<br>05 | The parameter value is not in the specified length range.                  |
| 5   | 020000<br>01 | Empty parameter.                                                           |
| 6   | 020000<br>02 | The parameter contains invalid characters.                                 |

## 7.8.2 Deleting a File Server

### Scenario

This interface is invoked to delete a file server. It can be used before importing an outbound call data file from the server.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.
  - A file server is available.
- Precautions
  - After a request is received, the server needs to return a 200 response. Other responses indicate that the writeback fails.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/file/{serverId}/deleteServer`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-306** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | serverId  | String  | Yes              | File server ID.                                            |

## Request Description

**Table 7-307** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 7-308** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-309</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-309</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

## Triggered Event

None

## Error Codes

**Table 7-309** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>6  | The server configuration does not exist.                                   |
| 3   | 020003<br>3  | The outbound call data does not exist.                                     |
| 4   | 020003<br>4  | The substatus does not match the business result.                          |
| 5   | 020000<br>01 | Empty parameter.                                                           |
| 6   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 7   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 8   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 9   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 10  | 020000<br>06 | Incorrect parameter type.                                                  |
| 11  | 020000<br>07 | Incorrect parameter value.                                                 |
| 12  | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 13  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 14  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 15  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

### Example

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
```

```
"resultCode": "0200000",
"resultDesc": "success",
"returnDesc": "success"
}
```

## 7.8.3 Modifying a File Server

### Scenario

This interface is invoked to modify a file server. It can be used before importing an outbound call data file from the server.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.
  - A file server is available.
- Precautions
  - After a request is received, the server needs to return a 200 response. Other responses indicate that the writeback fails.
  - If the IP address needs to be changed, the password must be transferred.
  - The username can contain a maximum of 30 characters and cannot contain the following special characters: `~!@#\$%^&\*()+=|{}";<>/?.\[]!
  - The password must be a string of 8 to 80 characters.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/file/{serverId}/updateServer`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-310** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | serverId  | String  | Yes              | File server ID.                                            |

## Request Description

**Table 7-311** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-312** Request body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                 |
|-----|------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | serverInfo | Object | Yes              | File server information.                                                                                                                                                                                    |
| 2   | userName   | String | Yes              | Username.                                                                                                                                                                                                   |
| 3   | serverPwd  | String | No               | Service password, which is transferred in plaintext and stored in ciphertext on the backend. This parameter is mandatory when the value of <b>serviceInfo.IP</b> is different from the original IP address. |

### serverInfo

| No. | Parameter | Type   | Mandatory or Not | Description                                                 |
|-----|-----------|--------|------------------|-------------------------------------------------------------|
| 1   | ip        | String | Yes              | File server IP address.                                     |
| 2   | port      | String | Yes              | Port number.                                                |
| 3   | filePath  | String | Yes              | Default file server path, for example, / <b>home/sftp</b> . |

## Response Description

**Table 7-313** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                              |
|-----|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-314</a> . |
| 2   | resultDesc | String | Description.                                                                                                                             |
| 3   | returnCode | String | Error code. The value <b>020000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-314</a> . |
| 4   | returnDesc | String | Description.                                                                                                                             |

## Triggered Event

None

## Error Codes

**Table 7-314** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>6  | The server configuration does not exist.                              |
| 2   | 020003<br>3  | The outbound call data does not exist.                                |
| 3   | 020003<br>4  | The substatus does not match the business result.                     |
| 4   | 020000<br>01 | Empty parameter.                                                      |
| 5   | 020000<br>02 | The parameter contains invalid characters.                            |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 6   | 02000003   | The parameter length cannot exceed the maximum length.                     |
| 7   | 02000004   | The parameter length cannot be less than the minimum length.               |
| 8   | 02000005   | The parameter length must be within the specified range.                   |
| 9   | 02000006   | Incorrect parameter type.                                                  |
| 10  | 02000007   | Incorrect parameter value.                                                 |
| 11  | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 12  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 13  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 14  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

```
{
 "userName": "WANGWU",
 "serverInfo": {
 "ip": "5.9.11.11",
 "port": "22",
 "filePath": "/home/sftp"
 },
 "serverPwd": "*****"
}
```

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "success",
 "returnDesc": "success"
}
```

## 7.8.4 Querying a File Server

### Scenario

This interface is invoked to query a file server. It can be used before importing an outbound call data file from the server.

## Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.
- Precautions
  - After a request is received, the server needs to return a 200 response. Other responses indicate that the writeback fails.

## Method

This interface supports only the POST method.

## URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/file/queryServer`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-315** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-316** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-317** Request body parameters

| No. | Parameter | Type             | Man<br>dato<br>ry or<br>Not | Description                                                                                                                                                                                  |
|-----|-----------|------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | offset    | Integer          | Yes                         | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1)<br><b>page</b> indicates the start page to be queried. |
| 2   | limit     | Integer          | Yes                         | Number of query records on each page. The value ranges from 1 to 100.                                                                                                                        |
| 3   | serverIds | List<br><String> | No                          | File server IDs.                                                                                                                                                                             |

## Response Description

**Table 7-318** Response body parameters

| No. | Parameter  | Type          | Description                                                                                                                               |
|-----|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String        | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-300</a> . |
| 2   | resultDesc | String        | Description.                                                                                                                              |
| 3   | server     | List <Server> | File server.                                                                                                                              |
| 4   | count      | Integer       | Total number of files.                                                                                                                    |
| 5   | returnCode | String        | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-319</a> . |
| 6   | returnDesc | String        | Description.                                                                                                                              |

Server

| No. | Parameter | Type   | Description               |
|-----|-----------|--------|---------------------------|

## 7.9 Outbound Call External Result Definition Interfaces

### 7.9.1 Querying OBS Outbound Call Result Codes

#### Scenario

This interface is invoked to query result codes of the outbound server (OBS). It can be used to set outbound call result codes.

#### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

#### Method

This interface supports only the GET method.

#### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/queryOBSResultCode?pageSize={pageSize}&pageNum={pageNum}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-320** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                             |
|-----|-----------|---------|------------------|-------------------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999.              |
| 2   | pageNum   | Integer | Yes              | Page number.<br>The value is greater than 0.                            |
| 3   | pageSize  | Integer | Yes              | Number of query records on each page.<br>The value ranges from 1 to 50. |

## Request Description

**Table 7-321** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 7-322** Response body parameters

| No. | Parameter  | Type    | Description                                                                                                                               |
|-----|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-324</a> . |
| 2   | resultDesc | String  | Description.                                                                                                                              |
| 3   | totalCount | Integer | Total number of result codes of the OBS.                                                                                                  |
| 4   | obsCodes   | List    | Outbound call result code set.                                                                                                            |
| 5   | returnCode | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-324</a> . |
| 6   | returnDesc | String  | Description.                                                                                                                              |

**Table 7-323** obsCodes

| No. | Parameter   | Type   | Description                                      |
|-----|-------------|--------|--------------------------------------------------|
| 1   | obsCodeDesc | String | Description of an OBS outbound call result code. |
| 2   | obsCode     | String | OBS outbound call result code.                   |

## Error Codes

**Table 7-324** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>01 | Empty parameter.                                                           |
| 3   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 6   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 7   | 020000<br>06 | Incorrect parameter type.                                                  |
| 8   | 020000<br>07 | Incorrect parameter value.                                                 |
| 9   | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 10  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 11  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the response body of this interface:

```
{
 "obsCodes": [
 {
 "obsCodeDesc": "The switch is busy.",
 "obsCode": "00605"
 },
 {
 "obsCodeDesc": "The call is rejected.",
 "obsCode": "00604"
 },
 {
 "obsCodeDesc": "The called party does not answer the call.",
 "obsCode": "00603"
 },
 {
 "obsCodeDesc": "No resource available on the ACD.",
 "obsCode": "00602"
 },
 {
 "obsCodeDesc": "The ACD times out.",
 "obsCode": "00606"
 }
],
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "query queryOBSResultCode Success!",
 "totalCount": 120,
 "returnDesc": "query queryOBSResultCode Success!"
}
```

## 7.9.2 Creating an External Result

### Scenario

This interface is invoked to create an external result. It is provided for the retry policy interface to create non-retry policies.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

### Method

This interface supports only the POST method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/createObResult`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-325** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-326** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-327** Request body parameters

| No. | Parameter     | Type          | Mandatory or Not | Description                                                                                                            |
|-----|---------------|---------------|------------------|------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode    | String        | No               | Result definition code. The value can contain fewer than eight characters.                                             |
| 2   | displayResult | String        | Yes              | External result code.                                                                                                  |
| 3   | obsCodes      | List <String> | Yes              | Result code definition list. The list can be obtained using the interface for querying OBS outbound call result codes. |

## Response Description

**Table 7-328** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-329</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | defId      | String | ID of the created external result.                                                                                                        |
| 4   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-329</a> . |
| 5   | returnDesc | String | Description.                                                                                                                              |

## Error Codes

**Table 7-329** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>01 | Empty parameter.                                                      |
| 3   | 020000<br>02 | The parameter contains invalid characters.                            |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |
| 6   | 020000<br>05 | The parameter length must be within the specified range.              |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 7   | 02000006   | Incorrect parameter type.                                                  |
| 8   | 02000007   | Incorrect parameter value.                                                 |
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:  

```
{"resultCode":"007", "displayResult":"7: The call is not answered.", "obsCodes":["00602","00606"]}
```
- The following provides an example of the response body of this interface:  

```
{
 "defId": "1645244637",
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "createObResult Success!",

## 7.9.3 Modifying an External Result

### Scenario

This interface is invoked to modify an external result. It is provided for the retry policy interface to create non-retry policies.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

### Method

This interface supports only the POST method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/updateObResult>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-330** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-331** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-332** Request body parameters

| No. | Parameter     | Type          | Mandatory or Not | Description                                                                                                            |
|-----|---------------|---------------|------------------|------------------------------------------------------------------------------------------------------------------------|
| 1   | obsCodes      | List <String> | Yes              | Result code definition list. The list can be obtained using the interface for querying OBS outbound call result codes. |
| 2   | displayResult | String        | Yes              | External result code.                                                                                                  |
| 3   | defId         | String        | Yes              | External result ID.                                                                                                    |

## Response Description

**Table 7-333** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-334</a> . |
| 2   | resultDesc | String | Description.                                                                                                                              |
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-334</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

## Error Codes

**Table 7-334** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>01 | Empty parameter.                                                      |
| 3   | 020000<br>02 | The parameter contains invalid characters.                            |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |
| 6   | 020000<br>05 | The parameter length must be within the specified range.              |
| 7   | 020000<br>06 | Incorrect parameter type.                                             |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 8   | 02000007   | Incorrect parameter value.                                                 |
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:  

```
{"defId":"1645244637", "displayResult":"8: The call is not answered.", "obsCodes":["00605","00604"]}
```
- The following provides an example of the response body of this interface:  

```
{
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "updateObsResult Success!",
 "returnDesc": "updateObsResult Success!"
}
```

## 7.9.4 Deleting an External Result

### Scenario

This interface is invoked to delete an external result. It is provided for the retry policy interface to create non-retry policies.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

### Method

This interface supports only the DELETE method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{defId}/deleteObsResult>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-335** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | defId     | String  | Yes              | External result ID to be deleted.                          |

## Request Description

**Table 7-336** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 7-337** Response body parameters

| No. | Parameter  | Type   | Description                                                                                                                                  |
|-----|------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-338</a> . |
| 2   | resultDesc | String | Description.                                                                                                                                 |

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-338</a> . |
| 4   | returnDesc | String | Description.                                                                                                                              |

## Error Codes

**Table 7-338** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>01 | Empty parameter.                                                           |
| 3   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 6   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 7   | 020000<br>06 | Incorrect parameter type.                                                  |
| 8   | 020000<br>07 | Incorrect parameter value.                                                 |
| 9   | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 10  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 11  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "resultCode": "0200000",
 "resultDesc": "delete ObResult success",
 "returnDesc": "delete ObResult success"
}
```

## 7.9.5 Querying the External Result List

### Scenario

This interface is invoked to query external results. It is provided for the retry policy interface to create non-retry policies.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

### Method

This interface supports only the GET method.

### URI

`https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/queryOBSResults?pageSize={pageSize}&pageNum={pageNum}`

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-339** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                 |
|-----|-----------|---------|------------------|-------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999.  |
| 2   | pageSize  | Integer | Yes              | Number of records on a page. The value ranges from 1 to 50. |

| No. | Parameter | Type    | Mandatory or Not | Description                               |
|-----|-----------|---------|------------------|-------------------------------------------|
| 3   | pageNum   | Integer | Yes              | Page number. The value is greater than 0. |

## Request Description

**Table 7-340** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 7-341** Response body parameters

| No. | Parameter  | Type    | Description                                                                                                                               |
|-----|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String  | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-343</a> . |
| 2   | resultDesc | String  | Description.                                                                                                                              |
| 3   | totalCount | Integer | Total number of external results.                                                                                                         |
| 4   | data       | List    | List of external results.                                                                                                                 |

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-343</a> . |
| 6   | returnDesc | String | Description.                                                                                                                              |

**Table 7-342** data

| No. | Parameter     | Type   | Description           |
|-----|---------------|--------|-----------------------|
| 1   | displayResult | String | External result.      |
| 2   | resultCode    | String | External result code. |
| 3   | defld         | String | External result ID.   |

## Error Codes

**Table 7-343** Error code description

| No. | Error Code   | Description                                                           |
|-----|--------------|-----------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> . |
| 2   | 020000<br>01 | Empty parameter.                                                      |
| 3   | 020000<br>02 | The parameter contains invalid characters.                            |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.          |
| 6   | 020000<br>05 | The parameter length must be within the specified range.              |
| 7   | 020000<br>06 | Incorrect parameter type.                                             |
| 8   | 020000<br>07 | Incorrect parameter value.                                            |

| No. | Error Code | Description                                                                |
|-----|------------|----------------------------------------------------------------------------|
| 9   | 02000008   | Parameter conversion error. Check the request parameters.                  |
| 10  | 02000009   | Incorrect parameter combination. Check the request parameters.             |
| 11  | 02000010   | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 02000011   | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "data": [
 {
 "displayResult": "6: The call is not answered.",
 "resultCode": "002",
 "defId": "12345"
 }
],
 "resultCode": "0200000",
 "resultDesc": "query outboundResult success",
 "totalCount": 1,
 "returnDesc": "query outboundResult success"
}
```

## 7.9.6 Querying a Single External Result

### Scenario

This interface is invoked to query a single outbound call external result. It is provided for the retry policy interface to create non-retry policies.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

### Method

This interface supports only the GET method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/{defId}/queryObsResultDetail>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-344** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |
| 2   | defId     | Integer | Yes              | External result ID to be queried.                          |

## Request Description

**Table 7-345** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 7-346** Response body parameters

| No. | Parameter  | Type        | Description                                                                                                                                  |
|-----|------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String      | Error code. The value <b>0200000</b> indicates success, and other values indicate failure.<br>For details, see <a href="#">Table 7-349</a> . |
| 2   | resultDesc | String      | Description.                                                                                                                                 |
| 3   | obResult   | JSON object | External result data.                                                                                                                        |

| No. | Parameter  | Type   | Description                                                                                                                               |
|-----|------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | returnCode | String | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-349</a> . |
| 5   | returnDesc | String | Description.                                                                                                                              |

**Table 7-347** obResult

| No. | Parameter     | Type               | Description                                               |
|-----|---------------|--------------------|-----------------------------------------------------------|
| 1   | defId         | String             | External result ID.                                       |
| 2   | displayResult | String             | External result.                                          |
| 3   | vdnId         | Integer            | vdnId                                                     |
| 4   | resultCode    | String             | External result code.                                     |
| 5   | resultMapList | List <JSON object> | OBS result code corresponding to an external result code. |

**Table 7-348** resultMapList

| No. | Parameter | Type    | Description                                                        |
|-----|-----------|---------|--------------------------------------------------------------------|
| 1   | mapId     | String  | ID of the mapping between the external result and OBS result code. |
| 2   | defId     | String  | External result ID.                                                |
| 3   | failCode  | String  | OBS result code.                                                   |
| 4   | vdnId     | Integer | vdnId                                                              |

## Error Codes

**Table 7-349** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>01 | Empty parameter.                                                           |
| 3   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 6   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 7   | 020000<br>06 | Incorrect parameter type.                                                  |
| 8   | 020000<br>07 | Incorrect parameter value.                                                 |
| 9   | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 10  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 11  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the response body of this interface:

