 "auth_token": "eyJhbG*****UzNSwian"
 }
}
```

After receiving the request in which the value of **inaction** is **7**, the ODFS determines whether to send a request for starting recording or a packet capture session to the packet capture and recording system (for example, VoiceCyber) based on the flow configuration. Then, the ODFS sends a response to the IVR.

## outparams (outaction=7: Successfully Starting and Interconnecting with the Packet Capture System)

Response Example

```
{
 "ret": "0",
 "userid": "16128422559300717ed3bf958dca2d0cda6c1",
 "outaction": "7",
 "outparams": {}
}
```

## 10.5.5 Recognition Result Requesting Interface (inaction=13)

The access party requests the ODFS to return the voice recognition result so that the voice playing can be interrupted. This interface is applicable only to the intelligent IVR service on the network where the packet capture system (for example, VoiceCyber) is interconnected.

**Table 10-29** inparams

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                           |
|-------------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | No        | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                         |
| call_sor_id | String | Body     | No        | User ID. (In the voice navigation and voice outbound call scenarios, the user number is transferred. In other interaction scenarios, the user ID is transferred.)<br>The value can contain a maximum of 64 characters.                                                                                                                |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the flow access code.<br>2. In the voice outbound call survey scenario, this parameter is set to the flow access code.<br>3. In other interaction scenarios, this parameter is set to the access ID.<br>The value can contain a maximum of 20 characters. |
| real_callee | String | Body     | No        | Called number for accessing the IVR. This parameter is valid in the voice navigation scenario.<br>The value can contain a maximum of 32 characters.                                                                                                                                                                                   |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                     |
|------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cti_callid | String | Body     | No (special field in the voice navigation scenario) | Call ID of the CTI to which a call is connected, which is transferred by Huawei IVR. In other scenarios, this parameter is left empty.<br><br>The value can contain a maximum of 32 characters. |
| auth_token | String | Body     | Yes                                                 | Authorization information, which is the token value returned by the access control system.                                                                                                      |

## Request

```
{
 "userid": "1528780879-9581",
 "inaction": 13,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "auth_token": "eyJhbG*****jUzNSwian"
 }
}
```

After receiving the request in which the value of **inaction** is **13**, the ODFS checks whether the call recognition result queue reported by VoiceCyber contains data. If yes, the ODFS returns **1** to the IVR. If no, the ODFS returns **0**.

**Table 10-30** outparams (outaction=13: Recognition Result Feedback)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter      | Type   | Position | Mandatory | Description                                                                                                                |
|----------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------|
| recognize_type | String | Body     | Yes       | Whether the recognition result has been obtained. <ul style="list-style-type: none"><li>• 0: no</li><li>• 1: yes</li></ul> |

## Response Example

```
{
 "ret": "0",
 "userid": "1528780879-9581",
 "outaction": "13",
 "outparams": {
 "call_id": "1528780879-9581",
 "recognize_type": "0"
 }
}
```

## 10.6 Dialog Interfaces (V2)

### Description

The OIAP provides interfaces for third-party systems to perform real-time dialog operations such as initialization, dialog interaction, dialog transfer, and hangup so that third-party systems can complete multi-round dialog interactions with customers as well as business handling and query.

Compared with the original dialog interfaces, the dialog interfaces (V2) support gray routing based on **vdnid** (carried in the interface URL). The interface parameters and logic are the same as those of the original dialog interfaces.

### Interface Method

The request method must be set to POST.

### URL

<https://IP:PORT/oifde/rest/v2/crs/process/{vdnid}>

## Request

**Table 10-31** Parameters in the request body

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|---------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userid    | String  | Body     | Yes       | The ODFS establishes call instances internally based on this parameter. The ODFS may have multiple call instances at the same time. Subsequent interactions are associated with the same call based on the parameter. The value can contain a maximum of 64 characters.                                                                                                                                                             |
| inaction  | Integer | Body     | Yes       | Type of the request that the access party executes this time.<br><b>8</b> : dialog initialization request (for the first invoking)<br><b>9</b> : request after dialog interaction<br><b>11</b> : request after dialog transfer<br>Note: This parameter is set to <b>8</b> for the first interface invoking. In subsequent interactions, the parameter is set to the value of <b>outaction</b> received in the previous interaction. |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                               |
|-----------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| seat      | String | Body     | No        | Agent type. The default value is <b>vir</b> . <ul style="list-style-type: none"> <li>• <b>vir</b>: virtual agent</li> <li>• <b>ass</b>: agent assistant</li> </ul>                                                                        |
| inparams  | Object | Body     | Yes       | Parameters that are sent to the ODFS to inform the ODFS of the detailed information about the operation result. The value of <b>inparams</b> varies depending on the value of <b>inaction</b> . The parameters are described by scenario. |
| extparams | Object | Body     | No        | Optional dynamic parameters that are sent to the ODFS, which are used only in the initialization scenario.                                                                                                                                |

## Response

| Parameter | Type    | Position | Mandatory | Description                                                                                                              |
|-----------|---------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------|
| ret       | Integer | Body     | Yes       | Execution result. <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> |

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                      |
|-----------|---------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userid    | String  | Body     | Yes       | The ODFS establishes call instances internally based on this parameter. The ODFS may have multiple call instances at the same time. Subsequent interactions are associated with the same call based on the parameter.                                                                                                                                            |
| outaction | Integer | Body     | Yes       | Type of the operation performed by the access party. <ul style="list-style-type: none"> <li>● <b>9</b>: dialog interaction</li> <li>● <b>11</b>: dialog transfer</li> <li>● <b>10</b>: hangup</li> <li>● <b>12</b>: query</li> <li>● <b>7</b>: packet capture and recording enabled in the dialog</li> <li>● <b>13</b>: recognition result requesting</li> </ul> |
| outparams | Object  | Body     | Yes       | Detailed information required for the access party to complete the operation. The parameters are described by scenario. <ul style="list-style-type: none"> <li>● <a href="#">Table 10-32</a></li> <li>● <a href="#">Table 10-38</a></li> <li>● <a href="#">Table 10-37</a></li> <li>● <a href="#">Table 10-36</a></li> </ul>                                     |

## Return Code

### NOTICE

If the response body does not contain the return code and description, use the native return code of HTTPS.

| Return Code | Description                              | Possible Cause                                                                                                                                    | Solution                                            |
|-------------|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| 200         | This operation is successful.            | The processing is successful.                                                                                                                     | -                                                   |
| 400         | The request is incorrect.                | The request URL is incorrect.                                                                                                                     | Use a correct request URL.                          |
| 500         | The business fails.                      | The value of a parameter in the request does not exist in the system. For example, the case type code that you send does not exist in the system. | Verify the values of the parameters in the request. |
| Others      | Refer to the standard HTTPS status code. | -                                                                                                                                                 | -                                                   |

### 10.6.1 Dialog Initialization Interface (inaction=8)

When the access party sends a request to the ODFS for the first time, the access party needs to send a request whose **inaction** is **8** to notify the ODFS of initialization. The ODFS returns the next operation of the access party in **outparams**. This section describes the **inparams** parameter structure and request example and the return parameter structure and message examples in different scenarios.

## inparams

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | Yes       | <p>Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.</p> <p>The value can contain a maximum of 64 characters.</p>                                                                                                                                                                                                                                           |
| call_sor_id | String | Body     | Yes       | <p>User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)</p> <p>The value can contain a maximum of 64 characters.</p>                                                                                                                                                                          |
| call_dst_id | String | Body     | Yes       | <p>Access ID.</p> <ol style="list-style-type: none"> <li>In the voice navigation scenario, this parameter is set to the flow access code.</li> <li>In the voice outbound call survey scenario, this parameter is set to the flow access code.</li> <li>In other interaction scenarios, this parameter is set to the access ID.</li> </ol> <p>The value can contain a maximum of 20 characters.</p> |
| real_callee | String | Body     | No        | <p>Called number for accessing the IVR. This parameter is valid in the voice navigation scenario.</p> <p>The value can contain a maximum of 32 characters.</p>                                                                                                                                                                                                                                     |

| Parameter       | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                 |
|-----------------|--------|----------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cti_callid      | String | Body     | No (special field in the voice navigation scenario) | Call ID of the CTI to which a call is connected, which is transferred by Huawei IVR. In other scenarios, this parameter is left empty.<br>The value can contain a maximum of 32 characters. |
| auth_token      | String | Body     | Yes                                                 | Authorization information, which is the token value returned by the access control system.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                       |
| suilu_region_id | String | Body     | No (special field in the voice navigation scenario) | Region where the calling party is located.<br>The value can contain a maximum of 64 characters.                                                                                             |

| Parameter   | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## ExtParams

| Parameter    | Type   | Position | Mandatory | Description                                                                                                                         |
|--------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| transin_data | String | Body     | No        | Call-associated data parameter agreed by the access party and the OIAP, for example, data packet parameters transferred by the IVR. |
| locationid   | String | Body     | No        | Call recording node ID.                                                                                                             |
| mediaability | String | Body     | No        | Media capability. <ul style="list-style-type: none"><li>• 1: audio</li><li>• 2: video</li><li>• 3: audio and video</li></ul>        |

| Parameter | Type   | Position | Mandator<br>y | Description                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ieValue   | String | Body     | No            | Call-associated data parameter agreed by the access party and the OIAP. This parameter is used to carry call information if a call is transferred from a third-party platform during interconnection to another platform.<br><br>Note: In the OIAP flow, the value of this parameter will be anonymized. |

### Request Example 1

```
{
 "userid": "1528780879-9581",
 "inaction": 8,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "auth_token": "eyJhbGc*****MjUzNSwian",
 "suilu_region_id": "025",
 "entrance_id": "03"
 },
 "extparams": {
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005"
 }
}
```

After receiving a request whose **inaction** is **8**, **9**, or **11**, the ODFS may send different responses based on the TUC configuration, that is, the value of **outaction** may be **9**, **10**, **11**, or **12**.

**Table 10-32** outparams (outaction=9: Dialog Interaction)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prompt_type | String | Body     | Yes       | <p>Interaction type.</p> <ul style="list-style-type: none"> <li>• <b>0:</b> Plays a specified voice for voice interaction (full path).</li> <li>• <b>1:</b> Plays a specified voice for voice interaction.</li> <li>• <b>2:</b> Plays TTS content for voice interaction.</li> <li>• <b>3:</b> text interaction.</li> <li>• <b>4:</b> Records the voice of the calling party.</li> <li>• <b>5:</b> Plays a video.</li> <li>• <b>6:</b> multimedia interaction.</li> <li>• <b>7:</b> card interaction.</li> </ul> |

| Parameter   | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------|----------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## outparams (outaction=12: Query Operation, Used in the Common IVR Flow)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prompt_type | String | Body     | Yes       | <p>Query type.</p> <ul style="list-style-type: none"> <li>• <b>1:</b> Query the queuing information about the current skill queue when a call is queuing in a skill queue.</li> <li>• <b>2:</b> Query the queuing information by skill queue ID before a call enters a skill queue.</li> <li>• <b>3:</b> Query the information about the skill queue where an agent belongs by agent ID.</li> <li>• <b>5:</b> Switch between audio and video calls.</li> </ul> |
| skill_id    | String | String   | No        | <p>Skill queue ID.</p> <p>This parameter is mandatory only when <b>prompt_type</b> is set to <b>2</b>.</p>                                                                                                                                                                                                                                                                                                                                                     |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                 |
|------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------|
| moduleName | String | Body     | No                                                  | Module name, that is, name of a diagram element.            |
| inter_idx  | String | Body     | No (special field in the voice navigation scenario) | Number of consecutive interactions with a user in the ODFS. |

### Response Example 3

```
{
 "outaction": 12,
 "outparams": {
 "call_id": "1528780879-9581",
 "prompt_type": "1",
 "inter_idx": "1",
 "moduleName": "Query",
 "xxx": "xxx" //Extend
 }
}
```

### outparams (outaction=11: Dialog Transfer)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                               |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.                                                                  |
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.) |

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| trans_type | String | Body     | Yes       | <p>Dialog transfer type.</p> <ul style="list-style-type: none"> <li>• <b>1:</b> transfer to the manual service (to a skill queue based on the routing number)</li> <li>• <b>2:</b> transfer to an IVR</li> <li>• <b>3:</b> transfer to the manual service (to a skill queue based on the skill name)</li> <li>• <b>4:</b> transfer to the manual service (to an agent ID)</li> <li>• <b>5:</b> transfer to a third-party number</li> <li>• <b>6:</b> online digital assistance</li> <li>• <b>7:</b> transfer to the manual service (to the last agent. Currently, only multimedia is supported.)</li> </ul> |

| Parameter | Type | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

 "answer_id": "Y"
 }
}
```

### outparams (outaction=10: Dialog Hangup)

After a session ends, if the IVR initiates a request whose **inaction** is **9** or **11** and **input** is **hangup**, the ODFS triggers the hangup response and sends the response to the IVR as the end flag. The IVR does not invoke the ODFS interface anymore.

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                 |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.                                                                                                                                                                                    |
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)                                                                                                                   |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID. |
| start_time  | String | Body     | Yes       | Dialog interaction start time.                                                                                                                                                                                                                                              |
| end_time    | String | Body     | Yes       | Dialog interaction end time.                                                                                                                                                                                                                                                |

| Parameter      | Type   | Position | Mandator<br>y                                       | Description                                                                                                                                                                                                                                                                                       |
|----------------|--------|----------|-----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No                                                  | Whether the ODFS flow enters the <b>End</b> diagram element properly.<br><b>0</b> : The flow enters the <b>End</b> diagram element properly.<br><b>1</b> : The flow enters the <b>End</b> diagram element when an exception or timeout occurs and no error tolerance business logic is processed. |
| region_id      | String | Body     | No (special field in the voice navigation scenario) | Region of a user.                                                                                                                                                                                                                                                                                 |
| entrance_id    | String | Body     | No (special field in the voice navigation scenario) | Entrance ID.                                                                                                                                                                                                                                                                                      |
| exit_id        | String | Body     | No (special field in the voice navigation scenario) | Exit ID. The value is the same as that of <b>entrance_id</b> .                                                                                                                                                                                                                                    |
| user_type_id   | String | Body     | No (special field in the voice navigation scenario) | User type.                                                                                                                                                                                                                                                                                        |

| Parameter       | Type   | Position | Mandatory                                              | Description            |
|-----------------|--------|----------|--------------------------------------------------------|------------------------|
| suilu_region_id | String | Body     | No<br>(special field in the voice navigation scenario) | Call access region ID. |

### Response Example 5

```
{
 "userid": "1528780879-9581",
 "outaction": 10,
 "outparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "start_time": "2018090407:16:24",
 "end_time": "2018090407:30:24",
 "release_reason": "0",
 "region_id": "025",
 "entrance_id": "03",
 "exit_id": "05",
 "user_type_id": "01",
 "suilu_region_id": "025"
 }
}
```

## 10.6.2 Interface Invoked After Dialog Interaction (inaction=9)

After performing operations such as voice playing and text chat, the access party uses the current operation result as the input parameter to send a request to the ODFS for the next operation. The following describes the request parameter structure.

### inparams

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                   |
|-----------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters. |

| Parameter        | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                      |
|------------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_dst_id      | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID.<br>The value can contain a maximum of 20 characters. |
| flow_result_type | String | Body     | Yes       | Result type. <ul style="list-style-type: none"><li>● 1: voice recognition input or text input</li><li>● 2: voice key input</li><li>● 3: no input (playing only)</li><li>● 4: recording ended</li><li>● -1: others</li></ul>                                                                                                      |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| input     | String | Body     | Yes       | <p>Dialog interaction result.</p> <ul style="list-style-type: none"> <li>• Voice recognition result or text input. The voice recognition result is the ID in <i>Redis value key +@+inter_no</i> format. The text input result is the text content.</li> <li>• Voice key result, which is the key value, for example, <b>1</b> and <b>201801</b>.</li> <li>• <b>playover</b>: voice playing completed</li> <li>• <b>timeout</b>: timeout</li> <li>• <b>nomatch</b>: recognition failure or key pressing failure</li> <li>• <b>sys_err</b>: system exception</li> <li>• <b>hangup</b>: hangup</li> <li>• <b>recordend</b>: recording ended</li> </ul> <p>If the result is <b>hangup</b>, the hangup response of the ODFS can be triggered.</p> <p>The value can contain a maximum of 1024 characters.</p> |

| Parameter      | Type   | Position | Mandatory                                                                             | Description                                                                                                                                                               |
|----------------|--------|----------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auth_token     | String | Body     | Yes                                                                                   | Authorization information, which is the token value returned by the access control system.<br><br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |
| recordFileName | String | Body     | No (special field in the voice navigation scenario that supports full-flow recording) | Full-flow recording path and file name, for example, <b>Y:/record/1/20200421/xxxxxx.wav</b> .                                                                             |
| inter_idx      | String | Body     | No (special field in the voice navigation scenario)                                   | Number of interaction times. The value is the same as that of <b>inter_idx</b> returned by the ODFS in the previous time.                                                 |
| begin_play     | String | Body     | No (special field in the voice navigation scenario)                                   | Voice playing start time.                                                                                                                                                 |
| end_play       | String | Body     | No (special field in the voice navigation scenario)                                   | Voice playing end time.                                                                                                                                                   |
| result_time    | String | Body     | No (special field in the voice navigation scenario)                                   | Time when the result is generated.                                                                                                                                        |
| inter_no       | String | Body     | No (special field in the voice navigation scenario)                                   | Recognition ID.                                                                                                                                                           |

| Parameter | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|----------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IACmd     | String | Body     | No (special field in the voice navigation scenario) | <p>Field dedicated for intelligent match and intelligent case filling.</p> <p>This parameter must be set to <b>match</b> when intelligent match is used.</p> <p>This parameter can be set to any of the following values when intelligent case filling is used:</p> <p><b>match:</b> A case filling request is submitted.</p> <p><b>rematch:</b> An event is re-identified when the classification of the identified event is incorrect.</p> <p><b>confirm:</b> When an agent selects a field, the system notifies the ODFS that the field has been confirmed.</p> |

| Parameter       | Type    | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TextSource      | String  | Body     | No (special field in the voice navigation scenario) | <p>Whether the input text is from an agent or a user when <b>IACmd</b> is set to <b>match</b> (same for intelligent matching and intelligent case filling). The options are <b>staff</b> and <b>customer</b>.</p> <p><b>staff</b>: agent<br/><b>customer</b>: user</p> <p>The name of the field selected by the agent is transferred when <b>IACmd</b> is set to <b>confirm</b>, for example, object level 2.</p> <p>This parameter is optional when <b>IACmd</b> is set to <b>rematch</b>.</p> |
| feedback        | Integer | Body     | No                                                  | Satisfaction. The options are <b>1</b> (satisfactory) and <b>0</b> (unsatisfactory).                                                                                                                                                                                                                                                                                                                                                                                                            |
| feedbackContent | String  | Body     | No                                                  | Dissatisfaction reason. If the feedback is satisfactory, leave this parameter empty.                                                                                                                                                                                                                                                                                                                                                                                                            |
| mediaType       | String  | Body     | No                                                  | Media type (text, audio, video, and so on).<br>Example: <b>audio</b> or <b>video</b>                                                                                                                                                                                                                                                                                                                                                                                                            |

| Parameter                     | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                   |
|-------------------------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| refeedbackContentcordFileName | String | Body     | No        | Name of a voice recording file.                                                                                                                                                                                                               |
| call_media_type               | String | Body     | No        | Type of an inbound IVR call. The options are <b>1</b> (audio) and <b>3</b> (video).                                                                                                                                                           |

## ExtParams

| Parameter    | Type   | Position | Mandatory | Description                                                                                                                          |
|--------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| transin_data | String | Body     | No        | Call-associated data parameters agreed by the access party and the OIAP, for example, data packet parameters transferred by the IVR. |

| Parameter      | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                        |
|----------------|--------|----------|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No (special field in the voice navigation scenario) | Reason code reported by the IVR to the ODFS for call release.<br><b>0:</b> The call is released in a business flow.<br><b>1:</b> The system releases the call abnormally.<br><b>2:</b> The user releases the call. |
| queueIndex     | String | Body     | No (only in the queuing information query scenario) | Queuing position of a skill queue.                                                                                                                                                                                 |
| agentCount     | String | Body     | No (only in the queuing information query scenario) | Number of online agents in a skill queue.                                                                                                                                                                          |
| estimateTime   | String | Body     | No (only in the queuing information query scenario) | Estimated wait time of a skill queue.                                                                                                                                                                              |
| idleAgentCount | String | Body     | No (only in the queuing information query scenario) | Number of idle agents in a skill queue.                                                                                                                                                                            |

## Request Example

```
{
 "userid": "1528780879-9581",
 "inaction": 9,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_dst_id": "10086",
 "flow_result_type": "1",
 "input": "Help me query the call fee."
 }
}
```

```
"inter_idx": "1",
"begin_play": "2018090407:16:24",
"end_play": "2018090407:16:30",
"result_time": "2018090407:16:3",
"inter_no": "0"
},
"extparams": {
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005",
 "queueIndex": "2",
 "agentCount": "5",
 "estimateTime": "10",
 "idleAgentCount": "1"
}
}
```

If the ODFS determines that **flow\_result\_type** is set to **1** and **input** is set to the recognition result ID, the ODFS invokes the Redis to obtain the converted text in which **key** is set to the Redis value key in the recognition result ID. The obtained recognition text is a non-JSON character string.

The following is an example of the code for the Lua script to obtain the Redis result. In the example, the key value is **msg**.

```
local red = redis:new()
red:set_timeout(1000)
local ip = "192.168.77.193"
local port = 22122
local ok, err = red:connect(ip, port)
- if not ok then
 ngx.say("connect to redis error : ", err)
 return close_redis(red)
end
local resp, err = red:get("msg")
- if not resp then
 ngx.say("get msg error : ", err)
 return close_redis(red)
end
```

After receiving a request whose **inaction** is **8**, **9**, or **11**, the ODFS may send different responses based on the TUC configuration, that is, the value of **outaction** may be **9**, **10**, **11**, or **12**.

**Table 10-33** outparams (outaction=9: Dialog Interaction)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| prompt_type | String | Body     | Yes       | Interaction type. <ul style="list-style-type: none"> <li>• <b>0</b>: Plays a specified voice for voice interaction (full path).</li> <li>• <b>1</b>: Plays a specified voice for voice interaction.</li> <li>• <b>2</b>: Plays TTS content for voice interaction.</li> <li>• <b>3</b>: text interaction.</li> <li>• <b>4</b>: Records the voice of the calling party.</li> <li>• <b>5</b>: Plays a video.</li> <li>• <b>6</b>: multimedia interaction.</li> <li>• <b>7</b>: card interaction.</li> </ul> |

| Parameter   | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------|----------|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prompt_wav  | String | Body     | No (special field in the voice navigation scenario) | <p>When <b>prompt_type</b> is set to <b>0</b>, <b>4</b>, or <b>5</b>, enter the full path name for storing the file to be played or recorded. (The path must be readable by the UAP.)</p> <p>When <b>prompt_type</b> is set to <b>1</b>, enter the name of the voice file (excluding the path header, which is assembled by the IVR during voice playing).</p> |
| prompt_text | String | Body     | Yes                                                 | <p>TTS dynamic text content or text dialog content.</p> <p>This parameter is mandatory when <b>prompt_type</b> is set to <b>2</b>, <b>3</b>, <b>6</b>, or <b>7</b>.</p>                                                                                                                                                                                        |
| language    | String | Body     | Yes                                                 | <p>Language ID. (This parameter is mandatory for TTS voice playing and ASR.)</p> <p><b>0</b>: Chinese<br/><b>1</b>: English</p>                                                                                                                                                                                                                                |

| Parameter | Type   | Position | Mandatory                                           | Description                                                 |
|-----------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------|
| inter_idx | String | Body     | No (special field in the voice navigation scenario) | Number of consecutive interactions with a user in the ODFS. |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|--------|----------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| model_type | String | Body     | No (special field in the voice navigation scenario) | <p>Template type. The value is a number of seven digits. The first three digits indicate whether voice playback, recognition, and key pressing are supported, respectively.</p> <ul style="list-style-type: none"> <li>• <b>100:</b> Only playback is supported.</li> <li>• <b>101:</b> Playback is interrupted during key pressing, and recognition is not supported.</li> <li>• <b>110:</b> Playback is interrupted during recognition, and key pressing is not supported.</li> <li>• <b>120:</b> Playback is not interrupted during recognition, and key pressing is not supported.</li> <li>• <b>122:</b> Playback is not interrupted</li> </ul> |

| Parameter | Type | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

(This parameter is valid and conference recording starts only when <b>route_value</b> is set to a third-party number. If this parameter is left empty or does not exist, recording is not performed.) |
| inter_idx   | String | Body     | No (special field in the voice navigation scenario) | Number of consecutive interactions with a user in the ODFS.                                                                                                                                                                     |
| trans_idx   | String | Body     | No (special field in the voice navigation scenario) | Jump sequence number.                                                                                                                                                                                                           |

| Parameter     | Type   | Position | Mandatory                                                     | Description                                                                          |
|---------------|--------|----------|---------------------------------------------------------------|--------------------------------------------------------------------------------------|
| question_id   | String | Body     | No (special field in the voice outbound call survey scenario) | Question ID in the outbound call scenario. (This parameter is discarded.)            |
| question_name | String | Body     | No (special field in the voice outbound call survey scenario) | Question name in the outbound call scenario. (This parameter is discarded.)          |
| answer_id     | String | Body     | No (special field in the voice outbound call survey scenario) | Answer to the question in the outbound call scenario. (This parameter is discarded.) |

**Table 10-38** outparams (outaction=10: Dialog Hangup)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                 |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)                                                                                                                   |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID. |
| start_time  | String | Body     | Yes       | Dialog interaction start time.                                                                                                                                                                                                                                              |
| end_time    | String | Body     | Yes       | Dialog interaction end time.                                                                                                                                                                                                                                                |

| Parameter      | Type   | Position | Mandator<br>y                                          | Description                                                                                                                                                                                                                                                                                       |
|----------------|--------|----------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No                                                     | Whether the ODFS flow enters the <b>End</b> diagram element properly.<br><b>0</b> : The flow enters the <b>End</b> diagram element properly.<br><b>1</b> : The flow enters the <b>End</b> diagram element when an exception or timeout occurs and no error tolerance business logic is processed. |
| region_id      | String | Body     | No<br>(special field in the voice navigation scenario) | Region of a user.                                                                                                                                                                                                                                                                                 |
| entrance_id    | String | Body     | No<br>(special field in the voice navigation scenario) | Entrance ID.                                                                                                                                                                                                                                                                                      |
| exit_id        | String | Body     | No<br>(special field in the voice navigation scenario) | Exit ID. The value is the same as that of <b>entrance_id</b> .                                                                                                                                                                                                                                    |
| user_type_id   | String | Body     | No<br>(special field in the voice navigation scenario) | User type.                                                                                                                                                                                                                                                                                        |

| Parameter       | Type   | Position | Mandatory                                           | Description            |
|-----------------|--------|----------|-----------------------------------------------------|------------------------|
| suilu_region_id | String | Body     | No (special field in the voice navigation scenario) | Call access region ID. |

 NOTE

After a session ends, if the IVR initiates a request whose **inaction** is **9** or **11** and **input** is **hangup**, the ODFS triggers the hangup response and sends the response to the IVR as the end flag. The IVR does not invoke the ODFS interface.

### Response Example 3

```
{
 "userid": "1528780879-9581",
 "outaction": 10,
 "outparams": {
 "call_id": "1528780879-9581",

 "end_time": "2018090407:30:24",
 "release_reason": "0",
 "region_id": "025",
 "entrance_id": "03",
 "exit_id": "05",
 "user_type_id": "01",
 "suilu_region_id": "025"
 }
}
```

### 10.6.3 Interface Invoked After Dialog Transfer (inaction=11)

After completing the dialog transfer operation, the access party uses the current operation result as the input parameter to send a request to the ODFS for the next operation. The following describes the request parameter structure.

#### inparams

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                   |
|-----------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters. |

| Parameter     | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_dst_id   | String | Body     | Yes       | <p>Access ID.</p> <ol style="list-style-type: none"> <li>In the voice navigation scenario, this parameter is set to the flow access code.</li> <li>In the voice outbound call survey scenario, this parameter is set to the flow access code.</li> <li>In other interaction scenarios, this parameter is set to the access ID.</li> </ol> <p>The value can contain a maximum of 20 characters.</p> |
| begin_trans   | String | Body     | Yes       | Transfer start time.                                                                                                                                                                                                                                                                                                                                                                               |
| end_trans     | String | Body     | Yes       | Transfer end time.                                                                                                                                                                                                                                                                                                                                                                                 |
| trans_result  | String | Body     | Yes       | <p>Transfer result.</p> <ul style="list-style-type: none"> <li>0: success</li> <li>Other values: failure</li> </ul>                                                                                                                                                                                                                                                                                |
| auth_token    | String | Body     | Yes       | <p>Authorization information, which is the token value returned by the access control system.</p> <p>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a>.</p>                                                                                                                                                                                                                    |
| record_result | String | Body     | No        | <p>Recording result (valid only when the call is successfully transferred to a third-party number.)</p> <ul style="list-style-type: none"> <li>0: success</li> <li>Other values: failure</li> </ul>                                                                                                                                                                                                |

| Parameter | Type   | Position | Mandatory                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|--------|----------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| input     | String | Body     | No                                                     | <p>Interaction result. (For details about this parameter, see the following scenarios.)</p> <p>After the transfer is successful, the <b>trans_result</b> parameter that is set to <b>0</b> is added to the request, and the <b>input</b> parameter is not required. Then, the access party receives the hangup response (in which <b>outaction</b> is set to <b>10</b>) of the ODFS, and the access party needs to send the request again. The request needs to obtain the <b>input</b> parameter that is set to <b>hangup</b>.</p> <ul style="list-style-type: none"> <li>• <b>hangup</b>: hangup</li> </ul> <p>The value can contain a maximum of 1024 characters.</p> |
| inter_idx | String | Body     | No<br>(special field in the voice navigation scenario) | <p>Number of interaction times. The value is the same as that of <b>inter_idx</b> returned by the ODFS in the previous time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                               |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| channelType | String | Body     | No        | Channel type. <ul style="list-style-type: none"> <li>• WEB</li> <li>• INSTAGRAM</li> <li>• TELEGRAM</li> <li>• WECHAT</li> <li>• FACEBOOK</li> <li>• TWITTER</li> <li>• EMAIL</li> <li>• LINE</li> <li>• WHATSAPP</li> <li>• 5G</li> <li>• SMS</li> </ul> |

### ExtParams

| Parameter    | Type   | Position | Mandatory | Description                                                                                                                          |
|--------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| transin_data | String | Body     | No        | Call-associated data parameters agreed by the access party and the OIAP, for example, data packet parameters transferred by the IVR. |

### Request Example

- If the call is transferred successfully, the access party sends the following request:

```
{
 "userid": "1528780879-9581",
 "inaction": 11,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_dst_id": "10086",
 "begin_trans": "2018090407:16:24",
 "end_trans": "2018090407:20:24",
 "trans_result": "0",
 "input": "",
 "inter_idx": "1"
 },
 "extparams": {
```

```
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005"
 }
}
```

After receiving a response from the ODFS, the access party sends the following request again:

```
{
 "userid": "1528780879-9581",
 "inaction": 11,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_dst_id": "10086",
 "begin_trans": "2018090407:16:24",
 "end_trans": "2018090407:20:24",
 "trans_result": "0",
 "input": "hangup",
 "inter_idx": "1"
 },
 "extparams": {
 "transin_data": "95,22714,0,,1,1,,test_gdj_01005"
 }
}
```

After receiving the request, the ODFS sends a hangup response again. The access party does not need to invoke the ODFS interface. The call transfer is complete.

- If the call fails to be transferred:  
After the preceding parameters are transferred, the access party may receive the response containing the value of **outaction** from the ODFS. The options are **9**, **10**, and **11**, and the actual value is determined by the business logic.

After receiving a request whose **inaction** is **8**, **9**, or **11**, the ODFS may send different responses based on the TUC configuration, that is, the value of **outaction** may be **9**, **10**, **11**, or **12**.