```
{
 "returnCode": "0200000",
 "obResult": {
 "defId": "1402245659",
 "displayResult": "6: The call is not answered.",
 "vdnId": 40,
 "resultCode": "002",
 "resultMapList": [
 {
 "mapId": "1059886898",
 "defId": "1402245659",
 "failCode": "34609",

```

```
 "vdnId": "40"
 },
 {
 "mapId": "1162133679",
 "defId": "1402245659",
 "failCode": "00008",
 "vdnId": "40"
 }
]
},
"resultCode": "0200000",
"resultDesc": "queryObsResultDetail success",
"returnDesc": "queryObsResultDetail success"
}
```

## 7.10 Querying Interface Invocation Records

### Scenario

This interface is invoked to query third-party interface invocation details and provided for the scenario where interface invocation records need to be queried.

### Usage Description

- Prerequisites
  - The corresponding AK/SK authentication permission is available.
  - You have applied for a developer account.

### Method

This interface supports only the POST method.

### URI

<https://ip:port/rest/isales/v1/openapi/campaigns/{vdnId}/calllogs>

In the URL, *ip* indicates the IP address of the CC-iSales server, and *port* indicates the HTTPS port number of the CC-iSales server.

**Table 7-350** Parameters in the URL

| No. | Parameter | Type    | Mandatory or Not | Description                                                |
|-----|-----------|---------|------------------|------------------------------------------------------------|
| 1   | vdnId     | Integer | Yes              | VDN ID.<br>The value is an integer ranging from 1 to 9999. |

## Request Description

**Table 7-351** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                            |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes              | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 7-352** Request body parameters

| No. | Parameter | Type    | Mandatory or Not | Description                                                                                                                                                                                  |
|-----|-----------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | offset    | Integer | Yes              | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1)<br><b>page</b> indicates the start page to be queried. |
| 2   | limit     | Integer | Yes              | Number of query records on each page. The value ranges from 1 to 100.                                                                                                                        |
| 3   | url       | String  | No               | Invocation URL.<br>If this parameter is set, the URL invocation records are queried.<br>If this parameter is left empty, all interface invocation records are queried.                       |
| 4   | beginTime | String  | Yes              | Start time.<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .                                                                                                                                    |
| 5   | endTime   | String  | Yes              | End time.<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .<br>The interval between the start time and end time cannot exceed seven days.                                                        |

## Response Description

**Table 7-353** Response body parameters

| No. | Parameter  | Type       | Description                                                                                                                                      |
|-----|------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see error code description in "Table 6." |
| 2   | resultDesc | String     | Description.                                                                                                                                     |
| 3   | result     | OpenapiLog | Scenario type list.                                                                                                                              |
| 4   | returnCode | String     | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-355</a> .        |
| 5   | returnDesc | String     | Description.                                                                                                                                     |

**Table 7-354** OpenapiLog

| No. | Parameter  | Type     | Description                                                                                                                               |
|-----|------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | id         | String   | Log ID.                                                                                                                                   |
| 2   | operTime   | Datetime | Log time.                                                                                                                                 |
| 3   | url        | String   | Invocation URL.                                                                                                                           |
| 4   | request    | Object   | Input parameter.                                                                                                                          |
| 5   | resultCode | String   | Error code. The value <b>0200000</b> indicates success, and other values indicate failure. For details, see <a href="#">Table 7-355</a> . |
| 6   | resultDesc | String   | Description.                                                                                                                              |
| 7   | httpStatus | Integer  | Interface invocation status code.                                                                                                         |
| 8   | type       | String   | Request type.                                                                                                                             |

## Error Codes

**Table 7-355** Error code description

| No. | Error Code   | Description                                                                |
|-----|--------------|----------------------------------------------------------------------------|
| 1   | 020000<br>1  | Parameter error. For details about the error, see <b>resultDesc</b> .      |
| 2   | 020000<br>01 | Empty parameter.                                                           |
| 3   | 020000<br>02 | The parameter contains invalid characters.                                 |
| 4   | 020000<br>03 | The parameter length cannot exceed the maximum length.                     |
| 5   | 020000<br>04 | The parameter length cannot be less than the minimum length.               |
| 6   | 020000<br>05 | The parameter length must be within the specified range.                   |
| 7   | 020000<br>06 | Incorrect parameter type.                                                  |
| 8   | 020000<br>07 | Incorrect parameter value.                                                 |
| 9   | 020000<br>08 | Parameter conversion error. Check the request parameters.                  |
| 10  | 020000<br>09 | Incorrect parameter combination. Check the request parameters.             |
| 11  | 020000<br>10 | The <b>hour</b> and <b>minute</b> parameters must be set at the same time. |
| 12  | 020000<br>11 | The number of parameters cannot exceed the specified number.               |

## Example

- The following provides an example of the request body of this interface:

## 8.1 Creating Answers (createScriptAnswer)

### Scenario

This interface is invoked to create answers for a survey.

### Method

POST

### URI

<https://Domain name/apiaccess/v1/scriptAnswer/createScriptAnswer> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 8-1** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                             |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after <b>Bearer</b> .) |
| 2   | x-app-key     | String | Yes              | App key, which is the user ID. Contact operations personnel to obtain the app key.                                                                                                      |

**Table 8-2** Request body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                |
|-----|------------|--------|------------------|------------------------------------------------------------------------------------------------------------|
| 1   | moduleId   | String | Yes              | Module ID.<br>Manual outbound call: 80031<br>Automatic outbound call: 80081<br>Intelligent training: 80083 |
| 2   | result     | String | Yes              | Operation performed on answers.<br><b>save</b> : Save (create) answers.<br><b>submit</b> : Submit answers. |
| 3   | surveyId   | String | Yes              | Survey ID.                                                                                                 |
| 4   | custId     | String | No               | User ID.                                                                                                   |
| 5   | serviceId1 | String | No               | Task ID corresponding to the survey.                                                                       |

## Response Description

- **Status code: 200**

**Table 8-3** Response body parameters

| No. | Parameter      | Type   | Mandat<br>ory or<br>Not | Description                                           |
|-----|----------------|--------|-------------------------|-------------------------------------------------------|
| 1   | resultCode     | String | Yes                     | Return code.                                          |
| 2   | resultDesc     | String | Yes                     | Description of the message returned by the interface. |
| 3   | surveyAnswerId | String | Yes                     | Answer ID.                                            |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**  
Authentication fails.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

- None

## Example

Request header:

```
{
 "x-app-key": "*****",
 "Authorization": "Bearer *****"
}
```

Request parameters:

```
{
 "moduleId": "80031",
 "result": "save",
 "surveyId": "987654321",
 "custId": "123456789",
 "serviceId1": "987654321"
}
```

Response parameters:

```
{
 "resultCode": "1203000",
```

```
"surveyAnswerId": "123456789",
"resultDesc": "Opration Successful."
}
```

## 8.2 Obtaining the Next Question (getNextQuestionInfo)

### Scenario

This interface is invoked to obtain the content of the next question in a survey.

### Method

POST

### URI

<https://Domain name/apiaccess/v1/scriptAnswer/getNextQuestionInfo>, for example, [service.besclouds.com](https://service.besclouds.com).

### Request Description

Table 8-4 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                |
|-----|---------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Authorization | String | Yes              | Authentication field. The format is <i>Bearer +AccessToken</i> returned by the <i>tokenByAKSK</i> interface. (A space is required next to <b>Bearer</b> .) |
| 2   | x-app-key     | String | Yes              | App key field, which is the user ID. Contact the operation personnel to obtain the app key.                                                                |

Table 8-5 Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description |
|-----|-----------|--------|------------------|-------------|
| 1   | surveyId  | String | Yes              | Survey ID.  |

| No. | Parameter        | Type         | Mandatory or Not | Description                                                                                                                                                                                                    |
|-----|------------------|--------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | questionId       | String       | No               | Current question ID. For example, to obtain the second question, set this parameter to the first question ID. To obtain the first question, do not transfer this parameter or transfer an empty string.        |
| 3   | isAnswered       | boolean      | Yes              | Whether the question is mandatory. The value is fixed to <b>true</b> .                                                                                                                                         |
| 4   | questionType     | String       | No               | Question type.<br><b>essay</b> : short-answer question<br><b>single</b> : single-answer question<br><b>multi</b> : multiple-answer question<br><b>voice</b> : voice<br><b>voiceOperation</b> : voice+operation |
| 5   | answerOptionList | List<String> | No               | List of answer option IDs, for example, ["optionId1"].                                                                                                                                                         |

## Response Description

- **Status code: 200**

**Table 8-6** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                           |
|-----|------------|--------|------------------|-------------------------------------------------------|
| 1   | resultCode | String | Yes              | Return code.                                          |
| 2   | resultDesc | String | Yes              | Description of the message returned by the interface. |
| 3   | questionId | String | Yes              | Question ID.                                          |

| No. | Parameter    | Type           | Mandatory or Not | Description                                                                                                                                                                                                    |
|-----|--------------|----------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | answerNo     | Integer        | Yes              | Question No.                                                                                                                                                                                                   |
| 5   | optionIdList | Array[Object ] | Yes              | Question option. This parameter has a value when the question type is a multiple choice question.                                                                                                              |
| 6   | questionType | String         | Yes              | Question type.<br><b>single</b> : single-answer question<br><b>multi</b> : multiple-answer question<br><b>essay</b> : short-answer question<br><b>voice</b> : voice<br><b>voiceOperation</b> : voice+operation |
| 7   | content      | String         | Yes              | Question content.                                                                                                                                                                                              |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**  
Authentication fails.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

- None

## Example

Request header:

```
{
 "x-app-key": *****
 "Authorization": Bearer *****
}
```

Request parameters:

```
{
 "surveyId": "987654321",
 "questionId": "123456789",
 "isAnswered": true
}
```

Response parameters:

```
{
 "score": 70,
 "oprRule": {},
 "questionId": "123456789",
 "answerNo": 1,
 "resultCode": "1203000",
 "optionIdList": [],
 "resultDesc": "Opration Successful.",
 "questionType": "voice",
 "content": "Why cannot I recharge part of the call fee through WeChat?"
}
```

## 8.3 Creating Answers to Questions (createQuestionAnswer)

### Scenario

This interface is invoked to create an answer data record.

### Method

POST

### URI

<https://Domain name/apiaccess/v1/scriptAnswer/createQuestionAnswer>, for example, service.besclouds.com.

### Request Description

Table 8-7 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                |
|-----|---------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | Authentication field. The format is <i>Bearer +AccessToken</i> returned by the <i>tokenByAKSK</i> interface. (A space is required next to <b>Bearer.</b> ) |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                 |
|-----|-----------|--------|------------------|---------------------------------------------------------------------------------------------|
| 3   | x-app-key | String | Yes              | App key field, which is the user ID. Contact the operation personnel to obtain the app key. |

**Table 8-8** Request body parameters

| No. | Parameter      | Type           | Mandatory or Not | Description      |
|-----|----------------|----------------|------------------|------------------|
| 1   | questionId     | String         | Yes              | Question ID.     |
| 2   | surveyAnswerId | String         | Yes              | Answer ID.       |
| 3   | surveyId       | String         | Yes              | Survey ID.       |
| 4   | answerText     | String         | No               | Answer content.  |
| 5   | voiceScore     | DECIMAL (11,2) | No               | Voice score.     |
| 6   | operScore      | DECIMAL (11,2) | No               | Operation score. |
| 7   | optionId       | String         | No               | Option ID.       |

## Response Description

- **Status code: 200**

**Table 8-9** Response body parameters

| No. | Parameter        | Type   | Mandatory or Not | Description                                           |
|-----|------------------|--------|------------------|-------------------------------------------------------|
| 1   | resultCode       | String | Yes              | Return code.                                          |
| 2   | resultDesc       | String | Yes              | Description of the message returned by the interface. |
| 2   | questionAnswerId | String | Yes              | ID of an answer to a question.                        |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.

- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**  
Authentication fails.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

- None

## Example

Request header:

```
{
 "x-app-key": "*****",
 "Authorization": "Bearer *****"
}
```

Request parameters:

```
{
 "surveyId": "123456789",
 "questionId": "987654321",
 "answerNo": 1,
 "surveyAnswerId": "123456666"
}
```

Response parameters:

```
{
 "resultCode": "1203000",
 "questionAnswerId": "123456789",
 "resultDesc": "Opration Successful."
}
```

## 8.4 Updating Answers to Questions (updateQuestionAnswer)

### Scenario

This Interface is invoked to update answers to questions.

### Method

POST

### URI

<https://Domain name/apiaccess/v1/scriptAnswer/updateQuestionAnswer>, for example, service.besclouds.com.

## Request Description

**Table 8-10** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                         |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | Authentication field. The format is <i>Bearer +AccessToken returned by the tokenByAKSK interface.</i> (A space is required next to <b>Bearer.</b> ) |
| 3   | x-app-key     | String | Yes              | App key field, which is the user ID. Contact the operation personnel to obtain the app key.                                                         |

**Table 8-11** Request body parameters

| No. | Parameter        | Type           | Mandatory or Not | Description                               |
|-----|------------------|----------------|------------------|-------------------------------------------|
| 1   | questionAnswerId | String         | Yes              | ID of an answer to a question.            |
| 2   | answerText       | String         | No               | Answer content.                           |
| 3   | voiceScore       | DECIMAL (11,2) | No               | Voice score.                              |
| 4   | operScore        | DECIMAL (11,2) | No               | Operation score.                          |
| 5   | costTime         | Integer        | No               | Answer duration to questions, in seconds. |

## Response Description

- **Status code: 200**

**Table 8-12** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                           |
|-----|------------|--------|------------------|-------------------------------------------------------|
| 1   | resultCode | String | Yes              | Return code.                                          |
| 2   | resultDesc | String | Yes              | Description of the message returned by the interface. |

- Status code: 400**  
Incorrect request. Check the request path and parameters.
- Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- Status code: 403**  
Authentication fails.
- Status code: 404**  
The requested content is not found. Check the request path.
- Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

- None

## Example

Request header:

```
{
 "x-app-key": "*****",
 "Authorization": "Bearer *****"
}
```

Request parameters:

```
{
 "questionAnswerId": "123456789",
 "answerText": "Hello",
 "voiceScore": 50.00,
 "operScore": 20.52,
 "costTime": 12
}
```

Response parameters:

```
{
 "resultCode": "1203000",
 "resultDesc": "Opration Successful."
}
```

## 8.5 Updating Surveys (updateScriptAnswer)

### Scenario

This interface is invoked to update the answer status and submit answers.

### Method

POST

### URI

<https://Domain name/apiaccess/v1/scriptAnswer/updateScriptAnswer>, for example, [service.besclouds.com](https://service.besclouds.com).

### Request Description

**Table 8-13** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                |
|-----|---------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes              | Authentication field. The format is <i>Bearer +AccessToken</i> returned by the <i>tokenByAKSK</i> interface. (A space is required next to <b>Bearer</b> .) |
| 3   | x-app-key     | String | Yes              | App key field, which is the user ID. Contact the operation personnel to obtain the app key.                                                                |

**Table 8-14** Request body parameters

| No. | Parameter      | Type   | Mandatory or Not | Description |
|-----|----------------|--------|------------------|-------------|
| 1   | surveyAnswerId | String | Yes              | Answer ID.  |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                              |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------|
| 2   | result    | String | Yes              | Operation performed on answers.<br><b>save:</b> Save (create) answers.<br><b>submit:</b> Submit answers. |

## Response Description

- **Status code: 200**

**Table 8-15** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                           |
|-----|------------|--------|------------------|-------------------------------------------------------|
| 1   | resultCode | String | Yes              | Return code.                                          |
| 2   | resultDesc | String | Yes              | Description of the message returned by the interface. |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**  
Authentication fails.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

- None

## Example

Request header:

```
{
 "x-app-key": *****
}
```

```
"Authorization": Bearer *****
}
```

Request parameters:

```
{
 "surveyAnswerId": "123456789",
 "result": "submit"
}
```

Response parameters:

```
{
 "resultCode": "1203000",
 "resultDesc": "Opration Successful."
}
```

## 8.6 Updating Ratings (updateScore)

### Scenario

This interface is invoked to update the operation score of the questionnaire module by the UEBA.

### Method

This interface supports only the POST method.

### URI

[https://domain\\_name/apiaccess/ngcrmpfcore\\_js/csf/exam/sorcresult](https://domain_name/apiaccess/ngcrmpfcore_js/csf/exam/sorcresult), for example, **service.besclouds.com**.

### Request Description

**Table 8-16** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                          |
|-----|---------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes              | The value is fixed at <b>application/json</b> .                                                                                                      |
| 2   | Authorization | String | Yes              | Authentication field. The format is <i>Bearer +AccessToken returned by the tokenByAKSK interface</i> . (A space is required next to <b>Bearer</b> .) |

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                 |
|-----|------------|--------|------------------|---------------------------------------------------------------------------------------------|
| 3   | x-app-key  | String | Yes              | App key field, which is the user ID. Contact the operation personnel to obtain the app key. |
| 4   | quotiety   | String | No               | Weight of the operation score.<br>A positive integer less than 100.                         |
| 5   | totalScore | String | No               | Total score of the questionnaire module.                                                    |

**Table 8-17** Request body parameters

| No.   | Parameter | Type         | Mandatory or Not | Description                                                                                                                           |
|-------|-----------|--------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------|

| 1.1   | exam_id   | String (32)  | Yes              | Unique exam ID.                                                                                                                       |
| 1.2   | param     | object       | Yes              | -                                                                                                                                     |
| 1.2.1 | code      | String (16)  | Yes              | Result codes of the UEBA interface for ending an exam.<br>The value <b>0</b> indicates success, and other values indicate exceptions. |
| 1.2.2 | msg       | String (256) | No               | Description of the processing result of the UEBA interface for ending an exam.                                                        |

| No.   | Parameter | Type       | Mandatory or Not | Description                                                                                                                                                                                                                           |
|-------|-----------|------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2.3 | result    | String (8) | Yes              | This parameter is used to calculate the score. A maximum of eight digits before the decimal point, and two decimal places are allowed.<br><br>Score = Weight of the operation score x Question score/100 x UEBA score (100-point)/100 |

## Response Description

- **Status code: 200**

**Table 8-18** Response body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                              |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1   | rtnCode   | String | Yes              | Return code. The value <b>0</b> indicates that the interface is invoked successfully, and other values indicate failure. |
| 2   | rtnMsg    | String | Yes              | Description of the message returned by the interface.                                                                    |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**  
Authentication fails.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

- None

## Example

Request header:

```
{
 "Content-Type": application/json
 "x-app-key": *****
 "Authorization": Bearer *****
 "totalScore": 90
 "quotiety": 80
}
```

Request parameters:

```
{
 "params": {
 "exam_id": "1247589060755793923",
 "param": {
 "code": "0",
 "result": "100.0",
 "msg": "Processing succeeded"
 }
 }
}
```

Response parameters:

```
{
 "rtnMsg": "query success!",
 "rtnCode": "0"
}
```

# 9 iKBS Interface Reference

---

[9.1 Authentication](#)

[9.2 Interface Description](#)

## 9.1 Authentication

### 9.1.1 SIA Authentication

SIA authentication is to call the SIA interface to obtain a token and add the token to the message header when the CC-iKBS interface is requested for identity authentication.

#### Scenario

When this interface is invoked, the authentication token and token expiration time are generated based on the JWT and domain in request parameters. The token must be carried when the CC-iKBS interface is invoked to pass the identity authentication.

#### Usage Description

- Prerequisites
  - SIA information has been configured in the developer environment.

**In `servicecloud.base.properties`:**

```
restapi.sia.tokenDeliveryServer=
restapi.sia.serviceName=
```

**In `servicecloud.security.properties`:**

```
restapi.sia.encJwtContent=
restapi.sia.encKey4JwtContent=
```

#### Method

POST

## URI

**Table 9-1** URI description

|                    |                                            |                                                                                       |
|--------------------|--------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Request URI</b> | https://ip:port/rest/sia/v1/tokens/jwt/sia | In the URL, <i>ip</i> and <i>port</i> indicate the access address of the SIA service. |
|--------------------|--------------------------------------------|---------------------------------------------------------------------------------------|

## Request Description

**Table 9-2** Parameters in request headers

| No. | Parameter    | Type   | Mandatory or Not | Default Value | Description                                                    |
|-----|--------------|--------|------------------|---------------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes              | None          | The value is fixed to <b>application/json; charset=UTF-8</b> . |

**Table 9-3** Parameters in the request body

| No. | Parameter | Type   | Mandatory or Not | Description                                                      |
|-----|-----------|--------|------------------|------------------------------------------------------------------|
| 1   | jwt       | String | Yes              | JWT password. Contact O&M personnel to obtain the password.      |
| 2   | domain    | String | Yes              | SIA service name. Contact the O&M personnel to obtain the value. |

## Response Description

**Table 9-4** Parameters in a response message

| No. | Parameter | Type   | Description           |
|-----|-----------|--------|-----------------------|
| 1   | token     | String | Authentication token. |
| 2   | expiredAt | String | Expiration time.      |

## Example

- Request  
POST https://ip:port/rest/sia/v1/tokens/jwt/sia  
Content-Type: application/json;charset=UTF-8  
{  
 "jwt": "\*\*\*\*\*",  
 "domain": "ccfsAppService"  
}
- Response  
{"token": "\*\*\*\*\*",  
 "expiredAt": "2021-03-04T03:25:57.327+0000"}

## 9.1.2 Authentication Mode of Knowledge Base Interfaces

### Obtaining an AK/SK

#### AK/SK Authentication

In AK/SK-based authentication, an AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: ID of the access key. It is a unique identifier that is associated with a secret access key. The AK and SK are used together to sign requests cryptographically.
- SK: secret access key that works with an AK to obtain an encrypted signature for a request, identify the sender, and prevent the request from being modified.

In AK/SK-based authentication, you can use an AK/SK to sign requests based on the signature algorithm.

#### Obtaining the Private AK/SK

- Integrated environment: Contact operations personnel to obtain it.

#### NOTE

If the interface authentication is successful, the HTTP response code 200 is returned. If the authentication fails, the HTTP response code 401 is returned.

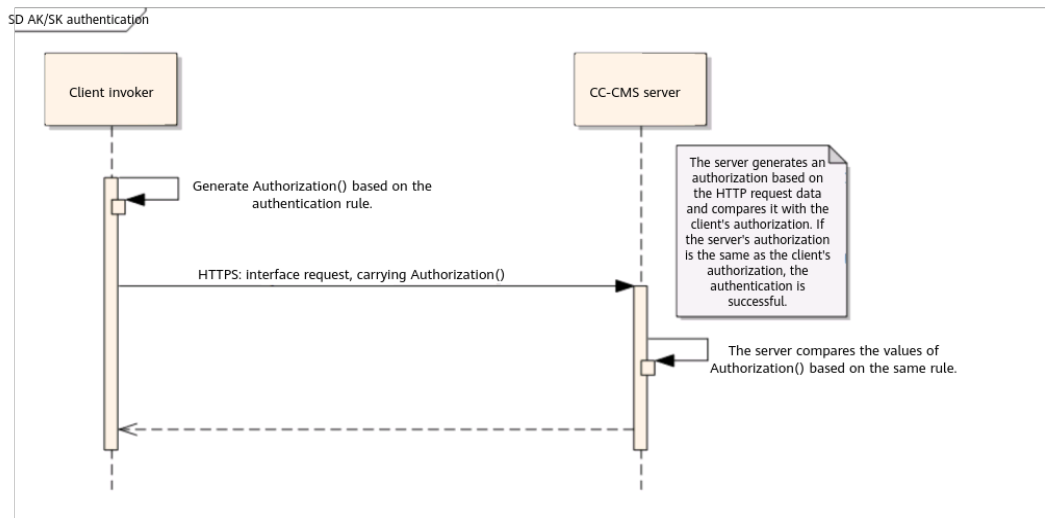

## Authentication Algorithm

### NOTICE

Assume that the CC-CMS interface is used as an example to describe the authentication algorithm. The authentication algorithms of the CC-iKBS, CC-FS, and CC-iSales are similar.

All interface servers authenticate the signature of the request data sent from the client. The authentication process is as follows.

The following is the rule for the invoker to generate **Authorization**.

### CanonicalRequest

```
$HttpMethod + "\n" +
$HttpURI + "\n" +
$HttpParameters + "\n" +
SignedHeaders($HttpHeaders) + "\n" +
CanonicalHeaders($HttpHeaders) + "\n" +
Normalize($HttpBody)
```

### SignedHeaders

Records are sorted by dictionary.

```
lowerCase($HeadName)+";"
lowerCase($HeadName)+";"
.....
lowerCase($HeadName)
```

### CanonicalHeaders

Records are sorted by dictionary.

```
Normalize (lowerCase($HeadName)+";"+Normalize($HeadValue)+"\n"
Normalize (lowerCase($HeadName)+";"+Normalize($HeadValue)+"\n"
.....
Normalize (lowerCase($HeadName)+";"+Normalize($HeadValue)
```

### Signature

```
SigningKey=Sha256Hex($SecreKey, "auth-v2/$AccessKey/$Timestamp/$SignedHeaders")
Signature=Sha256Hex($SigningKey, $CanonicalRequest)
```

***Authorization:auth-v2/\$AccessKey/\$Timestamp/\$SignedHeaders/\$Signature***

Algorithm and Rule of Each Content Segment

- **SignInfo**

 **NOTE**

This class contains some fixed **HEAD** definitions and some basic functions used to construct **CanonicalRequest** and **Signature**.

}
}
```

- **SignedHeaders**

 **NOTE**

The invoker can selectively encode the header part in an HTTP request. The only requirement is that the **Host** field must be encoded. However, the head whose **headname** is **Authorization** cannot be involved in the encoding calculation because **Authorization** is the final authentication head field.

Note: The value of **Host** is the value of *ip:port* in the HTTPS URL of the corresponding service.

In most cases, you are advised to encode the following headers:

```
Host="10.22.26.181:28080"
Content-Length="22"
Content-Type="application/json;charset=UTF-8"
```

- Content calculation rule:

Traverse the header names in the **HttpHead** involved in encoding.

- i. Invoke the `lowerCase()` function to convert a header name to lowercase letters.
  - ii. Add a separator (;) to the end of the characters converted from the header name. A record is generated. Note that the last field is not appended with semicolons (;).
  - iii. Sort all the preceding records in alphabetical order, and then concatenate the records into a character string in sequence.
- Code implementation:

- i. Construct the map of **signedHeaders**, fill in the required field information, and invoke the `lowerCaseSignedHeaders` function to process characters.

```
//Head field for signature authentication. The host field is mandatory.
Map<String, String> signedHeaders = new HashMap<>();
signedHeaders.put(SignInfo.HEAD_HOST, CmsParameters.host);
signedHeaders.put(SignInfo.HEAD_CONTENT_LENGTH,
String.valueOf(bodyJson.getBytes("UTF-8").length));
signedHeaders.put(SignInfo.HEAD_CONTENT_TYPE, "application/json;charset=UTF-8");

//Set the authentication data interface.
SignInfo signInfo = new SignInfo();
signInfo.setAccessKey(CmsParameters.accessKey);
signInfo.setSecretKey(CmsParameters.secretKey);
signInfo.setPayload(bodyJson);
signInfo.setTimestamp(new Date());
signInfo.setHttpMethod(HttpProxyHelper.HTTP_METHOD_POST);
signInfo.setUri(httpPath);
signInfo.setSignedHeaders(lowerCaseSignedHeaders(signedHeaders));
```

For details about the complete code of the preceding function, see [a](#).

- ii. Function: `lowerCaseSignedHeaders`

```
/**
 * The signedHeaders involved in the calculation are converted.
 * @param
 * @return Map<String, String>
 */
private Map<String, String> lowerCaseSignedHeaders(Map<String, String> signedHeaders)
{
 if ((null == signedHeaders) || signedHeaders.isEmpty())
 {
 throw new IllegalArgumentException("signedHeaders can't be null.");
 }
 Map<String, String> headers = new HashMap<>();
 for (Entry<String, String> e : signedHeaders.entrySet())
 {
 String name = e.getKey();
 String value = e.getValue();
 headers.put(name.toLowerCase(Locale.ENGLISH), value.trim());
 }
 if (!signedHeaders.containsKey(SignInfo.HEAD_HOST))
 {
 throw new IllegalArgumentException("signedHeaders must has host.");
 }
 return headers;
}
```

- Example:

Example: The **HttpHead** involved in encoding are as follows:

```
Host="10.22.26.181:28080"
```

```
Content-Length="22"
```

```
Content-Type="application/json;charset=UTF-8"
```

After the processing based on the preceding rules, the result is as follows:

```
SignedHeaders=content-length;content-type;host
```

- **CanonicalHeaders**

 NOTE

The encoding rule is the same as that of **SignedHeaders**, but head value encoding is added.

- Content calculation rule:  
Traverse the header names in the **HttpHead** involved in encoding.
  - i. Invoke the `toLowerCase()` function to convert a header name to lowercase letters.
  - ii. Invoke the `NormalizePath` function to format the converted lowercase character string.
  - iii. Generate a record character string in the formatted character string `+": "+NormalizePath((Header value).trim())`.
  - iv. Sort the preceding records in alphabetical order.
  - v. Traverse the sorted records and add the character string `\n` to connect them to a long character string.

Note that `\n` is not added to the last record.

HTTP headers involved in encoding are as follows:

```
Host="10.22.26.181:28080"
```

```
Content-Length="22"
```

```
Content-Type="application/json;charset=UTF-8"
```

After the processing based on the preceding rules, **CanonicalHeaders** is as follows:

```
content-length:22\n
```

```
content-type:application%2Fjson%3Bcharset%3DUTF-8\n
```

```
host:10.22.26.181%3A28080
```

- **CanonicalRequest**

- Content calculation rule:  

```
CanonicalRequest = $HttpMethod + "\n" + $HttpURI + "\n" + $HttpParameters + "\n" +
SignedHeaders($HttpHeaders) + "\n" + CanonicalHeaders ($HttpHeaders) + "\n" +
NormalizePath($HttpBody)
```

Parameter description:

  - i. **\$HttpMethod**: GET, PUT, and POST requests defined in the HTTP protocol. The value must be in uppercase. The involved HTTP methods include GET, POST, PUT, DELETE, and HEAD. However, the CC-CMS service supports only POST.
  - ii. **\$HttpURI**: HTTP URI of the interface request. For example, if the complete URL is `https://10.22.26.181:28080/rest/cmsapp/v1/ping`, the HTTP URI is `/rest/cmsapp/v1/ping`. The HTTP URI must start with a slash (/). If the HTTP URI does not start with a slash (/), add it. If the URL is left blank, the value is a slash (/).
  - iii. **\$HttpParameters**: request parameter following the request URI. For example, if the request URI is `https://10.22.26.181:28080/rest/cmsapp/v1/ping?id=123&name=test`, the value of **\$HttpParameters** is `id=123&name=test`. Currently, this parameter does not exist in the CC-CMS interface.
  - iv. **\$HttpBody**: character string submitted to the server through the HTTP body. The character string is a standard JSON string. For details about the fields, see the definition of each interface.
- Code implementation:  
For details, see the `canonicalRequest()` function in [•SignInfo](#).

- **Generating the Character String Authorization**

- Content calculation rule:

- i. Generate **authStringPrefix** and **SigningKey**.

- 1) The rules for generating **authStringPrefix** and **SigningKey** are as follows:

```
authStringPrefix="auth-v2/{accessKey}/{timestamp}/{SignedHeaders}";
SigningKey = sha256Hex(secretKey, authStringPrefix);
```

Note:

**auth-v2**: authentication version number. In the current version, the value is fixed to **auth-v2**.

**accessKey**: authentication ID of the invoker, that is, the AK.

**secretKey**: authentication key of the invoker, that is, the SK.

**timestamp**: UTC time generated by the invoker. The time is in *yyyy-MM-dd'T'HH:mm:ss'Z'* format.

- 2) Code implementation: **authStringPrefix**

The function for generating `authStringPrefix` is implemented in the following functions of the **SignInfo** class:

```
authStringPrefix()
appendSignedHeaders(StringBuilder buffer)
```

- 3) Code implementation: **SigningKey**

For details, see `authString()` in the **SignInfo** class.

```
String signingKey = SignerUtils.sha256Hex(this.getSecretKey(), authStringPrefix);
```

For details about the **sha256Hex()** encryption algorithm, see the following tool class:

```
package com.huawei.client.rest.v2.demo.utils;

import java.io.UnsupportedEncodingException;
import java.security.InvalidKeyException;
import java.security.NoSuchAlgorithmException;

import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;

/**
 * Tool class for the authentication digest algorithm of RESTful interfaces
 */
public class SignerUtils {

 private static final String CHARSET = "UTF-8";
 private static final char[] DIGITS_LOWER = {'0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a',
 'b', 'c', 'd', 'e', 'f'};

 /**
 * Digest algorithm
 * @param key
 * @param toSigned
 * @return String
 * @throws NoSuchAlgorithmException
 * @throws InvalidKeyException
 * @throws UnsupportedEncodingException
 */
 public static String sha256Hex(String key, String toSigned) throws
 NoSuchAlgorithmException, InvalidKeyException, UnsupportedEncodingException {
 Mac mac = Mac.getInstance("HmacSHA256");
 mac.init(new SecretKeySpec(key.getBytes(SignerUtils.CHARSET),
 "HmacSHA256"));
```

```
String digit = new
String(SignerUtils.encodeHex(mac.doFinal(toSigned.getBytes(SignerUtils.CHARSET))
);
return digit;
}

private static char[] encodeHex(final byte[] data) {
final int l = data.length;
final char[] out = new char[l << 1];
for (int i = 0, j = 0; i < l; i++) {
out[j++] = SignerUtils.DIGITS_LOWER[(0xF0 & data[i]) >>> 4];
out[j++] = SignerUtils.DIGITS_LOWER[0x0F & data[i]];
}
return out;
}
}
```

ii. Generate a signature.