**Table 10-39** outparams (outaction=9: Dialog Interaction)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

}
```

**Table 10-41** outparams (outaction=12: Query Operation, Used in the Common IVR Flow)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prompt_type | String | Body     | Yes       | <p>Query type.</p> <ul style="list-style-type: none"> <li>• <b>1:</b> Query the queuing information about the current skill queue when a call is queuing in a skill queue.</li> <li>• <b>2:</b> Query the queuing information by skill queue ID before a call enters a skill queue.</li> <li>• <b>3:</b> Query the information about the skill queue where an agent belongs by agent ID.</li> <li>• <b>5:</b> Switch between audio and video calls.</li> </ul> |
| skill_id    | String | String   | No        | <p>Skill queue ID.</p> <p>This parameter is mandatory only when <b>prompt_type</b> is set to <b>2</b>.</p>                                                                                                                                                                                                                                                                                                                                                     |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                 |
|------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------|
| moduleName | String | Body     | No                                                  | Module name, that is, name of a diagram element.            |
| inter_idx  | String | Body     | No (special field in the voice navigation scenario) | Number of consecutive interactions with a user in the ODFS. |

## Response Example

```
{
 "outaction": 12,
 "outparams": {
 "call_id": "1528780879-9581",
 "prompt_type": "1",
 "inter_idx": "1",
 "moduleName": "Query",
 "xxx": "xxx" //Extend
 }
}
```

**Table 10-42** outparams (outaction=11: Dialog Transfer)

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                               |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.                                                                  |
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.) |

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|
| call_id   | String | Body     | Yes       | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow. |

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                 |
|-------------|--------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_sor_id | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the value is a user number. In other interaction scenarios, the value is a user ID.)                                                                                                                   |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the called number.<br>2. In the voice outbound call survey scenario, this parameter is set to the survey type ID.<br>3. In other interaction scenarios, this parameter is set to the access ID. |
| start_time  | String | Body     | Yes       | Dialog interaction start time.                                                                                                                                                                                                                                              |
| end_time    | String | Body     | Yes       | Dialog interaction end time.                                                                                                                                                                                                                                                |

| Parameter      | Type   | Position | Mandator y                                          | Description                                                                                                                                                                                                                                                                                     |
|----------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| release_reason | String | Body     | No                                                  | Whether the ODFS flow enters the <b>End</b> diagram element properly.<br><b>0:</b> The flow enters the <b>End</b> diagram element properly.<br><b>1:</b> The flow enters the <b>End</b> diagram element when an exception or timeout occurs and no error tolerance business logic is processed. |
| region_id      | String | Body     | No (special field in the voice navigation scenario) | Region of a user.                                                                                                                                                                                                                                                                               |
| entrance_id    | String | Body     | No (special field in the voice navigation scenario) | Entrance ID.                                                                                                                                                                                                                                                                                    |
| exit_id        | String | Body     | No (special field in the voice navigation scenario) | Exit ID. The value is the same as that of <b>entrance_id</b> .                                                                                                                                                                                                                                  |
| user_type_id   | String | Body     | No (special field in the voice navigation scenario) | User type.                                                                                                                                                                                                                                                                                      |

| Parameter       | Type   | Position | Mandator y                                          | Description            |
|-----------------|--------|----------|-----------------------------------------------------|------------------------|
| suilu_region_id | String | Body     | No (special field in the voice navigation scenario) | Call access region ID. |

 NOTE

After a session ends, if the IVR initiates a request whose **inaction** is **9** or **11** and **input** is **hangup**, the ODFS triggers the hangup response and sends the response to the IVR as the end flag. The IVR does not invoke the ODFS interface.

### Response Example 3

```
{
 "userid": "1528780879-9581",
 "outaction": 10,
 "outparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "start_time": "2018090407:16:24",
 "end_time": "2018090407:30:24",
 "release_reason": "0",
 "region_id": "025",
 "entrance_id": "03",
 "exit_id": "05",
 "user_type_id": "01",
 "suilu_region_id": "025"
 }
}
```

## 10.6.4 Packet Capture and Recording Interface Invoked in the Dialog (inaction=7)

When sending a request to the ODFS for the first time, the access party first requests the ODFS to enable VoiceCyber recording. Whether the ODFS sends an enabling request to VoiceCyber is determined during the flow release. This feature applies only to the intelligent IVR service on the network where the packet capture system (such as VoiceCyber) is connected.

## inparams

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                           |
|-------------|--------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | No        | Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                         |
| call_sor_id | String | Body     | No        | Subscriber ID. (In the voice navigation and voice outbound call scenarios, the subscriber number is transferred. In other interaction scenarios, the subscriber ID is transferred.)<br>The value can contain a maximum of 64 characters.                                                                                              |
| call_dst_id | String | Body     | Yes       | Access ID.<br>1. In the voice navigation scenario, this parameter is set to the flow access code.<br>2. In the voice outbound call survey scenario, this parameter is set to the flow access code.<br>3. In other interaction scenarios, this parameter is set to the access ID.<br>The value can contain a maximum of 20 characters. |
| real_callee | String | Body     | No        | Called number for accessing the IVR. This parameter is valid in the voice navigation scenario.<br>The value can contain a maximum of 32 characters.                                                                                                                                                                                   |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                     |
|------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cti_callid | String | Body     | No (special field in the voice navigation scenario) | Call ID of the CTI to which a call is connected, which is transferred by Huawei IVR. In other scenarios, this parameter is left empty.<br><br>The value can contain a maximum of 32 characters. |
| auth_token | String | Body     | Yes                                                 | Authorization information, which is the token value returned by the access control system.                                                                                                      |

### Request Example

```
{
 "userid": "1528780879-9581",
 "inaction": 7,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "auth_token": "eyJhbGciOiJIUzU1NiJ9.eyJpYXQiOiJlMzgwMzg5MzUzUzU1NiJ9.eyJpYXQiOiJlMzgwMzg5MzUzUzU1NiJ9"
 }
}
```

After receiving the request in which the value of **inaction** is **7**, the ODFS determines whether to send a request for starting recording or a packet capture session to the packet capture and recording system (for example, VoiceCyber) based on the flow configuration. Then, the ODFS sends a response to the IVR.

### outparams (outaction=7: Successfully Starting and Interconnecting with the Packet Capture System)

Response Example

```
{
 "ret": "0",
 "userid": "16128422559300717ed3bf958dca2d0cda6c1",
 "outaction": "7",
 "outparams": {}
}
```

## 10.6.5 Recognition Result Requesting Interface (inaction=13)

The access party requests the ODFS to return the voice recognition result so that the voice playing can be interrupted. This feature applies only to the intelligent IVR service on the network where the packet capture system (such as VoiceCyber) is connected.

## inparams

| Parameter   | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| call_id     | String | Body     | No        | <p>Unique call ID, which is the same as the value of <b>userid</b> and is used by the flow.</p> <p>The value can contain a maximum of 64 characters.</p>                                                                                                                                                                                                                                           |
| call_sor_id | String | Body     | No        | <p>User ID. (In the voice navigation and voice outbound call scenarios, the user number is transferred. In other interaction scenarios, the user ID is transferred.)</p> <p>The value can contain a maximum of 64 characters.</p>                                                                                                                                                                  |
| call_dst_id | String | Body     | Yes       | <p>Access ID.</p> <ol style="list-style-type: none"> <li>In the voice navigation scenario, this parameter is set to the flow access code.</li> <li>In the voice outbound call survey scenario, this parameter is set to the flow access code.</li> <li>In other interaction scenarios, this parameter is set to the access ID.</li> </ol> <p>The value can contain a maximum of 20 characters.</p> |
| real_callee | String | Body     | No        | <p>Called number for accessing the IVR. This parameter is valid in the voice navigation scenario.</p> <p>The value can contain a maximum of 32 characters.</p>                                                                                                                                                                                                                                     |

| Parameter  | Type   | Position | Mandatory                                           | Description                                                                                                                                                                                     |
|------------|--------|----------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cti_callid | String | Body     | No (special field in the voice navigation scenario) | Call ID of the CTI to which a call is connected, which is transferred by Huawei IVR. In other scenarios, this parameter is left empty.<br><br>The value can contain a maximum of 32 characters. |
| auth_token | String | Body     | Yes                                                 | Authorization information, which is the token value returned by the access control system.                                                                                                      |

### Request Example

```
{
 "userid": "1528780879-9581",
 "inaction": 13,
 "inparams": {
 "call_id": "1528780879-9581",
 "call_sor_id": "13500000001",
 "call_dst_id": "10086",
 "auth_token": "eyJhbGciOiJIUzI1NiJ9.eyJpYXQiOiJlMzgwMzg5MzUslmV4cCI6MTUzODA0MjUzNSwian"
 }
}
```

After receiving the request in which the value of **inaction** is **13**, the ODFS checks whether the call recognition result queue reported by VoiceCyber contains data. If yes, the ODFS returns **1** to the IVR. If no, the ODFS returns **0**.

**Table 10-44** outparams (outaction=13: Recognition Result Feedback)

| Parameter | Type   | Position | Mandatory | Description                                                                              |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------|

 "outparams": {
 "call_id": "1528780879-9581",
 "recognize_type": "0"
 }
}
```

## 10.7 Interaction Record Query Interface

### Description

The OIAP provides an interface for third-party systems to query intelligent interaction records. This interface can be used to query only the instances of the latest incoming call of a user.

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/queryHistory

### Request

| Parameter | Type                 | Position | Mandatory | Description                                                       |
|-----------|----------------------|----------|-----------|-------------------------------------------------------------------|
| tenantId  | String               | Body     | Yes       | Tenant space ID.                                                  |
| params    | Map <String, Object> | Body     | Yes       | Parameter package. For details, see <a href="#">Table 10-45</a> . |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                             |
|-----------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authToken | String | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

**Table 10-45** params

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                       |
|------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userMobile | String | Body     | Yes       | User ID. (In the voice navigation and voice outbound call scenarios, the user number is transferred. In other interaction scenarios, the user ID is transferred.) |

## Response

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                                             |
|-----------|---------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rtnCode   | Integer | Body     | Yes       | Error code.<br><ul style="list-style-type: none"> <li>• <b>0</b> or <b>null</b>: success</li> <li>• Other values: failure</li> </ul> The status code <b>200</b> also indicates success. |
| rtnMsg    | String  | Body     | No        | Error description.                                                                                                                                                                      |

| Parameter | Type                 | Position | Mandatory | Description                                                            |

}
```

## 10.8 Session Record Query Interface

### Description

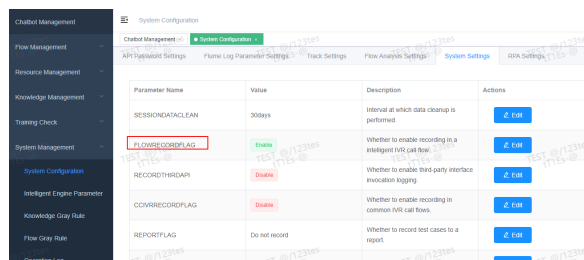

This interface is invoked by a third-party system to query intelligent session information.

### Prerequisites

**Step 1** Choose **Configuration Center > Flow Configuration > Intelligent IVR**.

**Step 2** Choose **System Management > System Configuration**. On the **System Settings** tab page, click **Edit** in the row containing **FLOWRECORDFLAG**, select **Enable**, and click **Confirm** to enable this parameter.

**Figure 10-1** Enabling the FLOWRECORDFLAG parameter

----End

## Interface Method

## 10.9 FAQ Configuration Interface

The OIAP provides FAQ configuration and test interfaces for third parties.

## 10.9.1 FAQ Group Query Interface

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/faqGroup/query

### Request

**Table 10-51** Parameters in the request body

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                       |
|-----------|---------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId  | String  | Body     | Yes       | Tenant ID.                                                                                                                                                        |
| language  | String  | Body     | No        | Language.<br><b>en_US</b> : English<br><b>zh_CN</b> : Chinese<br><b>es_ES</b> : Spanish<br><b>ar</b> : Arabic<br><b>th_TH</b> : Thai<br><b>pt_BR</b> : Portuguese |
| name      | String  | Body     | No        | Name.                                                                                                                                                             |
| pageNum   | Integer | Body     | Yes       | Page number.<br>Number of the page to be queried. The value <b>1</b> is for the first page.                                                                       |
| pageSize  | Integer | Body     | Yes       | Number of records on each page.                                                                                                                                   |
| authToken | String  | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                                                                  |

## Response

| Parameter | Type       | Position | Mandatory | Description              |
|-----------|------------|----------|-----------|--------------------------|
| data      | FaqModel[] | Body     | Yes       | FAQ group data.          |
| totalSize | Integer    | Body     | Yes       | Total number of records. |

**Table 10-52** FaqModel

| Parameter   | Type    | Position | Mandatory | Description                                                                 |
|-------------|---------|----------|-----------|-----------------------------------------------------------------------------|
| id          | Integer | Body     | No        | Internal sequence number.                                                   |
| tenantId    | String  | Body     | Yes       | Tenant ID.                                                                  |
| name        | String  | Body     | Yes       | Name, which contains a maximum of 64 characters.                            |
| description | String  | Body     | No        | Description, which contains a maximum of 512 characters.                    |

| tenantId    | String  | Body     | Yes       | Tenant ID.                                                                  |
| name        | String  | Body     | Yes       | Name, which contains a maximum of 64 characters.                            |
| description | String  | Body     | Yes       | Description, which contains a maximum of 512 characters.                    |
| language    | String  | Body     | Yes       | Language, which does not take effect and cannot be changed.                 |
| updateTime  | Long    | Body     | No        | Modification time.                                                          |
| on          | Boolean | Body     | No        | Activation flag.<br><b>true</b> : activation<br><b>false</b> : deactivation |
| amount      | Integer | Body     | No        | Number of FAQs.                                                             |

## Response

| Parameter     | Type            | Position | Mandatory | Description                                                                                                                                                              |
|---------------|-----------------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| faqGroupModel | FaqModel        | Body     | No        | Q&A data.                                                                                                                                                                |
| faqModel      | FaqElementModel | Body     | No        | Q&A object data.                                                                                                                                                         |
| errorCode     | String          | Body     | Yes       | Error code. <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure. For details, see <a href="#">Common Error Codes</a>.</li> </ul> |
| errorMsg      | String          | Body     | No        | Error description.                                                                                                                                                       |

## Example

- Request

```
{
 "authToken": "e*****",
 "model": {
 "id": 10000,
 "tenantId": "00030010",
 "name": "Social Security Related FAQ2",
 "description": "This is a test group.",
 "language": ""
 }
}
```

- Response

```
{
 "errorCode": "0",
 "errorMsg": ""
}
```

## 10.9.4 FAQ Group Deletion Interface

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/faqGroup/delete

### Request

**Table 10-56** Parameters in the request body

| Parameter   | Type   | Position | Mandatory | Description                                                                                      |
|-------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------|
| tenantId    | String | Body     | Yes       | Tenant ID.                                                                                       |
| faqGroupIds | int[]  | Body     | Yes       | List of IDs to be deleted.                                                                       |
| authToken   | String | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

### Response

| Parameter     | Type     | Position | Mandatory | Description |
|---------------|----------|----------|-----------|-------------|
| faqGroupModel | FaqModel | Body     | No        | Q&A data.   |

| Parameter | Type            | Position | Mandatory | Description                                                                                                 |
|-----------|-----------------|----------|-----------|-------------------------------------------------------------------------------------------------------------|
| faqModel  | FaqElementModel | Body     | No        | Q&A object data.                                                                                            |
| errorCode | String          | Body     | Yes       | Error code. <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: failure</li> </ul> |
| errorMsg  | String          | Body     | No        | Error description.                                                                                          |

### Example

- Request

```
{
 "tenantId": "00030010",
 "faqGroupIds": [10000, 10001],
 "authToken": "e*****"
}
```
- Response

```
{
 "errorCode": "0",
 "errorMsg": ""
}
```

## 10.9.5 FAQ Group Status Change Interface

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/faqGroup/changeStatus

### Request

Table 10-57 Parameters in the request body

| Parameter  | Type    | Position | Mandatory | Description                                        |
|------------|---------|----------|-----------|----------------------------------------------------|
| tenantId   | String  | Body     | Yes       | Tenant ID.                                         |
| faqGroupId | Integer | Body     | Yes       | ID of the FAQ group whose status is to be changed. |

| Parameter | Type    | Position | Mandatory | Description                                                                                                     |
|-----------|---------|----------|-----------|-----------------------------------------------------------------------------------------------------------------|
| on        | Boolean | Body     | No        | Activation flag. The default value is <b>false</b> .<br><b>true</b> : activation<br><b>false</b> : deactivation |
| authToken | String  | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                |

## Response

| Parameter     | Type            | Position | Mandatory | Description                                                                                                    |
|---------------|-----------------|----------|-----------|----------------------------------------------------------------------------------------------------------------|
| faqGroupModel | FaqModel        | Body     | No        | Q&A data.                                                                                                      |
| faqModel      | FaqElementModel | Body     | No        | Q&A object data.                                                                                               |
| errorCode     | String          | Body     | Yes       | Error code.<br><ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: failure</li> </ul> |
| errorMsg      | String          | Body     | No        | Error description.                                                                                             |

## Example

- Request
 

```
{
 "tenantId": "00030010",
 "faqGroupId": "10012",
 "on": true,
 "authToken": "e*****"
}
```
- Response
 

```
{
 "errorCode": "0",
 "errorMsg": ""
}
```

## 10.9.6 Q&A Query Interface

### Interface Method

The request method must be set to POST.

### URL

https://IP:PORT/oifde/rest/api/faq/query

### Request

**Table 10-58** Parameters in the request body

| Parameter  | Type    | Position | Mandatory | Description                                                                                   |
|------------|---------|----------|-----------|-----------------------------------------------------------------------------------------------|
| tenantId   | String  | body     | Yes       | Tenant ID.                                                                                    |
| faqGroupId | Integer | body     | Yes       | FAQ group ID.                                                                                 |
| name       | String  | body     | No        | Question in a Q&A. If this parameter is not set, all Q&As are returned.                       |
| pageNum    | Integer | body     | Yes       | Page number. Number of the page to be queried. The value is 1 for the first page.             |
| pageSize   | Integer | body     | Yes       | Number of records on each page.                                                               |
| authToken  | String  | body     | Yes       | Authentication token. For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

### Response

| Parameter | Type              | Position | Mandatory | Description              |
|-----------|-------------------|----------|-----------|--------------------------|
| data      | FaqElementModel[] | body     | Yes       | Q&A data.                |
| totalSize | Integer           | body     | Yes       | Total number of records. |

**Table 10-59** FaqElementModel

| Parameter    | Type               | Position | Mandatory | Description                                                       |
|--------------|--------------------|----------|-----------|-------------------------------------------------------------------|
| id           | Integer            | body     | Yes       | Internal sequence number.                                         |
| faqGroupId   | Integer            | body     | Yes       | FAQ group ID.                                                     |
| question     | String             | body     | Yes       | Question, which contains a maximum of 8192 characters.            |
| simQuestions | SimStatementUnit[] | body     | No        | Similar question. A maximum of 100 similar questions are allowed. |
| answer       | String             | body     | Yes       | Answer, which contains a maximum of 8192 characters.              |
| simAnswers   | SimStatementUnit[] | body     | No        | Similar answer. A maximum of 100 similar answers are allowed.     |
| keywords     | KeywordUnit[]      | body     | No        | Keyword. A maximum of 20 keywords are supported.                  |

**Table 10-60** SimStatementUnit

| Parameter | Type    | Position | Mandatory | Description                                                              |
|-----------|---------|----------|-----------|--------------------------------------------------------------------------|
| id        | Integer | body     | Yes       | Internal sequence number.                                                |
| elementId | Integer | body     | Yes       | Q&A ID.                                                                  |
| statement | String  | body     | Yes       | Question or answer content, which contains a maximum of 8192 characters. |
| type      | String  | body     | Yes       | <b>Q:</b> question<br><b>A:</b> answer                                   |

**Table 10-61** KeywordUnit

| Parameter | Type   | Position | Mandatory | Description                                         |
|-----------|--------|----------|-----------|-----------------------------------------------------|
| w         | String | body     | Yes       | Keyword, which contains a maximum of 64 characters. |

## Example

- Request

```
{
 "tenantId": "00030010",
 "faqGroupId": 10000,
 "name": "",
 "pageNum": 1,
 "pageSize": 10,
 "authToken": "e*****"
}
```

- Response

```
{
 "data": [
 {
 "id": 10007,
 "faqId": 10000,
 "question": "What is a Q&A chatbot?",
 "simQuestions": [],
 "answer": " A Q&A chatbot automatically provides answers to users' questions.",
 "simAnswers": [],
 "keywords": []
 },
 {
 "id": 10008,
 "faqId": 10000,
 "question": "What is a task-oriented chatbot?",
 "simQuestions": [],
 "answer": " A chatbot oriented for accomplishing a series of tasks (such as air ticket booking, meal ordering, and RBT subscription) with clear objectives.",
 "simAnswers": [],
 "keywords": []
 }
],
 "totalSize": 2
}
```

```

## 10.9.10 Specific FAQ Group Test Interface

### Interface Method

The request method must be set to POST.

### URL

<https://IP:PORT/oifde/rest/api/faq/testOneGroup>

### Request

**Table 10-69** Parameters in the request body

| Parameter  | Type    | Position | Mandatory | Description   |
|------------|---------|----------|-----------|---------------|
| tenantId   | String  | body     | Yes       | Tenant ID.    |
| faqGroupId | Integer | body     | Yes       | FAQ group ID. |

| Parameter | Type   | Position | Mandatory | Description                                                                                      |
|-----------|--------|----------|-----------|--------------------------------------------------------------------------------------------------|
| user      | String | body     | Yes       | Test subscriber ID.                                                                              |
| sentence  | String | body     | Yes       | Request statement.                                                                               |
| authToken | String | body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

## Response

| Parameter   | Type        | Position | Mandatory | Description   |
|-------------|-------------|----------|-----------|---------------|
| answer      | FaqAnswer   | body     | Yes       | Answer.       |
| similarFaqs | FaqAnswer[] | body     | Yes       | Answer group. |

**Table 10-70** FaqAnswer

| Parameter    | Type     | Position | Mandatory | Description                                                                                            |
|--------------|----------|----------|-----------|--------------------------------------------------------------------------------------------------------|
| faqGroupId   | Integer  | body     | Yes       | FAQ group ID.                                                                                          |
| faqGroupName | String   | body     | Yes       | FAQ group name.                                                                                        |
| faqId        | Integer  | body     | Yes       | Q&A ID.                                                                                                |
| question     | String   | body     | Yes       | Question.                                                                                              |
| answers      | String[] | body     | Yes       | Answer.                                                                                                |
| prob         | float    | body     | Yes       | Matching degree. A larger value indicates a higher matching degree.<br>The value must be 0 or greater. |

## Example

- Request

```
{
 "tenantId": "00030010",
 "faqGroupId": 10000,
```

```
"user": "138****8888",
"sentence": "What is guardian life insurance?",
"authToken": "5*****"
```

- Response

```
{
 "answer": {
 "faqGroupId": 10000,
 "faqGroupName": "Insurance consultation",
 "faqId": 10039,
 "question": "What is life insurance?",
 "answers": ["Life insurance is a type of personal insurance that takes the life span of the insured as the object of insurance and takes the survival and death of the insured as the prestation conditions. In the life insurance, the insured transfers risks to the insurer by accepting the terms raised by the insurer and paying the insurance premium. The difference between the life insurance and other insurance businesses lies in the risk that is transferred. In the life insurance, the risk of survival or death of the insured is transferred."],
 "prob": 121.11094785672965
 }
}
```

## 10.9.11 FAQ Group Test and Activation Interface

### Interface Method

POST

### URL

## 10.11 Dedicated Interfaces for Silent Agents

This interface is provided for the silent agent system to instruct chatbots in businesses when agents are silent.

### 10.11.1 Flow Status Change Interface

#### Interface Method

POST

#### URL

<https://IP:PORT/oifde/rest/api/flow/changeWorkMode>

#### Request

**Table 10-76** Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description |
|-----------|--------|----------|-----------|-------------|
| tenantId  | String | Body     | Yes       | Tenant ID.  |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|           |      |          |           | <p>example, <b>Agent Group 1</b>.</p> <ul style="list-style-type: none"> <li>• If <b>callTransferType</b> is set to <b>4</b>, set this parameter to the platform employee ID of the agent to whom the call is transferred.</li> <li>• If <b>callTransferType</b> is set to <b>5</b>, set this parameter to the third-party number.</li> <li>• If <b>callTransferType</b> is set to <b>6</b>, set this parameter to the flow route code agreed with the third-party intelligent system.</li> <li>• If <b>callTransferType</b> is set to <b>7</b>, you do not need to set this parameter.</li> <li>• If <b>callTransferType</b> is set to <b>8</b>, set this parameter to the platform employee ID or variable corresponding to the agent to whom the call is transferred.</li> <li>• If <b>callTransferType</b> is set to <b>31</b>, you do not need to set this parameter.</li> </ul> |

| Parameter             | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                       |        |          |           | <ul style="list-style-type: none"> <li>If <b>callTransferType</b> is set to <b>32</b>, set this parameter to the name or access code of the skill queue where the agent to whom the call is transferred resides.</li> <li>If <b>callTransferType</b> is set to <b>33</b>, set this parameter to the platform employee ID or variable corresponding to the agent to whom the call is transferred.</li> </ul> |
| callTransferTransData | String | Body     | No        | Channel-associated data.                                                                                                                                                                                                                                                                                                                                                                                    |
| callTransferNumber    | String | Body     | No        | Calling number.                                                                                                                                                                                                                                                                                                                                                                                             |

## Response

| Parameter | Type   | Position | Mandatory | Description                                                                                                    |
|-----------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------|
| errorCode | String | Body     | No        | Error code. <ul style="list-style-type: none"> <li><b>0</b>: success</li> <li>Other values: failure</li> </ul> |
| errorMsg  | String | Body     | No        | Response description.                                                                                          |

## Example

- Request

```
{
 "tenantId":"XXX",
```

```

"callId":"123123412300030010",
"agentId":"88880002",
"workMode":"3",
"authToken": "{*****}",
"callTransferRequest"{
 "callTransferType":"5",
 "callTransferRouteValue":"88880006",
 "callTransferTransData": "",
 "callTransferNumber": ""
}
}

```

- Response

```

{
 "errorCode" : "0",
 "errorMsg" : ""
}

```

## 10.11.2 Reply Interface

### Interface Method

POST

### URL

<https://IP:PORT/oifde/rest/api/flow/receiveDialogrecord>

### Request

**Table 10-78** Parameters in the request body

| Parameter | Type    | Position | Mandatory | Description                                                                                                                      |
|-----------|---------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------|
| tenantId  | String  | Body     | Yes       | Tenant ID.                                                                                                                       |
| callId    | String  | Body     | Yes       | Session ID.                                                                                                                      |
| agentId   | String  | Body     | Yes       | Agent ID.                                                                                                                        |
| nodeId    | String  | Body     | Yes       | ID of the diagram element node, which is transferred to a silent agent and then returned by the silent agent.                    |
| nodeIndex | Integer | Body     | No        | Execution position of the replied diagram element node, which is transferred to a silent agent and returned by the silent agent. |

| Parameter          | Type    | Position | Mandatory | Description                                                                                                                                                                                                                   |
|--------------------|---------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| replyType          | Integer | Body     | No        | Reply type. The default value is <b>0</b> .<br><b>0</b> : intention reply<br><b>1</b> : content reply                                                                                                                         |
| replyIntentCode    | String  | Body     | Yes       | Intention code. When a silent agent replies with customized content (that is, <b>replyType</b> is set to <b>1</b> ) and the session is in the insertion state, this parameter has a fixed value of <b>silentInsertReply</b> . |
| replyIntentContent | String  | Body     | Yes       | Reply returned by an agent. Reply content configured in the intention.<br>If the content is customized, directly enter the reply of the silent agent.                                                                         |
| replyIntentName    | String  | Body     | Yes       | Intention name. For the content reply, the value is the same as that of <b>replyIntentCode</b> .                                                                                                                              |
| authToken          | String  | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                                                                                                                              |

## Response

| Parameter | Type   | Position | Mandatory | Description                                                                                                       |
|-----------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------|
| errorCode | String | Body     | No        | Error code.<br><ul style="list-style-type: none"> <li><b>0</b>: success</li> <li>Other values: failure</li> </ul> |

| Parameter | Type   | Position | Mandatory | Description        |
|-----------|--------|----------|-----------|--------------------|
| errorMsg  | String | Body     | No        | Error description. |

## Example

- Request

```
{
 "callId":"16064786965020f6fb86792bd25dbbb489426",
 "agentId":"10001",
 "nodeId":"node_action_97511fbc15d9b23074405ee736187a82c529",
 "nodeIndex":2,
 "replyType":0,
 "replyIntentCode":"car",
 "replyIntentContent": "Test vehicles",
 "replyIntentName":"SSQ test"
 "authToken": "t*****"
}
```

- Response

```
{
 "errorCode" : "0",
 "errorMsg" : ""
}
```

## 10.12 Interface for Pushing Packet Capture Recording Request Results

When controlling the audio and video recording server for recording, the ODFS only enables the audio and video recording server to forward the ASR result. Therefore, an interface needs to be provided for the audio and video recording server to receive the continuously reported recognition results.

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/flow/asrrecognizeresult

### Message Header

Content-Type:application/json; charset=UTF-8

## Request

**Table 10-79** Parameters in the request body

| Parameter    | Type        | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-------------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serviceToken | String      | Body     | Yes       | Authentication token. It is the same as the <b>serviceToken</b> field carried in the VoiceCyber request recognition interface (transfertoasr) invoked by the OIAP.                                                                                                                                                                                                                            |
| subCCID      | String      | Body     | No        | ID of a call center.                                                                                                                                                                                                                                                                                                                                                                          |
| taskID       | String      | Body     | Yes       | ID used for <b>capturesession</b> .<br>Unique call ID used in the request (inaction=7) for starting packet capture recording in a dialog. The value is the same as those of <b>userid</b> and <b>call_id</b> and is used by the flow.<br><b>NOTE</b><br>For details about <b>capturesession</b> , see the interface reference provided by the corresponding audio and video recording server. |
| respType     | String      | Body     | Yes       | <b>NormalResult:</b> The user ends the speech normally.<br><b>StartSpeech:</b> The user starts to speak.<br>The default value is <b>StartSpeech</b> .                                                                                                                                                                                                                                         |
| sentence     | JSON object | Body     | Yes       | ASR result. For details, see <a href="#">Table 10-80</a> .                                                                                                                                                                                                                                                                                                                                    |

| Parameter | Type        | Position | Mandatory | Description                                                                                                                                                 |
|-----------|-------------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| analysis  | JSON object | Body     | No        | Object inspection analysis information. For details, see <a href="#">Table 10-81</a> .                                                                      |
| speakerID | String      | Body     | No        | ID of the speaker, which is used during the manual call.<br><b>0</b> : customer<br><b>1</b> : agent<br><b>2</b> : others<br>The default value is <b>0</b> . |

**Table 10-80** sentence

| Parameter  | Type    | Position | Mandatory | Description                                                                                                                                                     |
|------------|---------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| st         | Integer | Body     | Yes       | Start timestamp of a sentence, in milliseconds.                                                                                                                 |
| et         | Integer | Body     | Yes       | End timestamp of a sentence, in milliseconds.                                                                                                                   |
| isFinal    | Boolean | Body     | Yes       | The value <b>true</b> indicates that the result is the final result, and the value <b>false</b> indicates that the result is the intermediate temporary result. |
| text       | String  | Body     | Yes       | Text in the recognition result.<br>text =<br>URLEncoder.encode(text, "UTF-8");                                                                                  |
| confidence | Float   | Body     | Yes       | Confidence of the recognition result. The value ranges from 0 to 1. The value <b>0</b> indicates the intermediate result.                                       |

**Table 10-81** analysis

| Parameter | Type      | Position | Mandator<br>y | Description                                                                                                                                                                                                                                                                                        |
|-----------|-----------|----------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| emotions  | emotion[] | Body     | No            | Emotion information array. If the value of <b>checkEmotion</b> is <b>false</b> or no emotion information is detected, this field is invalid.<br><b>NOTE</b><br>For details about <b>checkEmotion</b> , see the interface reference provided by the corresponding audio and video recording server. |
| avgVol    | Integer   | Body     | No            | Average volume. If the value of <b>outputVolume</b> is <b>false</b> , this parameter is invalid.<br><b>NOTE</b><br>For details about <b>outputVolume</b> , see the interface reference provided by the corresponding audio and video recording server.                                             |
| maxVol    | Integer   | Body     | No            | Maximum volume. If the value of <b>outputVolume</b> is <b>false</b> , this parameter is invalid.                                                                                                                                                                                                   |
| speed     | Integer   | Body     | No            | Speaking speed. If the value of <b>outputSpeed</b> is <b>false</b> , this parameter is invalid.<br><b>NOTE</b><br>For details about <b>outputSpeed</b> , see the interface reference provided by the corresponding audio and video recording server.                                               |

**Table 10-82** emotion

| Parameter | Type    | Position | Mandatory | Description                                                                                                                  |
|-----------|---------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------|
| st        | Integer | Body     | Yes       | Audio start time, in milliseconds.                                                                                           |
| et        | Integer | Body     | Yes       | Audio end time, in milliseconds.                                                                                             |
| c         | Float   | Body     | Yes       | Confidence. The value ranges from 0.0 to 1.0.                                                                                |
| e         | String  | Body     | No        | Emotion. The value can be <b>HAPPY</b> , <b>ANGRY</b> , <b>SAD</b> , or <b>DISGUSTED</b> , which varies with the ASR vendor. |

## Response

| Parameter | Type   | Position | Mandatory | Description                                                |
|-----------|--------|----------|-----------|------------------------------------------------------------|
| retCode   | String | Body     | Yes       | Error code.<br><b>0</b> : success<br>Other values: failure |
| retMsg    | String | Body     | Yes       | Description.                                               |

## Example

- Request

```
{
 "serviceToken":"160*****bbb489426",
 "subCCID":"10001",
 "taskId":"node_action_97511fbc15d9b23074405ee736187a82c529",
 "respType":"StartSpeech",
 "sentence":{
 "st":1
 "et":2
 "isFinal":true
 "text":"sdfasdfaefasdfsad"
 "confidence":0
 }
}
```

- Response

```
{
 "retCode" : "0",
 "retMsg":"asr recognize success"
}
```

## 10.13 Spelling Check Interface

### Description

This interface is invoked by a third-party system to check the spelling.

When a subscriber enters the question to be queried, the system can correct the errors if the entered sentence contains wrong spellings (homonyms in Chinese and spellings in English).

When the system connects to the CSP, **userName** and **token** in the header are used for authentication. The value of **userName** is **ipcc**. For details about how to obtain the token, see [4.4 C3 OIAP Interface Authentication](#).

When other third-party systems are connected, **authToken** in the request body is used for authentication.

### Interface Method

The request method must be set to POST.

### URL

https://IP:PORT/oifde/rest/api/spellcheck

### Request

**Table 10-83** Parameters in the request body

| Parameter | Type   | Position | Mandator<br>y | Description                                                                                                                                                            |
|-----------|--------|----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId  | String | body     | Yes           | Tenant ID. The default value is <b>ipcc</b> , that is, the <b>ipcc</b> subscriber agreed upon token obtaining.                                                         |
| authToken | String | body     | Yes           | Token.<br>After the token expires, the token obtaining interface needs to be invoked again.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

| Parameter   | Type   | Position | Mandator<br>y | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|--------|----------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sentence    | String | body     | Yes           | Input text. The value contains a maximum of 4096 characters.                                                                                                                                                                                                                                                                                                                                                                                                    |
| language    | String | body     | Yes           | Language. <ul style="list-style-type: none"><li>• <b>zh_CN</b>: Chinese</li><li>• <b>en_US</b>: English</li></ul> The type of the language must match that of the input text.<br>[Restrictions] The errors in the Chinese and English texts can be corrected. Texts in other languages are directly returned without error correction. In the returned object, the <b>hasMistake</b> field is set to <b>false</b> , indicating that no error correction exists. |
| checkerType | String | body     | Yes           | Verification type.<br><b>nonWordSpellChecker</b> : spelling error correction<br><b>realWordSpellChecker</b> : wrongly written character correction<br>Wrongly written character correction is recommended for Chinese.<br>Spelling error correction is recommended for English.                                                                                                                                                                                 |

## Response

| Parameter             | Type                | Position | Mandatory | Description                                                                                                                                                                                                    |
|-----------------------|---------------------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hasMistake            | boolean             | body     | Yes       | Whether there is any spelling error. <ul style="list-style-type: none"> <li>• <b>true:</b> The sentence contains misspellings.</li> <li>• <b>false:</b> The sentence does not contain misspellings.</li> </ul> |
| spellCheckerMatchList | SpellCheckerMatch[] | body     | Yes       | Error correction result.                                                                                                                                                                                       |

**Table 10-84** SpellCheckerMatch

| Parameter   | Type    | Position              | Mandatory | Description                             |
|-------------|---------|-----------------------|-----------|-----------------------------------------|
| word        | String  | spellCheckerMatchList | Yes       | Word in the original input.             |
| startIndex  | Integer | spellCheckerMatchList | Yes       | Start index of the word in a sentence.  |
| endIndex    | Integer | spellCheckerMatchList | Yes       | End index of the word in a sentence.    |
| hasMistake  | boolean | spellCheckerMatchList | Yes       | Whether the word is misspelled.         |
| correctWord | String  | spellCheckerMatchList | Yes       | Corrected word if a word is misspelled. |

## Example

- Request
 

```
{
 "tenantId": "ipcc",
 "authToken": "0*****",
 "sentence": "eat apply",
 "language": "zh_CN",
 "checkerType": "nonWordSpellChecker"
}
```
- Response
 

```
{
 "hasMistake": false,
 "spellCheckerMatchList": [
 {
 "word": "Eat",
```

```

 "startIndex": 0,
 "endIndex": 1,
 "hasMistake": false,
 "correctWord": "eat"
 },
 {
 "word": "apply",
 "startIndex": 1,
 "endIndex": 2,
 "hasMistake": true,
 "correctWord": "apple"
 }
]
}

```

## 10.14 Specifications of the Interface for Connecting the ODFS to a Third-Party Robot System

If an enterprise uses only the ODFS of the OIAP for dialog process management and uses the chatbot semantic understanding module of a third-party system for semantic recognition, ensure that the interfaces provided by the third-party system meet the requirements described in this specification.