1) Signature generation rule:

```
Signature = sha256Hex(SigningKey, CanonicalRequest)
```

2) Code implementation: The encryption function sha256Hex is included.

For details, see the implementation method of sha256Hex() in SigningKey of [c. Code implementation: SigningKey](#).

iii. Authentication character string

1) Rule for generating an authentication string:

```
Authorization:$authStringPrefix/$Signature
```

2) Code implementation: **signedHeaders** is the map constructed in the signedHeaders module.

```
//Generate a signature.
String signature = signInfo.authString();
Map<String, String> httpHeads = new HashMap<>(signedHeaders);
//Append to HTTPHEAD and send it to the server.
httpHeads.put(SignInfo.HEAD_AUTHORIZATION, signature);
```

• Example

a. Commission the first interface:

 NOTE

Authentication is necessary for commissioning an interface.

In this project, the authentication entry is the buildSignHttpHead() function. This function constructs the map of signedHeaders and transfers the map to **SignInfo**.

The authString() function in the **SignInfo** class reveals the main process of constructing the authentication character string and generates the signature.

The key component of the authentication string is the signature. Other information concatenation functions are also included in the **SignInfo** class.

Define **BaseRequest**.

```
package com.huawei.client.rest.v2.demo.base;

@Setter
@Getter
public class BaseRequest
{
private RequestHeader request;

private Object msgBody;

public BaseRequest(Object body)
```

```
{
 this.request = new RequestHeader();
 this.msgBody = body;
}

public BaseRequest(RequestHeader head, Object body)
{
 this.request = head;
 this.msgBody = body;
}

public RequestHeader getRequest()
{
 return this.request;
}

public void setRequest(RequestHeader request)
{
 this.request = request;
}

public Object getMsgBody()
{
 return this.msgBody;
}

public void setMsgBody(Object msgBody)
{
 this.msgBody = msgBody;
}
}
```

**RequestHeader** is as follows:

```
package com.huawei.client.rest.v2.demo.base;

public class RequestHeader
{
 /**
 * Version
 */
 private String version = "2.0";

 public String getVersion()
 {
 return this.version;
 }

 public void setVersion(String version)
 {
 this.version = version;
 }
}
```

Define **BaseResponse**.

```
package com.huawei.client.rest.v2.demo.base;

@Setter
@Getter
public class BaseResponse
{
 final static int SUCCESS = 0;

 private ResponseHead resultHead;

 private Object resultData;
}
```

```
public BaseResponse()
{
}

public BaseResponse(String resultCode, String resultMsg, Object resultData)
{
 this.resultHead = new ResponseHead(resultCode, resultMsg);
 this.resultData = resultData;
}

public BaseResponse(ResponseHead resultHead, Object resultData)
{
 this.resultHead = resultHead;
 this.resultData = resultData;
}
}
```

**ResponseHead** is as follows:

```
package com.huawei.client.rest.v2.demo.base;

public class ResponseHead
{
 private String resultCode;

 /**
 * Response result
 */
 private String resultMsg;

 public ResponseHead()
 {
 }

 public ResponseHead(String resultCode, String resultMsg)
 {
 this.resultCode = resultCode;
 this.resultMsg = resultMsg;
 }

 public String getResultCode()
 {
 return this.resultCode;
 }

 public void setResultCode(String resultCode)
 {
 this.resultCode = resultCode;
 }

 public String getResultMsg()
 {
 return this.resultMsg;
 }

 public void setResultMsg(String resultMsg)
 {
 this.resultMsg = resultMsg;
 }
}
```

For details about the implementation of the `buildSignHttpHead()` function, see **ToolUtils**.

```
package com.huawei.client.rest.v2.demo.utils;

import java.io.BufferedReader;
import java.io.File;
import java.io.FileOutputStream;
```

```
import java.io.FileReader;
import java.io.InputStream;
import java.io.UnsupportedEncodingException;
import java.security.InvalidKeyException;
import java.security.NoSuchAlgorithmException;
import java.text.SimpleDateFormat;
import java.util.ArrayList;
import java.util.Date;
import java.util.HashMap;
import java.util.List;
import java.util.Locale;
import java.util.Map;
import com.alibaba.fastjson.JSONObject;

import com.huawei.client.rest.v2.demo.HttpProxyHelper;
import com.huawei.client.rest.v2.demo.base.BaseRequest;
import com.huawei.client.rest.v2.demo.config.CmsParameters;
import com.huawei.client.rest.v2.demo.sign.SignInfo;

/**
 * Tool class for the authentication digest algorithm of RESTful interfaces
 */
public class ToolUtils {
 /**
 * Convert character strings to files.
 * @param in
 * @param filePath
 * @param fileName
 * @return
 */
 public static boolean saveToFileByStr(InputStream in, String filePath, String fileName){
 boolean flag = true;
 if(in != null){
 try {
 //Restore the character string fileStr in the generated file to a file.

 File file=new File(filePath,fileName);
 FileOutputStream fos=new FileOutputStream(file);
 try{
 byte[] buffer = new byte[1024];
 int reader = 0;
 while ((reader = in.read(buffer)) != -1) {
 fos.write(buffer, 0, reader);
 }
 fos.flush();
 }
 finally {
 fos.close();
 in.close();
 }
 } catch (Exception e) {
 flag = false;
 e.printStackTrace();
 }
 }
 return flag;
 }

 /**
 * Enter the path of the .csv file.
 * Return the address of the original recording file that is read.
 * @param filePath
 * @return
 */
 public static List<String> readFile(String filePath){
 List<String> originalFileList = new ArrayList<String>();
 try {
 BufferedReader reader = new BufferedReader(new FileReader(filePath));
```

```
//The first line is the table header information.
reader.readLine();

String line = null;
while((line=reader.readLine())!=null){
 String item[] = line.split(",");//The CSV file is a comma-separated file.
 originalFileList.add(item[item.length-4]);
}
} catch (Exception e) {
 e.printStackTrace();
}

return originalFileList;
}

/**
 * During actual client development, BaseRequest is directly converted into a JSON string
 * based on the JSON framework.
 * @param request
 * @return String
 * @throws Exception
 */
public static String toJsonString(BaseRequest request) throws Exception
{
 JSONObject jsonObject = new JSONObject();
 StringBuilder buffer = new StringBuilder();
 buffer.append("{}");
 buffer.append("\"request\":");
 buffer.append(jsonObject.toJSONString(request.getRequest()));
 buffer.append(",");
 buffer.append("\"msgBody\":");
 buffer.append(jsonObject.toJSONString(request.getMsgBody()));
 buffer.append("{}");

 return buffer.toString();
}

/**
 * Construct authentication fields.
 * @param httpPath
 * @param bodyJson
 * @return
 * @throws InvalidKeyException
 * @throws NoSuchAlgorithmException
 * @throws UnsupportedEncodingException
 */
public Map<String, String> buildSignHttpHead(String httpPath, String bodyJson)
 throws InvalidKeyException, NoSuchAlgorithmException, UnsupportedEncodingException
{
 //Head field for signature authentication. The host field is mandatory.
 Map<String, String> signedHeaders = new HashMap<>();
 signedHeaders.put(SignInfo.HEAD_HOST, CmsParameters.host);
 signedHeaders.put(SignInfo.HEAD_CONTENT_LENGTH,
String.valueOf(bodyJson.getBytes("UTF-8").length));
 signedHeaders.put(SignInfo.HEAD_CONTENT_TYPE, "application/json;charset=UTF-8");

 //Set the authentication data interface.
 SignInfo signInfo = new SignInfo();
 signInfo.setAccessKey(CmsParameters.accessKey);
 signInfo.setSecretKey(CmsParameters.secretKey);
 signInfo.setPayload(bodyJson);
 signInfo.setTimestamp(new Date());
 signInfo.setHttpMethod(HttpProxyHelper.HTTP_METHOD_POST);
 signInfo.setUri(httpPath);
 signInfo.setSignedHeaders(this.lowerCaseSignedHeaders(signedHeaders));

 //Generate a signature.
 String signature = signInfo.authString();
 Map<String, String> httpHeads = new HashMap<>(signedHeaders);
```

```
//Append to HTTPHEAD and send it to the server.
httpHeads.put(SignInfo.HEAD_AUTHORIZATION, signature);

return httpHeads;
}

/**
 * The signedHeaders involved in the calculation are converted.
 * @param
 * @return Map<String, String>
 */
private Map<String, String> lowerCaseSignedHeaders(Map<String, String> signedHeaders)
{
 if ((null == signedHeaders) || signedHeaders.isEmpty())
 {
 throw new IllegalArgumentException("signedHeaders can't be null.");
 }
 Map<String, String> headers = new HashMap<>();
 for (Entry<String, String> e : signedHeaders.entrySet())
 {
 String name = e.getKey();
 String value = e.getValue();
 headers.put(name.toLowerCase(Locale.ENGLISH), value.trim());
 }
 if (!signedHeaders.containsKey(SignInfo.HEAD_HOST))
 {
 throw new IllegalArgumentException("signedHeaders must has host.");
 }
 return headers;
}
}
```

b. Code implementation:

■ Main function for creating a project:

```
public static void main(String[] args)
{
 HttpClientMain demo = new HttpClientMain();

 try
 {
 demo.cmsPingTest();
 }
 catch (Exception e)
 {
 e.printStackTrace();
 }
}
```

■ Main function for implementing the POST request of the interface (including authentication):

```
public void cmsPingTest() throws Exception
{
 HttpProxyHelper httpProxy = new HttpProxyHelper();
 //URL of the request interface.
 final String httpPath = "/rest/cmsapp/v1/ping";
 final String postUrl = CmsParameters.url + httpPath;
 //Construct bodyJson in the request interface.
 JSONObject jsonBody = new JSONObject();
 jsonBody.put("say", "Hello world!");
 String jsonBodyStr = JSONObject.toJSONString(jsonBody);

 //Construct authentication information.
 Map<String, String> httpHeads = ToolUtils.buildSignHttpHead(httpPath, jsonBodyStr);
 //Execute the HTTP request and obtain the returned JSON character string.
 String response = httpProxy.doPost(postUrl, httpHeads, jsonBodyStr);
 //If the interface is successfully invoked, information containing responseId is
 returned.
}
```

```
 System.out.println(response);
 }
}
```

- Main function for implementing the GET request of the interface (including authentication) (compared with the POST request, other code of the get request remains unchanged):

```
public void cmsPingTest() throws Exception
{
 HttpProxyHelper httpProxy = new HttpProxyHelper();
 //URL of the request interface.
 final String httpPath = "/rest/cmsapp/v1/ping";
 final String postUrl = CmsParameters.url + httpPath;
 //GET request parameters
 Map<String, String> queryParameters = new HashMap<>();
 //Authentication information constructed in a GET request
 Map<String, String> httpHeads = ToolUtils.buildSignHttpHead(httpPath, null,
queryParameters, HttpProxyHelper.HTTP_METHOD_GET);
 System.out.println("httpHeads:" + httpHeads);
 //Execute the HTTP request and obtain the returned JSON character string.
 String response = httpProxy.doGet(postUrl, httpHeads, queryParameters);
 //If the interface is successfully invoked, information containing responseId is
returned.
 System.out.println(response);
}
}
```

- For the implementation of the ToolUtils.toJsonString() function, the actual invoker needs to convert **BaseRequest** into a JSON string based on the JSON framework. The following is an example:

```
/**
 *During actual client development, BaseRequest is directly converted into a JSON string
based on the JSON framework.
 * @param request
 * @return String
 * @throws Exception
 */
public static String toJsonString(BaseRequest request) throws Exception
{
 JSONObject jsonObject = new JSONObject();
 StringBuilder buffer = new StringBuilder();
 buffer.append("{");
 buffer.append("\"request\":");
 buffer.append(jsonObject.toJsonString(request.getRequest()));
 buffer.append(",");
 buffer.append("\"msgBody\":");
 buffer.append(jsonObject.toJsonString(request.getMsgBody()));
 buffer.append("}");

 return buffer.toString();
}
}
```