The processing logic for connecting the ODFS to a third-party chatbot system is as follows:

### 10.14.1 Authorization Interface

#### Description

This interface is used for interface authentication.

#### Interface Method

POST

## URL

/chatbot/serverauth/login

## Request Parameters

**Table 10-85** Parameters in the request body

| Parameter | Mandatory | Type   | Length | Description                                                                                                                         |
|-----------|-----------|--------|--------|-------------------------------------------------------------------------------------------------------------------------------------|
| account   | Yes       | String | 32     | Sign-in account.                                                                                                                    |
| nonce     | Yes       | String | 128    | Original random text provided by the server, which comes from the "401 Unauthorized" message returned in the last business request. |
| checksum  | Yes       | String | 512    | Text encrypted by the client using the HMAC-SHA256 encryption algorithm based on the <b>nonce</b> value and local key.              |

## Response Parameters

| Parameter | Mandatory | Type    | Length | Description                                                                                                          |
|-----------|-----------|---------|--------|----------------------------------------------------------------------------------------------------------------------|
| token     | No        | String  | 128    | Token required by the business request interface. This parameter is mandatory when the authentication is successful. |
| duration  | No        | Integer | 4      | Token validity period, in seconds. This parameter is mandatory when the authentication is successful.                |
| error     | No        | String  | 512    | Error message returned when the authentication fails. The status code <b>401</b> is also returned.                   |

| Parameter | Mandatory | Type   | Length | Description                                                                                                  |
|-----------|-----------|--------|--------|--------------------------------------------------------------------------------------------------------------|
| nonce     | No        | String | 128    | Character string randomly generated by the server. This parameter is returned when the authentication fails. |

## Example

- Request
 

```
{
 "account": "odfs",
 "nonce": "*****", // Original random text provided by the server.
 "checksum": "0dbe11*****0b505de" // Text encrypted by the client using the HMAC-SHA256 algorithm based on the nonce value and local key.
}
```
- Response
 

```
{
 "token": "2*****d",
 "duration": 3600
}
```

## 10.14.2 Business Request Interface

### Description

- When this interface is invoked for the first time, the nonce information required for authentication can be obtained.
- After the interface authentication is successful, this interface can be invoked to obtain the intention template matching status from the third-party system.

### Interface Method

POST

### URL

/chatbot/u-route/api/router\_service/recognize

### Parameters in the request header

| Parameter     | Mandatory | Type   | Description                                     |
|---------------|-----------|--------|-------------------------------------------------|
| Content-Type  | Yes       | String | application/json;charset=utf-8                  |
| Chatbot-Token | Yes       | String | Token returned by the authentication interface. |

## Request

**Table 10-86** Parameters in the request body

| Parameter | Mandatory | Type        | Description   |
|-----------|-----------|-------------|---------------|
| request   | Yes       | requestBody | Request body. |

**Table 10-87** requestBody

| Parameter         | Mandatory | Type    | Length | Description                                                                                                                                                                                                           |
|-------------------|-----------|---------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userId            | Yes       | String  | 64     | User ID.                                                                                                                                                                                                              |
| accesscode        | No        | String  | 32     | Access code (number that a user dials to access the system).                                                                                                                                                          |
| channel           | No        | String  | 32     | Channel. (Currently, the value is fixed at <b>OIFDE</b> .)                                                                                                                                                            |
| sentence          | Yes       | String  | 1024   | Text information entered by a customer.                                                                                                                                                                               |
| tenantId          | Yes       | String  | 64     | Tenant ID.                                                                                                                                                                                                            |
| language          | Yes       | String  | 20     | Language.<br><b>zh_CN</b> : Chinese<br><b>en_US</b> : English                                                                                                                                                         |
| context           | No        | String  | 64     | Context required for intent recognition.                                                                                                                                                                              |
| targetIntentCount | No        | Integer | 4      | Number of intentions returned by the chatbot when multiple intentions are required. Generally, this parameter is used when a customer enters one sentence to match multiple intentions. The value ranges from 1 to 5. |

| Parameter      | Mandatory | Type   | Length | Description                                                                                                                                                                                                                                                                                            |
|----------------|-----------|--------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| confidence2Top | No        | Float  | 4      | Confidence interval.<br>If multiple intentions are returned, the confidence interval between the subsequent intentions and the first intention with the highest confidence is required. A smaller value indicates a closer proximity between the returned intentions.<br>The value ranges from 0 to 1. |
| timeZone       | No        | String | 10     | Time zone. The value <b>8</b> indicates GMT+8.                                                                                                                                                                                                                                                         |

## Response Parameters

| Parameter        | Mandatory | Type      | Length | Description                                                                                                                                                 |
|------------------|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| errorMsg         | No        | String    | 512    | Error message.                                                                                                                                              |
| errorCode        | No        | String    | 20     | Error code.                                                                                                                                                 |
| intentsResponses | No        | Intents[] | -      | Intention array, which must be returned when the operation is successful.                                                                                   |
| nonce            | No        | String    | 128    | Character string randomly generated by the server. This parameter is returned when the token authentication fails and the status code 401 is also returned. |

**Table 10-88** Intents

| Parameter      | Mandatory | Type     | Length | Description                                                                                                                                                                                                                                          |
|----------------|-----------|----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| responses      | No        | String[] | 4096   | Response returned by the chatbot. The value is a character string array. Multiple values are allowed.                                                                                                                                                |
| confidence     | Yes       | Float    | 4      | Confidence. <ul style="list-style-type: none"> <li>Confidence of the chatbot reply. The value ranges from 0 to 1. For example, if 10 answers are provided for question 1 and six of them are answer 1, the confidence of answer 1 is 0.6.</li> </ul> |
| commands       | Yes       | String[] | 64     | Intention command word.                                                                                                                                                                                                                              |
| params         | No        | Map      | -      | Keyword parameters. The slot information of general intentions is returned through this parameter. An example is {"Number": "3"}. For details about operations related to general intentions, see <a href="#">Adding Intention Templates</a> .       |
| scenarioName   | No        | String   | 64     | Intention name.                                                                                                                                                                                                                                      |
| scenarioType   | No        | Integer  | 4      | Scenario type.<br><b>1</b> : auxiliary scenario<br><b>0</b> : business scenario<br><b>-1</b> : no scenario                                                                                                                                           |
| scenarioStatus | No        | String   | 64     | Scenario status (not used currently).                                                                                                                                                                                                                |

### Example

- Request

```
{
 "request":
```

```
{
 "sentence": "Query the bill of March.",
 "targetIntentCount":1,
 "confidence2Top":0.2,
 "accessCode": "10086",
 "channel":"OIFDE",
 "tenantId":"NJ_001",
 "language":"en_US",
 "userId":"123456789"
}
```

- Successful response

```
{
 "errorCode":"0",
 "errorMsg":"","",
 "intentsResponses":
 [
 {
 "responses":[""],
 "confidence":1.0,
 "commands":["bill"],
 "params":{"Number":"3"},
 "scenarioName":"query bills",
 "scenarioType":"normal",
 "scenarioStatus":"finish"
 }
]
}
```

- Failed response

```
401 Unauthorized
{
 "errorMsg":"NEED_LOGIN","nonce":"0cf*****accesaf"
}
```

## 10.15 Statistics Report

### Basic Information

This interface is invoked by third-party systems to query statistics reports, including call statistics reports, chatbot reports, and knowledge reports.

When the system connects to the Customer Service Platform (CSP), **userName** and **token** in the header are used for authentication. The value of **userName** is **ipcc**. For details about how to obtain the token, see [4.4 C3 OIAP Interface Authentication](#).

When a third-party system is connected, the **authToken** authentication mode is used for the request body.

### 10.15.1 Querying Call Statistics Reports

#### Interface Method

POST

#### URL

https://IP:PORT/oifde/rest/api/queryCallStatisticsReport

## Request

**Table 10-89** Parameters in the request body

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                                                                          |
|------------|--------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type       | String | Body     | Yes       | Query type. <ul style="list-style-type: none"> <li><b>hour</b>: report data on a specified date, which is queried by hour.</li> <li><b>day</b>: report data of the last 30 days, which is queried by day.</li> </ul> |
| tenantId   | String | Body     | Yes       | Tenant ID.                                                                                                                                                                                                           |
| accessCode | String | Body     | Yes       | Access ID (chatbot access code).                                                                                                                                                                                     |
| timestamp  | Long   | Body     | Yes       | Timestamp of the query date, in milliseconds.                                                                                                                                                                        |
| authToken  | String | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                                                                                                                     |

## Response

| Parameter | Type                     | Position | Mandatory | Description             |
|-----------|--------------------------|----------|-----------|-------------------------|
| -         | QueryCallStatisticsRes[] | Body     | Yes       | Call statistics report. |

**Table 10-90** QueryCallStatisticsRes

| Parameter  | Mandatory | Type   | Description                                    |
|------------|-----------|--------|------------------------------------------------|
| recordTime | Yes       | Long   | Timestamp of the record date, in milliseconds. |
| tenantId   | Yes       | String | Tenant ID.                                     |

| Parameter               | Mandatory | Type   | Description                                                                                                                                                                                                      |
|-------------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accessCode              | Yes       | String | Access ID (chatbot access code).                                                                                                                                                                                 |
| callCount               | Yes       | Long   | Number of connected calls.                                                                                                                                                                                       |
| exitNoConsultCount      | Yes       | Long   | Number of calls disconnected without consultation, that is, the number of calls that a user interacts with IVR only once.                                                                                        |
| callStaffNoConsultCount | Yes       | Long   | Number of calls processed only by agents, that is, the number of calls that a user interacts with the IVR more than once but less than or equal to three times and the call is not hung up in the IVR.           |
| callStaffConsultCount   | Yes       | Long   | Number of calls that are transferred to the manual service after consultation, that is, the number of calls that a user interacts with the IVR for more than three times and the call is not hung up in the IVR. |
| exitConsultingCount     | Yes       | Long   | Number of calls processed only by chatbots, that is, the number of calls that a user interacts with the IVR for more than once and the call is hung up in the IVR.                                               |
| interactCount           | Yes       | Long   | Number of dialog rounds, that is, the total number of interactions between users and the IVR.                                                                                                                    |

| Parameter               | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| autonomyRate            | Yes       | String | Net self-service resolution rate. <ul style="list-style-type: none"> <li>• <b>-1.000</b>: No chatbot is used (Number of calls processed only by agents + Number of calls transferred to agents after consultation + Number of calls processed only by chatbots).</li> <li>• <b>0-1.000</b>: Number of calls processed only by chatbots/Total number of calls processed by chatbots.</li> </ul> |
| averageInteract-PerCall | Yes       | String | Average number of dialog rounds, that is, the average number of interactions between users and the IVR per call.                                                                                                                                                                                                                                                                               |
| dbRecordTime            | Yes       | Date   | Date recorded in the database. If this parameter is not set, the value is <b>null</b> .                                                                                                                                                                                                                                                                                                        |
| type                    | Yes       | String | Query type. <ul style="list-style-type: none"> <li>• <b>hour</b>: query by hour.</li> <li>• <b>day</b>: query by day.</li> </ul>                                                                                                                                                                                                                                                               |
| interfaceRequestCount   | Yes       | Long   | Number of interface invoking times.                                                                                                                                                                                                                                                                                                                                                            |
| interfaceSuccess-Count  | Yes       | Long   | Number of successful invoking times.                                                                                                                                                                                                                                                                                                                                                           |
| interfaceSuccess-Rate   | Yes       | String | Interface invoking success rate. <ul style="list-style-type: none"> <li>• <b>-1.000</b>: No interface is invoked.</li> <li>• <b>0-1.000</b>: Number of successful invoking times/Total number of interface invoking times.</li> </ul>                                                                                                                                                          |

## Example

- Request
 

```
{

```

## 10.15.2 Querying Chatbot Report Information

### Interface Method

The request method must be set to POST.

### URL

<https://IP:PORT/oifde/rest/api/queryChatbotReport>

### Request

**Table 10-91** Parameters in the request body

| Parameter | Type   | Position | Mandator<br>y | Description                                                                                                                                                                                                              |
|-----------|--------|----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| type      | String | body     | Yes           | Query type. <ul style="list-style-type: none"> <li>• <b>hour</b>: report data on a specified date, which is queried by hour.</li> <li>• <b>day</b>: report data of the last 30 days, which is queried by day.</li> </ul> |

| Parameter  | Type   | Position | Mandatory | Description                                                                                      |
|------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------|
| tenantId   | String | body     | Yes       | Tenant ID.                                                                                       |
| accessCode | String | body     | Yes       | Access ID (chatbot access code).                                                                 |
| timestamp  | long   | body     | Yes       | Millisecond timestamp of the query date.                                                         |
| authToken  | String | body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

## Response

| Parameter | Type               | Position | Mandatory | Description                 |
|-----------|--------------------|----------|-----------|-----------------------------|
| -         | ChatbotReportRes[] | body     | Yes       | Chatbot report information. |

**Table 10-92** ChatbotReportRes

| Name                  | Mandatory | Type    | Description                                                                                                                      |

## 10.16 Querying the Offline Analysis of Outbound Call Failure Causes

### Interface Method

The request method must be set to POST.

### URL

https://IP:PORT/oifde/rest/api/queryRbtRecognitionResult

### Request

**Table 10-97** Parameters in the request body

| Parameter | Type | Position | Mandatory | Description                                                                                                                                                                                                                 |
|-----------|------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| beginTime | Long | Body     | Yes       | Millisecond timestamp of the query start time.<br><b>NOTICE</b><br>To ensure efficiency, the interface data is stored in different tables by month. Only the table of the month corresponding to the start time is queried. |

| Parameter | Type    | Position | Mandatory | Description                                                                                      |
|-----------|---------|----------|-----------|--------------------------------------------------------------------------------------------------|
| endTime   | Long    | Body     | Yes       | Millisecond timestamp of the query end time.                                                     |
| tenantId  | String  | Body     | Yes       | Tenant ID.                                                                                       |
| pageNum   | Integer | Body     | No        | Number of pages to be queried. The value starts from 1. The default value is <b>1</b> .          |
| pageSize  | Integer | Body     | No        | Number of records on each page. The maximum value is 1000. The default value is <b>1000</b> .    |
| authToken | String  | Body     | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |

## Response

| Parameter       | Type             | Position | Mandatory | Description                                  |
|-----------------|------------------|----------|-----------|----------------------------------------------|
| rbtRecognitions | RbtRecognition[] | Body     | Yes       | Analysis of the outbound call failure cause. |
| total           | Integer          | Body     | Yes       | Total number.                                |
| pageSize        | Integer          | Body     | Yes       | Number of records on each page.              |
| pageNum         | Integer          | Body     | Yes       | Page number, starting from 1.                |

**Table 10-98** RbtRecognition

| Parameter        | Mandatory | Type   | Description                |
|------------------|-----------|--------|----------------------------|
| rbtRecognitionId | Yes       | Long   | Result ID.                 |
| callId           | Yes       | String | Chatbot access volume.     |
| fileName         | Yes       | String | Recording file drive path. |
| callerNo         | Yes       | String | Calling number.            |

| Parameter       | Mandatory | Type    | Description                                                       |
|-----------------|-----------|---------|-------------------------------------------------------------------|
| calleeNo        | Yes       | String  | Called number.                                                    |
| agentId         | Yes       | Integer | Agent ID.                                                         |
| recordBeginTime | Yes       | Long    | Recording start time.                                             |
| recordEndTime   | Yes       | Long    | Recording end time.                                               |
| callType        | Yes       | Integer | Call type. The fixed value is 7, indicating manual outbound call. |
| mediaType       | Yes       | Integer | Media type. The fixed value is 5, indicating voice.               |
| vdnId           | Yes       | Integer | CTI VDN ID.                                                       |
| tenantId        | Yes       | String  | Tenant ID.                                                        |
| callCenterId    | Yes       | Integer | CTI call center ID.                                               |
| releaseCause    | Yes       | Integer | Release cause. For details, see the CTI product documentation.    |
| beginTime       | Yes       | Long    | Result input time.                                                |
| endTime         | No        | Long    | Result update time.                                               |
| result          | No        | Integer | For details, see <a href="#">Table 10-99</a> .                    |
| asrTransResult  | No        | String  | ASR result.                                                       |
| confirmedResult | No        | String  | Manual confirmation result.                                       |
| confirmStatus   | Yes       | Integer | Manual confirmation status.                                       |
| remark          | No        | String  | Remarks.                                                          |
| locationId      | Yes       | Integer | Recording node, which is used when the CTI pool is used.          |
| updateTime      | No        | Long    | Modification time.                                                |

**Table 10-99** Failure causes

| Code | Cause                                 |
|------|---------------------------------------|
| -1   | The recording file name is incorrect. |
| -2   | Failed to download the recording.     |

| Code | Cause                                                                                       |
|------|---------------------------------------------------------------------------------------------|
| -3   | Failed to request ASR.                                                                      |
| -4   | Failed to obtain ASR.                                                                       |
| -5   | Failed to obtain the intention recognition result.                                          |
| 101  | The called number does not exist.                                                           |
| 102  | The called party has powered off.                                                           |
| 103  | The called party is busy.                                                                   |
| 104  | The calling number is suspended on arrears.                                                 |
| 105  | The called number is suspended.                                                             |
| 106  | The called party is busy and the call has been registered the call waiting service.         |
| 107  | The called party is busy and the call has not been registered the call waiting service.     |
| 108  | The called party is unreachable.                                                            |
| 109  | The called party has subscribed to the call transfer service.                               |
| 110  | The international call is barred.                                                           |
| 111  | The called party does not answer the call for a long time.                                  |
| 112  | The called party has enabled the inbound call barring function.                             |
| 113  | The line of another carrier is faulty.                                                      |
| 114  | The called party cannot be connected and the inbound call notification function is enabled. |

## 10.17 Intelligent Case Interface

### Basic Information

This interface is invoked by third-party access systems to implement the text classification and entity recognition capabilities. It can be used in the intelligent case classification and intelligent case filling scenarios of the intelligent agent assistant. The intelligent agent assistant invokes the text classification interface to classify cases and invokes the entity recognition interface to extract case entities from case information to improve cases. This further enhances the capabilities of the intelligent agent assistant.

When the system connects to the CSP, **userName** and **token** in the header are used for authentication. The value of **userName** is **ipcc**. For details about how to obtain the token, see [4.4 C3 OIAP Interface Authentication](#).

When other third-party systems are connected, **authToken** in the request body is used for authentication.

### 10.17.1 Text Classification Interface

#### Description

This interface is invoked by third-party access systems to implement the text classification capability and can be used in intelligent case classification scenarios.

**NOTICE**

Before invoking the text classification interface, commission the text classification function. For details, see OIAP VXXXRXXXCXX [Product Documentation](#) 01.

**Interface Method**

POST

```

## 10.17.2 Entity Recognition Interface

### Description

This interface is invoked by third-party access systems to implement the entity recognition capability, which can be used in intelligent ticket filling scenarios.

**NOTICE**

To use the LODAS-based entity recognition model, commission the entity recognition function before invoking the entity recognition interface. For details, see "Commissioning the Entity Extraction Model Function" in *OIAP Product Documentation*.

**Interface Method**

POST

**URL**<https://IP:PORT/oifde/rest/api/entityDetection>**Request****Table 10-102** Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 10.18 Interface for Querying the Recordings of Calls Transferred to a Third Party

### Description

This interface is invoked to query the recordings of calls transferred from a common IVR to a third party.

### Interface Method

POST

### URL

https://IP:PORT/oifde/rest/api/queryTransferRecordHistory

### Request

Table 10-104 Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                             |
|-----------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId  | String | Body     | Yes       | Tenant ID.                                                                                                                                                                                                              |
| authToken | String | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> . |
| beginTime | String | Body     | No        | Start time.<br>Format:<br>yyyy-MM-dd HH:mm:ss                                                                                                                                                                           |
| endTime   | String | Body     | No        | End time.<br>Format:<br>yyyy-MM-dd HH:mm:ss                                                                                                                                                                             |

| Parameter  | Type   | Position | Mandatory | Description                                                                                                                                                                         |
|------------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pageNum    | String | Body     | No        | Page number.<br>Number of the page to be queried. The value <b>1</b> is for the first page.<br>If this parameter is not transferred, the default value of page number is <b>1</b> . |
| pageSize   | String | Body     | No        | Number of records on each page.<br>The value can be <b>5, 10, 20, 50, or 100</b> .<br>If this parameter is not transferred, 100 records are displayed on each page by default.      |
| callId     | String | Body     | No        | Flow call ID. One of the <b>userMobile</b> , <b>callId</b> , and <b>ctiCallId</b> parameters must be transferred.                                                                   |
| userMobile | String | Body     | No        | Subscriber number. One of the <b>userMobile</b> , <b>callId</b> , and <b>ctiCallId</b> parameters must be transferred.                                                              |
| ctiCallId  | String | Body     | No        | CTI call ID. One of the <b>userMobile</b> , <b>callId</b> , and <b>ctiCallId</b> parameters must be transferred.                                                                    |

## Response

**Table 10-105** Parameters in the response body

| Parameter    | Type    | Position | Mandatory | Description                                                                                                           |
|--------------|---------|----------|-----------|-----------------------------------------------------------------------------------------------------------------------|
| errorCode    | Integer | Body     | Yes       | Error code.<br><ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> |
| errorMessage | String  | Body     | Yes       | Error description.                                                                                                    |

| Parameter          | Type             | Position | Mandatory | Description                                  |
|--------------------|------------------|----------|-----------|----------------------------------------------|
| total              | Long             | Body     | No        | Total number of records.                     |
| transferRecordList | transferRecord[] | Body     | No        | Call transfer record list (array structure). |

**Table 10-106** transferRecord

| Parameter      | Type   | Position | Mandatory | Description                                              |
|----------------|--------|----------|-----------|----------------------------------------------------------|
| id             | String | Body     | Yes       | Unique ID of a transfer record.                          |
| tenantId       | String | Body     | Yes       | Tenant ID.                                               |
| callId         | String | Body     | Yes       | Flow call ID.                                            |
| ctiCallId      | String | Body     | Yes       | CTI call ID.                                             |
| flowInstId     | String | Body     | Yes       | Flow instance ID.                                        |
| callingNumber  | String | Body     | Yes       | Calling number (user number).                            |
| calledNumber   | String | Body     | Yes       | Called flow access code.                                 |
| transfNumber   | String | Body     | Yes       | Number to be transferred to a third-party.               |
| startTime      | Long   | Body     | Yes       | Start time of a call. The value is in timestamp format.  |
| endTime        | Long   | Body     | No        | Call end time. The value is in timestamp format.         |
| recordFilePath | String | Body     | No        | Recording file address.                                  |
| locationId     | String | Body     | Yes       | Recording node, which is used when the CTI pool is used. |

| Parameter    | Type   | Position | Mandatory | Description                                                                                                  |
|--------------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------|
| opResult     | String | Body     | Yes       | Transfer result. The options are <b>INIT</b> (start), <b>SUCCESS</b> (successful), and <b>FAIL</b> (failed). |
| recordResult | String | Body     | No        | Recording result. The options are <b>0</b> (success), <b>N/A</b> (no feedback), and other values (failure).  |

**Table 10-107** Parameters in the request body

| Parameter         | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                                                      |
|-------------------|--------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userId            | String | Body     | Yes       | User ID.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                                                                                    |
| sentence          | String | Body     | Yes       | Text information entered by a customer.<br>The value can contain a maximum of 1024 characters.                                                                                                                                                                                                                   |
| tenantId          | String | Body     | Yes       | Tenant ID.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                                                                                  |
| language          | String | Body     | Yes       | Language. The options are as follows: <ul style="list-style-type: none"> <li>● <b>zh_CN</b>: Chinese</li> <li>● <b>en_US</b>: English</li> <li>● <b>es_ES</b>: Spanish</li> <li>● <b>ar</b>: Arabic</li> <li>● <b>th_TH</b>: Thai</li> <li>● <b>pt_BR</b>: Portuguese</li> <li>● <b>fr_FR</b>: French</li> </ul> |
| targetIntentCount | String | Body     | No        | Number of intentions returned by the chatbot when multiple intentions are required. Generally, this parameter is used when a customer enters one sentence to match multiple intentions.<br>The value ranges from 1 to 5.                                                                                         |

| Parameter      | Type          | Position | Mandatory | Description                                                                                                                                                                                                                                                                  |
|----------------|---------------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| confidence2Top | String        | Body     | No        | Confidence interval between the subsequent intentions and the first intention with the highest confidence is required if multiple intentions are returned. A smaller value indicates a closer proximity between the returned intentions.<br>The value ranges from 0 to 1.    |
| context        | String        | Body     | No        | Context required for intention recognition. Only one context can be transferred.<br>To use the context, configure a single context based on the intention.<br>The value can contain a maximum of 128 characters.                                                             |
| domainList     | List <String> | Body     | No        | IDs of activated domains.<br>A maximum of 100 IDs are allowed.                                                                                                                                                                                                               |
| faqGroupList   | List <String> | Body     | No        | IDs of activated FAQ groups.<br>A maximum of 100 IDs are allowed.                                                                                                                                                                                                            |
| authToken      | String        | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .<br>The value can contain a maximum of 32 characters. |

## Response

**Table 10-108** Parameters in the response body

| Parameter        | Type               | Position | Mandatory | Description                                                                             |
|------------------|--------------------|----------|-----------|-----------------------------------------------------------------------------------------|
| errorCode        | Integer            | Body     | Yes       | Error code.<br>The value <b>0</b> indicates success and other values indicates failure. |
| errorMessage     | String             | Body     | No        | Error message.                                                                          |
| intentsResponses | intentsResponses[] | Body     | No        | Intention array, which must be returned when the operation is successful.               |

**Table 10-109** intentsResponses

| Parameter     | Type     | Position | Mandatory | Description                                                                                                                                                                                                                                              |
|---------------|----------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| responses     | String[] | Body     | No        | Response returned by the chatbot. The value is a character string array. Multiple values are allowed.                                                                                                                                                    |
| confidence    | Float    | Body     | Yes       | Confidence.                                                                                                                                                                                                                                              |
| commands      | String[] | Body     | Yes       | Intention command word.                                                                                                                                                                                                                                  |
| commandParams | Map      | Body     | No        | Keyword parameters. The slot information of general intentions is returned through this parameter.<br>Example:<br><b>{"Number": "3"}</b><br>For details about operations related to general intentions, see <a href="#">Adding Intention Templates</a> . |
| scenarioName  | String   | Body     | No        | Intention name.                                                                                                                                                                                                                                          |

| Parameter      | Type          | Position | Mandatory | Description                                                                                                                                                      |
|----------------|---------------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| scenarioStatus | String        | Body     | No        | Scenario status.                                                                                                                                                 |
| simQuestions   | List <String> | Body     | No        | If a similar question exists in the FAQ question, the similar question is returned. (Similar questions refer to questions other than the matched main question.) |

## Example

- Request

```
{
 "userId": "1649209493813571405",
 "sentence": "Query the call fee.",
 "tenantId": "202205125916",
 "language": "en_US",

}

```

## 10.20 GTS RPA Integration Interfaces

### 10.20.1 Interface for Querying the RPA Task List

#### Description

This interface is invoked to query the RPA task list.

#### Interface Method

POST

#### URL

<https://IP:PORT/oifde/rest/api/rpa/queryJob>

#### Request

**Table 10-110** Parameters in the request body

| Parameter  | Type            | Position | Mandatory | Description                                                                                                         |
|------------|-----------------|----------|-----------|---------------------------------------------------------------------------------------------------------------------|
| tenantId   | String          | Body     | Yes       | Tenant ID.<br>The value can contain a maximum of 64 characters.                                                     |
| pageNo     | Integer         | Body     | No        | Number of pages to be queried. The default value is <b>1</b> .                                                      |
| pageSize   | Integer         | Body     | No        | Number of data records on each page. The default value is <b>50</b> .<br>The value can be <b>5, 10, 20, or 50</b> . |
| conditions | RpaJobCondition | Body     | No        | Search criteria.                                                                                                    |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                  |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| authToken | String | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .<br>The value can contain a maximum of 32 characters. |

**Table 10-111** RpaJobConditions

| Parameter | Type    | Position | Mandatory | Description                                                                                                                                                                                                                                      |
|-----------|---------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| jobName   | String  | Body     | No        | Task name for fuzzy search.                                                                                                                                                                                                                      |
| status    | Integer | Body     | No        | Task status for search. The options are as follows: <ul style="list-style-type: none"> <li>• <b>init</b>: to be executed</li> <li>• <b>running</b>: running</li> <li>• <b>suspend</b>: suspended</li> <li>• <b>success</b>: completed</li> </ul> |

## Response

**Table 10-112** Parameters in the response body

| Parameter | Type   | Position | Mandatory | Description                                                                             |
|-----------|--------|----------|-----------|-----------------------------------------------------------------------------------------|
| errorCode | Int    | Body     | Yes       | Error code.<br>The value <b>0</b> indicates success and other values indicates failure. |
| errorMsg  | String | Body     | No        | Error message.                                                                          |
| total     | Int    | Body     | No        | Total number of records.                                                                |

| Parameter | Type                 | Position | Mandatory | Description                                                         |
|-----------|----------------------|----------|-----------|---------------------------------------------------------------------|
| jobs      | RpaDetailJobResult[] | Body     | No        | Task list, which must be returned when the operation is successful. |

**Table 10-113** RpaDetailJobResult

| Parameter   | Type    | Position | Mandatory | Description                                                                                                                                                                                                                           |
|-------------|---------|----------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid         | String  | Body     | No        | Task UUID.                                                                                                                                                                                                                            |
| jobName     | String  | Body     | No        | Task name.                                                                                                                                                                                                                            |
| createTime  | String  | Body     | No        | Task creation time.                                                                                                                                                                                                                   |
| startTime   | String  | Body     | No        | Task start time.                                                                                                                                                                                                                      |
| status      | String  | Body     | No        | Task status. The options are as follows: <ul style="list-style-type: none"> <li>• <b>init</b>: to be executed</li> <li>• <b>running</b>: running</li> <li>• <b>success</b>: completed</li> <li>• <b>suspend</b>: suspended</li> </ul> |
| mode        | String  | Body     | No        | Execution mode. The options are <b>once</b> and <b>repeat</b> .                                                                                                                                                                       |
| runMode     | String  | Body     | No        | Running mode. The options are <b>online</b> and <b>offline</b> .                                                                                                                                                                      |
| timeout     | Integer | Body     | No        | Task timeout period, in seconds.                                                                                                                                                                                                      |
| description | String  | Body     | No        | Task description.                                                                                                                                                                                                                     |

## 10.20.2 Interface for Querying RPA Task Details

### Description

This interface is invoked to query RPA task details.

### Interface Method

POST

### URL

<https://IP:PORT/oifde/rest/api/rpa/queryJobDetails>

### Request

**Table 10-114** Parameters in the request body

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                    |
|-----------|--------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId  | String | Body     | Yes       | Tenant ID.<br>The value can contain a maximum of 64 characters.                                                                                                                |
| jobName   | String | Body     | No        | Task name. ( <b>jobName</b> can be used as a search criterion. If it is specified, <b>uid</b> can be set to <b>null</b> . Either <b>jobName</b> or <b>uid</b> must be passed.) |

| Parameter | Type   | Position | Mandatory | Description                                                                                                                                                                                                                                                                  |
|-----------|--------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uid       | String | Body     | No        | Task UUID. (If both <b>jobName</b> and <b>uid</b> are specified, <b>uid</b> is used. Either <b>jobName</b> or <b>uid</b> must be passed.)                                                                                                                                    |
| authToken | String | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .<br>The value can contain a maximum of 32 characters. |

## Response

**Table 10-115** Parameters in the response body

| Parameter | Type                 | Position | Mandatory | Description                                                                             |
|-----------|----------------------|----------|-----------|-----------------------------------------------------------------------------------------|
| errorCode | Int                  | Body     | Yes       | Error code.<br>The value <b>0</b> indicates success and other values indicates failure. |
| errorMsg  | String               | Body     | No        | Error message.                                                                          |
| jobDetail | RpaDetailJobResult[] | Body     | No        | Queue details.                                                                          |

**Table 10-116** RpaDetailJobResult

| Parameter | Type   | Position | Mandatory | Description |
|-----------|--------|----------|-----------|-------------|
| uid       | String | Body     | Yes       | Task UUID.  |
| jobName   | String | Body     | Yes       | Task name.  |

| Parameter        | Type    | Position | Mandatory | Description                                                                                                                                                                                                                                      |
|------------------|---------|----------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| startTime        | String  | Body     | No        | Job start time.<br>The format is <i>yyyy-mm-dd HH:mm:ss</i> .                                                                                                                                                                                    |
| createTime       | String  | Body     | Yes       | Job creation time.<br>The format is <i>yyyy-mm-dd HH:mm:ss</i> .                                                                                                                                                                                 |

```

## 10.20.3 Interface for Creating RPA Queue Data

### Description

This interface is invoked to create RPA queue data.

### Interface Method

The request method must be set to POST.