- To implement the POST method of the HTTP request, the actual invoker can select a framework and use the POST method of its own framework.

```
package com.huawei.client.rest.v2.demo;

import java.io.BufferedInputStream;
import java.io.ByteArrayOutputStream;
import java.io.Closeable;
import java.io.IOException;
import java.io.InputStream;
import java.io.OutputStream;
import java.net.HttpURLConnection;
import java.net.URL;
import java.security.KeyManagementException;
import java.security.NoSuchAlgorithmException;
import java.security.cert.CertificateException;
import java.security.cert.X509Certificate;
import java.util.Map;
```

```
import java.util.Map.Entry;

import javax.net.ssl.HostnameVerifier;
import javax.net.ssl.HttpURLConnection;
import javax.net.ssl.SSLContext;
import javax.net.ssl.SSLSession;
import javax.net.ssl.TrustManager;

## 9.2 Interface Description

### 9.2.1 Querying Knowledge Details

#### Scenario

This interface is invoked to query knowledge details.

#### Method

This interface supports only the POST method.

#### URI

SIA authentication: <https://ip:port/rest/ccikbs/v1/columnkngapi/queryKngDetail>

AK/SK authentication: <https://ip:port/rest/ccikbs/v1/columnkngapi/queryKngDetailByAKSK>

In the URL, *ip* and *port* indicate the machine-machine interface access address of the NSLB server.

## Request Description

**Table 9-5** Request header parameters

| No. | Parameter       | Type   | Mandatory or Not | Default Value | Description                                                                                                                                              |
|-----|-----------------|--------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type    | String | Yes              | None          | The value is fixed at <b>application/json; charset=UTF-8</b> (both authentication modes).                                                                |
| 2   | X-TenantSpaceID | String | Yes              | None          | Tenant ID (required for SIA authentication).                                                                                                             |
| 3   | X-Access-Token  | String | Yes              | None          | For details about the generation mode, see <a href="#">9.1.1 SIA Authentication</a> (required for SIA authentication).                                   |
| 4   | Authorization   | String | Yes              | None          | For details about the generation method, see <a href="#">9.1.2 Authentication Mode of Knowledge Base Interfaces</a> (required for AK/SK authentication). |

**Table 9-6** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Default Value | Description                                                                                                                                                                                                                                                                    |
|-----|-----------|--------|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | coluKngld | String | Yes              | None          | Category knowledge ID.                                                                                                                                                                                                                                                         |
| 2   | openType  | String | Yes              | None          | Ways to open a knowledge base. The options are as follows: <ul style="list-style-type: none"> <li>• <b>1</b>: quick entry</li> <li>• <b>2</b>: search</li> <li>• <b>3</b>: category</li> <li>• <b>4</b>: favorites folder</li> <li>• <b>5</b>: associated knowledge</li> </ul> |
| 3   | openKng   | String | No               | None          | Associated knowledge ID. This parameter is mandatory when <b>openType</b> is set to <b>5</b> .                                                                                                                                                                                 |

| No. | Parameter      | Type   | Mandatory or Not | Default Value | Description                                                                                                                                                                                                                                                                                                                                     |
|-----|----------------|--------|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | searchRank     | String | No               | 1             | Sequence number of a search result. This parameter is mandatory when <b>openType</b> is set to <b>2</b> .                                                                                                                                                                                                                                       |
| 5   | searchSortType | String | No               | None          | Sorting mode of search results. This parameter is mandatory when <b>openType</b> is set to <b>2</b> . The options are as follows: <ul style="list-style-type: none"> <li>• <b>hit</b>: hit ratio</li> <li>• <b>modifyTime</b>: update time</li> <li>• <b>clickNum</b>: number of clicks</li> <li>• <b>bidRankId</b>: bidding ranking</li> </ul> |
| 6   | searchWord     | String | No               | None          | Keyword. This parameter is mandatory when <b>openType</b> is set to <b>2</b> .                                                                                                                                                                                                                                                                  |
| 7   | cclid          | Number | No               | None          | Call center ID. This parameter is mandatory for AK/SK authentication.                                                                                                                                                                                                                                                                           |
| 8   | vdn            | Number | No               | None          | VDN ID. This parameter is mandatory for AK/SK authentication.                                                                                                                                                                                                                                                                                   |

## Response Description

If this interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 9-7](#).

**Table 9-7** Response body parameters

| No. | Parameter   | Type   | Description                                                                                                                                 |
|-----|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode  | String | Result code. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• <b>1</b>: failure</li> </ul> |
| 2   | description | String | Request result description.                                                                                                                 |
| 3   | data        | Object | Request result object. For details, see <a href="#">Table 9-8</a> .                                                                         |

**Table 9-8** Object parameters of data

| No.  | Parameter      | Type   | Description                                                                                                                                                                                                      |
|------|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.1  | relVersionNum  | String | Released version.                                                                                                                                                                                                |
| 4.2  | coluType       | String | Category type. The options are as follows: <ul style="list-style-type: none"> <li>• 1: normal category</li> <li>• 2: history category (This value is valid only when <b>coluKngType</b> is set to 1).</li> </ul> |
| 4.3  | code           | String | Node code of the category or knowledge in the category knowledge tree.                                                                                                                                           |
| 4.4  | coluKngType    | Number | Category knowledge type. The options are as follows: <ul style="list-style-type: none"> <li>• 1: category</li> <li>• 2: common knowledge</li> <li>• 3: Q&amp;A knowledge</li> </ul>                              |
| 4.5  | creationTime   | Number | Creation time.                                                                                                                                                                                                   |
| 4.6  | releaseTimes   | Number | Number of knowledge release times.                                                                                                                                                                               |
| 4.7  | orderId        | Number | Sequence number.                                                                                                                                                                                                 |
| 4.8  | kngStatus      | Number | Knowledge status. The options are as follows: <ul style="list-style-type: none"> <li>• 1: new</li> <li>• 2: reviewed</li> <li>• 3: released</li> <li>• 4: updated</li> <li>• 5: rejected</li> </ul>              |
| 4.9  | kngSize        | Number | Size of the knowledge content. The unit is KB.                                                                                                                                                                   |
| 4.10 | creatorId      | String | Creator employee ID.                                                                                                                                                                                             |
| 4.11 | modifierId     | String | Modifier employee ID.                                                                                                                                                                                            |
| 4.12 | beyondColuPath | String | Path of the category. The path of the first-level category is /.                                                                                                                                                 |
| 4.13 | coluKngName    | String | Category knowledge name.                                                                                                                                                                                         |
| 4.14 | modifyTime     | Number | Modification time.                                                                                                                                                                                               |

| No.  | Parameter         | Type   | Description                                                                                                                                                                              |
|------|-------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.15 | validEndTime      | Number | End time of the validity period.                                                                                                                                                         |
| 4.16 | summaryInfo       | String | Summary.                                                                                                                                                                                 |

## 9.2.2 Querying a Category

### Scenario

This interface is invoked to query category information.

### Method

This interface supports only the POST method.

### URI

SIA authentication: [https://ip:port/rest/ccikbs/v1/columnkngapi/  
queryColumnsBySuperCode](https://ip:port/rest/ccikbs/v1/columnkngapi/queryColumnsBySuperCode)

AK/SK authentication: [https://ip:port/rest/ccikbs/v1/columnkngapi/  
queryColumnsBySuperCodeByAKSK](https://ip:port/rest/ccikbs/v1/columnkngapi/queryColumnsBySuperCodeByAKSK)

In the URL, *ip* and *port* indicate the machine-machine interface access address of the NSLB server.

## Request Description

**Table 9-12** Request header parameters

| No. | Parameter       | Type   | Mandatory or Not | Default Value | Description                                                                                                                                              |
|-----|-----------------|--------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type    | String | Yes              | None          | The value is fixed at <b>application/json;charset=UTF-8</b> (both authentication modes).                                                                 |
| 2   | X-TenantSpaceID | String | Yes              | None          | Tenant ID (required for SIA authentication).                                                                                                             |
| 3   | X-Access-Token  | String | Yes              | None          | For details about the generation mode, see <a href="#">9.1.1 SIA Authentication</a> (required for SIA authentication).                                   |
| 4   | Authorization   | String | Yes              | None          | For details about the generation method, see <a href="#">9.1.2 Authentication Mode of Knowledge Base Interfaces</a> (required for AK/SK authentication). |

**Table 9-13** Request body parameters

| No. | Parameter    | Type   | Mandatory or Not | Default Value | Description                                                           |
|-----|--------------|--------|------------------|---------------|-----------------------------------------------------------------------|
| 1   | beyondCoulid | String | Yes              | None          | Category ID. The ID of the first-level category is <b>0</b> .         |
| 2   | cclid        | Number | No               | None          | Call center ID. This parameter is mandatory for AK/SK authentication. |
| 3   | vdn          | Number | No               | None          | VDN ID. This parameter is mandatory for AK/SK authentication.         |

## Response Description

If this interface fails to be called, the corresponding error code is returned. For details about the error code data structure, see [Table 9-14](#).

**Table 9-14** Response body parameters

| No. | Parameter   | Type   | Description                                                                                                               |
|-----|-------------|--------|---------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode  | String | Result code. The options are as follows: <ul style="list-style-type: none"> <li>0: success</li> <li>1: failure</li> </ul> |
| 2   | description | String | Request result description.                                                                                               |
| 3   | datas       | List   | Request result object. For details, see <a href="#">Table 9-15</a> .                                                      |

**Table 9-15** Object parameters of datas

| No. | Parameter      | Type   | Description                                                                         |
|-----|----------------|--------|-------------------------------------------------------------------------------------|
| 1   | coluKngId      | String | Category knowledge ID.                                                              |
| 2   | coluKngName    | String | Category knowledge name.                                                            |
| 3   | coluKngType    | String | Category knowledge type.                                                            |
| 4   | beyondColuld   | Number | Category ID. The ID of the first-level category is 0.                               |
| 5   | beyondColuPath | Number | Path of the category. The path of the first-level category is /.                    |
| 6   | coluType       | Number | Category type.                                                                      |
| 7   | code           | Number | Category code. Code of a category or knowledge node in the category knowledge tree. |
| 8   | superCode      | Number | Upper-level category code.                                                          |
| 9   | id             | String | AppCube ID.                                                                         |

## 9.2.3 Querying the Knowledge List

### Scenario

This interface is invoked to query the knowledge list.

### Method

This interface supports only the POST method.

### URI

SIA authentication: <https://ip:port/rest/ccikbs/v1/columnkngapi/advancedSearch>

AK/SK authentication: <https://ip:port/rest/ccikbs/v1/columnkngapi/advancedSearchByAKSK>

In the URL, *ip* and *port* indicate the machine-machine interface access address of the NSLB server.

### Request Description

**Table 9-16** Request header parameters

| No. | Parameter       | Type   | Mandatory or Not | Default Value | Description                                                                                                            |
|-----|-----------------|--------|------------------|---------------|------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type    | String | Yes              | None          | The value is fixed at <b>application/json; charset=UTF-8</b> (both authentication modes).                              |
| 2   | X-TenantSpaceID | String | Yes              | None          | Tenant ID (required for SIA authentication).                                                                           |
| 3   | X-Access-Token  | String | Yes              | None          | For details about the generation mode, see <a href="#">9.1.1 SIA Authentication</a> (required for SIA authentication). |

| No. | Parameter     | Type   | Mandatory or Not | Default Value | Description                                                                                                                                              |
|-----|---------------|--------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | Authorization | String | Yes              | None          | For details about the generation method, see <a href="#">9.1.2 Authentication Mode of Knowledge Base Interfaces</a> (required for AK/SK authentication). |

**Table 9-17** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Default Value | Description                                                                                                                                                                                              |
|-----|-------------|--------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | keyword     | String | Yes              | None          | Keyword.                                                                                                                                                                                                 |
| 2   | offset      | Number | Yes              | None          | Pagination query offset. The default value is <b>0</b> , indicating no offset.                                                                                                                           |
| 3   | limit       | Number | Yes              | None          | Maximum number of records on a page during pagination query.                                                                                                                                             |
| 4   | code        | String | No               | None          | Code of a category or knowledge node in the category knowledge tree.                                                                                                                                     |
| 5   | coluKngType | String | No               | None          | Category knowledge type. The options are as follows: <ul style="list-style-type: none"> <li>• <b>1</b>: category</li> <li>• <b>2</b>: common knowledge</li> <li>• <b>3</b>: Q&amp;A knowledge</li> </ul> |
| 6   | startTime   | Number | No               | None          | Start time (timestamp).                                                                                                                                                                                  |
| 7   | endTime     | Number | No               | None          | End time (timestamp).                                                                                                                                                                                    |
| 8   | cclId       | Number | No               | None          | Call center ID. This parameter is mandatory for AK/SK authentication.                                                                                                                                    |

| No. | Parameter | Type   | Mandatory or Not | Default Value | Description                                                   |
|-----|-----------|--------|------------------|---------------|---------------------------------------------------------------|
| 9   | vdn       | Number | No               | None          | VDN ID. This parameter is mandatory for AK/SK authentication. |

## Response Description

If this interface fails to be called, the corresponding error code is returned. For details about the error code response data structure, see [Table 9-18](#).

**Table 9-18** Response body parameters

| No. | Parameter   | Type   | Description                                                                                                               |
|-----|-------------|--------|---------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode  | String | Result code. The options are as follows: <ul style="list-style-type: none"> <li>0: success</li> <li>1: failure</li> </ul> |
| 2   | description | String | Request result description.                                                                                               |
| 3   | data        | Object | Request result object. For details, see <a href="#">Table 9-19</a> .                                                      |

**Table 9-19** Object parameters of data

| No. | Parameter | Type   | Description                                                                             |
|-----|-----------|--------|-----------------------------------------------------------------------------------------|
| 1   | total     | String | Number of query records.                                                                |
| 2   | results   | List   | For details about object parameters of this parameter, see <a href="#">Table 9-20</a> . |

**Table 9-20** Object parameters of results

| No. | Parameter | Type   | Description                                                          |
|-----|-----------|--------|----------------------------------------------------------------------|
| 1   | adjs      | String | Category knowledge attachment.                                       |
| 2   | code      | String | Code of a category or knowledge node in the category knowledge tree. |

| No. | Parameter      | Type   | Description                                                                                                                                                                                    |
|-----|----------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | coluKngType    | String | Category knowledge type. The options are as follows: <ul style="list-style-type: none"> <li>• 1: category</li> <li>• 2: common knowledge</li> <li>• 3: Q&amp;A knowledge</li> </ul>            |
| 4   | orderId        | String | Sequence number.                                                                                                                                                                               |
| 5   | creatorId      | String | Creator employee ID.                                                                                                                                                                           |
| 6   | modifierId     | String | Modifier employee ID.                                                                                                                                                                          |
| 7   | creatorName    | String | Creator name.                                                                                                                                                                                  |
| 8   | beyondColuPath | String | Path of the category. The path of the first-level category is /.                                                                                                                               |
| 9   | contentInfo    | String | Knowledge content.                                                                                                                                                                             |
| 10  | coluKngName    | String | Category knowledge name.                                                                                                                                                                       |
| 11  | modifyTime     | Number | Modification time.                                                                                                                                                                             |
| 12  | validEndTime   | Number | End time of the validity period.                                                                                                                                                               |
| 13  | summaryInfo    | String | Summary.                                                                                                                                                                                       |
| 14  | serviceStatus  | Number | Business status. The options are as follows: <ul style="list-style-type: none"> <li>• 1: common</li> <li>• 2: hotspot</li> <li>• 3: new</li> <li>• 4: updated</li> <li>• 5: expired</li> </ul> |
| 15  | clickNum       | Number | Number of clicks.                                                                                                                                                                              |
| 16  | keyword        | String | Keyword.                                                                                                                                                                                       |
| 17  | coluKngId      | String | Category knowledge ID.                                                                                                                                                                         |
| 18  | curVersionNum  | Number | Current system version.                                                                                                                                                                        |
| 19  | validStartTime | Number | Start time of the validity period.                                                                                                                                                             |

| No. | Parameter    | Type   | Description                    |
|-----|--------------|--------|--------------------------------|
| 20  | kngPath      | String | Knowledge path.                |
| 21  | superCode    | String | Upper-level category code.     |
| 22  | beyondColuld | String | Parent category ID.            |
| 23  | createTime   | Number | Creation time.                 |
| 24  | kngAdj       | String | Category knowledge attachment. |
| 25  | tenantId     | String | Tenant space ID.               |

## Example

- Request header**  
 Content-Type: application/json;charset=UTF-8  
 X-TenantSpaceID: \*\*\*\*\*  
 Authorization: \*\*\*\*\*
- Request parameters**

```
{
 "keyword": "001",
 "offset": 0,
 "limit": 10,
 "code": "001",
 "coluKngType": "2",
 "startTime": 1658474893000,
 "endTime": 1658820502000
}
```
- Response parameters**