### URL

<https://IP:PORT/oifde/rest/api/rpa/createRpaQueueData>

## Request

**Table 10-117** Parameters in the request body

| Parameter       | Type           | Position | Mandatory | Description                                                                                                                                                                                                                                                                  |
|-----------------|----------------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId        | String         | Body     | Yes       | Tenant ID.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                                              |
| authToken       | String         | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .<br>The value can contain a maximum of 32 characters. |
| tag             | String (32)    | Body     | No        | Queue data label, which is unique for the same queue.                                                                                                                                                                                                                        |
| priority        | String         | Body     | No        | Priority. The default value is <b>normal</b> . The options are as follows: <ul style="list-style-type: none"><li>● <b>low</b>: low</li><li>● <b>normal</b>: medium</li><li>● <b>high</b>: high</li></ul>                                                                     |
| inputJsonData   | String (65535) | Body     | No        | Input queue data, which is a JSON character string.                                                                                                                                                                                                                          |
| expectStartTime | Long           | Body     | No        | Planned start timestamp. The value ranges from 0 to 7258089600000L.                                                                                                                                                                                                          |
| expectEndTime   | Long           | Body     | No        | Planned end timestamp. The value ranges from 0 to 7258089600000L.                                                                                                                                                                                                            |
| description     | String (100)   | Body     | No        | Queue data description.                                                                                                                                                                                                                                                      |
| queueUid        | String         | Body     | Yes       | Queue UUID, which is unique.                                                                                                                                                                                                                                                 |

## Response

**Table 10-118** Parameters in the response body

| Parameter | Type        | Position | Mandatory | Description                                                                             |
|-----------|-------------|----------|-----------|-----------------------------------------------------------------------------------------|
| errorCode | Integer     | Body     | Yes       | Error code.<br>The value <b>0</b> indicates success and other values indicates failure. |
| errorMsg  | String      | Body     | No        | Error message.                                                                          |
| queueData | QueueData[] | Body     | No        | Queue data, which must be returned when the operation is successful.                    |

**Table 10-119** QueueData

| Parameter       | Type        | Position | Mandatory | Description                                                         |
|-----------------|-------------|----------|-----------|---------------------------------------------------------------------|
| id              | Long        | Body     | No        | Queue data ID that is automatically added.                          |
| uid             | String      | Body     | No        | Queue data UUID.                                                    |
| queueName       | String (32) | Body     | No        | Queue name.                                                         |
| queueUid        | String      | Body     | No        | Queue UUID.                                                         |
| createTime      | Long        | Body     | No        | Creation timestamp. The value ranges from 0 to 7258089600000L.      |
| expectStartTime | Long        | Body     | No        | Planned start timestamp. The value ranges from 0 to 7258089600000L. |
| expectEndTime   | Long        | Body     | No        | Planned end timestamp. The value ranges from 0 to 7258089600000L.   |

| Parameter          | Type           | Position | Mandatory | Description                                                                                                                                                                                                                                    |

| failedReasonDetail | String (65535) | Body     | No        | Failure cause details.                                                                                                                                                                                                                         |
| description        | String (100)   | Body     | No        | Queue data description.                                                                                                                                                                                                                        |
| progress           | Integer        | Body     | No        | Progress. The value ranges from 0 to 100.                                                                                                                                                                                                      |

## Example

- Request Example

```
{
 "tenantId": "202201010101",
 "authToken": "abcdefg",
 "inputJsonData": {
 "caseId": "0000000002",
 "userId": "123456",
 },
 "description": "Queue data description",
 "queueUid": "123456789",
 "priority": "normal"
}
```

- Response Example

```
{
 "errorCode": 0,
 "errorMsg": null,
 "queueData": {
 "id": 67,
 "uid": "1234567890123",
 "queueName": "Case creation",
 "queueUid": "123456789",
 "createTime": 1652100233488,
 "expectStartTime": null,
 "expectEndTime": null,
 "status": "init",
 "priority": "normal",
 "inactivated": "active",
 "tag": null,
 "inputJsonData": "{\"caseId\":\"0000000002\"}",
 "outputJsonData": null,
 "analysisJsonData": null,
 "failedReason": null,
 "failedReasonDetail": null,
 "description": "Queue data description",
 "progress": null
 }
}
```

## 10.20.4 Interface for Querying RPA Queue Data

### Description

This interface is invoked to query RPA queue data.

### Interface Method

POST

### URL

<https://IP:PORT/oifde/rest/api/rpa/queryRpaQueueData>

## Request

**Table 10-120** Parameters in the request body

| Parameter  | Type                   | Position | Mandatory | Description                                                                                                                                                                                                                                                                  |
|------------|------------------------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenantId   | String                 | Body     | Yes       | Tenant ID.<br>The value can contain a maximum of 64 characters.                                                                                                                                                                                                              |
| authToken  | String                 | Body     | Yes       | Valid token value for accessing the interface.<br>You can obtain the valid token information by invoking the interface for obtaining tokens.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .<br>The value can contain a maximum of 32 characters. |
| pageNo     | Integer                | Body     | No        | Number of pages to be queried. The default value is <b>1</b> .                                                                                                                                                                                                               |
| pageSize   | Integer                | Body     | No        | Number of data records on each page. The default value is <b>50</b> .<br>The value can be <b>5, 10, 20, or 50</b> .                                                                                                                                                          |
| conditions | RpaQueueDataConditions | Body     | Yes       | Search criteria.<br>Either <b>uid</b> or <b>queueUid</b> must be passed.                                                                                                                                                                                                     |

**Table 10-121** RpaQueueDataConditions

| Parameter | Type   | Position | Mandatory | Description                                                                                                                         |
|-----------|--------|----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------|
| uid       | String | Body     | No        | Queue data UUID for query (at least one of the <b>uid</b> , <b>queueUid</b> , and <b>queueName</b> parameters must be transferred). |

| Parameter   | Type        | Position | Mandatory | Description                                                                                                                                                                                                                                                    |
|-------------|-------------|----------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| queueUid    | String      | Body     | No        | Queue data UUID for query (at least one of the <b>uid</b> , <b>queueUid</b> , and <b>queueName</b> parameters must be transferred).                                                                                                                            |
| queueName   | String (32) | Body     | No        | Queue name for query (at least one of <b>uid</b> , <b>queueUid</b> , and <b>queueName</b> must be transferred).                                                                                                                                                |
| tag         | String      | Body     | No        | Queue data label for query.                                                                                                                                                                                                                                    |
| status      | String      | Body     | No        | Queue status for query. The options are as follows: <ul style="list-style-type: none"> <li>• <b>init</b>: waiting for processing</li> <li>• <b>processing</b>: processing</li> <li>• <b>success</b>: success</li> <li>• <b>failed</b>: failed</li> </ul>       |
| inactivated | String      | Body     | No        | Queue enabling status for query. The options are as follows: <ul style="list-style-type: none"> <li>• <b>active</b>: enabled</li> <li>• <b>inactive</b>: disabled</li> <li>• If this parameter is not transferred, the query is enabled by default.</li> </ul> |
| priority    | String      | Body     | No        | Queue priority for query. The options are as follows: <ul style="list-style-type: none"> <li>• <b>low</b>: low</li> <li>• <b>normal</b>: medium</li> <li>• <b>high</b>: high</li> </ul>                                                                        |

## Response

**Table 10-122** Parameters in the response body

| Parameter | Type        | Position | Mandatory | Description                                                                             |
|-----------|-------------|----------|-----------|-----------------------------------------------------------------------------------------|
| errorCode | Integer     | Body     | Yes       | Error code.<br>The value <b>0</b> indicates success and other values indicates failure. |
| errorMsg  | String      | Body     | No        | Error message.                                                                          |
| total     | Integer     | Body     | No        | Number of queue data records, which must be returned when the operation is successful.  |
| queueData | QueueData[] | Body     | No        | Queue data, which must be returned when the operation is successful.                    |

**Table 10-123** QueueData

| Parameter       | Type        | Position | Mandatory | Description                                                         |
|-----------------|-------------|----------|-----------|---------------------------------------------------------------------|
| id              | Long        | Body     | No        | Queue data ID that is automatically assigned.                       |
| uid             | String      | Body     | No        | Queue data UUID.                                                    |
| queueName       | String (32) | Body     | No        | Queue name.                                                         |
| queueUid        | String      | Body     | No        | Queue UUID.                                                         |
| createTime      | Long        | Body     | No        | Creation timestamp. The value ranges from 0 to 7258089600000L.      |
| expectStartTime | Long        | Body     | No        | Planned start timestamp. The value ranges from 0 to 7258089600000L. |

| Parameter          | Type           | Position | Mandatory | Description                                                                                                                                                                                                                                    |
|--------------------|----------------|----------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| expectEndTime      | Long           | Body     | No        | Planned end timestamp. ## 10.21 Interface for Generating TTS Voices Based on Texts

### Description

This interface, provide by the OIAP, is invoked by third-party systems to generate TTS voices.

If the text to be converted is long, the interface response time increases accordingly.

## Interface Method

POST

## URI

https://IP:PORT/oifde/rest/api/tts/texttovoice

## Message Header

Content-Type:application/json; charset=UTF-8

## Request

**Table 10-124** Parameters in the request body

| No. | Parameter | Type   | Mandatory | Description                                                                                                           |
|-----|-----------|--------|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 1   | tenantId  | String | Yes       | Tenant ID.                                                                                                            |
| 2   | authToken | String | Yes       | Authentication token.<br>For details, see <a href="#">4.4 C3 OIAP Interface Authentication</a> .                      |
| 3   | text      | String | Yes       | Text to be synthesized, which must be encoded using UTF-8.                                                            |
| 4   | config    | Object | Yes       | TTS configuration information.<br>For details about the parameters of this object, see <a href="#">Table 10-125</a> . |

Table 10-125 config

| No. | Parameter | Type   | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-----|-----------|--------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4.1 | voiceName | String | Yes       | Model feature string, which is used by the server to invoke different models.<br>The options are as follows: <ul style="list-style-type: none"><li>• <b>cn_chengshuxing_common</b>: mature</li><li>• <b>cn_kefuman_common</b>: graceful</li><li>• <b>cn_roumeiqian_common</b>: soft</li><li>• <b>cn_tianmeiru_common</b>: sweet</li><li>• <b>cn_ziranzhen_common</b>: natural</li></ul> |
| 4.2 | pitch     | String | No        | Fundamental frequency, which is used to adjust the pitch.<br>The value ranges from -500 to 500.<br>The default value is <b>0</b> .                                                                                                                                                                                                                                                      |
| 4.3 | volume    | String | No        | Volume, which is used to adjust the volume.<br>The value ranges from 0 to 100. The default value is <b>50</b> .                                                                                                                                                                                                                                                                         |
| 4.4 | speed     | String | No        | Speed, which is used to adjust the speech speed.<br>The value ranges from -500 to 500.<br>The default value is <b>0</b> .                                                                                                                                                                                                                                                               |

## Response

- **Status code: 200**

**Table 10-126** Parameters in the response body

| No. | Parameter | Type   | Description                                                                                           |
|-----|-----------|--------|-------------------------------------------------------------------------------------------------------|
| 1   | retCode   | String | Result code. The value <b>0</b> indicates success and other values indicates failure.                 |
| 2   | retMsg    | String | Description of a failure cause.                                                                       |
| 3   | data      | Object | Return result.<br>For details about the parameters of this object, see <a href="#">Table 10-127</a> . |

**Table 10-127** data

| No. | Parameter  | Type    | Description                                                                                                         |
|-----|------------|---------|---------------------------------------------------------------------------------------------------------------------|
| 3.1 | format     | String  | Audio encoding format.                                                                                              |
| 3.2 | sampleRate | Integer | Audio sampling rate.                                                                                                |
| 3.3 | voiceData  | String  | Base64-encoded voice data.                                                                                          |
| 3.4 | sentences  | List    | Output sentence information.<br>For details about the parameters of this object, see <a href="#">Table 10-128</a> . |

**Table 10-128** sentences

| No.   | Parameter | Type    | Description                                                  |
|-------|-----------|---------|--------------------------------------------------------------|
| 3.4.1 | st        | Integer | Start timestamp of a sentence, in milliseconds.              |
| 3.4.2 | et        | Integer | End timestamp of a sentence, in milliseconds.                |
| 3.4.3 | offset    | Integer | Start position of a sentence in the original text, in bytes. |
| 3.4.4 | len       | Integer | Length of a sentence in the original text, in bytes.         |

## 10.22 Offline Conversion Callback Interface

### Description

This interface is provided by the OIAP for a third-party system to return the ASR offline conversion result to the ODFS.

This interface is a system-level third-party interface. For details about the authentication mode, see the third point in "NOTE" in [4.4 C3 OIAP Interface Authentication](#).

## Interface Method

POST

## URI

| No.   | Parameter | Type   | Mandatory | Description                                                                                 |
|-------|-----------|--------|-----------|---------------------------------------------------------------------------------------------|
| 1.2.1 | aid       | String | Yes       | Unique ID of an audio file, which is passed by the client.                                  |
| 1.2.2 | lattices  | List   | Yes       | Conversion result.<br><a href="#">Table 10-134</a> describes the parameters of this object. |

**Table 10-134** Description of lattices parameters

| No.     | Parameter | Type    | Mandatory | Description                   |
|---------|-----------|---------|-----------|-------------------------------|
| 1.2.2.1 | lid       | Integer | Yes       | Sequence number of a segment. |
| 1.2.2.2 | begin     | Integer | Yes       | Start time of a segment.      |
| 1.2.2.3 | end       | Integer | Yes       | End time of a segment.        |
| 1.2.2.4 | onebest   | String  | Yes       | Text after conversion.        |
| 1.2.2.5 | spk       | Integer | Yes       | Role of the speaker.          |

## Response

- **Status code: 200**

**Table 10-135** Parameters in the response body

| No. | Parameter | Type   | Description                                                                           |
|-----|-----------|--------|---------------------------------------------------------------------------------------|
| 1   | retCode   | String | Result code. The value <b>0</b> indicates success and other values indicates failure. |
| 2   | retMsg    | String | Failure cause.                                                                        |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation.  
1. Check whether you have purchased related services.  
2. Contact customer service to check the status of your account.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

Request header:

```
Content-Type:application/json; charset=UTF-8
userName:ODFS_SYS_OPENAPI
token:*****
```

Request body:

```
{
 "body": {
 "state": {
 "code": 0,
 "success": true
 },
 "body": {
 "aid": "FJKkMeepk8l",
 "lattices": [{
 "begin": 4360,
 "end": 5970,
 "lid": 0,
 "onebest": "Hello, is the call connected?",
 "spk": 0
 }]
 }
 }
}
```

Response body:

```
{
 "retCode": "0",
 "retMsg": "success"
}
```

## 10.23 Health Check Interface

### Description

This interface is invoked by a third-party access party to check whether ODFS is running properly. If the response code is **200**, ODFS is running properly.

### Interface Method

POST or GET

### URL

<https://IP:PORT/oifde/rest/api/servicemonitor>

## Request

**Table 10-136** Parameter in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

No request body parameter.

## Response

No response body parameter.

## Example

- Request  
None
- Response  
None

## 11.1 Performing Third-Party Request Authentication (applyToken)

### Scenario

This interface is invoked to generate a client access token for a third-party request.

### Method

POST

### URI

`https://Domain name/apiaccess/ccmessaging/applyToken` (For example, the domain name is `service.besclouds.com`.)

### Request Description

**Table 11-1** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | x-app-key     | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                         |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 11-2** Request body parameter

| No. | Parameter | Type                     | Mandatory or Not | Description  |
|-----|-----------|--------------------------|------------------|--------------|
| 1   | reqBody   | <b>applyTokenReqBody</b> | Yes              | Request body |

**Table 11-3** applyTokenReqBody parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                               |
|-----|-----------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | userId    | String | Yes              | User ID<br>The value is defined by the enterprise and is a string of 1 to 32 characters.                                                                                                  |
| 1.2 | userName  | String | Yes              | Username<br>The value is defined by the enterprise. This parameter is used for name display.                                                                                              |
| 1.3 | channelId | String | Yes              | Channel ID<br>The value is the same as that of <b>Configuration ID</b> of the channel configured on the <b>Service Channel Configuration &gt; Channel Configuration</b> page in the AICC. |
| 1.4 | locale    | String | Yes              | Language information<br>The value does not contain the country code. For example, <b>zh</b> indicates Chinese, and <b>en</b> indicates English. For details, see ISO 639 language codes.  |

## Response Description

- Status code: 200

**Table 11-4** applyTokenRspBody parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | token      | String | Yes              | <p>Generated token. When another request is initiated later, the value of this parameter must be assigned to <b>ccmessaging-token</b> in the header.</p> <p>Notes:</p> <ul style="list-style-type: none"><li>• The token is valid within 1 hour. If the system returns error code 401 (the authentication fails), you need to use the applyToken interface to generate a token again.</li><li>• If the token expires during a session, the AICC automatically returns a new token for the current request. The enterprise needs to update the value of <b>ccmessaging-token</b> in the header.</li></ul> |
| 1.2 | resultCode | String | Yes              | <p>Result code</p> <ul style="list-style-type: none"><li>• <b>0</b>: success</li><li>• <b>1</b>: failure</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 1.3 | resultDesc | String | No               | <p>Result description</p> <p>Currently, no value is returned.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

- **Status code: 400**

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: example message

Request parameters:

```
{
 "userId": "XXXXXXXXXX",
 "userName": "XXXXXXXX",
 "channelId": "XXXXXXXXXXXX",
 "locale": "en"
}
```

Response parameters:

```
{
 "XX"
}
```

## 11.2 Querying Queuing Information (queryQueueInfo)

### Scenario

This interface is invoked to query queuing information for queuing notification on the customer side.

Queuing information can be used only after a connection is successfully established through the send interface.

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/queryQueueInfo> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-5** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                                        |
|-----|-------------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | No               | <ul style="list-style-type: none"> <li>Value of <b>token</b> returned by the applyToken interface</li> <li>Value of <b>ccmessaging-token</b> returned in the interface response header during a session</li> </ul> |
| 2   | x-app-key         | String | No               | App key, which is the user ID and is configured on the API Fabric                                                                                                                                                  |
| 3   | Authorization     | String | No               | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the tokenByAkSk interface}. (A space is required after <b>Bearer</b> .)                                                 |

## Error Codes

None

## Example

- Scenario: Query queuing information.

Request header:

```
ccmessaging-token: xxxx
x-app-key: xxxx
Authorization: Bearer xxxx
Content-Type: application/json
```

Request parameters:

```
{
 "userId": "xxxx",
 "channelConfigId": "xxxxx",
 "channel": "WEB"
}
```

Response parameters:

```
{
 "totalWaitTime": 3,
 "resultCode": "0",
 "longestWaitTime": 3,
 "position": 1,
 "currentDeviceWaitTime": 3,
 "configMaxcWaitTime": 60,
 "estimateWaitTime": 60
}
```

## 11.3 Proactively Polling Messages Sent by Agents (poll)

### Scenario

This interface is invoked to proactively poll messages sent by agents to users.

If no message is found, check whether the send interface is invoked to set up a connection (CONNECT).

#### NOTE

If the send interface is not invoked during a session, the session is automatically released when the default session duration (configured on the CCUCS backend) is exceeded.

### Method

GET

## URI

<https://Domain name/apiaccess/ccmessaging/poll> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-9** Query parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                              |
|-----|------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | receiverId | String | Yes              | Recipient ID, that is, <b>userId</b> in <b>applyToken</b>                                                                                                                                                                |
| 2   | channel    | String | Yes              | Recipient channel type. The default value <b>WEB</b> must be used.                                                                                                                                                       |
| 3   | isNeedRead | String | No               | Whether to read the message indicating that the agent has read the user message. The value <b>true</b> indicates that the message is required. Other values or an empty value indicate that the message is not required. |

**Table 11-10** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                                               |
|-----|-------------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | Yes              | <ul style="list-style-type: none"> <li>Value of <b>token</b> returned by the <b>applyToken</b> interface</li> <li>Value of <b>ccmessaging-token</b> returned in the interface response header during a session</li> </ul> |
| 2   | x-app-key         | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                                                                         |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                      |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> (space){Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

## Response Description

- Status code: 200

Table 11-11 pollRsp parameters

| No. | Parameter        | Type                  | Mandatory or Not | Description                                                                                                                                                       |
|-----|------------------|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | resultDesc       | String                | No               | Result description<br>If the operation is successful, the description is <b>query user messages success</b> . If the operation fails, no description is returned. |
| 1.2 | downlinkMessages | <b>downLinkMsgArr</b> | Yes              | Array of messages sent to users                                                                                                                                   |
| 1.3 | resultCode       | String                | Yes              | Result code of the message received by the client. The value <b>0</b> indicates success, and other values indicate failure.                                       |

**Table 11-12** downLinkMsgArr parameters

| No. | Parameter      | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                     |
|-----|----------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | channel        | String | Yes              | Message channel type. Currently, the value is fixed to <b>WEB</b> , indicating the access from the web channel.                                                                                                                                                                 |
| 1.2 | content        | String | Yes              | Content of the MT message sent to a customer. The value can contain a maximum of 500 characters.<br>The value varies according to the media type.<br>For a multimedia library file, the value is the multimedia library file ID.<br>For a local file, the value is the OBS key. |
| 1.3 | from           | String | Yes              | Message sender ID. Generally, the value is the same as that of <b>Configuration ID</b> of the channel in the AICC.                                                                                                                                                              |
| 1.4 | mediaType      | String | Yes              | Message media type. The options are <b>TEXT, IMAGE, VIDEO, AUDIO, LOCATE, and DOCUMENT.</b>                                                                                                                                                                                     |
| 1.5 | senderNickname | String | No               | Nickname configured when an agent signs in or the robot is enabled. If the message is a system message, the nickname is <b>system.</b>                                                                                                                                          |

| No.  | Parameter       | Type    | Mandatory or Not | Description                                                                                                                                                                                                              |
|------|-----------------|---------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.6  | sourceType      | String  | Yes              | Message sender. The options are <b>AGENT</b> , <b>ROBOT</b> , and <b>SYSTEM</b> .                                                                                                                                        |
| 1.7  | timestamp       | String  | No               | Message sending timestamp                                                                                                                                                                                                |
| 1.8  | to              | String  | Yes              | Message recipient ID. Generally, the value is that of <b>userId</b> sent by the enterprise client                                                                                                                        |
| 1.9  | simQuestions    | String  | Yes              | Similar question content                                                                                                                                                                                                 |
| 1.10 | isOfflineStatus | Boolean | No               | This parameter is used by the client to determine whether a message can be sent in the next step.                                                                                                                        |
| 1.11 | messageCode     | String  | No               | Unique message code, which is used to identify the message for canceling or deleting an action                                                                                                                           |
| 1.12 | interIdx        | String  | No               | Number of interaction times. The value is the same as that of <b>inter_idx</b> returned by the ODFS in the previous time.                                                                                                |
| 1.13 | contentType     | String  | No               | If the file is a multimedia library file, the return value is <b>null</b> .<br>If the file is a local file, the value is <b>1</b> .                                                                                      |
| 1.14 | mediaFileType   | String  | No               | Multimedia file type. The options are <b>jpg</b> , <b>png</b> , <b>bpm</b> , <b>mp3</b> , <b>aac</b> , <b>mp4</b> , <b>txt</b> , <b>csv</b> , <b>richtext</b> , <b>doc</b> , <b>docx</b> , <b>pdf</b> , and <b>zip</b> . |

| No.  | Parameter   | Type   | Mandatory or Not | Description                                                         |
|------|-------------|--------|------------------|---------------------------------------------------------------------|
| 1.15 | controlType | String | No               | The options are <b>CHAT</b> , <b>DISCONNECT</b> , and <b>READ</b> . |

## 11.4 Submitting the Customer Satisfaction Evaluation Result (saveSatisfaction)

### Scenario

This interface is invoked to save the satisfaction evaluation result submitted by a user.

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/saveSatisfaction> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 11-13 Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                        |
|-----|-------------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | Yes              | <ul style="list-style-type: none"> <li>Token returned by the applyToken interface</li> <li>Value of <b>ccmessaging-token</b> returned by the Response Header interface during a session</li> </ul> |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                             |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | x-app-key     | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                                       |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after <b>Bearer</b> .) |

**Table 11-14** Request body parameter

| No. | Parameter    | Type                    | Mandatory or Not | Description                         |
|-----|--------------|-------------------------|------------------|-------------------------------------|
| 1   | satisfaction | <b>satisfactionInfo</b> | Yes              | Satisfaction evaluation information |

**Table 11-15** satisfactionInfo parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                 |
|-----|-----------|--------|------------------|-------------------------------------------------------------|
| 1.1 | channel   | String | Yes              | Channel type. Currently, the value is fixed to <b>WEB</b> . |
| 1.2 | userId    | String | Yes              | User ID. The value is a string of 1 to 32 characters.       |

| No. | Parameter       | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|-----------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.3 | evaluation      | String | Yes              | <p>Satisfaction level. The value ranges from 1 to 5. The default satisfaction levels are as follows:</p> <ul style="list-style-type: none"><li>• 1: very dissatisfied</li><li>• 2: dissatisfied</li><li>• 3: general</li><li>• 4: satisfied</li><li>• 5: very satisfied</li></ul> <p>You can invoke the interface for querying the satisfaction survey configuration to query the satisfaction level set in <b>Configuration Center &gt; Workbench Configuration &gt; Satisfaction Survey &gt; Satisfaction Level</b> or use the default value. The satisfaction level is the same as the pressed key.</p> |
| 1.4 | comment         | String | Yes              | <p>Satisfaction comment. The value can contain a maximum of 512 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1.5 | channelConfigId | String | Yes              | <p>Channel ID. The value is the same as that of <b>Configuration ID</b> of the web channel configured in the AICC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Response Description

- Status code: 200

**Table 11-16** RspMsg parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | resultCode | String | Yes              | Return code <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● <b>13</b>: failure to obtain the call information or submit the satisfaction evaluation result</li> </ul>                                                                                                                                                                            |
| 1.2 | resultDesc | String | No               | Return description <ul style="list-style-type: none"> <li>● If the return code is <b>0</b>, the description may be <b>Save satisfaction success!</b><br/>The description may also be <b>Exception appeared!</b></li> <li>● If the return code is <b>13</b>, the description is <b>The callIdString obtained failed!</b> or <b>Save satisfaction failed.</b></li> </ul> |

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: example message

Request parameters:

```
{
 "channel": "WEB",
 "userId": "XXXXXXXX",
 "evaluation": "5",
 "comment": "Satisfied",
 "channelConfigId": "XXXXXXXX"
}
```

Response parameters:

```
{
 "resultCode": "0"
}
```

## 11.5 Sending a Message (send)

### Scenario

This interface is invoked to send a channel message (such as a connection, sending input status, session, transfer-to-manual, or disconnection message).

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/send> (For example, the domain name is <https://service.besclouds.com>.)

### Request Description

**Table 11-17** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                             |
|-----|-------------------|--------|------------------|-------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | Yes              | Value of <b>ccmessaging-token</b> generated by the applyToken interface |
| 2   | x-app-key         | String | Yes              | App key, which is the user ID and is configured on the API Fabric       |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 11-18** Request body parameter

| No. | Parameter | Type                       | Mandatory or Not | Description  |
|-----|-----------|----------------------------|------------------|--------------|
| 1   | reqBody   | <a href="#">sendMsgReq</a> | Yes              | Request body |

**Table 11-19** sendMsgReq parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                      |
|-----|-----------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | channel   | String | Yes              | Type of the channel through which the client sends a message, for example, the web channel (web customer service access channel) |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2 | content   | String | No               | <p>Message content, which varies depending on <b>mediaType</b>. For example, if <b>mediaType</b> is set to <b>TEXT</b>, the value is the text content to be sent. The size of the text content to be sent cannot exceed 1 KB. If <b>mediaType</b> is set to audio, video, or other media types, the value is in the format of <i>fileId,mediaType</i>, where <i>fileId</i> indicates the value of <b>objectKey</b> returned by the /ccmessaging/uploadFileStream interface. The value is <i>value of <b>objectKey</b>,jpg</i> for images, <i>value of <b>objectKey</b>,mp4</i> for videos, <i>value of <b>objectKey</b>,mp3</i> for audio, and <i>value of <b>objectKey</b>,txt</i> for locations. The file download interface uses <i>fileId</i> to download a file.</p> <p>If <b>mediaType</b> is set to <b>WEBCARD</b>, the value is a string converted from the JSON structure. For example, the fixed JSON structure is as follows:</p> <pre>{ "title": "Card title", "description": "Card description", "mediaFileId": "Card media file ID (which is returned by the upload" }</pre> |

| No. | Parameter      | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|----------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     |                |        |                  | <p><i>interface)","mediaFileType": "Only fixed values <b>img</b>, <b>img/png</b>, and <b>img/jpg</b> are supported. If this parameter is left empty, the default value <b>jpg</b> is used."</i>, "redirectUrl": "Redirection URL"}<br/>                     Either <b>redirectUrl</b> or <b>mediaFileId</b> must be set. Other parameters can be left empty. For details, see the example of sending a web card message to an agent.</p> |
| 1.3 | controlType    | String | Yes              | Message control type. The options are <b>CONNECT</b> , <b>CHAT</b> , <b>TRANSAGENT</b> , <b>INPUT</b> , <b>DISCONNECT</b> , and <b>READ</b> .                                                                                                                                                                                                                                                                                            |
| 1.4 | from           | String | Yes              | ID of the user who sends a message through a channel                                                                                                                                                                                                                                                                                                                                                                                     |
| 1.5 | mediaType      | String | Yes              | Message media type. The options are <b>TEXT</b> , <b>IMAGE</b> , <b>AUDIO</b> , <b>VIDEO</b> , <b>FILE</b> , <b>FILE_IMAGE</b> , <b>FILE_VIDEO</b> , <b>WEBCARD</b> , and <b>LOCATE</b> .                                                                                                                                                                                                                                                |
| 1.6 | senderNickname | String | No               | Nickname of the message sender                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1.7 | sourceType     | String | Yes              | Message source type. Set this parameter to <b>CUSTOMER</b> .                                                                                                                                                                                                                                                                                                                                                                             |
| 1.8 | timestamp      | String | No               | Time when a message is sent                                                                                                                                                                                                                                                                                                                                                                                                              |
| 1.9 | to             | String | Yes              | Channel configuration ID                                                                                                                                                                                                                                                                                                                                                                                                                 |

| No.  | Parameter    | Type   | Mandatory or Not | Description                                                                                                                         |
|------|--------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 1.10 | userAgent    | String | No               | User client type, which is obtained from <b>UserAgent</b>                                                                           |
| 1.11 | senderAvatar | String | No               | Avatar of the message sender. For the WeChat channel, the WeChat avatar URL is transmitted.                                         |
| 1.12 | messageld    | String | No               | Unique ID of the user who sends the message. The value can contain a maximum of 32 characters. The value cannot contain commas (,). |
| 1.13 | transData    | String | No               | Data in JSON format, which is transferred to the robot flow when the robot is connected                                             |

## Response Description

- Status code: 200

**Table 11-20** senMsgRsp parameters

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Send a request for connecting to the robot.

Request parameters:

```
{
 "content": "",
 "controlType": "CONNECT",
 "from": "session_1619573111751_user_1619573111751",
 "mediaType": "TEXT",
 "senderNickname": "user_1619573111751",
 "sourceType": "CUSTOMER",
 "timestamp": "1619573122352",
 "to": "1011577355744904195",
 "userAgent": null,
 "senderAvatar": null,
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "connect to robot successfully."
}
```

- Scenario: Send a request for chatting with a robot.

Request parameters:

```
{
 "content": "Version",
 "controlType": "CHAT",
 "from": "session_1619573111751_user_1619573111751",
 "mediaType": "TEXT",
 "senderNickname": "user_1619573111751",
 "sourceType": "CUSTOMER",
 "timestamp": "1619573123199",
 "to": "1011577355744904195",
 "userAgent": null,
 "senderAvatar": null,
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "Send message to robot successfully"
}
```

- Scenario: Send a request for switching from robot service to manual service.

Request parameters:

```
{
 "content": "",
 "controlType": "TRANS2AGENT",
 "from": "session_1619573111751_user_1619573111751",
 "mediaType": "TEXT",
 "senderNickname": "user_1619573111751",
 "sourceType": "CUSTOMER",
 "timestamp": "1619573129953",
 "to": "1011577355744904195",
 "userAgent": null,
 "senderAvatar": null,
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "transfer from robot to agent success."
}
```

- Scenario: Send a web card message to an agent.

Request parameters:

```
{
 "content": "{\"title\":\"Test title\",\"description\":\"Test description\",\"mediaFileId\":\"xxx-xxx-xxx-xxx-2e171ac78313\",\"mediaFileType\":\"img\",\"redirectUrl\":\"https://www.***.com\"}",
 "controlType": "CHAT",
 "from": "session_1619573111751_user_1619573111751",
 "mediaType": "WEBCARD",
 "senderNickname": "user_1619573111751",
 "sourceType": "CUSTOMER",
 "timestamp": "1619573129953",
 "to": "1011577355744904195",
 "userAgent": null,
 "senderAvatar": null,
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "sendUserMessage successfully."
}
or
{
 "resultCode": "3",
 "resultDesc": "The redirection address is not in the trust list, contact operation staff to add it."
}
```

- Scenario: Send a disconnection request.

Request parameters:

```
{
 "content": "",
 "controlType": "DISCONNECT",
 "from": "session_1619573842490_user_1619573842490",
 "mediaType": "TEXT",
 "senderNickname": "user_1619573842490",
 "sourceType": "CUSTOMER",
 "timestamp": "1619573854156",
 "to": "1011577355744904195",
 "userAgent": null,
 "senderAvatar": null,
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "Disconnect robot successfully"
}
```

## 11.6 Sending a File by a Customer (uploadFileStream)

### Scenario

This interface is invoked by a customer to send a file.