```
{

}
```

## 9.2.4 Querying an Attachment Download Address

### Scenario

This interface is invoked to query an attachment download address.

### Method

This interface supports only the POST method.

### URI

SIA authentication: `https://ip:port/rest/ccikbs/v1/knowledge/download`

AK/SK authentication: `https://ip:port/rest/ccikbs/v1/knowledge/downloadByAKSK`

In the URL, *ip* and *port* indicate the machine-machine interface access address of the NSLB server.

### Request Description

Table 9-21 Request header parameters

| No. | Parameter       | Type   | Mandatory or Not | Default Value | Description                                                                                                                                              |
|-----|-----------------|--------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type    | String | Yes              | None          | The value is fixed at <b>application/json;charset=UTF-8</b> (both authentication modes).                                                                 |
| 2   | X-TenantSpacelD | String | Yes              | None          | Tenant ID (required for SIA authentication).                                                                                                             |
| 3   | X-Access-Token  | String | Yes              | None          | For details about the generation mode, see <a href="#">9.1.1 SIA Authentication</a> (required for SIA authentication).                                   |
| 4   | Authorization   | String | Yes              | None          | For details about the generation method, see <a href="#">9.1.2 Authentication Mode of Knowledge Base Interfaces</a> (required for AK/SK authentication). |

**Table 9-22** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Default Value | Description                                                                                                                                                                                                                                                          |
|-----|-----------|--------|------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | kngld     | String | Yes              | None          | Knowledge ID. The value is the same as that of <b>AICC_kngld_CST</b> in a data table of the AppCube database. Query the <b>AICC_Ikbs_Kngadjedit_CST</b> , <b>AICC_Ikbs_Columnknghis_CST</b> , or <b>AICC_Ikbs_Kngadjpre_CST</b> table based on the knowledge status. |
| 2   | fileKey   | String | Yes              | None          | File ID. The value is the same as that of <b>AICC_adjKey_CST</b> in a data table of the AppCube database. Query the <b>AICC_Ikbs_Kngadjedit_CST</b> , <b>AICC_Ikbs_Columnknghis_CST</b> , or <b>AICC_Ikbs_Kngadjpre_CST</b> table based on the knowledge status.     |
| 3   | cclid     | Number | No               | None          | Call center ID. This parameter is mandatory for AK/SK authentication.                                                                                                                                                                                                |
| 4   | vdn       | Number | No               | None          | VDN ID. This parameter is mandatory for AK/SK authentication.                                                                                                                                                                                                        |

## Response Description

If this interface fails to be called, the corresponding error code is returned. For details about the error code response data structure, see [Table 9-23](#).

**Table 9-23** Response body parameters

| No. | Parameter   | Type   | Description                                                                                                               |
|-----|-------------|--------|---------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode  | String | Result code. The options are as follows: <ul style="list-style-type: none"> <li>0: success</li> <li>1: failure</li> </ul> |
| 2   | description | String | Request result description.                                                                                               |
| 3   | data        | Object | Request result object. For details, see <a href="#">Table 9-19</a> .                                                      |

**Table 9-24** Object parameters of data

| No. | Parameter | Type   | Description                                                                |
|-----|-----------|--------|----------------------------------------------------------------------------|
| 1   | url       | String | OBS address from which the current knowledge attachment can be downloaded. |

## 10.1 Overview

The Online Intelligent Assistant Platform (OIAP) provides interfaces for the interactive voice response (IVR), chat app, CSP, or CEC to meet the requirements of intelligent interaction scenarios.

### NOTE

*IP:PORT* in all URLs indicates the IP address and port number of the OIAP on the NSLB.

### Typical Interaction Sequence

- Step 1 Obtain the token.  
Check whether the OIAP needs to interconnect with an internal system (such as the CEC or CSP) or a tenant (third-party system).  
If a third-party system needs to be interconnected, obtain a token using the tenant ID ([4.4 C3 OIAP Interface Authentication](#)) and invoke the interface within the token validity period. The obtained token must be transferred for each interface invocation.  
If an internal system (the CEC or CSP) needs to be interconnected, obtain a token using the default user specified for system interconnection ([4.4 C3 OIAP Interface Authentication](#)) and invoke the interface within the token validity period. The obtained token must be transferred for each interface invocation.
- Step 2 Establish the binding relationship with the OIAP.
- After a token is obtained, a third-party system can query activated domains ([10.2 Domain Query Interface](#)) based on the tenant and language information and bind third-party access codes to domains ([10.3.1 Interface for Querying Dialog ID Binding Relationships](#)).
- Step 3 Complete the dialog interaction.  
After the access codes are bound to domains in the OIAP, the dialog interfaces ([10.5 Dialog Interfaces](#)) of the OIAP can be invoked for dialog interaction, for example, initialization, voice playing, call transfer, and hang-up.

### Common Error Codes

**Table 10-1** Common error codes

| Error Code | Description                                                             |
|------------|-------------------------------------------------------------------------|
| 900001     | No token information exists or the token has expired.                   |
| 900002     | Failed to check the token information.                                  |
| 10000001   | Internal error, which is usually caused by an application system fault. |

| Error Code | Description                                                                               |
|------------|-------------------------------------------------------------------------------------------|
| 10000002   | The parameter is incorrect. Generally, the request does not provide all mandatory fields. |
| 10000006   | The interface input parameter with the same name already exists.                          |
| 10000007   | The interface output parameter with the same name already exists.                         |
| 10000008   | The interface header parameter with the same name already exists.                         |
| 10000003   | The parameter does not exist. You must enter the parameter.                               |
| 10000004   | The parameter already exists in the system and cannot be used again.                      |
| 20000001   | The flow in the released state cannot be modified.                                        |
| 20000002   | The flow name already exists.                                                             |
| 20000003   | Failed to delete the node. The node is referenced by another flow.                        |
| 20000004   | Failed to delete the variable. The variable is referenced by a flow or template.          |
| 20000005   | Failed to modify the variable. The original variable is referenced by a flow or template. |
| 20000006   | The file path does not exist.                                                             |
| 20000007   | An I/O exception occurred. Failed to read the file stream.                                |
| 20000008   | An error occurred when updating data.                                                     |
| 200900002  | Internal error, which is usually caused by an application system fault.                   |
| 200900003  | The parameter is incorrect. Generally, the request does not provide all mandatory fields. |
| 200800001  | The key does not exist.                                                                   |
| 200800002  | The key is incorrect.                                                                     |
| 200800003  | The account is locked.                                                                    |

## 10.2 Domain Query Interface

### Description

The OIAP provides an interface for third-party systems to query activated domain information in the intelligent interaction system.

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/querydomaininfo

### Request

**Table 10-2** Parameter in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> . |

**Table 10-3** Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description |
|-----------|--------|----------|-----------|-------------|
| tenantId  | String | Body     | Yes       | Tenant ID.  |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| language  | String | Body     | No        | <p>Language. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>zh_CN</b>: Chinese</li> <li>• <b>en_US</b>: English</li> <li>• <b>es_ES</b>: Spanish</li> <li>• <b>ar</b>: Arabic</li> <li>• <b>fr_FR</b>: French</li> </ul> <p>If this parameter is left blank or set to "", domains in all languages are returned. If a language is specified, only domains in the specified language are returned.</p> |
| authToken | String | Body     | Yes       | <p>Authentication token.</p> <p>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a>.</p>                                                                                                                                                                                                                                                                                                                         |

## Response

| Parameter | Type     | Position | Mandatory | Description                                                                                                                                                                                        |
|-----------|----------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| errorCode | Integer  | Body     | Yes       | <p>Error code.</p> <ul style="list-style-type: none"> <li>• <b>0</b> or <b>null</b>: success</li> <li>• Other values: failure</li> </ul> <p>The status code <b>200</b> also indicates success.</p> |
| errorMsg  | String   | Body     | No        | Error description.                                                                                                                                                                                 |
| domains   | domain[] | Body     | Yes       | Domain information, which is generated in array format.                                                                                                                                            |

**Table 10-4** domain

| Parameter  | Type    | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|---------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId   | String  | Body     | Yes       | Tenant ID.                                                                                                                                                                                                                                                                                                                                                                                                           |
| domainId   | Integer | Body     | Yes       | Domain ID.                                                                                                                                                                                                                                                                                                                                                                                                           |
| domainName | String  | Body     | Yes       | Domain name.                                                                                                                                                                                                                                                                                                                                                                                                         |
| language   | String  | Body     | Yes       | <p>Language. The options are as follows:</p> <ul style="list-style-type: none"> <li>● <b>zh_CN</b>: Chinese</li> <li>● <b>en_US</b>: English</li> <li>● <b>es_ES</b>: Spanish</li> <li>● <b>ar</b>: Arabic</li> <li>● <b>fr_FR</b>: French</li> </ul> <p>If this parameter does not exist, domains in all languages are returned. If this parameter exists, only domains in the specified language are returned.</p> |

## Example

- Request

```
{
 "tenantId":"202104237142",
 "language":"en_US",
 "authToken":"w*****"
}
```

- Response

```
{
 "errorCode" : 0, // Error code, which is an integer. If no error is reported, the value is 0.
 "errorMsg" : "", // Error message, which is a string. If no error is reported, this parameter is left blank.
 "domains" : [{ // Domain list, which is an object array.
 "tenantId":"tenant0001", // Tenant ID, which is a string.
 "domainId": 10079, // Domain ID, which is an integer.
 "domainName":"Shanxi flow" // Domain name, which is a string.
 "language" : "en_US"// Language, which is a string. (Currently, zh_CN, en_US, es_ES, and ar are supported.)
 }, {

 }]
}
```

## 10.3 Dialog ID Binding Interfaces

The IVN provides interfaces for third-party systems to add, delete, modify, and query binding relationships between dialog IDs and tenants and domains.

### 10.3.1 Interface for Querying Dialog ID Binding Relationships

#### Description

This interface is used to query the session ID binding relationships.

#### Interface Method

POST

#### URL

https://IP:PORT/oifde/rest/api/querynavigationinfo

#### Request

**Table 10-5** Parameters in the message body

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                          |
|------------|--------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId   | String | Body     | Yes       | Tenant ID.                                                                                                                                                                                                                                           |
| accessCode | String | Body     | No        | Access ID. If this parameter is not passed, all binding relationships of the tenant are queried. If this parameter is passed, the <b>pageNum</b> and <b>pageSize</b> parameters need to be passed. The value can contain a maximum of 20 characters. |
| pageNum    | String | Body     | Yes       | Page number. Number of the page to be queried. The value <b>1</b> is for the first page.                                                                                                                                                             |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                   |
|-----------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pageSize  | String | Body     | Yes       | Number of records on each page.<br>The value can be <b>5, 10, 20, 50, or 100</b> .                                                                                                                                                                                                                            |
| authToken | String | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                                                                                                                                                                                                              |
| source    | String | Body     | No        | Source device that initiates a dialog. <ul style="list-style-type: none"> <li>• <b>IVR</b>: IVR flow</li> <li>• <b>OIFDE</b>: intelligent flow configured by the ODFS</li> <li>• If this parameter is not passed, the IVR is queried by default.</li> </ul> The value can contain a maximum of 64 characters. |

## Response

| Parameter      | Type         | Position | Mandatory | Description                                                                                                                                   |
|----------------|--------------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| errorCode      | Integer      | Body     | No        | Error code.<br>If the operation is successful, no error code is returned.<br>If the operation fails, see <a href="#">Common Error Codes</a> . |
| errorMsg       | String       | Body     | No        | Error description.                                                                                                                            |
| total          | Long         | Body     | Yes       | Total number of records.                                                                                                                      |
| accessInfoList | accessInfo[] | Body     | Yes       | Dialog binding relationship list in an array.                                                                                                 |

**Table 10-6** accessInfo

| Parameter          | Type    | Position | Mandatory | Description                                                                                                                                                                                           |

| description        | String  | Body     | No        | Description.                                                                                                                                                                                          |
| source             | String  | Body     | No        | Source device that initiates a dialog. <ul style="list-style-type: none"> <li>• <b>IVR</b>: IVR flow</li> <li>• <b>OIFDE</b>: intelligent flow configured by the ODFS</li> </ul>                      |
| chatBotName        | String  | Body     | No        | Chatbot name.                                                                                                                                                                                         |
| usingRecordService | Integer | Body     | No        | Whether to use VoiceCyber for recording. <ul style="list-style-type: none"> <li>• <b>0</b>: VoiceCyber recording is disabled.</li> <li>• Other values: VoiceCyber recording is enabled.</li> </ul>    |

## Example

- Request

```
{
 "tenantId": "tenant001",
```

```
"accessCode": "10086" ,
"pageNum": "1" ,
"pageSize": "10" ,
"authToken": "Odbe1*****b505de" ,
"source": "OIFDE"
}
```

- Response

```
{
 "total": 2, // Total number of records, which is of the long type.
 "accessInfoList" : [{ // Dialog binding relationship list, which is an object array.
 "accessId": "100001", // Internal sequence number, which is a string.
 "tenantId": "tenantId001", // Tenant ID, which is a string.
 "accessCode": "10086", // Access ID, which is a string.
 "domainId": 10001, // Domain ID, which is an integer.
 "dialogType": 1, // Dialog type, which is an integer.
 "flowCode": "flowxxxxx", // Flow code, which is a string.
 "description": "", // Source device that initiates a dialog, which is a string.
 "source": "OIFDE", // Description, which is a string.
 "chatBotName": "10086", // Robot name, which is a string.
 "usingRecordService": 0 // VoiceCyber recording is disabled. The value is an integer.
 }],
 ...
}]
}
```

## 10.3.2 Interface for Adding Dialog ID Binding Relationships

### Description

This interface is used to add dialog ID binding.

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/createnavigationinfo

### Request

**Table 10-7** Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description |
|-----------|--------|----------|-----------|-------------|
| tenantId  | String | Body     | Yes       | Tenant ID.  |

| Parameter  | Type    | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------|---------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accessCode | String  | Body     | No        | <p>Access ID. If this parameter is not passed, the system automatically generates an access ID.</p> <ul style="list-style-type: none"> <li>In the OP scenario, if <b>source</b> is left empty or set to <b>IVR</b>, this parameter is mandatory, and the value can contain a maximum of 20 characters.</li> <li>In the SaaS scenario, if <b>createFlag</b> is not empty, the access code generated by the system is used, and this parameter is optional.</li> <li>In the SaaS scenario, if <b>createFlag</b> is empty, this parameter is mandatory, and the value is a string of 9 to 24 characters.</li> </ul> |
| domainId   | Integer | Body     | No        | Domain ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| description | String | Body     | No            | Description.<br>Either <b>description</b> or <b>createFlag</b> must be set.<br>The value is used as the flow description in the SaaS scenario. It must be globally unique and can contain a maximum of 50 characters.                             |
| authToken   | String | Body     | Yes           | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                                                                                                                                                  |
| source      | String | Body     | No            | Source device that initiates a dialog. <ul style="list-style-type: none"><li>● <b>IVR</b>: IVR flow</li><li>● <b>OIFDE</b>: intelligent flow configured by the ODFS</li><li>● If this parameter is not set, the IVR is used by default.</li></ul> |

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| createFlag | String | Body     | No        | <p>Creation flag.</p> <p>Either <b>description</b> or <b>createFlag</b> must be set.</p> <ul style="list-style-type: none"> <li>• <b>0</b>: In the scenario where a chatbot is added, add the binding relationship between the chatbot and flow.</li> <li>• <b>1</b>: In the scenario where flows (duplicate names are allowed) and access codes are imported, if the binding relationship is found, delete the binding relationship, and then add the binding relationship.</li> </ul> |

## Response

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                 |
|-----------|---------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| errorCode | Integer | Body     | No        | <p>Error code.</p> <p>If the operation is successful, no error code is returned.</p> <p>If the operation fails, see <a href="#">Common Error Codes</a>.</p> |
| errorMsg  | String  | Body     | No        | Error description.                                                                                                                                          |

## Example

- Request

```
{
 "tenantId": "tenant001",
```

```
"accessCode": "10086",
"domainId": 10001,
"dialogType":1,
"flowCode": "flowxxxxx",
"description": "",
"authToken": "0dbe*****b505de"
}
```

- Response  
Addition succeeded:  
No response body.  
Addition failed:

```
{
 "errorCode" : 10000, // Error code, which is an integer. The status code 200 indicates success.
 "errorMsg" : ""
}
```

### 10.3.3 Interface for Modifying Dialog ID Binding Relationships

#### Description

This interface is used to modify dialog ID binding.

#### Interface Method

POST

#### URL

<https://IP:PORT/oifde/rest/api/updatenavigationinfo>

#### Request

**Table 10-8** Parameters in the request body

| Parameter  | Type    | Position | Mandator<br>y | Description                                                     |
|------------|---------|----------|---------------|-----------------------------------------------------------------|
| tenantId   | String  | Body     | Yes           | Tenant ID.                                                      |
| accessId   | String  | Body     | Yes           | Internal sequence number of a dialog ID binding relationship.   |
| accessCode | String  | Body     | No            | Access ID.<br>The value can contain a maximum of 20 characters. |
| domainId   | Integer | Body     | No            | Domain ID.                                                      |

| Parameter   | Type    | Position | Mandatory | Description                                                                                                                                                                      |
|-------------|---------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dialogType  | Integer | Body     | Yes       | Dialog type. <ul style="list-style-type: none"> <li>• 1: voice navigation</li> <li>• 2: intelligent outbound call</li> <li>• 3: chatbot</li> <li>• 4: IVR flow</li> </ul>        |
| flowCode    | String  | Body     | No        | Flow code.                                                                                                                                                                       |
| description | String  | Body     | Yes       | Description.                                                                                                                                                                     |
| authToken   | String  | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                                                                                 |
| source      | String  | Body     | No        | Source device that initiates a dialog. <ul style="list-style-type: none"> <li>• <b>IVR</b>: IVR flow</li> <li>• <b>OIFDE</b>: intelligent flow configured by the ODFS</li> </ul> |

## Response

**Table 10-9** Parameters in the response body

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                   |
|-----------|---------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| errorCode | Integer | Body     | No        | Error code.<br>If the operation is successful, no error code is returned.<br>If the operation fails, see <a href="#">Common Error Codes</a> . |
| errorMsg  | String  | Body     | No        | Error description.                                                                                                                            |

## Example

- Request

```
{
 "tenantId": "tenant001",
 "accessCode": "10086",
 "accessId": "100001",
 "domainId": 10001,
 "dialogType": 1,
 "flowCode": "flowxxxxx",
 "description": "",
 "authToken": "Odbe11*****b505de"
}
```

- Response  
Modification succeeded:  
No response body.  
Modification failed:

```
{
 "errorCode": 100000, // Error code, which is an integer. The status code 200 indicates success.
 "errorMsg": ""
}
```

### 10.3.4 Interface for Deleting Dialog ID Binding Relationships

#### Description

This interface is used to delete a dialog ID binding.

#### Interface Method

The request method must be set to POST.

#### URL

<https://IP:PORT/oifde/rest/api/deletenavigationinfo>

#### Request

**Table 10-10** Parameters in the request body

| Parameter      | Type     | Position | Mandator<br>y | Description                                                               |
|----------------|----------|----------|---------------|---------------------------------------------------------------------------|
| tenantId       | String   | body     | Yes           | Tenant ID.                                                                |
| accessIdList   | String[] | body     | Yes           | List of dialog binding relationship IDs in an array. Each ID is a string. |
| accessCodeList | String[] | body     | No            | List of dialog binding relationship codes.                                |

| Parameter | Type   | Position | Mandatory | Description                                                                                      |
|-----------|--------|----------|-----------|--------------------------------------------------------------------------------------------------|
| authToken | String | body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

## Response

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                   |
|-----------|---------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| errorCode | Integer | body     | No        | Error code.<br>If the operation is successful, no error code is returned.<br>If the operation fails, see <a href="#">Common Error Codes</a> . |
| errorMsg  | String  | body     | No        | Error description.                                                                                                                            |

## Example

- Request

```
{
 "tenantId": "tenant001",
 "accessIdList": ["10001", "..."],
 "accessCodeList": ["10086", "..."],
 "authToken": "0*****"
}
```

- Response

Deletion succeeded.

No response body

Deletion failed.