## Method

POST

## URI

https://*Domain name*/apiaccess/ccmessaging/uploadFileStream (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-21** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                                        |
|-----|-------------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | Yes              | <ul style="list-style-type: none"> <li>Value of <b>token</b> returned by the applyToken interface</li> <li>Value of <b>ccmessaging-token</b> returned in the interface response header during a session</li> </ul> |
| 2   | x-app-key         | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                                                                  |
| 3   | Authorization     | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the tokenByAkSk interface}</b> . (A space is required after <b>Bearer</b> .)                                                |

**Table 11-22** Request body parameter

| No. | Parameter | Type           | Mandatory or Not | Description  |
|-----|-----------|----------------|------------------|--------------|
| 1   | reqBody   | <b>ReqBody</b> | Yes              | Request body |

**Table 11-23** ReqBody parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                        |
|-----|------------|--------|------------------|------------------------------------------------------------------------------------|
| 1.1 | fileType   | String | Yes              | File type. The supported types include JPG, PNG, BPM, MP3, AAC, MP4, TXT, and CSV. |
| 1.2 | fileStream | String | Yes              | File stream encoded using Base64                                                   |
| 1.3 | channel    | String | Yes              | Channel for sending file streams. Only <b>WEB</b> is supported.                    |

## Response Description

ANPV3SpXfxCP/9k="
}
```

Response parameters:

```
{
 "returnCode": "0",
 "objectKey": "44992392*****6cc328db296"
}
```

## 11.7 Receiving a File by a Customer (downloadFileStream)

### Scenario

This interface is invoked by a customer to receive a file.

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/downloadFileStream> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 11-25 Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                                     |
|-----|-------------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | Yes              | <ul style="list-style-type: none"><li>Value of <b>token</b> returned by the applyToken interface</li><li>Value of <b>ccmessaging-token</b> returned in the interface response header during a session</li></ul> |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                             |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | x-app-key     | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                                       |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after <b>Bearer</b> .) |

**Table 11-26** Request body parameter

| No. | Parameter | Type           | Mandatory or Not | Description  |
|-----|-----------|----------------|------------------|--------------|
| 1   | reqBody   | <b>ReqBody</b> | Yes              | Request body |

**Table 11-27** ReqBody parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                             |
|-----|-----------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | fileId    | String | Yes              | File ID for file download, which is carried in the poll interface<br><br>If the value of <b>fileId</b> is <b>local</b> / <i>{Value of <b>content</b>}</i> , a local file is sent. The value of <b>content</b> is in the response of the poll interface. |
| 1.2 | channel   | String | Yes              | Download channel type. Currently, the value is fixed to <b>WEB</b> .                                                                                                                                                                                    |

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                  |
|-----|------------|--------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.3 | fileType   | String | Yes              | Type of the file to be downloaded. The options are <b>jpg, png, bpm, mp3, aac, mp4, txt, csv, richtext, doc, docx, pdf, and zip</b> .<br>In scenarios where local files are sent, set this parameter to the value of <b>mediaFileType</b> in the MT multimedia file message. |
| 1.4 | multiMedia | String | No               | If the file is a multimedia library file, this parameter is mandatory and must be set to <b>multiMedia</b> .                                                                                                                                                                 |

# 11.8 Associating Common Phrases Based on the Customer Input (queryPhraseByKeyword)

## Scenario

This interface is invoked to associate common phrases based on keywords entered by the customer. This interface requires that the chatbot be enabled in the channel configuration.

If no content is returned, check whether activated FAQ groups exist in the tenant space.

## Method

POST

## URI

<https://Domain name/apiaccess/ccmessaging/queryPhraseByKeyword> (For example, the domain name is service.besclouds.com.)

## Request Description

The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Check whether the click-to-dial function is supported.

URL: `https://Domain name/apiaccess/ccmessaging/v1/checkClickToCallSupport`

Request header:

```
ccmessaging-token: XXXXXXXXX
x-app-key: XXXXXXXXX
Authorization: XXXXXXXXX
```

Request parameters:

```
{
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "",
 "webRTCSupported": true,
 "clickToCallSupported": true
}
```

## 11.10 Creating a Click-to-Dial Call (createClickToCall)

### Scenario

This interface is invoked to create a click-to-dial call.

### Method

POST

### URI

`https://Domain name/apiaccess/ccmessaging/v1/createClickToCall` (For example, the domain name is `service.besclouds.com`.)

### Request

**Table 11-36** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                          |
|-----|-------------------|--------|------------------|--------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | No               | Value of <b>ccmessaging-token</b> generated by the <code>applyToken</code> interface |
| 2   | x-app-key         | String | No               | App key, which is the user ID and is configured on the API Fabric                    |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | No               | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 11-37** Request body parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                        |
|-----|--------------|--------|------------------|--------------------------------------------------------------------|
| 1.1 | channel      | String | Yes              | Recipient channel type ( <b>WEB</b> )                              |
| 1.2 | mediaAbility | String | Yes              | Media capability<br><b>0</b> : voice call<br><b>1</b> : video call |

## Response

- **Status code: 200**

**Table 11-38** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                              |
|-----|------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Error Code

None

## Example

Request header:

```
ccmessaging-token:eyJjcmVhdG*****NzlxMTc4
Authorization:Bearer dbb0*****bbb33a
x-app-key:6e9d9c*****152c2f6
Content-Type:application/json
```

Request parameters:

```
{
 "channel": "WEB",
 "mediaAbility": "0"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": null
}
```

## 11.11 Obtaining a Click-to-Dial Event (getClickToCallEvents)

### Scenario

This interface is invoked to obtain a click-to-dial event.

### Method

GET

### URI

<https://Domain name/apiaccess/ccmessaging/v1/getClickToCallEvents> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-39** Query parameter

| No. | Parameter | Type   | Mandatory or Not | Description                           |
|-----|-----------|--------|------------------|---------------------------------------|
| 1   | channel   | String | Yes              | Recipient channel type ( <b>WEB</b> ) |

**Table 11-40** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|-------------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | ccmessaging-token | String | Yes              | Value of <b>ccmessaging-token</b> generated by the applyToken interface                                                                                                   |
| 2   | x-app-key         | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                         |
| 3   | Authorization     | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

## Response Description

## 11.12 Releasing a Click-to-Dial Call (dropClickToCall)

### Scenario

This interface is invoked to release a click-to-dial call.

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/v1/dropClickToCall> (For example, the domain name is service.besclouds.com.)

### Request Description

**Table 11-42** Request header parameters

| No. | Parameter             | Type   | Mandato<br>ry or Not | Description                                                             |
|-----|-----------------------|--------|----------------------|-------------------------------------------------------------------------|
| 1   | ccmessaging-<br>token | String | Yes                  | Value of <b>ccmessaging-token</b> generated by the applyToken interface |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                             |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | x-app-key     | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                                       |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after <b>Bearer</b> .) |

**Table 11-43** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                           |
|-----|-----------|--------|------------------|---------------------------------------|
| 1.1 | channel   | String | Yes              | Recipient channel type ( <b>WEB</b> ) |

## Response Description

- **Status code: 200**

**Table 11-44** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                         |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**

Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.

- **Status code: 404**

The requested content is not found. Check the request path.

- **Status code: 500**

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Release a click-to-dial call.

- Request header:

```
x-app-key: *****,
Authorization: *****,
ccmessaging-token: *****
```

- Request parameters:

```
{
 "channel": "WEB"
}
```

- Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": ""
}
```

## 11.13 Creating an Anonymous Call (createcall)

### Scenario

An operator logs in to the app and invokes the createcall interface provided by the chat module to create an anonymous outbound call task. Then, the operator can initiate an anonymous call by integrating the SDK.

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/v1/mobileagent/createcall> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-45** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                             |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | Yes              | App key, which is the user ID                                                                                                                                                           |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after <b>Bearer</b> .) |

**Table 11-46** Request body parameters

| No. | Parameter     | Type          | Mandatory or Not | Description                                                                                                                                        |
|-----|---------------|---------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | called        | String (32)   | Yes              | Called number                                                                                                                                      |
| 1.2 | callData      | String (1024) | No               | Call data                                                                                                                                          |
| 1.3 | callerPresent | String (32)   | Yes              | Calling number displayed to users and customer managers. If this parameter is not included, the calling number of the platform is used by default. |

## Response Description

- Status code: 200

**Table 11-47** Response body parameters

| No.   | Parameter    | Type        | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**

The requested content is not found. Check the request path.

- **Status code: 500**

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

Request header:

```
ccmessaging-token: x-app-key: Authorization:
```

Request parameters:

```
{
 "callId": "111111222111",
 "caller": "138****7777",
 "leaveMessage": "Please reply",
 "channel": "WEB"
}
```

Response parameters:

```
{
 "resultCode": "0",
 "resultDesc": "Save leaveMessage success!"
}
```

## 11.15 Submitting the Chatbot Satisfaction Evaluation Result (feedbacksatisfaction)

### Scenario

This interface is invoked to submit the satisfaction evaluation result of the chatbot's reply.

### Method

POST

### URI

<https://Domain name/apiaccess/ccmessaging/v1/robot/feedbacksatisfaction> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-51** Request header parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|-------------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | x-app-key         | String | Yes              | App key, which is the user ID                                                                                                                                              |
| 2   | Authorization     | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the tokenByAkSk interface}</i> . (A space is required after <b>Bearer</b> .) |
| 3   | ccmessaging-token | String | Yes              | Value of <b>ccmessaging-token</b> generated by the applyToken interface                                                                                                    |

**Table 11-52** Request body parameters

| No. | Parameter       | Type        | Mandatory or Not | Description                                                                                                              |
|-----|-----------------|-------------|------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1.1 | feedback        | Integer     | Yes              | Satisfaction feedback. The options are <b>1</b> (satisfied) and <b>0</b> (dissatisfied).                                 |
| 1.2 | feedbackContent | String (64) | No               | When <b>feedback</b> is set to <b>0</b> , the value cannot be empty and can contain a maximum of 64 characters.          |
| 1.3 | from            | String      | Yes              | Message sender ID                                                                                                        |
| 1.4 | interIdx        | String      | Yes              | Number of interaction times. The value is the same as that of <b>interidx</b> returned by the ODFS in the previous time. |

## Response Description

- **Status code: 200**

**Table 11-53** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Discard an email.  
URL: successful request message  
Request header:  
x-app-Key:\*\*\*\*\* Authorization:Bearer \*\*\*\*\*  
Request parameters:

```
{
 "emailId": "10195068940994050"
}
```

Response parameters:

```
{
 "returnCode": "0",
 "description": "dropMail success"
}
```

## 11.18 Sending an MT WhatsApp Message (sendWhatsappMessage)

### Scenario

This interface is invoked to send an MT WhatsApp message.

### Method

POST

### URI

<https://Domain name/apiaccess/rest/ccmessaging/omni/1/advanced> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 11-60 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 2   | x-app-key     | String | Yes              | App key, which is the user ID and is configured on the API Fabric                                                                                                         |
| 3   | Content-Type  | String | Yes              | Content type                                                                                                                                                              |

**Table 11-61** Request body parameters

| No.     | Parameter    | Type            | Mandatory or Not | Description                                                                                                                                                                                               |
|---------|--------------|-----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1     | scenarioKey  | String          | No               | Unique key of the solution that will be used to send messages. If this field is not set, the default solution is used.<br>The AICC does not send this field.                                              |
| 1.2     | bulkId       | String          | Yes              | Unique request ID. Multiple IDs will be received only when the message is sent to multiple destination addresses.                                                                                         |
| 1.3     | destinations | Array [Object]  | Yes              | List of message recipients                                                                                                                                                                                |
| 1.3.1   | messageId    | String          | Yes              | Unique ID of a sent message                                                                                                                                                                               |
| 1.3.2   | to           | Object          | Yes              | Message destination address                                                                                                                                                                               |
| 1.3.2.1 | phoneNumber  | String          | Yes              | Destination phone number. The value must be in the international number format, for example, <b>41793026727</b> .                                                                                         |
| 1.4     | whatsApp     | <b>whatsApp</b> | Yes              | Encapsulated <b>whatsApp</b> object                                                                                                                                                                       |
| 1.5     | sendAt       | String          | No               | Date and time when the message needs to be sent. This parameter is used for scheduled OMNI messaging. The first message in the OMNI flow is not sent immediately, but will be sent at the scheduled time. |

**Table 11-62** whatsApp parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                                                                                                                                     |
|-----|--------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | text         | String | No               | Text of the message to be sent                                                                                                                                                  |
| 1.2 | imageUrl     | String | No               | URL of the image sent in the WhatsApp message. The value can contain a maximum of 2048 characters. The image type must be JPG, JPEG, or PNG. The image size cannot exceed 2 MB. |
| 1.3 | audioUrl     | String | No               | URL of the audio file sent in the WhatsApp message. The value can contain a maximum of 2048 characters. The audio type must be AAC. The audio size cannot exceed 2 MB.          |
| 1.4 | videoUrl     | String | No               | URL of the video sent in the WhatsApp message. The value can contain a maximum of 2048 characters. The video type must be MP4. The video size cannot exceed 10 MB.              |
| 1.5 | locationName | String | No               | Text of the message to be sent<br>The value contains a maximum of 1000 characters.                                                                                              |
| 1.6 | address      | String | No               | Address. This parameter is optional. The value contains a maximum of 1000 characters.                                                                                           |
| 1.7 | longitude    | Number | No               | Longitude. The value ranges from -180 to 180.                                                                                                                                   |

| No.  | Parameter         | Type              | Mandatory or Not | Description                                                                                                         |
|------|-------------------|-------------------|------------------|---------------------------------------------------------------------------------------------------------------------|
| 1.8  | latitude          | Number            | No               | Latitude. The value ranges from -90 to 90.                                                                          |
| 1.9  | templateName      | String            | No               | Template name                                                                                                       |
| 1.10 | templateData      | Array [String]    | No               | Template parameter values sorted by registration sequence in the template                                           |
| 1.11 | language          | String            | No               | Code of the language or locale to be used. The code must be the same as that used for registration in the template. |
| 1.12 | mediaTemplateData | mediaTemplateData | No               | Encapsulated <b>mediaTemplateData</b> object                                                                        |

**Table 11-63** mediaTemplateData parameters

| No. | Parameter | Type                | Mandatory or Not | Description                                                                      |
|-----|-----------|---------------------|------------------|----------------------------------------------------------------------------------|
| 1.1 | header    | <b>HeaderObject</b> | No               | Media template type. This parameter is required for media templates with titles. |
| 1.2 | body      | <b>BodyObject</b>   | No               | Media template body                                                              |
| 1.3 | buttons   | Array [Object]      | No               | Media template buttons                                                           |

**Table 11-64** HeaderObject parameters

| No. | Parameter       | Type   | Mandatory or Not | Description                                                                  |
|-----|-----------------|--------|------------------|------------------------------------------------------------------------------|
| 1.1 | textPlaceholder | String | No               | Text placeholder. This parameter is required for templates with text titles. |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                         |
|-----|-----------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2 | imageUrl  | String | No               | Image URL. This parameter is required for templates with image titles. The image type must be JPG, JPEG, or PNG. The image size cannot exceed 2 MB. |
| 1.3 | videoUrl  | String | No               | Video URL. This parameter is required for templates with video titles. The video type must be MP4. The video size cannot exceed 10 MB.              |
| 1.4 | latitude  | Number | No               | Latitude. The value ranges from -90 to 90. This parameter is required for templates with location titles.                                           |
| 1.5 | longitude | Number | No               | Longitude. The value ranges from -180 to 180. This parameter is required for templates with location titles.                                        |

**Table 11-65** BodyObject parameters

| No. | Parameter    | Type           | Mandatory or Not | Description                                                                                                                             |
|-----|--------------|----------------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | placeholders | Array [String] | No               | Media template body placeholders. The value cannot be null, but can be an empty array. Values within the array cannot be null or empty. |

**Table 11-66** ButtonObject parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                                                                                                                               |
|-----|-------------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | urlPlaceholder    | String | No               | Date and time when the message needs to be sent. This parameter is used for scheduled OMNI messaging. The first message in the OMNI flow is not sent immediately, but will be sent at the scheduled time. |
| 1.2 | quickReplyPayload | String | No               | Quick reply payload. This parameter is required for the quick reply button.                                                                                                                               |

**Table 11-67** destinations parameters

| No. | Parameter | Type            | Mandatory or Not | Description                 |
|-----|-----------|-----------------|------------------|-----------------------------|
| 1.1 | messageId | String          | Yes              | Unique ID of a sent message |
| 1.2 | to        | <b>toObject</b> | Yes              | Message destination address |

**Table 11-68** MessageObject parameters

| No. | Parameter | Type                | Mandatory or Not | Description                                                                                                          |
|-----|-----------|---------------------|------------------|----------------------------------------------------------------------------------------------------------------------|
| 1.1 | to        | <b>toObject</b>     | No               | Message destination address                                                                                          |
| 1.2 | status    | <b>StatusObject</b> | No               | Message status. The message states include successfully sent, not sent, passed, not passed, and waiting for passing. |
| 1.3 | messageId | String              | No               | Unique ID of a sent message                                                                                          |

**Table 11-69** toObject parameters

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                       |
|-----|-------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------|
| 1.1 | phoneNumber | String | Yes              | Destination phone number. The value must be in the international number format, for example, <b>41793026727</b> . |

**Table 11-70** StatusObject parameters

| No. | Parameter   | Type    | Mandatory or Not | Description                            |
|-----|-------------|---------|------------------|----------------------------------------|
| 1.1 | groupName   | String  | Yes              | Status group name                      |
| 1.2 | id          | Integer | Yes              | Status ID                              |
| 1.3 | groupId     | Integer | Yes              | Status group ID                        |
| 1.4 | name        | String  | Yes              | Status name                            |
| 1.5 | action      | String  | No               | Action to be taken to eliminate errors |
| 1.6 | description | String  | Yes              | Readable status description            |

## Response Description

- **Status code: 200**

**Table 11-71** Response body parameters

| No.   | Parameter | Type           | Mandatory or Not | Description                                                           |
|-------|-----------|----------------|------------------|-----------------------------------------------------------------------|
| 1.1   | messages  | Array [Object] | Yes              | Array of sent message objects. Each message corresponds to an object. |
| 1.1.1 | to        | Object         | Yes              | Message destination address                                           |

| No.     | Parameter   | Type   | Mandatory or Not | Description                                                                                                       |
|---------|-------------|--------|------------------|-------------------------------------------------------------------------------------------------------------------|
| 1.1.1.1 | phoneNumber | String | Yes              | Destination phone number. The value must be in the international number format, for example, <b>41793026727</b> . |
| 1.1.2   | status      | Object | Yes              | Status object                                                                                                     |
| 1.1.2.1 | groupId     | Number | Yes              | Status group ID                                                                                                   |
| 1.1.2.2 | groupName   | String | Yes              | Status group name                                                                                                 |
| 1.1.2.3 | id          | Number | Yes              | Status ID                                                                                                         |

 "id": 1
 }
 }
],
 "bulkId": "20221025"
}
```

## 11.19 Querying Information About the Current Chat on the Online Chat Workbench (getUserInfoBycallId)

### Scenario

This interface is invoked to query information about the current chat on the online chat workbench.

### Method

POST

## URI

<https://Domain name/apiaccess/rest/workbench/v1/getUserInfoBycallId> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 11-72** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | X-APP-Key     | String | No               | App key, which is the user ID                                                                                                                                             |
| 2   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 11-73** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                           |
|-----|-----------|--------|------------------|-------------------------------------------------------|
| 1   | callId    | String | Yes              | Call ID                                               |
| 2   | userId    | String | Yes              | User ID. The value is a string of 1 to 32 characters. |
| 3   | tenantId  | String | Yes              | Tenant ID                                             |

## Response Description

- **Status code: 200**

**Table 11-74** Response body parameters

| No. | Parameter    | Type   | Mandatory or Not | Description |
|-----|--------------|--------|------------------|-------------|
| 1   | userNickname | String | Yes              | Name        |
| 2   | userId       | String | Yes              | User ID     |
| 3   | userAvatar   | String | No               | User avatar |

| No. | Parameter       | Type   | Mandatory or Not | Description                                                                |
|-----|-----------------|--------|------------------|----------------------------------------------------------------------------|
| 4   | channel         | String | Yes              | Channel name, for example, <b>WEB</b> , <b>WECHAT</b> , or <b>FACEBOOK</b> |
| 5   | createTime      | String | Yes              | Creation time                                                              |
| 6   | channelConfigId | String | Yes              | Channel configuration ID                                                   |
| 7   | userAgent       | String | No               | User proxy                                                                 |
| 8   | clientIp        | String | No               | Client IP address                                                          |
| 9   | osName          | String | No               | Operating system name                                                      |
| 10  | borderType      | String | No               | Operating system version                                                   |

}
```

# 12 Inspection, Monitoring, and Statistics Collection Interface Reference

---

[12.1 Real-time Inspection: qualitycontrol](#)

[12.2 Intelligent Quality Check](#)

[12.3 Monitoring and Statistics Collection](#)

## 12.1 Real-time Inspection: qualitycontrol

### NOTE

Currently, video calls are not supported.

To support inspection on inspectors, you need to configure data on the CTI platform by choosing **Web Configuration Console > VDN Configuration > Recording Quality Inspection > Recording Quality Inspection Parameter**.

**Support QC on QC Inspectors** is set to **Yes**.

### 12.1.1 Inserting

#### Prerequisites

- The inspector has signed in.
- The inspector is in idle state.

#### Description

This interface is used by an inspector to inspect a specified agent in real time after the inspector signs in and shows idle.

An agent who has the inspection permission can barge into an agent who has signed in. After barging into an agent, the inspector enters the barge state, and the agent and inspector enter the two-party conversation mode. If the monitored agent answers the call from the customer, the inspector can directly talk with the agent and the customer.

## Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

## URI

https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/addinsert/{workNo}

In the URL, **ip** indicates the IP address of the CC-Gateway, **port** indicates the HTTPS port number of the CC-Gateway, **{agentid}** indicates the employee ID of the agent that has logged in, and **{workno}** indicates the employee ID of the agent to be inserted.

**Table 12-1** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                 |
| 2   | workNo    | string    | Yes                | ID of the agent to be inserted. The value ranges from 101 to 59999. The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

}
```

## 12.1.2 Listening

### Prerequisites

- The inspector has signed in.
- The inspector is in idle state.

### Description

This interface is used by an inspector to listen to a specified agent after the inspector signs in and shows idle.

An agent with the inspection permission can listen to an agent who has signed in. When the listening starts, the inspector enters the listening state, and the listened-to agent and the customer are unaware of the listening. If the listened-to agent is answering an inbound call of a customer, the inspector can hear the talk between the agent and the customer.

### Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

### URI

`https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/addsupervise/{workNo}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 12-4** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                                         |
|-----|-----------|-----------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                       |
| 2   | workNo    | string    | Yes                | ID of the agent to be listened to. The value ranges from 101 to 59999.<br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

}
```

## 12.1.3 Intercepting

### Prerequisites

- The inspector has signed in.
- The inspector has performed the insertion, listening, or whisper operation.

## Description

An inspector needs to interrupt the session between an agent and a customer and directly talk with the customer.

After an inspection inspector signs in and intercepts an agent who has been barged in, listened to, or whispered, the inspection inspector enters the interception state. The conversation between the agent and the customer is interrupted, the agent enters the idle state, and the inspection inspector continues to talk with the customer.

## Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

## URI

`https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/intercept/{workNo}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 12-7** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                                         |
|-----|-----------|-----------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                       |
| 2   | workNo    | string    | Yes                | ID of the agent to be intercepted. The value ranges from 101 to 59999.<br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

## 12.1.4 Canceling Listening and Inserting

### Prerequisites

- The inspector has signed in.
- The inspector has listened to or inserted into a call.

### Description

This interface is used by an inspector that has signed in to cancel listening and inserting on a specified agent.

### Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

### URI

<https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/{workNo}>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 12-10** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|

}
```

## 12.1.6 Indicating an Agent in Idle State Forcibly

### Prerequisites

- The inspector has signed in.

### Description

This interface is used by an inspector that has signed in to indicate that a specified agent is in idle state forcibly.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### URI

<https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/forceidle/{workNo}>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 12-16** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                          |
|-----|-----------|-----------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                        |
| 2   | workNo    | string    | Yes                | Specified agent ID. The value ranges from 101 to 59999.<br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

### Method Name in Logs

forceidle

## Request Description

- Message header

**Table 12-17** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

 "result": {}
}
```

## 12.1.11 Forcing an Agent to Rest

### Prerequisites

- The inspector has signed in.

### Description

This interface is used to force a specified agent to rest after an inspector has signed in.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/forcerest/{workNo}/{time}/{reason}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 12-32** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                                                                                          |
|-----|-----------|-----------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                        |
| 2   | workNo    | string    | Yes                | Specified agent ID. The value ranges from 101 to 59999.<br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |
| 3   | time      | long      | Yes                | Rest duration, in seconds. The value ranges from 1 to 86399.                                                                         |
| 4   | reason    | int       | Yes                | Rest reason code. The value ranges from 1 to 255.                                                                                    |

## 12.1.12 Requesting for Whispering

### Prerequisites

- The inspector has signed in.
- The inspector is in idle state.

### Description

This interface is used by an inspector to request for whispering.

An agent who has the whisper permission can hear the conversation between the service agent and a customer and provide online guidance for the service agent during the conversation. The customer cannot hear the guidance.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### URI

`https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/requestwhisperagent?whisperagentid={whisperagentid}`

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 12-35** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

| No. | Parameter      | Data Type | Mandatory (Yes/No) | Description                                                                                                                                                      |
|-----|----------------|-----------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | whisperagentid | string    | No                 | ID of the agent whose whisper is inspected. The value ranges from 101 to 59999.<br><br>The agent ID must belong to the same VDN as the value of <b>agentid</b> . |

## Method Name in Logs

## 12.1.14 Switching Among Whispering, Listening, and Barging

### Prerequisites

- The inspector has signed in.
- The inspector has whispered, and listened to and inserted into a call.

### Description

This interface is used by an inspector to switch modes among whispering, listening, and insertion after the inspector signs in.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### URI

https://ip:port/agentgateway/resource/qualitycontrol/{agentid}/  
requestswitchinsertwhisperagent?  
whisperagentid={whisperagentid}&switchtype={switchtype}

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 12-41** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

| No. | Parameter      | Data Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                   |

## 12.2 Intelligent Quality Check

### 12.2.1 scoresetting

#### 12.2.1.1 POST /CCSQM/rest/ccisqm/v1/appraisescore/createAppraiseScore

##### Scenario

This interface is invoked to create an inspection rating rule.

##### Method

POST

##### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/appraisescore/createAppraiseScore> (For example, the domain name is service.besclouds.com.)

##### Request Description

**Table 12-44** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                             |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                    |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the <i>tokenByAkSk</i> interface}</b> . (A space is required after <b>Bearer</b> .) |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                      |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | x-UserId  | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface. |

**Table 12-45** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description   |
|-----|-------------|--------|------------------|---------------|
| 1.1 | name        | String | Yes              | Rule name     |
| 1.2 | lower_bound | Number | Yes              | Minimum score |
| 1.3 | upper_bound | Number | Yes              | Maximum score |
| 1.4 | base        | Number | Yes              | Start score   |

## Response Description

- **Status code: 200**

**Table 12-46** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                        |
|-----|------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------|
| 1.1 | id         | Number | Yes              | Unique rule ID                                                                                                     |
| 1.2 | resultCode | String | No               | Return code <ul style="list-style-type: none"> <li>• <b>0412000</b>: success</li> <li>• Others: failure</li> </ul> |
| 1.3 | resultDesc | String | No               | Return description                                                                                                 |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.

- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Create an inspection rating rule.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "name": "test",
 "lower_bound": 11,
 "upper_bound": 111,
 "base": 11
}
```

Response parameters:

```
{
 "resultCode": "0412000",
 "id": "1828287446",
 "resultDesc": "Operation successful."
}
```

### 12.2.1.2 POST /CCSQM/rest/ccisqm/v1/appraisescore/applyAppraiseScore

#### Scenario

This interface is invoked to use an inspection rating rule.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/appraisescore/applyAppraiseScore> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 12-47** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |

#### Request Description

**Table 12-56** Request header parameters

| No. | Parameter    | Type   | Mandato ry or Not | Description                                                    |
|-----|--------------|--------|-------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | No                | The value is fixed to <b>application/json; charset=UTF-8</b> . |
| 2   | x-app-key    | String | No                | App key                                                        |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                          |

**Table 12-57** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description    |
|-----|-------------|--------|------------------|----------------|
| 1.1 | id          | String | Yes              | Unique rule ID |
| 1.2 | name        | String | Yes              | Rule name      |
| 1.3 | lower_bound | Number | Yes              | Minimum score  |
| 1.4 | upper_bound | Number | Yes              | Maximum score  |
| 1.5 | base        | Number | Yes              | Start score    |

## Response Description

- **Status code: 200**

**Table 12-58** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description                                                                                                        |
|-----|------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------|
| 1.1 | resultCode | String | No               | Return code <ul style="list-style-type: none"> <li>• <b>0412000</b>: success</li> <li>• Others: failure</li> </ul> |
| 1.2 | resultDesc | String | No               | Return description                                                                                                 |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Modify an inspection rating rule.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "id": "1980058583",
 "name": "1",
 "lower_bound": 10,
 "upper_bound": 100,
 "base": 10,
}
```

Response parameters:

```
{
 "resultCode": "0412000",
 "resultDesc": "Operation successful."
}
```

## 12.2.2 sentencemanagement

### 12.2.2.1 POST /CCSQM/rest/ccisqm/v1/sentencemanage/ createSentenceCategory

#### Scenario

This interface is invoked to create a sentence category.

#### Method

POST

## URI

`https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/sentencemanage/createSentenceCategory` (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 12-59** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                            |

## Error Codes

None

## Example

- Scenario 1: Query a sentence list.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "category_id": "1070149256381206528",
 "keyword": "Sentence",
 "page": 1,
 "limit": 10
}
```

Response parameters:

```
{
 "paging": {
 "total": 4
 },
 "data": [
 {
 "category_id": "1070149256381206528",
 "sentence_id": "10870",
 "sentence_name": "Sentence name 78",
 "tags": null
 },
 {
 "category_id": "1070149256381206528",
 "sentence_id": "10877",
 "sentence_name": "Sentence name 25",
 "tags": null
 },
 {
 "category_id": "1070149256381206528",
 "sentence_id": "10884",
 "sentence_name": "Sentence name 39",
 "tags": null
 },
 {
 "category_id": "1070149256381206528",
 "sentence_id": "10891",
 "sentence_name": "Sentence name 85",
 "tags": null
 }
]
}
```

- Scenario 2: Query sentence details by sentence ID.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "sentence_id": "10891"
}
```

Response parameters:

```
{
 "category_id": "1070149256381206528",
 "sentence_id": "10891",
 "tagDataList": [
 {
 "tag_type": "dialogue_act",
 "pos_sentences": [
 {
 "name": "Synonym corpus 18",

 "id": "10107"
 }
]
 }
],
"sentence_name": "Sentence name 85",
"resultCode": "0403000",
"resultDesc": "Operation successful."
}

```

### 12.2.2.5 POST /CCSQM/rest/ccisqm/v1/sentencemanage/ querySentenceByCategoryId

#### Scenario

This interface is invoked to obtain the list of sentences in a sentence category based on its unique ID.

#### Method

POST

#### URI

[https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/sentencemanage/  
querySentenceByCategoryId](https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/sentencemanage/querySentenceByCategoryId) (For example, the domain name is service.besclouds.com.)

#### Request Description

**Table 12-71** Request header parameters

| No. | Parameter    | Type   | Mandato<br>ry or Not | Description                                                    |
|-----|--------------|--------|----------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | No                   | The value is fixed to <b>application/json; charset=UTF-8</b> . |
| 2   | x-app-key    | String | No                   | App key                                                        |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | No               | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                          |

**Table 12-72** Request body parameters

| No. | Parameter   | Type   | Mandatory or Not | Description                                                                                                                    |
|-----|-------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1.1 | category_id | String | Yes              | Unique ID of a sentence category                                                                                               |
| 1.2 | page        | Number | Yes              | Page number                                                                                                                    |
| 1.3 | limit       | Number | Yes              | Number of records on each page<br><ul style="list-style-type: none"> <li>Value range: <b>5, 10, 20, 50, and 100</b></li> </ul> |

## Response Description

Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**  
The requested path is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Obtain the list of sensitive words in a sensitive word category based on its unique ID.  
Request header:  

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "page": 1,
 "limit": 10,
 "category_id": "894378241379274753"
}
```

Response parameters:

```
{
 "data": [{
 "category_id": "894378241379274753",
 "sw_id": "894378241689653248",
 "sw_name": "Ha ha ha"
 }],
 "resultCode": "0401000",
 "paging": {
 "total": 1
 },
 "resultDesc": "Operation successful."
}
```

### 12.2.3.7 POST /CCSQM/rest/ccisqm/v1/sensitiveWordManage/createSensitiveCategory

#### Scenario

This interface is invoked to create a sensitive word category.

#### Method

POST

#### URI

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Add a sensitive word.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "category_id": "923002678840135680",
 "sw_name": "test11",
 "score": -4,
 "exception": {
 "customer": ["14166"],
 "staff": []
 }
}
```

Response parameters:

```
{
 "resultCode": "0401000",
 "sw_id": "923007085031985152",
 "resultDesc": "Operation successful."
}
```

### 12.2.3.10 POST /CCSQM/rest/ccisqm/v1/sensitiveWordManage/updateSensitiveCategory

#### Scenario

This interface is invoked to update a sensitive word category.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/sensitiveWordManage/updateSensitiveCategory> (For example, the domain name is service.besclouds.com.)

#### Request Description

Table 12-114 Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                    |
|-----|--------------|--------|------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> . |
| 2   | x-app-key    | String | No               | App key                                                        |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                          |

## Error Codes

None

## Example

- Scenario: Update a script.  
Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "sentences": ["14171"],
 "role": "any",
 "position": "any",
 "SGType": "must",
 "sg_id": "923004925930115072",
 "sg_name": "Script name 98",
 "dialogue_flow_id": "923004925523267584",
 "position_distance": 0
}
```

Response parameters:

```
{
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
}
```

## 12.2.4.2 POST /CCSQM/rest/ccisqm/v1/conversation-rules/getSentenceGroup

### Scenario

This interface is invoked to query script details by ID. The query criterion is **sg\_id**, which indicates the unique ID of a script and is mandatory.

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/conversation-rules/getSentenceGroup> (For example, the domain name is service.besclouds.com.)

### Request Description

**Table 12-123** Request header parameters

| No. | Parameter    | Type   | Mandatory or Not | Description                                                   |
|-----|--------------|--------|------------------|---------------------------------------------------------------|
| 1   | Content-Type | String | No               | The value is fixed to <b>application/json; charset=UTF-8.</b> |
| 2   | x-app-key    | String | No               | App key                                                       |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                          |

**Table 12-124** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description |
|-----|-----------|--------|------------------|-------------|
| 1   | sg_id     | Object | Yes              | Script ID   |

## Response Description

The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Delete a dialog logic.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "flow_id": "871578307970207744"
}
```

Response parameters:

```
{
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
}
```

### 12.2.6.3 POST /CCSQM/rest/ccisqm/v1/conversation-rules/ updateConversationFlow

#### Scenario

This interface is invoked to update a dialog logic.

#### Method

POST

#### URI

[https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/conversation-rules/  
updateConversationFlow](https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/conversation-rules/updateConversationFlow) (For example, the domain name is  
service.besclouds.com.)

#### Request Description

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Create a dialog logic.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "flow_name": "APIcs",
 "min": 2,
 "expression": "must",
 "rule_id": "894378241748373505"
}
```

Response parameters:

```
{
 "flow_id": "925093880544628736",
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
}
```

## 12.2.7 conversationrules

### 12.2.7.1 POST /CCSQM/rest/ccisqm/v1/conversation-rules/getOneRule

#### Scenario

This interface is invoked to query a dialog rule by ID. The query criterion is **rule\_id**, which indicates the unique ID of a dialog rule and is mandatory.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/conversation-rules/getOneRule> (For example, the domain name is service.besclouds.com.)

#### Request Description

**Table 12-152** Request header parameters

| No. | Parameter    | Type   | Mandato<br>ry or Not | Description                                                    |
|-----|--------------|--------|----------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | No                   | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |

## Example

- Scenario: Query a dialog rule by ID. The query criterion is **rule\_id**, which indicates the unique ID of a dialog rule and is mandatory.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "rule_id": "922202599711576064"
}
```

Response parameters:

```
{
 "severity": "normal",
 "rule_id": "922202599711576064",
 "score": "1",
 "other": {
 "call_end": 1625020693,
 "call_from": 1622515089
 },
 "min": "1",
 "method": "positive",
 "rule_name": "Dialog rule"
 "flows": [{
 "flow_id": "923000489761574912",
 "flow_name": "cs"
 }],
 "resultCode": "0405000",
 "description": "Dialog rule",
 "completeness": {
 "hasConversationFlow": true,
 "sentenceComplete": true,
 "ruleComplete": true,
 "hasDescription": true
 },
 "resultDesc": "Operation successful."
}
```

## 12.2.7.2 POST /CCSQM/rest/ccisqm/v1/conversation-rules/queryRules

### Scenario

This interface is invoked to query a dialog rule list in pagination mode. The query criteria are **limit** (number of records on each page), **page** (current page number), **keyword** (query keyword), and **completeOnly** (whether a rule is complete).

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/conversation-rules/queryRules> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-155 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                             |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                    |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the <i>tokenByAkSk</i> interface}</b> . (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                           |

**Table 12-156** Request body parameters

| No. | Parameter      | Type         | Mandatory or Not | Description                                             |
|-----|----------------|--------------|------------------|---------------------------------------------------------|
| 1.1 | limit          | Number       | Yes              | Number of records on each page. Pagination information. |
| 1.2 | page           | Number       | No               | Current page number. Pagination information.            |
| 1.3 | keyword        | String (128) | No               | Query keyword                                           |
| 1.4 | incompleteOnly | Boolean      | No               | Whether to search for complete rules                    |

## Response Description

- **Status code: 200**

**Table 12-157** Response body parameters

| No.     | Parameter    | Type           | Mandatory or Not | Description                          |
|---------|--------------|----------------|------------------|--------------------------------------|
| 1.1     | data         | Array [Object] | No               | Returned data                        |
| 1.1.1   | rule_id      | String         | No               | Rule ID                              |
| 1.1.2   | score        | String         | No               | Rule score                           |
| 1.1.3   | rule_name    | String         | No               | Rule name                            |
| 1.1.4   | flows        | Array [Object] | No               | Dialog logics associated with a rule |
| 1.1.4.1 | expression   | String         | No               | Expression                           |
| 1.1.4.2 | min          | Number         | No               | Minimum number of dialog logics      |

## Error Codes

None

## Example

- Scenario: Create a dialog rule.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "severity": "normal",
 "score_type": "valid",
 "method": "positive",
 "score": 1,
 "min": 1,
 "other": {},
 "rule_name": "aseew",
 "description": "3"
}
```

Response parameters:

```
{
 "rule_id": "923084345118298112",
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
}
```

## Example

- Scenario: Query an interruption rule by ID.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "interposal_id": "922993405183660032"
}
```

Response parameters:

```
{
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
 "setting": {
 "score": "-4",
 "seconds": "4",
 "times": "4",
 "other": {
 "call_end": 1623999504,
 "call_from": 1623913102
 }
 },
 "interposal_id": "922993405183660032",
 "name": "test0613"
}
```

## 12.2.8.2 POST /CCSQM/rest/ccisqm/v1/interposal-rules/queryInterposalRules

### Scenario

This interface is invoked to query all interruption rules. The query criteria are **limit** (number of records on each page), **page** (current page number), and **keyword** (query keyword).

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/interposal-rules/queryInterposalRules> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-170 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                             |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                    |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the <i>tokenByAkSk</i> interface}</b> . (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                           |

**Table 12-171** Request body parameters

| No. | Parameter | Type        | Mandatory or Not | Description                                             |
|-----|-----------|-------------|------------------|---------------------------------------------------------|
| 1.1 | limit     | Number      | Yes              | Number of records on each page. Pagination information. |
| 1.2 | page      | Number      | No               | Current page number. Pagination information.            |
| 1.3 | keyword   | String (64) | No               | Query keyword                                           |

## Response Description

- **Status code: 200**

**Table 12-172** Response body parameters

| No.   | Parameter  | Type                       | Mandatory or Not | Description                                                                                 |
|-------|------------|----------------------------|------------------|---------------------------------------------------------------------------------------------|
| 1.1   | data       | Array<br>[InterposaleRule] | Yes              | Rule set                                                                                    |
| 1.2   | paging     | Object                     | Yes              | Pagination information                                                                      |
| 1.2.1 | total      | Number                     | Yes              | Total number of records                                                                     |
| 1.3   | resultCode | String                     | Yes              | Return code. The value <b>0405000</b> indicates success, and other values indicate failure. |
| 1.4   | resultDesc | Number                     | Yes              | Return description                                                                          |

## Error Codes

None

## Example

- Scenario: Update an interruption rule.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "score": 4,
 "seconds": 4,
 "times": 4,
 "other": {
 "call_end": 1623999504,
 "call_from": 1623913102
 },
 "interposal_id": "922993405183660032",
 "name": "test0613"
}
```

Response parameters:

```
{
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
}
```

### 12.2.8.6 Common Parameter Structure

### 12.2.8.6.1 InterposalsRule

Table 12-182 InterposalsRule Parameters

| Seq.  | Name           | Type   | Mandatory | Description                        |
|-------|----------------|--------|-----------|------------------------------------|
| 1.1   | name           | string | True      | Rule Name                          |
| 1.2   | score          | number | True      | Rule Deduction                     |
| 1.3   | seconds        | number | True      | Overlapping Seconds Limit          |
| 1.4   | times          | number | True      | Overlapping Count Limit            |
| 1.5   | interposals_id | string | True      | Rule ID                            |
| 1.6   | other          | object | False     | Inspection Condition               |
| 1.6.1 | call_end       | number | False     | End time of a one-way audio call   |
| 1.6.2 | call_from      | number | False     | Start time of a one-way audio call |

## 12.2.9 silencerule

### 12.2.9.1 POST /CCSQM/rest/ccisqm/v1/silencerule/querySilenceRule

#### Scenario

This interface is invoked to query silence rule details by ID. The query criterion is **silence\_id**, which indicates the unique ID of a silence rule and is mandatory.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/silencerule/querySilenceRule> (For example, the domain name is service.besclouds.com.)

## Request Description

Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Add a silent rule.  
Request header:  
x-app-key:\*\*\*\*\*  
X-UserID:1611917095665261978  
Authorization:Bearer \*\*\*\*\*

Request parameters:

```
{
 "setting": {
 "name": "test34",
 "score": 4,
 "seconds": 5,
 "times": 4,
 "other": {
 "call_from": 1623911884,
 "call_end": 1624430285
 }
 },
 "exception": {
 "before": {
 "staff": ["14161"],
 "customer": []
 },
 "after": {}
 }
}
```

Response parameters:

```
{
 "silence_id": "922987647176019968",
 "resultCode": "0405000",
 "resultDesc": "Operation successful."
}
```

### 12.2.9.3 POST /CCSQM/rest/ccisqm/v1/silencerule/querySilenceRules

#### Scenario

This interface is invoked to query a silent rule list. The query criteria are **page** (current page number), **limit** (number of records on each page), and **keyword** (query keyword).

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/silencerule/querySilenceRules> (For example, the domain name is service.besclouds.com.)

#### Request Description

**Table 12-189** Request header parameters

| No. | Parameter    | Type   | Mandato ry or Not | Description                                                    |
|-----|--------------|--------|-------------------|----------------------------------------------------------------|
| 1   | Content-Type | String | No                | The value is fixed to <b>application/json; charset=UTF-8</b> . |
| 2   | x-app-key    | String | No                | App key                                                        |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | No               | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                          |

**Table 12-190** Request body parameters

| No. | Parameter | Type        | Mandatory or Not | Description                    |
|-----|-----------|-------------|------------------|--------------------------------|
| 1.1 | page      | Number      | No               | Current page number            |
| 1.2 | limit     | Number      | Yes              | Number of records on each page |
| 1.3 | keyword   | String (64) | No               | Query keyword                  |

## Response Description

- **Status code: 200**

**Table 12-191** Response body parameters

| No.   | Parameter | Type           | Mandatory or Not | Description                  |
|-------|-----------|----------------|------------------|------------------------------|
| 1.1   | data      | Array [Object] | No               | Return information           |
| 1.1.1 | score     | String         | No               | Rule score                   |
| 1.1.2 | seconds   | String         | No               | Silence duration, in seconds |
| 1.1.3 | times     | String         | No               | Number of silence times      |

| No.   | Parameter  | Type   | Mandatory or Not | Description                                                                                 |
|-------|------------|--------|------------------|---------------------------------------------------------------------------------------------|
| 1.1.4 | silence_id | String | No               | Silence rule ID                                                                             |
| 1.1.5 | name       | String | No               | Rule name                                                                                   |
| 1.2   | resultCode | String | No               | Return code. The value <b>0405000</b> indicates success, and other values indicate failure. |
| 1.3   | paging     | Object | No               | Pagination information                                                                      |
| 1.3.1 | total      | Number | No               | Total number of records                                                                     |
| 1.4   | resultDesc | String | No               | Return description                                                                          |

## Example

- Scenario: Add a speed rule.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
x-TenantSpaceId:202101124979
```

Request parameters:

```
{
 "setting": {
 "name": "APIcs",
 "score": 4,
 "min": 80,
 "max": 120,
 "other": {
 "call_from": 1622515590,
 "call_end": 1625021193
 }
 },
 "exception": {
 "under": {},
 "over": {}
 }
}
```

```
}
}
Response parameters:
{
 "resultCode": "0405000",
 "speed_id": "925095745760006144",
 "resultDesc": "Operation successful."
}
```

## 12.2.10.2 POST /CCSQM/rest/ccisqm/v1/speedrule/querySpeedRuleById

### Scenario

This interface is invoked to query speed rule details by ID. The query criterion is **speed\_id**, which indicates the unique ID of a speed rule and is mandatory.

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/speedrule/querySpeedRuleById> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-201 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                             |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                    |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the <i>tokenByAkSk</i> interface}</b> . (A space is required after <b>Bearer</b> .) |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                      |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | x-UserId  | String | No               | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface. |

## 12.2.10.4 POST /CCSQM/rest/ccisqm/v1/speedrule/querySpeedRules

### Scenario

This interface is invoked to query speed rules in pagination mode. The query criteria are **page** (current page number), **limit** (number of records on each page), and **keyword** (query keyword).

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/speedrule/querySpeedRules> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-207 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                             |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                    |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the <i>tokenByAkSk</i> interface}</b> . (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | No               | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                           |

**Table 12-208** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                             |
|-----|-----------|--------|------------------|---------------------------------------------------------|
| 1.1 | page      | Number | No               | Current page number. Pagination information.            |
| 1.2 | limit     | Number | Yes              | Number of records on each page. Pagination information. |
| 1.3 | keyword   | String | No               | Query keyword                                           |

## Response Description

- Status code: 200

## Error Codes

None

## Example

- Scenario: Update the business scenario status.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "group_id": "groupid_826b89d9-bec9-4c14-b677-1d86f16c4993",
 "is_enable": 1
}
```

Response parameters:

```
{
 "resultCode": "0406000",
 "resultDesc": "The business scenario status is updated successfully."
}
```

### 12.2.11.3 POST /CCSQM/rest/ccisqm/v1/scenariomanage/createScenario

#### Scenario

This interface is invoked to create a business scenario.

After a business scenario is created, it is unavailable. You need to invoke the interface for updating a business scenario to update it before using it normally.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/scenariomanage/createScenario> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 12-219** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                       |

## Error Codes

None

## Example

- Scenario: Update a business scenario.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "group_name": "OIAP",
 "description": "OIAP",
 "is_enable": 1,
 "ignore_sensitive": 0,
 "other": {
 "call_from": null,
 "call_end": null
 },
 "Speed_rules": ["919423582684057600"],
 "group_id": "groupid_826b89d9-bec9-4c14-b677-1d86f16c4993"
}
```

Response parameters:

```
{
 "resultCode": "0406000",
 "resultDesc": "The business scenario is updated successfully."
}
```

## 12.2.11.6 POST /CCSQM/rest/ccisqm/v1/scenariomanage/queryAllScenario

### Scenario

This interface is invoked to query all business scenarios.

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/scenariomanage/queryAllScenario> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-228 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |

## 12.2.12.2 POST /CCSQM/rest/ccisqm/v1/appraisecall/detail

### Scenario

This interface is invoked to obtain the inspection result of a call.

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/appraisecall/complain> (For example, the domain name is service.besclouds.com.)

### Request Description

**Table 12-234** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                       |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                                    |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                           |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <b>tokenByAkSk</b> interface}</i> . (A space is required after <b>Bearer</b> .) |

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                                                      |
|-----|-----------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | x-UserId  | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface. |

**Table 12-235** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description                                                                                                |
|-----|-----------|--------|------------------|------------------------------------------------------------------------------------------------------------|
| 1.1 | call_uuid | String | Yes              | Call ID<br>You can obtain the value of <b>call_uuid</b> from the result returned by the details interface. |

## Response Description

- **Status code: 200**

**Table 12-236** Response body parameters

| No. | Parameter         | Type   | Mandatory or Not | Description                                                                                       |
|-----|-------------------|--------|------------------|---------------------------------------------------------------------------------------------------|
| 1.1 | deal              | Number | No               | Whether a deal is made                                                                            |
| 1.2 | left_speed        | Number | No               | Left channel speaking speed. The speaker is determined by the <b>left_channel</b> parameter.      |
| 1.3 | left_speech_ratio | Number | No               | Left channel speaking proportion. The speaker is determined by the <b>left_channel</b> parameter. |
| 1.4 | file_name         | String | No               | Inspection file name                                                                              |

| No.    | Parameter                     | Type           | Mandatory or Not | Description                                                                                                              |
|--------|-------------------------------|----------------|------------------|--------------------------------------------------------------------------------------------------------------------------|
| 1.5    | left_channel                  | String         | No               | Left channel speaker. The options are <b>Customer</b> and <b>Agent</b> .                                                 |

## Response Description

- **Status code: 200**

**Table 12-242** Response body parameters

| No. | Parameter | Type   | Mandatory or Not | Description        |
|-----|-----------|--------|------------------|--------------------|
| 1.1 | status    | String | No               | Status             |
| 1.2 | message   | String | No               | Return information |

- **Status code: 400**  
Incorrect request. Check the request path and parameters.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Initiate an appeal.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "taskDescription": "remark",
 "callId": "c6a31191-6c69-486b-b8f9-c3412ef44bfd",
 "callGroupId": "c6a31191-6c69-486b-b8f9-c3412ef44bfd",
 "isGroup": false,
 "chooseRuleGroupList": [{

}
```

Response parameters:

```
{
 "callId": "c6a31191-6c69-486b-b8f9-c3412ef44bfd",
 "available": true
}
```

## 12.2.13 regularQualityTask

### 12.2.13.1 POST /CCSQM/rest/ccisqm/v1/regularqualitytask/addQualityTask

#### Scenario

This interface is invoked to add a scheduled sample inspection plan.

#### Method

POST

#### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/regularqualitytask/addQualityTask> (For example, the domain name is service.besclouds.com.)

## Request Description

**Table 12-243** Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                       |
|-----|---------------|--------|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                                    |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                           |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> <i>{Value of <b>AccessToken</b> returned by the <b>tokenByAkSk</b> interface}</i> . (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                                  |

**Table 12-244** Request body parameters

| No.   | Parameter      | Type           | Mandatory or Not | Description               |
|-------|----------------|----------------|------------------|---------------------------|
| 1.1   | appointQuality | Object         | Yes              | Inspectors to be assigned |
| 1.1.1 | setCounts      | Array [Object] | Yes              | Inspectors                |

| No.     | Parameter     | Type    | Mandatory or Not | Description                                                                                                                                                                                                                                                                                            |
|---------|---------------|---------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.1.1.1 | count         | Number  | No               | Quantity. The value can contain a maximum of eight characters. <ul style="list-style-type: none"> <li>When <b>setCountsType</b> is not set to <b>2</b>, <b>count</b> is mandatory.</li> <li>When <b>setCountsType</b> is set to <b>2</b>, the sum of all counts in <b>setCounts</b> is 100.</li> </ul> |
| 1.1.1.2 | personID      | String  | Yes              | Inspector ID. The value can contain a maximum of 64 characters.                                                                                                                                                                                                                                        |
| 1.1.2   | setCountsType | Integer | Yes              | Quantity type. The options are <b>0</b> (on average) and <b>2</b> (by percentage).                                                                                                                                                                                                                     |
| 1.2     | cronStructure | Object  | Yes              | Period                                                                                                                                                                                                                                                                                                 |
| 1.2.1   | qiqtCycleType | String  | Yes              | Repetition mode. The options are <b>1</b> (daily), <b>2</b> (weekly), and <b>3</b> (monthly).                                                                                                                                                                                                          |
| 1.2.2   | qiqtEndTime   | Integer | No               | End time, in seconds. This parameter is valid when <b>qiqtEndType</b> is set to <b>2</b> . The value can contain a maximum of 10 digits.                                                                                                                                                               |
| 1.2.3   | qiqtEndType   | String  | Yes              | End condition. The options are <b>1</b> (number of times) and <b>2</b> (time).                                                                                                                                                                                                                         |
| 1.2.4   | qiqtStartTime | Integer | Yes              | Start time, in seconds. The value can contain a maximum of 10 characters.                                                                                                                                                                                                                              |

| No.     | Parameter        | Type    | Mandatory or Not | Description                                                                                                                                                                            |
|---------|------------------|---------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 12.2.14.6 POST /CCSQM/rest/ccisqm/v1/qualitytask/appointQualityTask

### Scenario

This interface is invoked to assign a manual review task.

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/qualitytask/appointQualityTask> (For example, the domain name is service.besclouds.com.)

### Request Description

**Table 12-276** Request header parameters

| No. | Parameter    | Type   | Mandato<br>ry or Not | Description                                                             |
|-----|--------------|--------|----------------------|-------------------------------------------------------------------------|
| 1   | Content-Type | String | No                   | The value is fixed to <b>application/json;</b><br><b>charset=UTF-8.</b> |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                   |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                          |

**Table 12-277** Request body parameters

| No.   | Parameter     | Type           | Mandatory or Not | Description                                                                    |
|-------|---------------|----------------|------------------|--------------------------------------------------------------------------------|
| 1.1   | qualityTaskId | Number         | Yes              | Sample inspection task ID                                                      |
| 1.2   | setCountsType | Number         | Yes              | Type of the inspector to be assigned. The value can only be <b>1</b> .         |
| 1.3   | isTakeEffect  | Number         | Yes              | Whether to take effect immediately. The options are <b>0</b> and <b>1</b> .    |
| 1.4   | setCounts     | Array [Object] | Yes              | Inspector list                                                                 |
| 1.4.1 | personID      | String         | Yes              | Inspector ID                                                                   |
| 1.4.2 | count         | Number         | No               | Number of assigned tasks. The value can contain a maximum of eight characters. |

## Response Description

- **Status code: 200**

## Error Codes

None

## Example

- Scenario: Create a manual review task.

Request header:

```
x-app-key:*****
X-UserID:1611917095665261978
Authorization:Bearer *****
```

Request parameters:

```
{
 "customColumns": null,
```

```

"currentRole": "qualityDirector",
"startTimeMillis": "",
"endTimeMillis": "",
"fixedColumns": {
 "maxNum": 10,
 "qualityCondition": 0,
 "qualityNum": 100,
 "qualityType": 1,
 "scoreStart": 10,
 "scoreEnd": 120,
 "staffIds": []
},
"qualityTask": {
 "planName": "234"
}
}

```

Response parameters:

```

{
 "qualityTaskId": "16239245027406915901",
 "resultCode": "0409000",
 "resultDesc": "Operation successful."
}

```

## 12.2.16.5 POST /CCSQM/rest/ccisqm/v1/qualityitem/queryQualityItemDetail

### Scenario

This interface is invoked to query inspection task details.

### Method

POST

### URI

<https://Domain name/apiaccess/CCSQM/rest/ccisqm/v1/qualityitem/queryQualityItemDetail> (For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-303 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                                |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                                             |
| 2   | x-app-key     | String | No               | App key                                                                                                                                                                    |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of <i>AccessToken</i> returned by the <i>tokenByAkSk</i> interface}</b> . (A space is required after <b>Bearer</b> .) |
| 4   | x-UserId      | String | Yes              | Operator ID<br>You can sign in to the system and go to the employee management page to view the value of <b>userId</b> returned by an interface.                           |

**Table 12-304** Request body parameters

| No. | Parameter     | Type   | Mandatory or Not | Description        |
|-----|---------------|--------|------------------|--------------------|
| 1.1 | qualityItemId | Number | Yes              | Inspection task ID |

## Response Description

- **Status code: 200**

**Table 12-305** Response body parameters

| No.   | Parameter           | Type           | Mandatory or Not | Description                                                                                                                                                                                                   |
|-------|---------------------|----------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 12.2.17.4 POST /CCISQM/rest/ccisqm/v1/appraisecall/credit

### Scenario

This interface invoked to query recording inspection results.

### Method

POST

### URI

<https://Domain name/apiaccess/CCISQM/rest/ccisqm/v1/appraisecall/credit> (For example, the domain name is service.besclouds.com.)

### Request Description

**Table 12-321** Request header parameters

| No. | Parameter    | Type   | Mandato<br>ry or Not | Description                                                   |
|-----|--------------|--------|----------------------|---------------------------------------------------------------|
| 1   | Content-Type | String | No                   | The value is fixed to <b>application/json; charset=UTF-8.</b> |

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                               |
|-----|---------------|--------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | x-app-key     | String | No               | App key. Contact operations personnel to obtain it.                                                                                                                       |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer</b> {Value of <b>AccessToken</b> returned by the <i>tokenByAkSk</i> interface}. (A space is required after <b>Bearer</b> .) |

**Table 12-322** Request body parameters

| No. | Parameter | Type   | Mandatory or Not | Description |
|-----|-----------|--------|------------------|-------------|
| 1.1 | call_uuid | String | Yes              | Call ID     |

## Response Description

- **Status code: 200**

**Table 12-323** Response body parameters

| No.     | Parameter       | Type           | Mandatory or Not | Description                                                               |
|---------|-----------------|----------------|------------------|---------------------------------------------------------------------------|
| 1.1     | create_time     | Number         | No               | Creation time                                                             |
| 1.2     | credit          | Array [Object] | No               | Inspection results of related business scenarios                          |
| 1.2.1   | score           | Number         | No               | Inspection score                                                          |
| 1.2.2   | rules           | Array [Object] | No               | Dialog rule inspection result                                             |
| 1.2.2.1 | valid           | Boolean        | No               | Validity. The options are <b>true</b> (valid) and <b>false</b> (invalid). |
| 1.2.2.2 | score           | Number         | No               | Rule score                                                                |

## 12.2.17.5 POST /CCISQM/rest/ccisqm/v1/openapi/qualityInspect

### Scenario

This interface is invoked to create an inspection task.

### Method

POST

### URI

[https://Domain name/apiaccess/CCISQM/rest/ccisqm/v1/openapi/qualityInspect](https://Domain%20name/apiaccess/CCISQM/rest/ccisqm/v1/openapi/qualityInspect)  
(For example, the domain name is service.besclouds.com.)

### Request Description

Table 12-324 Request header parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                                                                                  |
|-----|---------------|--------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | No               | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                               |
| 2   | x-app-key     | String | No               | App key. Contact operations personnel to obtain it.                                                                                                          |
| 3   | Authorization | String | Yes              | Authentication field. The format is <b>Bearer {Value of AccessToken returned by the tokenByAkSk interface}</b> . (A space is required after <b>Bearer</b> .) |

**Table 12-325** Request body parameters

| No. | Parameter     | Type   | Mandatory or Not | Description                                                                                        |
|-----|---------------|--------|------------------|----------------------------------------------------------------------------------------------------|
| 1.1 | language      | String | Yes              | Language of the recording file. The options are <b>zh_CN</b> (Chinese) and <b>en_US</b> (English). |
| 1.2 | voiceFilePath | String | Yes              | Recording file path                                                                                |
| 1.3 | agentId       | Number | Yes              | Agent ID                                                                                           |
| 1.4 | beginTime     | String | Yes              | Call start time, in <i>yyyy-MM-dd HH:mm:ss</i> format                                              |
| 1.5 | endTime       | String | Yes              | Call end time, in <i>yyyy-MM-dd HH:mm:ss</i> format                                                |

## Response Description

- **Status code: 200**

**Table 12-326** Response body parameters

| No. | Parameter  | Type   | Mandatory or Not | Description             |
|-----|------------|--------|------------------|-------------------------|
| 1.1 | resultCode | String | Yes              | Response status code    |
| 1.2 | resultDesc | String | Yes              | Response status message |
| 1.3 | call_uuid  | String | No               | Call ID                 |

- **Status code: 400**  
The requested content is not found. Check the request path and parameter values.
- **Status code: 401**  
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**  
The requested content is not found. Check the request path.
- **Status code: 500**  
Business failure. Check the values of parameters in the request.

## Error Codes

None

## Example

- Scenario: Create an inspection task.

Request header:

```
x-app-key:XXXXXXXXXX
Authorization:Bearer XXXXXXXXXXXX
```

Request parameters:

```
{
 "language": "zh_CN",
 "voiceFilePath": "Y:\27\0\20210201\1118\0951044.V3",
 "agentId": 1118,
 "beginTime": "2021-02-01 09:51:07",
 "endTime": "2021-02-01 09:57:57"
}
```

Response parameters:

```
{
 "resultCode": "1010200",
 "call_uuid": "822bbf4d-c4f8-473a-9144-199058375be8",
 "resultDesc": "success"
}
```

# 12.3 Monitoring and Statistics Collection

## 12.3.1 Real-Time Data Query

### 12.3.1.1 Real-Time Interfaces for VDNs

#### 12.3.1.1.1 Querying Information About System Access Codes in a Specified VDN

### Description

This interface is invoked to query system access codes of a specified VDN. (VDN: virtual directory number. A tenant corresponds to a VDN after being created and configured.)

For details about system access codes, see *(For Engineer) ICD VxxxRxxxCxx Product Documentation 01 (ICD)*.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/vdn/queryaccesscodeinfo>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-327** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-328** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Description

**Table 12-329** Parameters in the response message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                                |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |

| No. | Parameter  | Value Type | Description                                                                                                                                                       |
|-----|------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-330</a> . |

**Table 12-330** Parameters of resultDesc

| No. | Parameter       | Value Type | Description                                                                   |
|-----|-----------------|------------|-------------------------------------------------------------------------------|
| 2.1 | acId            | Integer    | Access code ID.                                                               |
| 2.2 | mediatypeId     | Integer    | Media type. For details about this object, see <a href="#">Table 12-695</a> . |
| 2.3 | accessCode      | String     | Access code.                                                                  |
| 2.4 | codeDescription | String     | Description of an access code.                                                |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters  

```
{
 "cclId":1,
 "vdn":170
}
```
- Response parameters  

```
{
 "resultDesc":[
 {
 "acId":289,
 "mediatypeId":5,
 "accessCode":"650114",
 "codeDescription":"Voice access"
 },
 {
 "acId":288,
 "mediatypeId":5,
 "accessCode":"650115",
 "codeDescription":"Voice access"
 }
],
 "resultCode":"0100000"
}
```

### 12.3.1.1.2 Querying Agent Rest Information in a Specified VDN

#### Scenario

This interface is invoked to query all agent rest information in a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interfaces:

- /ccbms/ws/monitor/teamrestinfo
- /ccbms/ws/monitor/teamrestagentinfo
- /ccbms/ws/monitor/agentstatusinfofobyagentids

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/vdn/queryagentreststate

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values.

In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-331** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-332** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                         |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclid     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                                                                                                                                           |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                                                                                                                                    |
| 3   | limit     | Integer    | Yes       | Number of query records on each page.<br>The value ranges from 1 to 1000.                                                                                                                                                                           |
| 4   | offset    | Integer    | Yes       | Parameter for determining the start page of the query. Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1). The value of <b>offset</b> is greater than or equal to 0.<br><b>page</b> indicates the start page of the query. |

## Response Description

**Table 12-333** Parameters in the response message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |

| 2.1                                                                                                                                                                                                                                                                                                                                                                     | onRestAgentNum    | Integer    | Number of resting agents.                                                                                            |
| 2.2                                                                                                                                                                                                                                                                                                                                                                     | allowRestAgentNum | Integer    | Number of agents who are allowed to have a rest but still at work.                                                   |
| 2.3                                                                                                                                                                                                                                                                                                                                                                     | waitRestAgentNum  | Integer    | Number of agents who apply for a rest.                                                                               |
| 2.4                                                                                                                                                                                                                                                                                                                                                                     | details           | Array      | Agent rest details. For details about the parameters of the object in this array, see <a href="#">Table 12-335</a> . |
| <p><b>NOTE</b><br/>The response result is the agent rest data obtained based on the pagination parameters <b>limit</b> and <b>offset</b> in the request.<br/>For example, if both <b>limit</b> and <b>offset</b> are set to <b>10</b>, the 10 agents on the second page (10 agents per page) are obtained, and then rest statistics on the 10 agents are collected.</p> |                   |            |                                                                                                                      |

**Table 12-335** Agent rest details

| No.   | Parameter       | Value Type | Description                                                                                                                                                                                               |
|-------|-----------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.4.1 | agentId         | Integer    | Agent ID.                                                                                                                                                                                                 |
| 2.4.2 | cantRestCause   | Integer    | Reason why agents are not allowed to have a rest. This parameter is valid only for the agents who wait for a rest.<br>For details about the parameters of this object, see <a href="#">Table 12-336</a> . |
| 2.4.3 | vdnId           | Integer    | ID of a VDN.                                                                                                                                                                                              |
| 2.4.4 | cclId           | Integer    | ID of a call center.                                                                                                                                                                                      |
| 2.4.5 | beginTime       | Long       | Start time. This parameter indicates the rest start time for resting agents, and the start time of applying for or approving a rest for agents not resting. The time format is timestamp.                 |
| 2.4.6 | applyRestLength | Integer    | Requested rest duration, in seconds.                                                                                                                                                                      |
| 2.4.7 | name            | String     | Agent name.                                                                                                                                                                                               |
| 2.4.8 | reqRestDuration | Long       | Rest duration, that is, the rest duration of an agent who is taking a rest, in seconds.                                                                                                                   |
| 2.4.9 | skillIds        | String     | Skill queue to which an agent waiting for a rest signs in. The value is returned only when the value of <b>cantRestCause</b> is 4.                                                                        |

**Table 12-336** Reason for not allowing rest

| Value of the Reason for Not Allowing Rest | Description                        |
|-------------------------------------------|------------------------------------|
| 0                                         | The agent is waiting for approval. |
| 1                                         | The agent is in busy state.        |

| Value of the Reason for Not Allowing Rest | Description                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------|
| 2                                         | The number of agents who can take a rest in the VDN reaches the maximum.                             |
| 3                                         | The agent does not answer any inbound calls, because the agent does not sign in to any skill queues. |
| 4                                         | The number of resting agents in a skill queue the agent signs in reaches the maximum.                |

### 12.3.1.1.3 Querying Agent Phone Numbers in a Specified VDN

#### Scenario

This interface is used to query all agent phone numbers in a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/siteagentinfobyagentids

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/vdn/allagentphones>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the

administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-337** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-338** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                            |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                                                                                                                                              |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                                                                                                                                       |
| 3   | limit     | Integer    | Yes       | Number of query records on each page.<br>The value ranges from 1 to 1000.                                                                                                                                                                              |
| 4   | offset    | Integer    | Yes       | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1). The value of <b>offset</b> is greater than or equal to 0.<br><b>page</b> indicates the start page of the query. |

## Response Description

**Table 12-339** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 1   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                                                                                             |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-340</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                          |
| 2   | resultDesc  | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-340</a> .                                                                                                                                                                                                      |
| 3   | count       | Integer    | Total number of agents in the VDN.                                                                                                                                                                                                                                                                                                                                     |

**Table 12-340** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description         |
|-----|-----------|------------|---------------------|
| 2.1 | agentId   | Integer    | Agent ID.           |
| 2.2 | phone     | String     | Agent phone number. |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters

```
{
 "ccld":1,
 "vdn":170,
 "offset":0,
 "limit":4
}
```

- Response parameters

```
{
 "result": "0",
 "resultCode": "0100000",
 "count": 30,
 "resultDatas": [
 {
 "agentId": 55002,
 "phone": 620001
 },
 {
 "agentId": 833,
 "phone": 620002
 },
 {
 "agentId": 834,
 "phone": 620003
 },
 {
 "agentId": 835,
 "phone": 620004
 }
],
 "resultDesc": [
 {
 "agentId": 55002,
 "phone": 620001
 },
 {
 "agentId": 833,
 "phone": 620002
 },
 {
 "agentId": 834,
 "phone": 620003
 },
 {
 "agentId": 835,
 "phone": 620004
 }
]
}
```

### 12.3.1.1.4 Querying Information About All Agents in a Specified VDN

#### Scenario

This interface is invoked to query information about all agents in a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/siteagentinfoobyagentids

### Request URL

https://ip:port/rest/cmsapp/v1/openapi/vdn/totalagentabstractex3

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

### Request Description

**Table 12-341** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-342** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                               |
|-----|-----------|------------|-----------|---------------------------------------------------------------------------|
| 1   | cclid     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                 |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                          |
| 3   | limit     | Integer    | Yes       | Number of query records on each page.<br>The value ranges from 1 to 1000. |

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                            |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | offset    | Integer    | Yes       | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1). The value of <b>offset</b> is greater than or equal to 0.<br><b>page</b> indicates the start page of the query. |

## Response Description

**Table 12-343** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 1   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                                                                                             |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-344</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                          |

| No. | Parameter  | Value Type | Description                                                                                                                                                       |
|-----|------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-344</a> . |
| 3   | count      | Integer    | Total number of agents in the VDN.                                                                                                                                |

**Table 12-344** Parameters of resultDesc/resultDatas

| No. | Parameter        | Value Type | Description                                                                                                      |
|-----|------------------|------------|------------------------------------------------------------------------------------------------------------------|
| 2.1 | agentId          | Integer    | Agent ID.                                                                                                        |
| 2.2 | currentState     | Integer    | Current status of an agent. For details, see <a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> . |
| 2.3 | currentStateTime | Long       | Duration of the current state, in seconds.                                                                       |
| 2.4 | locationId       | Integer    | Home distributed access node.<br>This parameter is a CTI reserved field and has no actual meaning.               |

### 12.3.1.1.6 Querying Information About Static Configurations of All Agents in a Specified VDN

#### Scenario

This interface is invoked to query information about static configurations of all agents in a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/vdn/queryagentstaticconfinfo`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-349** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-350** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |

| No. | Parameter | Value Type | Mandatory | Description                                                    |
|-----|-----------|------------|-----------|----------------------------------------------------------------|
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.               |
| 3   | offset    | Integer    | Yes       | Pagination offset.<br>The value is greater than or equal to 0. |
| 4   | limit     | Integer    | Yes       | Pagination limit.<br>The value ranges from 1 to 100.           |

## Response Description

**Table 12-351** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                 |

**Table 12-352** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                     |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | agentId   | Integer    | Agent ID.                                                                                                                                                                                                                                                                                                                                                                       |
| 2.2 | groupId   | Integer    | ID of the group to which an agent belongs. Currently, the value of this field is <b>-1</b> .<br>Group: To facilitate the management of agents, the agents of a VDN are usually grouped. Agents in a group form an agent group. Currently, the AICC does not support the return value <b>-1</b> of this field, which indicates that the agents do not belong to any agent group. |
| 2.3 | rights    | String     | Permission value of an agent. The value <b>0</b> indicates that the agent has no permission, and <b>1</b> indicates that the agent has permission. <a href="#">Table 12-353</a> describes the role permission.                                                                                                                                                                  |
| 2.4 | name      | String     | Agent name.                                                                                                                                                                                                                                                                                                                                                                     |

| No. | Parameter | Value Type | Description                                                                                                                                                                |
|-----|-----------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.5 | realFlag  | Integer    | Whether an agent is a network agent. The value <b>0</b> indicates network agent, and <b>1</b> indicates common agent. Currently, all agents in the AICC are common agents. |

**Table 12-353** Agent permission value

| Bit | Description                                                       |
|-----|-------------------------------------------------------------------|
| 1   | Showing busy/idle.                                                |
| 2   | Muting/Unmuting calls.                                            |
| 3   | Holding calls/Canceling to hold calls.                            |
| 4   | Connecting held calls.                                            |
| 5   | Making common outbound calls.                                     |
| 6   | Making internal calls.                                            |
| 7   | Transferring calls internally.                                    |
| 8   | Answering transferred inbound calls.                              |
| 9   | Making three-party calls.                                         |
| 10  | Transferring out calls.                                           |
| 11  | Transferring calls from the agent service to automatic service.   |
| 12  | Rejecting inbound calls.                                          |
| 13  | Listening/Listening and inserting/Whispering.                     |
| 14  | Intercepting calls.                                               |
| 15  | Forcibly signing out/Forcibly showing busy/Forcibly showing idle. |
| 16  | Inspecting recordings/Inspecting voice playing.                   |
| 17  | Monitoring inspections.                                           |
| 18  | Appraisal administrator.                                          |
| 19  | Ordinary appraisal personnel.                                     |

| Bit    | Description                                                  |
|--------|--------------------------------------------------------------|
| 20     | Alarm console.                                               |
| 21     | Report handler.                                              |
| 22     | Reserved value.                                              |
| 23     | Monitoring console.                                          |
| 24     | Configuration administrator.                                 |
| 25     | Report administrator.                                        |
| 26     | Making national outbound toll calls.                         |
| 27     | Making international outbound toll calls.                    |
| 28     | Making outbound calls using access codes of the call center. |
| 29     | Performing inspections in fullscreen mode.                   |
| 30     | Picking up calls for the agents in the same agent group.     |
| 31     | Reserved value.                                              |
| 32     | Configuring agents.                                          |
| 33     | Configuring skills.                                          |
| 34     | Not setting the outbound call.                               |
| 35     | Configuring the audit.                                       |
| 36-128 | Reserved value.                                              |

| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-357</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                   |
| 4   | resultDesc  | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-357</a> .                                                                                                                                                                                               |

**Table 12-357** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description |
|-----|-----------|------------|-------------|
| 2.1 | callId    | String     | Call ID.    |

| No. | Parameter     | Value Type | Description                                                                                                                              |
|-----|---------------|------------|------------------------------------------------------------------------------------------------------------------------------------------|
| 2.2 | customerLevel | Integer    | Level of the customer making a call.<br>The sequence number ranges from 1 to 254. A larger value indicates the importance of a customer. |
| 2.3 | requestType   | Integer    | Call feature.<br>For details about this object, see <a href="#">Table 12-699</a> .                                                       |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters  