```
{
 "errorCode": 100000, // Error code, which is an integer. The status code 200 indicates success.
 "errorMsg": ""
}
```

## 10.4 Flow Query Interface

### Description

The OIAP provides an interface for third-party systems to query flow information in the intelligent interaction system.

## Interface Method

The request method must be set to POST.

## URL

https://IP:PORT/oifde/rest/api/queryflows

## Request

**Table 10-11** Parameters in the request body

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                                                                               |
|-----------|---------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId  | String  | body     | Yes       | Tenant ID.                                                                                                                                                                                                                |
| flowId    | String  | body     | No        | Flow ID.                                                                                                                                                                                                                  |
| flowName  | String  | body     | No        | Flow name.                                                                                                                                                                                                                |
| flowCode  | String  | body     | No        | Flow code.                                                                                                                                                                                                                |

## 10.5 Dialog Interfaces

### Description

The OIAP provides interfaces for third-party systems to perform real-time dialog operations such as initialization, dialog interaction, dialog transfer, and hangup so that third-party systems can complete multi-round dialog interactions with customers as well as business handling and query.

### Interface Method

POST

### URL

<https://IP:PORT/oifde/rest/crs/process>

### Request

**Table 10-13** Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                             |
|-----------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userid    | String | Body     | Yes       | The ODFS establishes call instances internally based on this parameter. The ODFS may have multiple call instances at the same time. Subsequent interactions are associated with the same call based on the parameter. The value can contain a maximum of 64 characters. |

| Parameter | Type    | Position | Mandator<br>y | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------|----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inaction  | Integer | Body     | Yes           | Type of the request that the access party executes this time.<br><b>8</b> : dialog initialization request (for the first invoking)<br><b>9</b> : request after dialog interaction<br><b>11</b> : request after dialog transfer<br>Note: This parameter is set to <b>8</b> for the first interface invoking. In subsequent interactions, the parameter is set to the value of <b>outaction</b> received in the previous interaction.      |
| seat      | String  | Body     | No            | Agent type. The default value is <b>vir</b> .<br><ul style="list-style-type: none"> <li>• <b>vir</b>: virtual agent</li> <li>• <b>ass</b>: agent assistant</li> </ul>                                                                                                                                                                                                                                                                    |
| inparams  | Object  | Body     | Yes           | Parameters that are sent to the ODFS to inform the ODFS of the detailed information about the operation result. The value of <b>inparams</b> varies depending on the value of <b>inaction</b> . The parameters are described by scenario.<br><ul style="list-style-type: none"> <li>• <b>inaction=8</b></li> <li>• <b>inaction=9</b></li> <li>• <b>inaction=11</b></li> <li>• <b>inaction=7</b></li> <li>• <b>inaction=13</b></li> </ul> |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| extparams | Object | Body     | No        | <p>Optional dynamic parameters that are sent to the ODFS, which are used only in the initialization scenario.</p> <p>The value of <b>extparams</b> varies depending on the value of <b>inaction</b>. The parameters are described by scenario.</p> <ul style="list-style-type: none"> <li>• <b>inaction=8</b></li> <li>• <b>inaction=9</b></li> <li>• <b>inaction=11</b></li> <li>• <b>inaction=7</b></li> <li>• <b>inaction=13</b></li> </ul> |

## Response

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                                                                                  |

## Return Code

### NOTICE

If the response body does not contain the return code and description, use the native return code of HTTPS.

| Return Code | Description                              | Possible Cause                                                                                                                                    | Solution                                            |
|-------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| 200         | This operation is successful.            | The processing is successful.                                                                                                                     | -                                                   |
| 400         | The request is incorrect.                | The request URL is incorrect.                                                                                                                     | Use a correct request URL.                          |
| 500         | The business fails.                      | The value of a parameter in the request does not exist in the system. For example, the case type code that you send does not exist in the system. | Verify the values of the parameters in the request. |
| Others      | Refer to the standard HTTPS status code. | -                                                                                                                                                 | -                                                   |

### 10.5.1 Dialog Initialization Interface (inaction=8)

When the access party sends a request to the ODFS for the first time, the access party needs to send a request whose **inaction** is **8** to notify the ODFS of initialization. The ODFS returns the next operation of the access party in **outparams**. This section describes the **inparams** parameter structure and request example and the return parameter structure and message examples in different scenarios.

#### inparams

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                   |
|-----------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                           |
|-------------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)<br>The value can contain a maximum of 64 characters.                                                                                                                        |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the flow access code.<br>2. In the voice outbound call survey scenario, this parameter is set to the flow access code.<br>3. In other interaction scenarios, this parameter is set to the access ID.<br>The value can contain a maximum of 20 characters. |
| real_callee | String | Body     | No        | Called number for accessing the IVR. This parameter is valid in the voice navigation scenario.<br>The value can contain a maximum of 32 characters.                                                                                                                                                                                   |

| Parameter       | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                 |
|-----------------|--------|----------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cti_callid      | String | Body     | No (special field in the voice navigation scenario) | Call ID of the CTI to which a call is connected, which is transferred by Huawei IVR. In other scenarios, this parameter is left empty.<br>The value can contain a maximum of 32 characters. |
| auth_token      | String | Body     | Yes                                                 | Authorization information, which is the token value returned by the access control system.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                       |
| suilu_region_id | String | Body     | No (special field in the voice navigation scenario) | Region where the calling party is located.<br>The value can contain a maximum of 64 characters.                                                                                             |

| Parameter   | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|--------|----------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| entrance_id | String | Body     | No (special field in the voice navigation scenario) | Navigation entrance. <ul style="list-style-type: none"><li>● <b>01</b>: advertising message</li><li>● <b>02</b>: greeting</li><li>● <b>03</b>: main menu of the first layer</li><li>● <b>04</b>: manual interception</li><li>● <b>05</b>: agent</li><li>● <b>06</b>: access through short numbers</li><li>● <b>07</b>: full-voice portal</li><li>● <b>08</b>: night navigation mode. Customers can access the mode by pressing <b>0</b>.</li><li>● <b>09</b>: full-voice portal at night</li><li>● <b>10</b>: access through self-service short numbers</li><li>● <b>11</b>: service mode accessed by the customer when all agents are in busy state</li><li>● <b>98</b>: others</li><li>● <b>99</b>: unidentified</li></ul> |
| mediaType   | String | Body     | No                                                  | Media type (text, audio, video, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter     | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                               |
|---------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channelType   | String | Body     | No        | Channel type. <ul style="list-style-type: none"> <li>• WEB</li> <li>• INSTAGRAM</li> <li>• TELEGRAM</li> <li>• WECHAT</li> <li>• FACEBOOK</li> <li>• TWITTER</li> <li>• EMAIL</li> <li>• LINE</li> <li>• WHATSAPP</li> <li>• 5G</li> <li>• SMS</li> </ul> |
| responseStyle | String | Body     | No        | Response style.                                                                                                                                                                                                                                           |

## ExtParams

| Parameter    | Type   | Position | Mandatory | Description                                                                                                                         |
|--------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| transin_data | String | Body     | No        | Call-associated data parameter agreed by the access party and the OIAP, for example, data packet parameters transferred by the IVR. |
| locationid   | String | Body     | No        | Call recording node ID.                                                                                                             |
| mediaability | String | Body     | No        | Media capability. <ul style="list-style-type: none"> <li>• 1: audio</li> <li>• 2: video</li> <li>• 3: audio and video</li> </ul>    |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ieValue   | String | Body     | No        | Call-associated data parameter agreed by the access party and the OIAP. This parameter is used to carry call information if a call is transferred from a third-party platform during interconnection to another platform.<br><br>Note: In the OIAP flow, the value of this parameter will be anonymized. |

### Request Example 1

```
{
 "userid": "1528780879-9581",
 "inaction": 8,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "auth_token": "eyJhbGciOiJSUzI1NiJ9.eyJpYXQiOiJlMzgwMzg5MzUzUzUzODAwMjUzNSwian",
 "suilu_region_id": "025",
 "entrance_id": "03"
 },
 "extparams": {
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005"
 }
}
```

After receiving a request whose **inaction** is **8**, **9**, or **11**, the ODFS may send different responses based on the TUC configuration, that is, the value of **outaction** may be **9**, **10**, **11**, or **12**.

**Table 10-14** outparams (outaction=9: Dialog Interaction)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prompt_type | String | Body     | Yes       | Interaction type. <ul style="list-style-type: none"> <li>• <b>0:</b> Plays a specified voice for voice interaction (full path).</li> <li>• <b>1:</b> Plays a specified voice for voice interaction.</li> <li>• <b>2:</b> Plays TTS content for voice interaction.</li> <li>• <b>3:</b> text interaction.</li> <li>• <b>4:</b> Records the voice of the calling party.</li> <li>• <b>5:</b> Plays a video.</li> <li>• <b>6:</b> multimedia interaction.</li> <li>• <b>7:</b> card interaction.</li> </ul> |

| Parameter   | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                           |
|-------------|--------|----------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prompt_wav  | String | Body     | No (special field in the voice navigation scenario) | <p>When <b>prompt_type</b> is set to <b>0</b>, <b>4</b>, or <b>5</b>, enter the full name of the path for storing the file to be played or recorded. (The path must be readable by the UAP.)</p> <p>When <b>prompt_type</b> is set to <b>1</b>, enter the name of the voice file (excluding the path header, which is assembled by the IVR during voice playing).</p> |
| prompt_text | String | Body     | Yes                                                 | <p>TTS dynamic text content or text dialog content.</p> <p>This parameter is mandatory when <b>prompt_type</b> is set to <b>2</b>, <b>3</b>, <b>6</b>, or <b>7</b>.</p>                                                                                                                                                                                               |
| language    | String | Body     | Yes                                                 | <p>Language ID. (This parameter is mandatory for TTS voice playing and ASR.)</p> <p><b>0</b>: Chinese<br/><b>1</b>: English</p>                                                                                                                                                                                                                                       |

| Parameter | Type   | Position | Mandatory                                           | Description                                                 |
|-----------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------|
| inter_idx | String | Body     | No (special field in the voice navigation scenario) | Number of consecutive interactions with a user in the ODFS. |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| call_script | JSON string | Body     | Yes       | <p>Recommended script.</p> <p>Note:<br/>The <b>intentcode</b> parameter indicates the TUC intention code and can be empty. The <b>intentDsp</b> parameter indicates the intention description and cannot be empty.</p> <pre>{   {intentcode:   "",   intentDsp:   "",   "status":"","   childintent[   {intentcode:   "",   intentDsp:   "",   "status":""},   {intentcode:   "",   intentDsp:   "",   "status":""}..   .]}   { intentcode   :"",   intentDsp:""   ,   "status":""} }</pre> | ODFS resource template configuration |

| Parameter               | Type   | Position | Mandatory | Description                                                                                                                         | Source        |
|-------------------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------|---------------|
| call_script_matchedstep | String | Body     | No        | Intention code.<br>It corresponds to the intention code in <b>call_script</b> .<br>It indicates the script progress (matched step). | TUC intention |

**Prompt\_text** format description (for intelligent case filling businesses)

| Parameter  | Type   | Position | Mandatory | Description                                  | Usage Method                                                                    |
|------------|--------|----------|-----------|----------------------------------------------|---------------------------------------------------------------------------------|
| beginIndex | String | Body     | Yes       | Start index of an entity in a text file.     | Start index of an entity in a text file.                                        |
| endIndex   | String | Body     | Yes       | End index of an entity in a text file.       | End index of an entity in a text file.                                          |
| type       | String | Body     | Yes       | Extracted entity type.                       | Recognition type of the entity. You do not need to enter the value in the form. |
| entity     | String | Body     | Yes       | Entity content, which has been standardized. | Used to fill in the corresponding fields in the form.                           |

| Parameter | Type   | Position | Mandatory | Description                                 | Usage Method                   |
|-----------|--------|----------|-----------|---------------------------------------------|--------------------------------|
| tag       | String | Body     | Yes       | Name of the field to be filled in the form. | Example: <b>object level 2</b> |

**Table 10-17** outparams (outaction=10: Dialog Hangup)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                 |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)                                                                                                                   |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID. |
| start_time  | String | Body     | Yes       | Dialog interaction start time.                                                                                                                                                                                                                                              |
| end_time    | String | Body     | Yes       | Dialog interaction end time.                                                                                                                                                                                                                                                |

| Parameter      | Type   | Position | Mandator<br>y                                          | Description                                                                                                                                                                                                                                                                                       |
|----------------|--------|----------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No                                                     | Whether the ODFS flow enters the <b>End</b> diagram element properly.<br><b>0</b> : The flow enters the <b>End</b> diagram element properly.<br><b>1</b> : The flow enters the <b>End</b> diagram element when an exception or timeout occurs and no error tolerance business logic is processed. |
| region_id      | String | Body     | No<br>(special field in the voice navigation scenario) | Region of a user.                                                                                                                                                                                                                                                                                 |
| entrance_id    | String | Body     | No<br>(special field in the voice navigation scenario) | Entrance ID.                                                                                                                                                                                                                                                                                      |
| exit_id        | String | Body     | No<br>(special field in the voice navigation scenario) | Exit ID. The value is the same as that of <b>entrance_id</b> .                                                                                                                                                                                                                                    |
| user_type_id   | String | Body     | No<br>(special field in the voice navigation scenario) | User type.                                                                                                                                                                                                                                                                                        |

| Parameter       | Type   | Position | Mandatory                                              | Description            |
|-----------------|--------|----------|--------------------------------------------------------|------------------------|
| suilu_region_id | String | Body     | No<br>(special field in the voice navigation scenario) | Call access region ID. |

 NOTE

Note: After a session ends, if the IVR initiates a request whose **inaction** is **9** or **11** and **input** is **hangup**, the ODFS triggers the hangup response and sends the response to the IVR as the end flag. The IVR does not invoke the ODFS interface anymore.

### Response Example 5

```
{
 "userid": "1528780879-9581",
 "outaction": 10,
 "outparams": {
 "call_id": "1528780879-9581",