```
{
 "ccld":1,
 "vdn":170,
 "flowId":1
}
```

- Response parameters  

```
{
 "result": "0",
 "resultCode": "0100000",
 "resultDatas": [
 {
 "callId": "1453724606-576",
 "customerLevel": 1,
 "requestType": 0
 }
],
 "resultDesc": [
 {
 "callId": "1453724606-576",
 "customerLevel": 1,
 "requestType": 0
 }
]
}
```

### 12.3.1.1.8 Querying Information About IVR Flow Access Codes in a Specified VDN

#### Scenario

This interface is invoked to query information about IVR flow access codes in a specified VDN.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/queryivrInfo

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/vdn/queryivrprocessinnoinfo

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-358** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-359** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Description

**Table 12-360** Parameters in the response message body

| No | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |

### 12.3.1.1.9 Querying Information about Each Skill Queue in a Specified VDN

#### Description

This interface is invoked to query information about each skill queue in a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/configures/skills`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-362** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-363** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclid     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Message

**Table 12-364** Parameters in the response message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                      |
|-----|------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 12.3.1.1.10 Querying All Rest Reason Codes in a Specific VDN

#### Scenario

This interface is invoked to query all rest reason codes in a specific VDN.

For details about how to configure the rest reason code, see "Configuring Rest Reason Codes" in *(For Engineer) ICD VxxxRxxxCxx Product Documentation 01 (ICD)*.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/restreason

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/agentgroup/restreasons/{cclid}/{vdn}

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-366** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

]
}
```

### 12.3.1.1.11 Querying Information About Calls of a Specified Access Code

#### Description

This interface is invoked to query information about calls of a specified access code. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/querycallstatbyinno

### Request URL

https://ip:port/rest/cmsapp/v1/openapi/vdn/queryaccesscodecallinfo

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

### Request Description

**Table 12-370** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-371** Parameters in the request message body

| No. | Parameter | Type    | Mandatory | Description                                                                  |
|-----|-----------|---------|-----------|------------------------------------------------------------------------------|
| 1   | cclId     | Integer | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> .     |
| 2   | vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                             |
| 3   | innolds   | Array   | Yes       | Array of access code IDs on the WAS. The maximum length of the array is 500. |

## Response Message

**Table 12-372** Parameters in the response message body

| No. | Parameter  | Type   | Description                                                                                                                                                                                                                                                |
|-----|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| 2   | resultDesc | Array  | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-373</a> .                                                                                          |

**Table 12-373** Parameters of resultDesc

| No. | Parameter       | Type    | Description                                                                         |
|-----|-----------------|---------|-------------------------------------------------------------------------------------|
| 2.1 | innold          | Integer | Access code ID.                                                                     |
| 2.2 | allCallCount    | Long    | Total number of online customers using the access code.                             |
| 2.3 | ivrCallCount    | Long    | Total number of online customers using the access code in the IVR.                  |
| 2.4 | agentCallCount  | Long    | Total number of online customers who are handled by agents and use the access code. |
| 2.5 | queueCallCount  | Long    | Total number of online customers who are in a queue and use the access code.        |
| 2.6 | longestWaitTime | Long    | Maximum call waiting duration among the calls using the access code, in seconds.    |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters  

```
{
 "ccld":1,
 "vdn":170,
 "innolds":[1,2]
}
```

- Response parameters  

```
{
 "resultCode":"0100000",
 "resultDesc":[
 {
 "innold": 1,
 "allCallCount": 1,
 "ivrCallCount": 0,
 "agentCallCount": 1,
 "queueCallCount": 0,
 "longestWaitTime": 0
 },
 {
 "innold": 2,
 "allCallCount": 1,
 "ivrCallCount": 1,
 "agentCallCount": 0,
 "queueCallCount": 0,
 "longestWaitTime": 0
 }
]
}
```

### 12.3.1.1.12 Querying Call Information in a Specified VDN

#### Description

This interface is invoked to query call information in a specified VDN based on the calling number, called number, and time segment.

This interface is invoked to query only the inbound call information of a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/vdn/querycalls>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-374** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-375** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                     |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> .                                                                                        |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                                                |
| callerNo  | String  | No        | Calling number. The value can be empty, indicating that all calling numbers are queried.<br>The value consists of digits and must comply with the number rules. |
| calleeNo  | String  | No        | Called number. The value can be empty, indicating that all called numbers are queried.<br>The value consists of digits and must comply with the number rules.   |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                     |
|-----------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| beginDate | Long    | Yes       | <p>Start time of a query period.</p> <p>The value is a timestamp in milliseconds. The time cannot be earlier than 00:00:00 of the previous day.</p> <p>The data source is time zone 0. During query, the time zone needs to be converted based on the specific time zone. For example, GMT+8 is 8 hours ahead the GMT time.</p> |
| endDate   | Long    | Yes       | <p>End time of a query period.</p> <p>The value is a timestamp in milliseconds. The time cannot be later than 23:59:59 on the current day.</p> <p>The data source is time zone 0. During query, the time zone needs to be converted based on the specific time zone. For example, GMT+8 is 8 hours ahead the GMT time.</p>      |
| limit     | Integer | No        | <p>Number of query records on each page.</p> <p>The maximum value is <b>100</b>.</p>                                                                                                                                                                                                                                            |
| offset    | Integer | No        | <p><b>offset</b> specifies the start page of the query.</p> <p>The value range of <b>offset</b> is as follows: The value of <b>offset</b> is equal to limit x (page - 1). The value is greater than or equal to 0.</p> <p><b>page</b> indicates the start page to be queried.</p>                                               |

## Response Message

**Table 12-376** Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                                |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc | Object | Object in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-377</a> .                                                                                                             |

**Table 12-377** Parameters of resultDesc

| Parameter | Type                 | Description                                                                                                              |
|-----------|----------------------|--------------------------------------------------------------------------------------------------------------------------|
| data      | Array <callinDetail> | Object array in the returned result. For details about the parameters of this object, see <a href="#">Table 12-378</a> . |
| count     | Integer              | Number of data records that can be queried.                                                                              |

**Table 12-378** Parameters of data

| Parameter | Type   | Description                                                                           |
|-----------|--------|---------------------------------------------------------------------------------------|
| logDate   | Long   | Time when data is imported to the database. The value is a timestamp in milliseconds. |
| callerNo  | String | Calling number.                                                                       |
| calleeNo  | String | Called number.                                                                        |
| callId    | String | Call ID.                                                                              |

| Parameter    | Type    | Description                                                                                      |
|--------------|---------|--------------------------------------------------------------------------------------------------|
| callType     | Integer | Call type. For details, see <a href="#">12.3.8.6 Description of Call Types</a> .                 |
| waitBegin    | Long    | Waiting start time in millisecond-level timestamp.                                               |
| ackBegin     | Long    | Response start time in millisecond-level timestamp.                                              |
| callBegin    | Long    | Start time of a call in millisecond-level timestamp.                                             |
| callEnd      | Long    | End time of a call in millisecond-level timestamp.                                               |
| vdn          | Integer | ID of a VDN.                                                                                     |
| leaveReason  | Integer | Reason why a call is disconnected from a device. For details, see <a href="#">Table 12-700</a> . |
| mediaType    | Integer | Media type. For details, see <a href="#">Table 12-695</a> .                                      |
| subMediaType | Integer | Submedia type. For details, see <a href="#">Table 12-696</a> .                                   |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters

```
{
 "cclid":1,
 "vdn":170,
 "callerNo": "12345",
 "calleeNo": "23131",
 "beginDate": "14511111111",
 "endDate": "14522222222",
 "limit": 10,
 "offset": 0
}
```

- Response parameters

```
{
 "resultCode":"0100000",
 "resultDesc":{
 "data":[
```

```

 {
 "logDate": "1615717765000", //Statistics collection time
 "callerNo": "1212", //Calling number
 "calleeNo": "12121212", //Called number
 "callId": "167789709-33", //Call ID
 "callType": "1", //Call type
 "waitBegin": "1615717765000", //Start time of call waiting
 "ackBegin": "1615717765000", //Time when a call is answered
 "callBegin": "1615717765000", //Start time of a call
 "callEnd": "1615717765000", //End time of a call

 "leaveReason": "1", //Reason why a call is disconnected from a device
 "mediaType": 53, //Media type
 "subMediaType": 1 //Submedia type
 }
],
 count: 5
}

```

### 12.3.1.1.13 (V2) Querying Call Information in a Specified VDN

#### Scenario

This interface is invoked to query call information in a specified VDN based on the calling number, called number, and time segment.

In the V1 version, this interface provides only information about inbound calls. In the V2 version, the **isCallIn** parameter is added to query information about inbound or outbound calls.

#### Interface Method

This interface supports only the POST method.

#### URI

<https://ip:port/rest/cmsapp/v2/openapi/vdn/querycalls>

In the URL, *ip* indicates the IP address of the server where the CC-CMS is installed, and *port* indicates the HTTPS port number of the CC-CMS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-CMS service mapped on the NSLB.

#### Request Description

**Table 12-379** Parameters in the request header

| Parameter    | Mandatory | Type   | Default Value | Description                                                    |
|--------------|-----------|--------|---------------|----------------------------------------------------------------|
| Content-Type | Yes       | String | None          | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| Parameter     | Mandatory | Type   | Default Value | Description                                                                                                                                            |
|---------------|-----------|--------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authorization | Yes       | String | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-380** Parameters in the request body

| Parameter | Mandatory | Type    | Default Value | Description                                                                                                                                                     |
|-----------|-----------|---------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Yes       | Integer | None          | ID of a call center.<br>The value ranges from 1 to 65535.                                                                                                       |
| vdn       | Yes       | Integer | None          | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                                                |
| callerNo  | No        | String  | None          | Calling number. The value can be empty, indicating that all calling numbers are queried.<br>The value consists of digits and must comply with the number rules. |
| calleeNo  | No        | String  | None          | Called number. The value can be empty, indicating that all called numbers are queried.<br>The value consists of digits and must comply with the number rules.   |
| beginDate | Yes       | Long    | None          | Start time of a query period.<br>The value is a timestamp in milliseconds.<br>The time cannot be earlier than 00:00:00 of the previous day.                     |
| endDate   | Yes       | Long    | None          | End time of a query period.<br>The value is a timestamp in milliseconds.<br>The time cannot be later than 23:59:59 on the current day.                          |
| isCallIn  | Yes       | String  | None          | If the value is <b>true</b> , inbound call information is queried. If the value is <b>false</b> , outbound call information is queried.                         |

| Parameter | Mandatory | Type    | Default Value | Description                                                                                                                                                                                                                                                                   |
|-----------|-----------|---------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| limit     | No        | Integer | None          | Limit of records in a query result.<br>The maximum value is <b>100</b> .                                                                                                                                                                                                      |
| offset    | No        | Integer | None          | <b>offset</b> is used to determine the start page of the query.<br>The value range of <b>offset</b> is as follows: The value of <b>offset</b> is equal to limit x (page - 1). The value is greater than or equal to 0.<br><b>page</b> indicates the start page to be queried. |

## Response Description

**Table 12-381** Parameters in the response message body

| Parameter  | Type                 | Description                                                                                                                                                                                                                                                |
|------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String               | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc | Object               | Object in the returned result after a successful query.                                                                                                                                                                                                    |
| data       | Array <callinDetail> | Object array in the returned result. For details about the parameters of this object, see <a href="#">Table 12-382</a> .                                                                                                                                   |
| count      | Integer              | Number of data records that can be queried.                                                                                                                                                                                                                |

**Table 12-382** Parameters of data

| Parameter    | Type    | Description                                                                                      |
|--------------|---------|--------------------------------------------------------------------------------------------------|
| logDate      | Long    | Time when data is imported to the database. The value is a timestamp in milliseconds.            |
| callerNo     | String  | Calling number.                                                                                  |
| calleeNo     | String  | Called number.                                                                                   |
| callId       | String  | Call ID.                                                                                         |
| callType     | Integer | Call type. For details, see <a href="#">12.3.8.6 Description of Call Types</a> .                 |
| waitBegin    | Long    | Waiting start time in millisecond-level timestamp.                                               |
| ackBegin     | Long    | Response start time in millisecond-level timestamp.                                              |
| callBegin    | Long    | Start time of a call in millisecond-level timestamp.                                             |
| callEnd      | Long    | End time of a call in millisecond-level timestamp.                                               |
| vdn          | Integer | ID of a VDN.                                                                                     |
| leaveReason  | Integer | Reason why a call is disconnected from a device. For details, see <a href="#">Table 12-700</a> . |
| mediaType    | Integer | Media type. For details, see <a href="#">Table 12-695</a> .                                      |
| subMediaType | Integer | Submedia type. For details, see <a href="#">Table 12-696</a> .                                   |

## Error Codes

For details, see [12.3.8.2 Error Code Reference](#).

### 12.3.1.1.14 Querying the Call track Data in a Specific VDN

#### Description

This interface is invoked to query call track data in a specified VDN based on the call ID.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/vdn/querycalltracedetail>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-383** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-384** Parameters in the request message body

| No. | Parameter | Type    | Mandatory | Description                                                                                                           |
|-----|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> .                                              |
| 2   | vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                      |
| 3   | callId    | string  | Yes       | Call ID.                                                                                                              |
| 4   | logDate   | long    | Yes       | Query time, which is used to parse the month and query the specified table. The value is a timestamp in milliseconds. |

## Response Message

**Table 12-385** Parameters in the response message body

| No. | Parameter  | Type            | Description                                                                                                                                                                                                                                            |
|-----|------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | string          | Query result. The options are as follows: <ul style="list-style-type: none"><li>• <b>0100000</b>: success</li><li>• Other values: failure</li><li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li></ul> |
| 2   | resultDesc | array<tbilllog> | Object array in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-386</a> .                                                                                                   |

**Table 12-386** Parameters of resultDesc

| No. | Parameter | Type    | Description                                                                                                                                                                  |
|-----|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | callId    | string  | Call ID.                                                                                                                                                                     |
| 2.2 | mediaType | Integer | Media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                  |
| 2.3 | callIdNum | Integer | CDR sequence number. Sequence number of multiple CDRs generated for a call. The value starts from 1 and indicates the first CDR. The value <b>-1</b> indicates the last CDR. |
| 2.4 | callerNo  | string  | Calling number.                                                                                                                                                              |
| 2.5 | calleeNo  | string  | Called number.                                                                                                                                                               |
| 2.6 | waitBegin | long    | Waiting start time in millisecond-level timestamp.                                                                                                                           |
| 2.7 | ackBegin  | long    | Response start time in millisecond-level timestamp.                                                                                                                          |

| No.      | Parameter    | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------|--------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.8      | callBegin    | long    | Start time of a call in millisecond-level timestamp.                                                                                                                                                                                                                                                                                                                                                              |
| 2.9      | callEnd      | long    | End time of a call in millisecond-level timestamp.                                                                                                                                                                                                                                                                                                                                                                |
| 2.1<br>0 | subCcNo      | Integer | ID of a call center in a network call center.                                                                                                                                                                                                                                                                                                                                                                     |
| 2.1<br>1 | deviceType   | Integer | Type of a device that processes calls. For details, see <a href="#">Table 12-701</a> .                                                                                                                                                                                                                                                                                                                            |
| 2.1<br>2 | deviceNo     | string  | ID of the device that processes the current call. <ul style="list-style-type: none"><li>• For an agent device, the device ID is the agent ID.</li><li>• For a queue or virtual device, the device ID is the queue ID configured on the configuration console or the ID of the network shared device corresponding to the virtual device.</li><li>• For other device types, the value is an internal ID.</li></ul> |
| 2.1<br>3 | deviceIn     | string  | Device description.                                                                                                                                                                                                                                                                                                                                                                                               |
| 2.1<br>4 | callType     | Integer | Call type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                                                                                                                                                                        |
| 2.1<br>5 | releaseCause | Integer | Call release cause code. For details, see <a href="#">12.3.8.10 Cause Code</a> .                                                                                                                                                                                                                                                                                                                                  |
| 2.1<br>6 | EnterReason  | Integer | Reason why a call accesses a device. For details, see <a href="#">Table 12-700</a> .                                                                                                                                                                                                                                                                                                                              |

| No.      | Parameter      | Type    | Description                                                                                      |
|----------|----------------|---------|--------------------------------------------------------------------------------------------------|
| 2.1<br>7 | LeaveReason    | Integer | Reason why a call is disconnected from a device. For details, see <a href="#">Table 12-700</a> . |
| 2.1<br>8 | CurrentSkillID | string  | ID of the skill queue that processes the current call.                                           |
| 2.2<br>0 | subMediaType   | Integer | Submedia type. For details, see <a href="#">Table 12-696</a> .                                   |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters

```
{
 "ccld":1,
 "vdn":170,
 "callId": "1678978542-92",
 "logDate": "1615717765000"
}
```
- Response parameters

```
{
 "resultCode":"0100000",
 "resultDesc":
 [
 {
 "callId": "1678978542-92",
 "mediaType": "1",
 "subMediaType": "1",
 "callIdNum": "-1",
 "callerNo": "80000888",
 "calleeNo": "624192",
 "waitBegin": "1615717765000", //Start time of call waiting
 "ackBegin": "1615717765000", //Time when a call is answered
 "callBegin": "1615717765000", //Start time of a call
 "callEnd": "1615717765000", //End time of a call
 "subCcNo": "0",
 "deviceType": "1",
 "deviceNo": "1",
 "deviceIn": "1",
 "callType": "1",

 "subMediaType":1 //Submedia type
 }
]
}
```

### 12.3.1.1.15 Querying Static Configuration Information About All Agents in a Specified VDN (Not Supported by CTI 3.6)

#### Scenario

This interface is invoked to query static configuration information about all agents in a specified VDN. Pagination is not supported. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/querytotalagentinfo

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/vdn/querytotalagentinfo

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-387** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-388** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Description

**Table 12-389** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 2   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>010000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                                                                                              |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-390</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                          |

| No. | Parameter  | Value Type | Description                                                                                                                                                       |
|-----|------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-390</a> . |

**Table 12-390** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description                                                                                                                                                                                                    |
|-----|-----------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | agentId   | Integer    | Agent ID.                                                                                                                                                                                                      |
| 2.2 | groupId   | Integer    | Agent group ID.<br>Group: To facilitate the management of agents, the agents of a VDN are usually grouped. Agents in a group form an agent group.                                                              |
| 2.3 | rights    | String     | Permission value of an agent. The value <b>0</b> indicates that the agent has no permission, and <b>1</b> indicates that the agent has permission. <a href="#">Table 12-391</a> describes the role permission. |
| 2.4 | name      | String     | Agent name.                                                                                                                                                                                                    |
| 2.5 | realFlag  | Integer    | Whether an agent is a network agent. The value <b>0</b> indicates network agent, and <b>1</b> indicates common agent. Currently, all agents in the AICC are common agents.                                     |

**Table 12-391** Agent permission value

| Bit | Description                                                       |
|-----|-------------------------------------------------------------------|
| 1   | Showing busy/idle.                                                |
| 2   | Muting/Unmuting calls.                                            |
| 3   | Holding/Unholding calls.                                          |
| 4   | Connecting held calls.                                            |
| 5   | Common outbound call.                                             |
| 6   | Internal call.                                                    |
| 7   | Transferring calls internally.                                    |
| 8   | Answering transferred inbound calls.                              |
| 9   | Making three-party calls.                                         |
| 10  | Transferring out calls.                                           |
| 11  | Transferring calls from the agent service to automatic service.   |
| 12  | Rejecting inbound calls.                                          |
| 13  | Listening/Listening and inserting/<br>Whispering.                 |
| 14  | Intercepting calls.                                               |
| 15  | Forcibly signing out/Forcibly showing busy/Forcibly showing idle. |
| 16  | Inspecting recordings/Inspecting voice playing.                   |
| 17  | Monitoring inspections.                                           |
| 18  | Appraisal administrator.                                          |
| 19  | Ordinary appraisal personnel.                                     |
| 20  | Alarm console.                                                    |
| 21  | Report handler.                                                   |
| 22  | Reserved value.                                                   |
| 23  | Monitoring console.                                               |
| 24  | Configuration administrator.                                      |
| 25  | Report administrator.                                             |
| 26  | Making national outbound toll calls.                              |

## Request Description

**Table 12-392** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-393** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Description

**Table 12-394** Parameters in the response message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |

### 12.3.1.1.17 Obtaining Real-Time Monitoring Indicators by VDN

#### Description

This interface is invoked to obtain real-time monitoring indicators by VDN. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interfaces:

- /ccbms/ws/monitor/rindexSkill
- /ccbms/ws/monitor/queryivrInfo
- /ccbms/ws/monitor/queryivrdevicestatus
- /ccbms/ws/monitor/teamagentstatusinfobyvdns

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/rindex/vdn>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-396** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-397** Parameters in the request message body

| No. | Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"><li>• In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li><li>• In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li></ul> |
| 2   | vdnIds    | Array   | Yes       | <p>Array of VDN IDs. The maximum length of the array is 100. The VDN ID is of the integer type.</p> <p>The value of <b>vdn</b> ranges from 1 to 5000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| No. | Parameter | Type  | Mandatory | Description                                                                                                                           |
|-----|-----------|-------|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| 3   | indexIds  | Array | Yes       | Array of VDN real-time monitoring indicators. The indicator is of the string type.<br>For details, see <a href="#">Table 12-693</a> . |

## Response Message

**Table 12-398** Parameters in the response message body

| No. | Parameter  | Type   | Description                                                                                                                                                                                                                                   |
|-----|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | string | Query result. The options are as follows: <ul style="list-style-type: none"><li>• <b>0100000</b>: success</li><li>• Other values: failure</li></ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |

### 12.3.1.2 Real-Time Interfaces for Skill Queues

### 12.3.1.2.1 Querying Signed-in Agents in Skill Queues in Batches

#### Scenario

This interface is invoked to query signed-in agents in skill queues in batches.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/agentskillstatusinfo

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/realindex/agent/agentsinskill

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-401** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-402** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                          |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                     |
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The skill queue ID ranges from 1 to 2000. |

## Response Description

**Table 12-403** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.12 and earlier versions. |
| 2   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                                                                                             |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-404</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.12 and earlier versions.                                                                          |

| No. | Parameter  | Value Type | Description                                                                                                                                                       |
|-----|------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-404</a> . |

**Table 12-404** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description                                                |
|-----|-----------|------------|------------------------------------------------------------|
| 2.1 | skillId   | Integer    | Skill queue ID.                                            |
| 2.2 | agentIds  | Array      | Array of IDs of the agents who sign in to the skill queue. |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters

```
{
 "queryParam":
 {
 "ccId":1,
 "vdn":1,
 "skillIds":[1,2]
 }
}
```

- Response parameters

```
{
 "result": "0",
 "resultCode": "0100000",
 "resultDatas": [
 {
 "skillId": 1,
 "agentIds": [
 291
]
 },
 {
 "skillId": 2,
 "agentIds": []
 }
],
 "resultDesc": [
 {
 "skillId": 1,
 "agentIds": [
 291
]
 },
 {
 "skillId": 2,
 "agentIds": []
 }
]
}
```

```
}
]
}
```

### 12.3.1.2.2 Querying Extended Information About Skill Queues in Batches

#### Scenario

This interface is invoked to query extended information about skill queues in batches. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/querytotalskillstatusex3

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/skill/totalskillstatusex3

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-405** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-406** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                          |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> .                                                             |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                     |
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The skill queue ID ranges from 1 to 2000. |

## Response Description

**Table 12-407** Parameters in the response message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |

### 12.3.1.2.3 Querying Call Statistics of Skill Queues in the Current 5 Minutes in Batches

#### Scenario

This interface is invoked to query the call statistics of skill queues in the current 5 minutes in batches. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/querycurrentcallstatinfo

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/skill/currentcallstateinfo>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-409** Parameters in the request header

| No. | Parameter    | Value Type | Mandatory | Description                                                    |
|-----|--------------|------------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-410** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                 |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                   |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                            |
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The value ranges from 1 to 2000. |

## Response Description

**Table 12-411** Parameters in the response message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----|-----------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result    | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● 0: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                   |
|-----|-------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                    |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-412</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 4   | resultDesc  | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-412</a> .                                                                                                                             |

**Table 12-412** Parameters of resultDesc/resultDatas

| No. | Parameter     | Value Type | Description                                                      |
|-----|---------------|------------|------------------------------------------------------------------|
| 2.1 | id            | Integer    | Skill queue ID.                                                  |
| 2.2 | startTime     | Long       | Statistics start time. The value is a timestamp in milliseconds. |
| 2.3 | allCallCount  | Long       | Total number of inbound calls in the current 5 minutes.          |
| 2.4 | cnndCallCount | Long       | Total number of connected calls in the current 5 minutes.        |
| 2.5 | abanCallCount | Long       | Total number of lost calls in the current 5 minutes.             |

| No.      | Parameter          | Value Type | Description                                                                                                                                           |
|----------|--------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.6      | callEndCount       | Long       | Total number of finished calls in the current 5 minutes.                                                                                              |
| 2.7      | talkTimeOnlvr      | Long       | Call duration in the IVR system, in seconds. (When a suspended call is transferred to an agent, the suspension time is counted in the call duration.) |
| 2.8      | cnndIn20sCallCount | Long       | Total number of calls that are connected in 20 seconds in the current 5 minutes.                                                                      |
| 2.9      | clearUpCallCount   | Long       | Total number of calls that have been wrapped up in the current 5 minutes.                                                                             |
| 2.1<br>0 | clearUpTime        | Long       | Total wrap-up duration in the current 5 minutes, in seconds.                                                                                          |

### 12.3.1.2.4 Querying Information About Status of a Specified Skill Queue

#### Scenario

This interface is invoked to query information about the status of a specified skill queue. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/querybatchmultiskillqueue

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/skill/queuedevicestatus>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the

NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-413** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-414** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |
| 3   | skillId   | Integer    | Yes       | Skill queue ID.<br>The value ranges from 1 to 2000.       |

## Response Description

**Table 12-415** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |

| 3   | resultDatas | Array      | <p>Object array in the returned result after a successful query.</p> <p>For details about the parameters of the object in this array, see <a href="#">Table 12-420</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                             |
| 2   | resultDesc  | Array      | <p>Object array in the returned result after a successful query.</p> <p>For details about the parameters of the object in this array, see <a href="#">Table 12-420</a>.</p>                                                                                                                                                                                                              |

**Table 12-420** Parameters of resultDesc/resultDatas

| No. | Parameter      | Value Type | Description                           |
|-----|----------------|------------|---------------------------------------|
| 2.1 | skillId        | Integer    | Skill queue ID.                       |
| 2.2 | maxCallNum     | Integer    | Maximum number of queuing calls.      |
| 2.3 | maxHoldCallNum | Integer    | Maximum number of held calls.         |
| 2.4 | maxWaitTime    | Long       | Maximum waiting duration, in seconds. |

| No. | Parameter          | Value Type | Description                                               |
|-----|--------------------|------------|-----------------------------------------------------------|
| 2.5 | maxAnswerWaitTime  | Long       | Maximum ringing duration, in seconds.                     |
| 2.6 | maxTalkTime        | Long       | Maximum call duration, in seconds.                        |
| 2.7 | maxRestAgentNum    | Integer    | Maximum number of agents that are allowed to have a rest. |
| 2.8 | maxAgentWrapupTime | Integer    | Maximum agent wrap-up duration, in seconds.               |

### 12.3.1.2.6 Querying Statistics Details of Skill Queues in Batches

#### Scenario

This interface is invoked to query statistics details of skill queues in batches. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interfaces:

- /ccbms/ws/monitor/querycurrentcallstatinfo
- /ccbms/ws/monitor/queryStatInfoOfEverySkill

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/skill/stateinfo

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-421** Parameters in the request header

| No. | Parameter    | Value Type | Mandatory | Description                                                    |
|-----|--------------|------------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-422** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                 |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> .                                                    |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                            |
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The value ranges from 1 to 2000. |

## Response Description

**Table 12-423** Parameters in the response message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result    | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.12 and earlier versions. |

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                   |
|-----|-------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                    |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-424</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.12 and earlier versions. |
| 4   | resultDesc  | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-424</a> .                                                                                                                             |

**Table 12-424** Parameters of resultDesc/resultDatas

| No. | Parameter           | Value Type | Description                                                                                                                             |
|-----|---------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | skillId             | Integer    | Skill queue ID.                                                                                                                         |
| 2.2 | agentLoginNums      | Long       | Number of signed-in agents.                                                                                                             |
| 2.3 | agentTalkingNums    | Long       | Number of agents in talking state.                                                                                                      |
| 2.4 | agentIdleNums       | Long       | Number of idle agents.                                                                                                                  |
| 2.5 | agentAvailableNums  | Long       | Number of available agents. The value may be different from the number of idle agents when an agent can have one-to-many conversations. |
| 2.6 | agentSetBusyNums    | Long       | Number of agents who indicate busy.                                                                                                     |
| 2.7 | agentRestNums       | Long       | Number of agents who take a rest.                                                                                                       |
| 2.8 | agentMaxIdleTimeIn5 | Long       | Maximum idle duration of agents in 5 minutes.                                                                                           |
| 2.9 | agentWorkNums       | Long       | Number of agents in after-call processing state, including agents in wrap-up state.                                                     |

| No.  | Parameter          | Value Type | Description                                                                      |
|------|--------------------|------------|----------------------------------------------------------------------------------|
| 2.10 | agentStudyNums     | Long       | Number of agents who are in the <b>Study</b> state.                              |
| 2.11 | agentOccupyNums    | Long       | Number of agents in the occupied state.                                          |
| 2.12 | agentPreOccupyNums | Long       | Number of preoccupied agents.                                                    |
| 2.13 | totalCallNums      | Long       | Total number of processed calls, including the calls that are being processed.   |
| 2.14 | processingCallNums | Long       | Number of calls that are being processed.                                        |
| 2.15 | maxCallWaitTimeIn5 | Long       | Maximum time that a call can wait in 5 minutes.                                  |
| 2.16 | callWaitNums       | Long       | Number of queuing calls (number of calls that are waiting).                      |
| 2.17 | evenCallTimeIn5    | Long       | Average call duration in 5 minutes.                                              |
| 2.18 | evenWaitTimeIn5    | Long       | Average call waiting duration in 5 minutes.                                      |
| 2.19 | allCallCount       | Long       | Total number of inbound calls in the current 5 minutes.                          |
| 2.20 | cnndIn20sCallCount | Long       | Total number of calls that are connected in 20 seconds in the current 5 minutes. |

### 12.3.1.2.7 Querying All Calls Queuing in a Skill Queue in Batches

#### Description

This interface is invoked to query all calls queuing in a skill queue in batches. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interfaces:

- /ccbms/ws/monitor/querybatchmultiskillqueue
- /ccbms/ws/monitor/skillcallqueueinfos

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/skill/batchmultiskill>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-425** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-426** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                 |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                   |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                            |
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The value ranges from 1 to 2000. |

## Response Message

**Table 12-427** Parameters in the response message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                                |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| 2   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-428</a> .                                                                                          |

**Table 12-428** Parameters of resultDesc

| No. | Parameter       | Value Type | Description                                                                                                                                    |
|-----|-----------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | skillId         | Integer    | Skill queue ID.                                                                                                                                |
| 2.2 | callPropertyExs | Array      | Array of calls queuing in the skill queue.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-429</a> . |