 "end_time": "2018090407:30:24",
 "release_reason": "0",
 "region_id": "025",
 "entrance_id": "03",
 "exit_id": "05",
 "user_type_id": "01",
 "suilu_region_id": "025"
 }
}
```

## 10.5.2 Interface Invoked After Dialog Interaction (inaction=9)

After performing operations such as voice playing and text chat, the access party uses the current operation result as the input parameter to send a request to the ODFS for the next operation. The following describes the request parameter structure.

### inparams

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                   |
|-----------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters. |

| Parameter        | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_dst_id      | String | Body     | Yes       | <p>Access ID.</p> <ol style="list-style-type: none"> <li>1. In the voice navigation scenario, this parameter is set to the called number.</li> <li>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.</li> <li>3. In other interaction scenarios, this parameter is set to the access ID.</li> </ol> <p>The value can contain a maximum of 20 characters.</p> |
| flow_result_type | String | Body     | Yes       | <p>Result type.</p> <ul style="list-style-type: none"> <li>● <b>1</b>: voice recognition input or text input</li> <li>● <b>2</b>: voice key input</li> <li>● <b>3</b>: no input (playing only)</li> <li>● <b>4</b>: recording ended</li> <li>● <b>-1</b>: others</li> </ul>                                                                                                                            |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| input     | String | Body     | Yes       | <p>Dialog interaction result.</p> <ul style="list-style-type: none"> <li>• Voice recognition result or text input. The voice recognition result is the ID in <i>Redis value key +@+inter_no</i> format. The text input result is the text content.</li> <li>• Voice key result, which is the key value, for example, <b>1</b> and <b>201801</b>.</li> <li>• <b>playover</b>: voice playing completed</li> <li>• <b>timeout</b>: timeout</li> <li>• <b>nomatch</b>: recognition failure or key pressing failure</li> <li>• <b>sys_err</b>: system exception</li> <li>• <b>hangup</b>: hangup</li> <li>• <b>recordend</b>: recording ended</li> </ul> <p>If the result is <b>hangup</b>, the hangup response of the ODFS can be triggered.</p> <p>The value can contain a maximum of 1024 characters.</p> |

| Parameter      | Type   | Position | Mandatory                                                                             | Description                                                                                                                                                               |
|----------------|--------|----------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth_token     | String | Body     | Yes                                                                                   | Authorization information, which is the token value returned by the access control system.<br><br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |
| recordFileName | String | Body     | No (special field in the voice navigation scenario that supports full-flow recording) | Full-flow recording path and file name, for example, <b>Y:/record/1/20200421/xxxxxx.wav</b> .                                                                             |
| inter_idx      | String | Body     | No (special field in the voice navigation scenario)                                   | Number of interaction times. The value is the same as that of <b>inter_idx</b> returned by the ODFS in the previous time.                                                 |
| begin_play     | String | Body     | No (special field in the voice navigation scenario)                                   | Voice playing start time.                                                                                                                                                 |
| end_play       | String | Body     | No (special field in the voice navigation scenario)                                   | Voice playing end time.                                                                                                                                                   |
| result_time    | String | Body     | No (special field in the voice navigation scenario)                                   | Time when the result is generated.                                                                                                                                        |

| Parameter | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IACmd     | String | Body     | No (special field in the voice navigation scenario) | <p>Field dedicated for intelligent match and intelligent case filling.</p> <p>This parameter must be set to <b>match</b> when intelligent match is used.</p> <p>This parameter can be set to any of the following values when intelligent case filling is used:</p> <p><b>match:</b> A case filling request is submitted.</p> <p><b>rematch:</b> An event is re-identified when the classification of the identified event is incorrect.</p> <p><b>confirm:</b> When an agent selects a field, the system notifies the ODFS that the field has been confirmed.</p> |

| Parameter       | Type    | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TextSource      | String  | Body     | No (special field in the voice navigation scenario) | <p>Whether the input text is from an agent or a user when <b>IACmd</b> is set to <b>match</b> (same for intelligent matching and intelligent case filling). The options are <b>staff</b> and <b>customer</b>.</p> <p><b>staff</b>: agent<br/><b>customer</b>: user</p> <p>The name of the field selected by the agent is transferred when <b>IACmd</b> is set to <b>confirm</b>, for example, object level 2.</p> <p>This parameter is optional when <b>IACmd</b> is set to <b>rematch</b>.</p> |
| feedback        | Integer | Body     | No                                                  | Satisfaction. The options are <b>1</b> (satisfactory) and <b>0</b> (unsatisfactory).                                                                                                                                                                                                                                                                                                                                                                                                            |
| feedbackContent | String  | Body     | No                                                  | Dissatisfaction reason. If the feedback is satisfactory, leave this parameter empty.                                                                                                                                                                                                                                                                                                                                                                                                            |
| mediaType       | String  | Body     | No                                                  | Media type (text, audio, video, and so on).<br>Example: <b>audio</b> or <b>video</b>                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter                     | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                   |
|-------------------------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channelType                   | String | Body     | No        | Channel type. <ul style="list-style-type: none"><li>• WEB</li><li>• INSTAGRAM</li><li>• TELEGRAM</li><li>• WECHAT</li><li>• FACEBOOK</li><li>• TWITTER</li><li>• EMAIL</li><li>• LINE</li><li>• WHATSAPP</li><li>• 5G</li><li>• SMS</li></ul> |
| refeedbackContentcordFileName | String | Body     | No        | Name of a voice recording file.                                                                                                                                                                                                               |
| call_media_type               | String | Body     | No        | Type of an inbound IVR call. The options are <b>1</b> (audio) and <b>3</b> (video).                                                                                                                                                           |

## ExtParams

| Parameter    | Type   | Position | Mandatory | Description                                                                                                                          |
|--------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| transin_data | String | Body     | No        | Call-associated data parameters agreed by the access party and the OIAP, for example, data packet parameters transferred by the IVR. |

| Parameter      | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                        |
|----------------|--------|----------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No (special field in the voice navigation scenario) | Reason code reported by the IVR to the ODFS for call release.<br><b>0:</b> The call is released in a business flow.<br><b>1:</b> The system releases the call abnormally.<br><b>2:</b> The user releases the call. |
| queueIndex     | String | Body     | No (only in the queuing information query scenario) | Queuing position of a skill queue.                                                                                                                                                                                 |
| agentCount     | String | Body     | No (only in the queuing information query scenario) | Number of online agents in a skill queue.                                                                                                                                                                          |
| estimateTime   | String | Body     | No (only in the queuing information query scenario) | Estimated wait time of a skill queue.                                                                                                                                                                              |
| idleAgentCount | String | Body     | No (only in the queuing information query scenario) | Number of idle agents in a skill queue.                                                                                                                                                                            |

## Request Example

```
{
 "userid": "1528780879-9581",
 "inaction": 9,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_dst_id": "10086",
 "flow_result_type": "1",
 "input": "Help me query the call fee."
 }
}
```

```
"inter_idx": "1",
"begin_play": "2018090407:16:24",
"end_play": "2018090407:16:30",
"result_time": "2018090407:16:3",
"inter_no": "0"
},
"extparams": {
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005",
 "queueIndex": "2",
 "agentCount": "5"
}
}
```

If the ODFS determines that **flow\_result\_type** is set to **1** and **input** is set to the recognition result ID, the ODFS invokes the Redis to obtain the converted text in which **key** is set to the Redis value key in the recognition result ID. The obtained recognition text is a non-JSON character string.

The following is an example of the code for the Lua script to obtain the Redis result. In the example, the key value is **msg**.

```
local red = redis:new()

red:set_timeout(1000)

local ip = "192.168.77.193"
local port = 22122
local ok, err = red:connect(ip, port)
- if not ok then
 ngx.say("connect to redis error : ", err)
 return close_redis(red)
end

local resp, err = red:get("msg")
- if not resp then
 ngx.say("get msg error : ", err)
 return close_redis(red)
end
```

After receiving a request whose **inaction** is **8**, **9**, or **11**, the ODFS may send different responses based on the TUC configuration, that is, the value of **outaction** may be **9**, **10**, **11**, or **12**.

**Table 10-18** outparams (outaction=9: Dialog Interaction)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| prompt_type | String | Body     | Yes       | Interaction type. <ul style="list-style-type: none"> <li>• <b>0</b>: Plays a specified voice for voice interaction (full path).</li> <li>• <b>1</b>: Plays a specified voice for voice interaction.</li> <li>• <b>2</b>: Plays TTS content for voice interaction.</li> <li>• <b>3</b>: text interaction.</li> <li>• <b>4</b>: Records the voice of the calling party.</li> <li>• <b>5</b>: Plays a video.</li> <li>• <b>6</b>: multimedia interaction.</li> <li>• <b>7</b>: card interaction.</li> </ul> |

| Parameter   | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                    |

**Table 10-21** outparams (outaction=10: Dialog Hangup)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                 |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)                                                                                                                   |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID. |
| start_time  | String | Body     | Yes       | Dialog interaction start time.                                                                                                                                                                                                                                              |
| end_time    | String | Body     | Yes       | Dialog interaction end time.                                                                                                                                                                                                                                                |

| Parameter      | Type   | Position | Mandator<br>y                                          | Description                                                                                                                                                                                                                                                                                       |
|----------------|--------|----------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No                                                     | Whether the ODFS flow enters the <b>End</b> diagram element properly.<br><b>0</b> : The flow enters the <b>End</b> diagram element properly.<br><b>1</b> : The flow enters the <b>End</b> diagram element when an exception or timeout occurs and no error tolerance business logic is processed. |
| region_id      | String | Body     | No<br>(special field in the voice navigation scenario) | Region of a user.                                                                                                                                                                                                                                                                                 |
| entrance_id    | String | Body     | No<br>(special field in the voice navigation scenario) | Entrance ID.                                                                                                                                                                                                                                                                                      |
| exit_id        | String | Body     | No<br>(special field in the voice navigation scenario) | Exit ID. The value is the same as that of <b>entrance_id</b> .                                                                                                                                                                                                                                    |
| user_type_id   | String | Body     | No<br>(special field in the voice navigation scenario) | User type.                                                                                                                                                                                                                                                                                        |

| Parameter       | Type   | Position | Mandatory                                              | Description            |
|-----------------|--------|----------|--------------------------------------------------------|------------------------|
| suilu_region_id | String | Body     | No<br>(special field in the voice navigation scenario) | Call access region ID. |

 NOTE

After a session ends, if the IVR initiates a request whose **inaction** is **9** or **11** and **input** is **hangup**, the ODFS triggers the hangup response and sends the response to the IVR as the end flag. The IVR does not invoke the ODFS interface.

### Response Example 3

```
{
 "userid": "1528780879-9581",
 "outaction": 10,
 "outparams": {
 "call_id": "1528780879-9581",

 }
}
```

## 10.5.3 Interface Invoked After Dialog Transfer (inaction=11)

After completing the dialog transfer operation, the access party uses the current operation result as the input parameter to send a request to the ODFS for the next operation. The following describes the request parameter structure.

### inparams

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                       |
|-----------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br><br>The value can contain a maximum of 64 characters. |

| Parameter     | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_dst_id   | String | Body     | Yes       | <p>Access ID.</p> <ol style="list-style-type: none"> <li>In the voice navigation scenario, this parameter is set to the flow access code.</li> <li>In the voice outbound call survey scenario, this parameter is set to the flow access code.</li> <li>In other interaction scenarios, this parameter is set to the access ID.</li> </ol> <p>The value can contain a maximum of 20 characters.</p> |
| begin_trans   | String | Body     | Yes       | Transfer start time.                                                                                                                                                                                                                                                                                                                                                                               |

| input     | String | Body     | No                                                     | <p>Interaction result. (For details about this parameter, see the following scenarios.)</p> <p>After the transfer is successful, the <b>trans_result</b> parameter that is set to <b>0</b> is added to the request, and the <b>input</b> parameter is not required. Then, the access party receives the hangup response (in which <b>outaction</b> is set to <b>10</b>) of the ODFS, and the access party needs to send the request again. The request needs to obtain the <b>input</b> parameter that is set to <b>hangup</b>.</p> <ul style="list-style-type: none"> <li>• <b>hangup</b>: hangup</li> </ul> <p>The value can contain a maximum of 1024 characters.</p> |
| inter_idx | String | Body     | No<br>(special field in the voice navigation scenario) | <p>Number of interaction times. The value is the same as that of <b>inter_idx</b> returned by the ODFS in the previous time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mediaType | String | Body     | No                                                     | <p>Media type (text, audio, video, and so on).</p> <p>Example: <b>audio</b> or <b>video</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                               |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channelType | String | Body     | No        | Channel type. <ul style="list-style-type: none"> <li>• WEB</li> <li>• INSTAGRAM</li> <li>• TELEGRAM</li> <li>• WECHAT</li> <li>• FACEBOOK</li> <li>• TWITTER</li> <li>• EMAIL</li> <li>• LINE</li> <li>• WHATSAPP</li> <li>• 5G</li> <li>• SMS</li> </ul> |

### ExtParams

| Parameter    | Type   | Position | Mandatory | Description                                                                                                                          |
|--------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| transin_data | String | Body     | No        | Call-associated data parameters agreed by the access party and the OIAP, for example, data packet parameters transferred by the IVR. |

### Request

- If the call is transferred successfully, the access party sends the following request:

```
{
 "userid": "1528780879-9581",
 "inaction": 11,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_dst_id": "10086",
 "begin_trans": "2018090407:16:24",
 "end_trans": "2018090407:20:24",
 "trans_result": "0",
 "input": "",
 "inter_idx": "1"
 },
 "extparams": {
```

```
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005"
 }
}
```

After receiving a response from the ODFS, the access party sends the following request again:

```
{
 "userid": "1528780879-9581",
 "inaction": 11,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_dst_id": "10086",
 "begin_trans": "2018090407:16:24",
 "end_trans": "2018090407:20:24",
 "trans_result": "0",
 "input": "hangup",
 "inter_idx": "1"
 },
 "extparams": {
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005"
 }
}
```

After receiving the request, the ODFS sends a hangup response again. The access party does not need to invoke the ODFS interface. The call transfer is complete.

- If the call fails to be transferred:  
After the preceding parameters are transferred, the access party may receive the response containing the value of **outaction** from the ODFS. The options are **9**, **10**, and **11**, and the actual value is determined by the business logic.

After receiving a request whose **inaction** is **8**, **9**, or **11**, the ODFS may send different responses based on the TUC configuration, that is, the value of **outaction** may be **9**, **10**, **11**, or **12**.

**Table 10-22** outparams (outaction=9: Dialog Interaction)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 10-27** outparams (outaction=10: Dialog Hangup)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                 |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)                                                                                                                   |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID. |
| start_time  | String | Body     | Yes       | Dialog interaction start time.                                                                                                                                                                                                                                              |
| end_time    | String | Body     | Yes       | Dialog interaction end time.                                                                                                                                                                                                                                                |

| Parameter      | Type   | Position | Mandator<br>y                                          | Description                                                                                                                                                                                                                                                                                       |
|----------------|--------|----------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No                                                     | Whether the ODFS flow enters the <b>End</b> diagram element properly.<br><b>0</b> : The flow enters the <b>End</b> diagram element properly.<br><b>1</b> : The flow enters the <b>End</b> diagram element when an exception or timeout occurs and no error tolerance business logic is processed. |
| region_id      | String | Body     | No<br>(special field in the voice navigation scenario) | Region of a user.                                                                                                                                                                                                                                                                                 |
| entrance_id    | String | Body     | No<br>(special field in the voice navigation scenario) | Entrance ID.                                                                                                                                                                                                                                                                                      |
| exit_id        | String | Body     | No<br>(special field in the voice navigation scenario) | Exit ID. The value is the same as that of <b>entrance_id</b> .                                                                                                                                                                                                                                    |
| user_type_id   | String | Body     | No<br>(special field in the voice navigation scenario) | User type.                                                                                                                                                                                                                                                                                        |

| Parameter       | Type   | Position | Mandator y                                          | Description            |
|-----------------|--------|----------|-----------------------------------------------------|------------------------|
| suilu_region_id | String | Body     | No (special field in the voice navigation scenario) | Call access region ID. |

 NOTE

After a session ends, if the IVR initiates a request whose **inaction** is **9** or **11** and **input** is **hangup**, the ODFS triggers the hangup response and sends the response to the IVR as the end flag. The IVR does not invoke the ODFS interface.

### Response Example 3

```
{
 "userid": "1528780879-9581",
 "outaction": 10,

 "entrance_id": "03",
 "exit_id": "05",
 "user_type_id": "01",
 "suilu_region_id": "025"
 }
}
```

## 10.5.4 Packet Capture and Recording Interface Invoked in the Dialog (inaction=7)

When sending a request to the ODFS for the first time, the access party first requests the ODFS to enable VoiceCyber recording. Whether the ODFS sends an enabling request to VoiceCyber is determined during the flow release. This interface is applicable only to the intelligent IVR service on the network where the packet capture system (for example, VoiceCyber) is interconnected.

**Table 10-28** inparams

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                           |
|-------------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | No        | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                         |
| call_sor_id | String | Body     | No        | User ID. (In the voice navigation and voice outbound call scenarios, the user number is transferred. In other interaction scenarios, the user ID is transferred.)<br>The value can contain a maximum of 64 characters.                                                                                                                |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the flow access code.<br>2. In the voice outbound call survey scenario, this parameter is set to the flow access code.<br>3. In other interaction scenarios, this parameter is set to the access ID.<br>The value can contain a maximum of 20 characters. |
| real_callee | String | Body     | No        | Called number for accessing the IVR. This parameter is valid in the voice navigation scenario.<br>The value can contain a maximum of 32 characters.                                                                                                                                                                                   |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                     |
|------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cti_callid | String | Body     | No (special field in the voice navigation scenario) | Call ID of the CTI to which a call is connected, which is transferred by Huawei IVR. In other scenarios, this parameter is left empty.<br><br>The value can contain a maximum of 32 characters. |
| auth_token | String | Body     | Yes                                                 | Authorization information, which is the token value returned by the access control system.                                                                                                      |

## Request

```
{