**Table 12-429** Parameters of callPropertyExs

| No.   | Parameter | Value Type | Description |
|-------|-----------|------------|-------------|
| 2.2.1 | callId    | String     | Call ID.    |

| No.        | Parameter     | Value Type | Description                                                                                                                                            |
|------------|---------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.2.<br>2  | customerLevel | Integer    | Level of the customer making a call.<br>The sequence number ranges from 1 to 254. A larger value indicates the importance of a customer.               |
| 2.2.<br>3  | requestType   | Integer    | Call feature. For details, see <a href="#">Table 12-699</a> .                                                                                          |
| 2.2.<br>4  | calling       | Array      | Calling number.                                                                                                                                        |
| 2.2.<br>5  | called        | Array      | Called number.                                                                                                                                         |
| 2.2.<br>6  | mediaType     | String     | Media type of a call. For details, see <a href="#">Table 12-695</a> .                                                                                  |
| 2.2.<br>7  | orgiCalled    | String     | Original called number. If the called number changes before the call accesses the system, this parameter records the number of the first called party. |
| 2.2.<br>8  | callInTime    | Integer    | Call arrival time (millisecond-level timestamp).                                                                                                       |
| 2.2.<br>9  | callPriority  | Long       | Call priority. For details, see "Configuring Skill Groups" in <i>(For Engineer) ICD VxxxRxxxCxx Product Documentation 01 (ICD)</i> .                   |
| 2.2.<br>10 | waitTime      | Long       | Duration that a call waits in the current queue.                                                                                                       |

| No.    | Parameter     | Value Type | Description                                                                                                                                      |
|--------|---------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.2.11 | callQueueFlag | Long       | Whether the current queue is the main queue of a call. <ul style="list-style-type: none"> <li>• <b>1</b>: yes</li> <li>• <b>0</b>: no</li> </ul> |

### 12.3.1.2.8 Querying the Number of Calls that Each Queue Answers from Other Queues in Batches When Calls are Queuing in Multiple Skill Queues

#### Scenario

This interface is invoked to query the number of calls that each queue answers from other queues in batches when calls are queuing in multiple skill queues.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/calloverloadstatus

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/skill/batchskilloverload

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-430** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-431** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                 |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------|
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The value ranges from 1 to 2000. |

## Response Description

Table 12-432 Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                     |

| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                     |
| 3   | skillIds  | Array      | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The skill queue ID ranges from 1 to 2000. |

| No. | Parameter       | Value Type | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----|-----------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | isSkillAllMatch | String     | No        | <p>Whether the agent skill queue is fully matched. The value is of the Boolean type. The default value is <b>false</b>. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>true</b>: yes. The statistics are collected only when the skill queue to which an agent logs in completely matches the queried skill queue.</li> <li>• <b>false</b>: no. The statistics are collected if the skill queue to be queried is contained in the skill queues to which the agent logs in.</li> </ul> |

## Response Description

Table 12-437 Parameters in the response message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result    | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                   |
|-----|-------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul>                                    |
| 3   | resultDatas | object     | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-438</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 4   | resultDesc  | Object     | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-438</a> .                                                                                                                             |

**Table 12-438** Parameters of resultDesc/resultDatas

| No. | Parameter         | Value Type | Description                         |
|-----|-------------------|------------|-------------------------------------|
| 2.1 | workSubStateBegin | Integer    | Number of agents in wrap-up state   |
| 2.2 | lateAdjust        | Integer    | Number of agents in wrap-up state.  |
| 2.3 | usable            | Integer    | Number of available agents          |
| 2.4 | rest              | Integer    | Number of agents in rest state      |
| 2.5 | studying          | Integer    | Number of agents in study state.    |
| 2.6 | setBusy           | Integer    | Number of agents in busy state      |
| 2.7 | occupy            | Integer    | Number of agents in occupied state. |
| 2.8 | idle              | Integer    | Number of agents in idle state      |

| No.      | Parameter | Value Type | Description                               |
|----------|-----------|------------|-------------------------------------------|
| 2.9      | preoccupy | Integer    | Number of agents in preoccupied state.    |
| 2.1<br>0 | answering | Integer    | Number of agents in answering state       |
| 2.1<br>1 | talking   | Integer    | Number of agents in talking state         |
| 2.1<br>2 | loginEd   | Integer    | Number of sign-in agents                  |
| 2.1<br>3 | callOut   | Integer    | Number of agents who make outbound calls. |

### 12.3.1.2.10 Querying Details About Signed-in Agents in a Skill Queue

#### Description

This interface is invoked to return details about signed-in agents in a skill queue based on the skill queue ID.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/agentstatusinfo

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/skill/agentbyconfigedskill

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-439** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-440** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                                              |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> . |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                         |
| 3   | skillId   | Integer    | Yes       | Skill queue ID.<br>The value ranges from <b>1</b> to <b>2000</b> .       |

## Response Message

**Table 12-441** Parameters in the message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                                |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| 2   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-442</a> .                                                                                                       |

**Table 12-442** Parameters of resultDesc

| No. | Parameter | Value Type | Description                                                   |
|-----|-----------|------------|---------------------------------------------------------------|
| 2.1 | workNo    | Integer    | Agent ID.                                                     |
| 2.2 | name      | String     | Agent name.                                                   |
| 2.3 | status    | Integer    | Agent status. For details, see <a href="#">Table 12-443</a> . |

| No.      | Parameter        | Value Type | Description                                                                                                 |
|----------|------------------|------------|-------------------------------------------------------------------------------------------------------------|
| 2.4      | ctiStatus        | Integer    | Platform agent status. For details, see <a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> . |
| 2.5      | groupId          | Integer    | Agent group ID.                                                                                             |
| 2.6      | mediaType        | Integer    | Agent media type. For details, see <a href="#">Table 12-695</a> .                                           |
| 2.7      | vdnId            | Integer    | ID of the VDN to which a call belongs.                                                                      |
| 2.8      | phoneNumber      | String     | Agent phone number.                                                                                         |
| 2.9      | currentStateTime | Long       | Duration of the current state, in seconds.                                                                  |
| 2.1<br>0 | loginDate        | Long       | Sign-in time. The value is a timestamp in milliseconds.                                                     |

**Table 12-443** Agent status

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | Unknown. The value corresponds to status 9 on the CTI platform.              |
| 2     | An exception occurs when the interface is invoked.                           |
| 3     | Showing busy. The value corresponds to status 7 on the CTI platform.         |
| 4     | Idle. The value corresponds to status 1 on the CTI platform.                 |
| 5     | Wrap-up. The value corresponds to status 6 on the CTI platform.              |
| 7     | Talking. The value corresponds to states 2, 3, 4, and 5 on the CTI platform. |
| 8     | Rest. The value corresponds to status 8 on the CTI platform.                 |

### 12.3.1.2.11 Querying Service Quality for Skill Queues in Batches

#### Description

This interface is invoked to query the service quality data of the skill queue in the current 5 minutes.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/callStatInfos

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/skill/servicequality>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-444** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |

### 12.3.1.2.12 Obtaining Real-Time Monitoring Indicators by Skill Queue

#### Description

This interface is invoked to obtain real-time monitoring indicators by skill queue.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/rindexSkill

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/skill/rindex

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

Table 12-448 Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

Table 12-449 Parameter description

| Parameter | Type    | Mandatory | Description                                               |
|-----------|---------|-----------|-----------------------------------------------------------|
| cclid     | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

| Parameter | Type  | Mandatory | Description                                                                                                                                                                                                                                       |
|-----------|-------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skillIds  | Array | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters.<br>The value ranges from 1 to 2000.                                                                                                                       |
| indexIds  | Array | Yes       | Array of indicators. The maximum length of the array depends on the number of real-time monitoring indicators by skill. The maximum value is 12 currently.<br>For details about the parameters of this object, see <a href="#">Table 12-687</a> . |

## Response Message

**Table 12-450** Parameter description

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-451</a> .                                                                                |

**Table 12-451** Parameters of resultDesc

| Parameter | Type    | Description                                                                                                 |
|-----------|---------|-------------------------------------------------------------------------------------------------------------|
| id        | Integer | Skill queue ID.                                                                                             |
| idxs      | Array   | Group of indicators.<br>For details about the parameters of this object, see <a href="#">Table 12-452</a> . |

**Table 12-452** Parameter description of idxs

| Parameter | Type   | Description                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------|
| id        | String | Indicator ID.                                                                                            |
| val       | Object | Indicator result.<br>For details about the parameters of this object, see <a href="#">Table 12-687</a> . |

### 12.3.1.3 Real-Time Interfaces for Agents

#### 12.3.1.3.1 Querying Skill Queues to Which Agents Sign In in Batches

##### Scenario

This interface is invoked to query skill queues to which specified agents sign in in batches.

##### Interface Method

The request method must be set to POST. This interface supports only the POST method.

##### Internal Encapsulation Interface

CTI3.6: BMS interface: /ccbms/ws/monitor/siteagentcallandskillinfobyagentids

CTI3.8: BMS interface: /ccbms/ws/monitor/queryAgentsLoginSkills

##### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/agentgroup/siteagentcallandskillinfobyagentids>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port*

indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-453** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-454** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                            |

### 12.3.1.3.3 Querying the Current Call ID of a Specified Agent

#### Scenario

This interface is invoked to query information about the current call ID of a specified agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/queryagentCalls

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/agent/queryagentcalls>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-462** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-463** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclid     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |
| 3   | agentId   | Integer    | Yes       | Agent ID.<br>The value ranges from 101 to 59999.          |

## Response Description

### 12.3.1.3.4 Querying Call Information About All Agents in Batches

#### Description

This interface is invoked to query real-time call information about all agents in batches.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/queryagentCalls

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/agentgroup/queryagentcalls

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-465** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-466** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                           |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> .                                              |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                      |
| 3   | agentIds  | Array      | Yes       | Array of agent IDs.<br>The maximum length of the array is 3000.<br>The value ranges from <b>101</b> to <b>59999</b> . |

## Response Message

**Table 12-467** Parameters in the message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                                |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |

| 2.2.4 | mediaType  | Integer    | Media type. For details, see <a href="#">Table 12-695</a> .                                                          |

**Table 12-470** Call status

| No. | Call Type     | Description                                                                       |
|-----|---------------|-----------------------------------------------------------------------------------|
| 0   | IDLE          | Indicates that the called party is idle (no call).                                |
| 1   | OCCUPY        | Indicates that the called party is occupied.                                      |
| 2   | QUEUE         | Indicates that the call is queuing in a skill queue.                              |
| 3   | PRIVATE_QUEUE | Indicates that the call is queuing in a private skill queue.                      |
| 4   | ALERTING      | Indicates that the phone of the called party rings and waits for answer.          |
| 5   | TALK          | Indicates that the calling and called parties are in conversation or interaction. |

| No. | Call Type | Description                                     |
|-----|-----------|-------------------------------------------------|
| 6   | HOLD      | Indicates that the call is held.                |
| 7   | SUSPEND   | Indicates that the call is suspended.           |
| 8   | MUTE      | Indicates that the call is muted.               |
| 9   | TRITALK   | Indicates that a three-party call is initiated. |

 "callList": []
 },
 {
 "agentId": 1099,
 "callList": [
 {
 "callId": "1605494261-1449",
 "callStatus": 5,
 "callInOut": 0,
 "mediaType": 5
 }
]
 }
]
}
```

### 12.3.1.3.5 Querying Private Calls of a Specified Agent

#### Scenario

This interface is invoked to query private calls of a specified agent. To access a private skill queue, perform the following steps.

If both of the following conditions are met, the system transfers a call to the private skill queue of an agent. When an agent is idle, the agent first answers the calls in the private queue.

- The call is transferred to the agent.  
Generally, a call is assigned to an agent in the following cases:
  - When a call is in a special situation (such as **Skill Timeout**, **Skill Busy**, **Skill NoAgents**, or **Canceling queuing**), the call is transferred to another agent.
  - A call is transferred by an agent to another agent for a certain reason.
- The agent is in talking or working state and cannot handle calls.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/agentprivatecall

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/agent/agentprivatecall

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-471** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-472** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |
| 3   | agentId   | Integer    | Yes       | Agent ID.<br>The value ranges from 101 to 59999.          |

## Response Description

**Table 12-473** Parameters in the message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 2.1 | workNo    | Integer    | Agent ID.                              |
| 2.2 | vdnId     | Integer    | ID of the VDN to which a call belongs. |

| No. | Parameter        | Value Type | Description                                                                                                       |
|-----|------------------|------------|-------------------------------------------------------------------------------------------------------------------|
| 2.3 | citStatus        | Integer    | Platform status of an agent. For details, see <a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> . |
| 2.4 | name             | String     | Agent name.                                                                                                       |
| 2.5 | phoneNumber      | String     | Agent phone number.                                                                                               |
| 2.6 | loginDate        | Long       | Sign-in time (millisecond-level timestamp).                                                                       |
| 2.7 | currentStateTime | Long       | Duration of the current state, in seconds.                                                                        |
| 2.8 | mediaType        | Integer    | Agent media type. For details, see <a href="#">Table 12-695</a> .                                                 |
| 2.9 | status           | Integer    | Agent status. For details, see <a href="#">Table 12-482</a> .                                                     |

**Table 12-482** Agent status

| Value | Description                                                                  |
|-------|------------------------------------------------------------------------------|
| 0     | Unknown. The value corresponds to status 9 on the CTI platform.              |
| 1     | Sign-in. The value is not used.                                              |
| 2     | Sign-out. The value corresponds to status 0 on the CTI platform.             |
| 3     | Showing busy. The value corresponds to status 7 on the CTI platform.         |
| 4     | Idle. The value corresponds to status 1 on the CTI platform.                 |
| 5     | Wrap-up. The value corresponds to status 6 on the CTI platform.              |
| 6     | Same as the idle state. The value is not used.                               |
| 7     | Talking. The value corresponds to states 2, 3, 4, and 5 on the CTI platform. |
| 8     | Rest. The value corresponds to status 8 on the CTI platform.                 |

### 12.3.1.3.8 Querying Agent Rest Information

#### Scenario

This interface is invoked to query all agent rest information.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

- CTI3.6 BMS interface: /ccbms/ws/monitor/teamrestinfo
- CTI3.6 BMS interface: /ccbms/ws/monitor/teamrestagentinfo
- CTI3.8 BMS interface: /ccbms/ws/monitor/queryAgentRestDetailInfo

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/agentgroup/agentrestinfos>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-483** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-484** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                                                                      |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                                                                                                                                                                                        |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                                                                                                                                                                                 |
| 3   | offset    | Integer    | No        | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1).<br>The value of <b>offset</b> is greater than or equal to 0.<br><b>page</b> indicates the start page of the query.<br>This field is valid only in CTI3.6. |

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                    |
|-----|-----------|------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | limit     | Integer    | No        | <p>Number of query records on each page.</p> <p>The value ranges from 1 to 100.</p> <p><b>limit</b> and <b>offset</b> must exist or not exist at the same time.</p> <p>This field is valid only in CTI3.6.</p> |

## Response Description

**Table 12-485** Parameters in the message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |

| 3   | resultDatas | Object     | <p>Object array in the returned result after a successful query.</p> <p>For details about the parameters of the object in this array, see <a href="#">Table 12-486</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                             |

| No. | Parameter  | Value Type | Description                                                                                                                                    |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | resultDesc | Object     | Object in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-486</a> . |

**Table 12-486** Parameters of resultDesc/resultDatas

| No. | Parameter         | Value Type | Description                                                                                                                                                  |
|-----|-------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | allowRestNum      | Integer    | Number of agents who are allowed to have a rest but still at work.                                                                                           |
| 2.2 | onRestNum         | Integer    | Number of agents that are resting.                                                                                                                           |
| 2.3 | waitRestNum       | Integer    | Number of agents who apply for a rest.                                                                                                                       |
| 2.4 | agentsRestDetails | Array      | List of details about agents who take a rest in the VDN.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-487</a> . |

**Table 12-487** Parameters of agentsrestdetails

| No.   | Parameter      | Value Type | Description                                                                                                                                                                                               |
|-------|----------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.4.1 | agentName      | String     | Agent name.                                                                                                                                                                                               |
| 2.4.2 | workNo         | Integer    | Agent ID.                                                                                                                                                                                                 |
| 2.4.3 | cantRestReason | Integer    | Reason why agents are not allowed to have a rest. This parameter is valid only for the agents who wait for a rest.<br>For details about the parameters of this object, see <a href="#">Table 12-488</a> . |

| No.   | Parameter    | Value Type | Description                                                                                                                                                                                                             |
|-------|--------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.4.4 | beginTime    | Long       | Start time. For resting agents, this parameter indicates the rest start time. For agents who are not in rest, this parameter indicates the requested or approved rest start time. The value is in the timestamp format. |
| 2.4.5 | restDuration | Long       | Requested rest duration, in seconds.                                                                                                                                                                                    |

**Table 12-488** Reason for not allowing rest

| No.     | Value of the Reason for Not Allowing Rest | Description                                                                                          |
|---------|-------------------------------------------|------------------------------------------------------------------------------------------------------|
| 2.4.3.1 | 0                                         | The agent is waiting for approval.                                                                   |
| 2.4.3.2 | 1                                         | The agent is in busy state.                                                                          |
| 2.4.3.3 | 2                                         | The number of agents who can take a rest in the VDN reaches the maximum.                             |
| 2.4.3.4 | 3                                         | The agent does not answer any inbound calls, because the agent does not sign in to any skill queues. |
| 2.4.3.5 | 4                                         | The number of resting agents in a skill queue the agent signs in reaches the maximum.                |

### 12.3.1.3.9 Checking Whether an Agent Is Processing a Call

#### Scenario

This interface is invoked to check whether a specified agent is processing a call.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/siteagentinfobyagentids

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/calldata/isprocesscall>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-489** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-490** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |
| 3   | agentId   | Integer    | Yes       | Agent ID.<br>The value ranges from 101 to 59999.          |

## Response Description

**Table 12-491** Parameters in the message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |
| 2   | resultCode  | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p>                                                                                                                            |
| 3   | resultDatas | boolean    | <p>If the query is successful, <b>true</b> (yes) or <b>false</b> (no) is returned.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                                                                                                                  |
| 4   | resultDesc  | Boolean    | <p>If the query is successful, <b>true</b> (yes) or <b>false</b> (no) is returned.</p>                                                                                                                                                                                                                                                                                                   |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters

```
{
 "queryParam":
 {
 "cclid":1,
 "vdn":1,
 "agentId":101
 }
}
```

- Response parameters

```
{
 "result": "0",
 "resultCode": "0100000",
 "resultDatas": false,
 "resultDesc": false
}
```

### 12.3.1.3.10 Querying System Status by Agent

#### Scenario

This interface is invoked to query system status by agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/teamagentstatusinfo

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/agentgroup/systemstate

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values.

In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-492** Parameters in the request header

| No. | Parameter    | Value Type | Mandatory | Description                                                    |
|-----|--------------|------------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-493** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                                                                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                                                                                                                                                 |
| 2   | vdn       | Integer    | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                                                                                                                                                                                          |
| 3   | offset    | Integer    | Yes       | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1).<br>The value of <b>offset</b> is greater than or equal to 0.<br><b>page</b> indicates the start page of the query. |
| 4   | limit     | Integer    | Yes       | Number of query records on each page.<br>The value ranges from 1 to 100.                                                                                                                                                                                  |

## Response Description

**Table 12-494** Parameters in the message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |
| 2   | resultCode  | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p>                                                                                                                            |
| 3   | resultDatas | Object     | <p>Object in the returned result after a successful query.</p> <p>For details about the parameters of this object, see <a href="#">Table 12-495</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                                                |
| 4   | resultDesc  | Object     | <p>Object in the returned result after a successful query.</p> <p>For details about the parameters of this object, see <a href="#">Table 12-495</a>.</p>                                                                                                                                                                                                                                 |

**Table 12-495** Parameters of resultDesc/resultDatas

| No. | Parameter       | Value Type | Description                        |
|-----|-----------------|------------|------------------------------------|
| 2.1 | busyAgent       | Integer    | Number of busy agents.             |
| 2.2 | talkingNum      | Integer    | Number of agents in talking state. |
| 2.3 | idleAgent       | Integer    | Number of idle agents.             |
| 2.4 | totalLoginAgent | Integer    | Number of signed-in agents.        |

| No.                                                                                                                                                                                                                                                                                                                                                                            | Parameter | Value Type | Description |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|------------|-------------|
| <p><b>NOTE</b><br/>The response result is the agent status data obtained based on the pagination parameters <b>limit</b> and <b>offset</b> in the request.</p> <p>For example, if both <b>limit</b> and <b>offset</b> are set to <b>10</b>, the 10 agents on the second page (10 agents per page) are obtained, and then status statistics on the 10 agents are collected.</p> |           |            |             |

## Message Example

- Message body

The following provides an example of the request message body of this interface:

```
{
 "queryParam":
 {
 "ccId":1,
 "vdn":1,
 "offset":0,
 "limit":100
 }
}
```

- The following provides an example of the response message body of this interface:

```
{
 "result": "0",
 "resultCode": "0100000",
 "resultDatas": {
 "busyAgent": 0,
 "talkingNum": 0,
 "idleAgent": 0,
 "totalLoginAgent": 0
 },
 "resultDesc": {
 "busyAgent": 0,
 "talkingNum": 0,
 "idleAgent": 0,
 "totalLoginAgent": 0
 }
}
```

### 12.3.1.3.11 Obtaining Real-Time Monitoring Indicators by Agent

#### Description

This interface is used to obtain real-time monitoring indicators by agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/agentstatusinfobyagentids

## Request URL

`https://ip:port/rest/cmsapp/v1/openapi/agentgroup/rindex`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-496** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-497** Parameter description

| Parameter | Type    | Mandatory | Description                                                                                 |
|-----------|---------|-----------|---------------------------------------------------------------------------------------------|
| cclid     | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                   |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                            |
| agentIds  | Array   | Yes       | Array of agent IDs. The maximum array length is 100.<br>The value ranges from 101 to 59999. |

| Parameter | Type  | Mandatory | Description                                                                                                                                                                                                                            |
|-----------|-------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| indexIds  | Array | Yes       | Array of indicators. The maximum length of the array depends on the number of real-time monitoring indicators by agent. The maximum value is 4.<br>For details about the parameters of this object, see <a href="#">Table 12-690</a> . |

## Response Message

**Table 12-498** Parameter description

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-499</a> .                                                                                |

**Table 12-499** Parameters of resultDesc

| Parameter | Type    | Description                                                                                                 |
|-----------|---------|-------------------------------------------------------------------------------------------------------------|
| id        | Integer | Agent ID.                                                                                                   |
| idxs      | Array   | Group of indicators.<br>For details about the parameters of this object, see <a href="#">Table 12-500</a> . |

**Table 12-500** Parameter description of idxs

| Parameter | Type   | Description                                                                                              |
|-----------|--------|----------------------------------------------------------------------------------------------------------|
| id        | String | Indicator ID.                                                                                            |
| val       | Object | Indicator result.<br>For details about the parameters of this object, see <a href="#">Table 12-690</a> . |

### 12.3.1.3.12 Obtaining Agent Operation Details

#### Scenario

This interface is invoked to query agent operation details.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/agent/agentoprinfo`

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-501** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-502** Parameters in the message body

| Parameter      | Type    | Mandatory | Description                                                                                                                                                                                                                        |
|----------------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| currentAgentId | Integer | Yes       | Agent ID. The value ranges from 0 to 99999.                                                                                                                                                                                        |
| operateType    | Integer | No        | Operation type. For details, see <a href="#">Table 12-702</a> .                                                                                                                                                                    |
| beginTime      | String  | Yes       | Statistics start time. The value must be in <i>yyyy-MM-dd HH:mm:ss</i> format. The time in the UTC time zone is used. The time range must be an integer multiple of 15 minutes, and the time span cannot be greater than 24 hours. |
| endTime        | String  | Yes       | Statistics end time. The value must be in <i>yyyy-MM-dd HH:mm:ss</i> format. The time in the UTC time zone is used. The time range must be an integer multiple of 15 minutes, and the time span cannot be greater than 24 hours.   |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"><li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li><li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li></ul> |

 **NOTE**

The operation objects and operation reasons are marked "-", indicating that the agent operation table does not need to be recorded for the corresponding operation types.

## Response Message

**Table 12-503** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                                |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc | List   | Object list in the returned result after a successful query.<br>For details about the parameters of this object in the array, see the following table.                                                                                                     |

**Table 12-504** Parameters of resultDesc

| Parameter      | Type    | Description                                                                             |
|----------------|---------|-----------------------------------------------------------------------------------------|
| id             | String  | Configuration ID.                                                                       |
| callId         | String  | Call ID.                                                                                |
| phoneNo        | String  | Agent phone number or conference ID.                                                    |
| subCcNo        | Integer | Subsystem ID.                                                                           |
| currentAgentId | Integer | ID of an agent.                                                                         |
| currentSkillId | Integer | ID of the skill queue to which a call belongs.                                          |
| mediaType      | Integer | Media type. For details, see <a href="#">12.3.8.4 Description of Call Media Types</a> . |
| beginTime      | String  | Start time of the statistics collection operation. The UTC time zone is used.           |

| Parameter     | Type    | Description                                                                                                                                                             |
|---------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| endTime       | String  | End time of the statistics collection operation. The UTC time zone is used.                                                                                             |
| vdn           | Integer | ID of the VDN that processes a call.                                                                                                                                    |
| callType      | Integer | Call type. For details, see <a href="#">12.3.8.6 Description of Call Types</a> .                                                                                        |
| serviceNo     | Integer | Business type ID.                                                                                                                                                       |
| operateType   | Integer | Operation type. For details, see <a href="#">Table 12-702</a> .                                                                                                         |
| operateObject | Integer | Operation object. For details, see <a href="#">Table 12-702</a> .                                                                                                       |
| operateCause  | Integer | Operation reason. For details, see <a href="#">Table 12-702</a> .                                                                                                       |
| agentType     | Integer | Agent type. For details, see <a href="#">12.3.8.7 Description of Agent Types</a> .                                                                                      |
| locationId    | Integer | Distributed node ID.                                                                                                                                                    |
| logonSn       | String  | Sign-in SN.                                                                                                                                                             |
| skillInfoSn   | String  | Index of the skills owned by an agent.<br><br>If this field is empty, the agent does not have the task skill. For example, when an agent signs in, this field is empty. |

### 12.3.1.3.13 Querying Agent Information by Agent Status in Pagination Mode

#### Scenario

This interface is invoked to query agent information in pagination mode by agent status.

#### Interface Method

This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/siteagentinfoobyagentids

## URI

`https://ip:port/rest/cmsapp/v1/openapi/vdn/queryAgentByStatus`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values.

In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-505** Parameters in the request header

| Parameter     | Mandatory | Type   | Default Value | Description                                                                                                                                            |
|---------------|-----------|--------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type  | Yes       | String | None          | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| Authorization | Yes       | String | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-506** Parameters in the request body

| Parameter | Mandatory | Type          | Default Value | Description                                                                                                           |
|-----------|-----------|---------------|---------------|-----------------------------------------------------------------------------------------------------------------------|
| cclid     | Yes       | String (1-25) | None          | Call center ID.<br>The value ranges from 1 to 65535.                                                                  |
| vdn       | Yes       | String        | None          | ID of a virtual call center.<br>The value ranges from 1 to 5000.                                                      |
| status    | Optional  | String        | None          | Agent status.<br>For details about the value, see <a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> . |

| Parameter | Mandatory | Type   | Default Value | Description                                                                                                                                                                                                                                                                        |
|-----------|-----------|--------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| offset    | Yes       | Number | None          | <b>offset</b> is used to determine the start page of the query.<br>The value range of <b>offset</b> is as follows: The value of <b>offset</b> is equal to limit x (page - 1). The value is greater than or equal to <b>0</b> . <b>page</b> indicates the start page to be queried. |
| limit     | Yes       | Number | None          | Number of records on each page. The maximum value is <b>1000</b> .                                                                                                                                                                                                                 |

## Response Description

**Table 12-507** Parameters in the response message

| Parameter   | Type   | Description                                                          |
|-------------|--------|----------------------------------------------------------------------|
| returnCode  | String | Result code returned.<br><b>0</b> : success<br>Other values: failure |
| description | String | Request result description.                                          |
| data        | Array  | Response data.                                                       |

**Table 12-508** Parameters in the response message body

| Parameter        | Type   | Description                                                                                                  |
|------------------|--------|--------------------------------------------------------------------------------------------------------------|
| agentId          | Number | Agent ID.                                                                                                    |
| locationId       | Number | Home distributed access node.<br>This parameter is a CTI reserved field and has no actual meaning.           |
| currentState     | Number | Agent status.<br><a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> describes the parameters. |
| currentStateTime | Number | Duration of the current state, in seconds.                                                                   |

## Error Codes

None

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters  

```
{
 "ccld": "1", "vdn": "3", "status": "0", "limit": 10, "offset": 0
}
```
- Response parameters  

```
{
 "returnCode": "0",
 "data": [
 {
 "agentId": 108,
 "locationId": 65535,
 "currentStateTime": 426849,
 "currentState": 0
 },
 {
 "agentId": 109,
 "locationId": 65535,
 "currentStateTime": 426849,
 "currentState": 0
 }
],
 "description": "success"
}
```

### 12.3.1.4 Real-Time Interfaces for Call Details

#### 12.3.1.4.1 Querying Basic Information About a Call with a Specified Call ID

##### Scenario

This interface is invoked to query basic information about a call with a specified call ID. (CTI 3.6 does not support this interface.)

##### Interface Method

The request method must be set to POST. This interface supports only the POST method.

##### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/querybasecallinfo

##### Request URL

<https://ip.port/rest/cmsapp/v1/openapi/calldata/querybasiccallinfo>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-509** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-510** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                               |
|-----------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | Yes       | ID of a call center. The value ranges from <b>1</b> to <b>65535</b> .                                                                                                                                                     |
| vdn       | Integer | Yes       | ID of a VDN. The value ranges from 1 to 5000.                                                                                                                                                                             |
| callid    | String  | Yes       | Call ID. The value contains a maximum of 20 characters. The value is in the format of <i>Call start time-Call ID</i> . <i>Call start time</i> is a timestamp in milliseconds. An example is <b>1659513159000-546750</b> . |

## Response Message

**Table 12-511** Parameters in the message body

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| resultCode  | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .                                                                                                                       |
| resultDatas | Object | Object in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-512</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                                             |
| resultDesc  | Object | Object in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-512</a> .                                                                                                                                                                                                                         |

**Table 12-512** Parameters of resultDesc or resultDatas

| Parameter | Type    | Description                                                    |
|-----------|---------|----------------------------------------------------------------|
| time      | Date    | Time when a call enters the platform. The unit is millisecond. |
| dsn       | Integer | Call task ID.                                                  |
| handle    | Integer | Number of times that a call task control block is reused.      |
| server    | Integer | ID of a media server that processes calls.                     |

| Parameter     | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| keyId         | String  | Unique ID of a call.                                                                                                                                                                                                                                                                                                                                                                                        |
| callingNum    | String  | Calling number.                                                                                                                                                                                                                                                                                                                                                                                             |
| calledNum     | String  | Called number.                                                                                                                                                                                                                                                                                                                                                                                              |
| mid           | Integer | UAP module ID.                                                                                                                                                                                                                                                                                                                                                                                              |
| trunkNo       | Integer | Trunk ID.                                                                                                                                                                                                                                                                                                                                                                                                   |
| priority      | Integer | User level.                                                                                                                                                                                                                                                                                                                                                                                                 |
| deviceType    | Integer | Type of the device that is being processed. For details, see <a href="#">Table 12-701</a> .                                                                                                                                                                                                                                                                                                                 |
| deviceNo      | Integer | ID of the device that is processing a call. <ul style="list-style-type: none"><li>• For an agent device, the device ID is the agent ID.</li><li>• For a queue or virtual device, the device ID is the queue ID configured on the configuration console or the ID of the network shared device corresponding to the virtual device.</li><li>• For other device types, the value is an internal ID.</li></ul> |
| callSkill     | Integer | Skill queue description.                                                                                                                                                                                                                                                                                                                                                                                    |
| partyNum      | Integer | Number of devices involved in a call track.                                                                                                                                                                                                                                                                                                                                                                 |
| callFeature   | Integer | Call feature. For details, see <a href="#">Table 12-699</a> .                                                                                                                                                                                                                                                                                                                                               |
| orgiCalledNum | Integer | Original called number. If the called number changes before the call accesses the system, this parameter records the number of the first called party.                                                                                                                                                                                                                                                      |
| mediaType     | Integer | Media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                                                                                                                                                                 |

| Parameter         | Type    | Description                                                                      |
|-------------------|---------|----------------------------------------------------------------------------------|
| place             | Integer | User location (call access place).                                               |
| waitTime          | Long    | Waiting time in a queue.                                                         |
| totalTalkingTimes | Long    | Call duration.                                                                   |
| logonTimes        | Long    | Total sign-in duration.                                                          |
| serviceType       | Integer | Business type.                                                                   |
| callInCause       | Integer | Reason for an inbound call.                                                      |
| enterReason       | Integer | Reason for accessing the device. For details, see <a href="#">Table 12-700</a> . |
| mediaBillType     | String  | Multimedia report type.                                                          |

## Message Example

- Request header

### 12.3.1.4.2 Querying Private Call Details of a Specified Agent

#### Scenario

This interface is used to query private call details of a specified agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/callinfo

#### Request URL

<https://ip.port/rest/cmsapp/v1/openapi/calldata/querydetailcallinfo>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-513** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-514** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                        |
|-----------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | Yes       | ID of a call center. The value ranges from 1 to 65535.                                                                                                                                                                             |
| vdn       | Integer | Yes       | ID of a VDN. The value ranges from 1 to 5000.                                                                                                                                                                                      |
| callid    | String  | Yes       | Call ID, which is the private call ID of a specified agent. The value contains a maximum of 20 characters. For details about how to obtain the value, see <a href="#">12.3.1.3.5 Querying Private Calls of a Specified Agent</a> . |

## Response Message

**Table 12-515** Parameters in the message body

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String | <p>Query result. | resultDatas | Object | <p>Object in the returned result after a successful query.</p> <p>For details about the parameters of this object, see <a href="#">Table 12-516</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                                                |
| resultDesc  | Object | <p>Object in the returned result after a successful query.</p> <p>For details about the parameters of this object, see <a href="#">Table 12-516</a>.</p>                                                                                                                                                                                                                                 |

**Table 12-516** Parameters of resultDesc or resultDatas

| Parameter   | Type    | Description                                                                                                                                                                                                                                                                                                                                                                |
|-------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cb          | Long    | Internal ID.                                                                                                                                                                                                                                                                                                                                                               |
| time        | Long    | Time when a call enters the platform.                                                                                                                                                                                                                                                                                                                                      |
| dsn         | Integer | Call task ID.                                                                                                                                                                                                                                                                                                                                                              |
| handle      | Integer | Number of times that a call task control block is reused.                                                                                                                                                                                                                                                                                                                  |
| server      | Integer | ID of a media server that processes calls.                                                                                                                                                                                                                                                                                                                                 |
| keyId       | String  | Business ID of a call.                                                                                                                                                                                                                                                                                                                                                     |
| callingNum  | String  | Calling number.                                                                                                                                                                                                                                                                                                                                                            |
| calledNum   | String  | Called number.                                                                                                                                                                                                                                                                                                                                                             |
| mid         | Integer | Module ID.                                                                                                                                                                                                                                                                                                                                                                 |
| trunkNo     | Integer | Trunk ID.                                                                                                                                                                                                                                                                                                                                                                  |
| priority    | Integer | User level.                                                                                                                                                                                                                                                                                                                                                                |
| deviceType  | Integer | Device type. For details, see <a href="#">Table 12-701</a> .                                                                                                                                                                                                                                                                                                               |
| deviceNo    | Integer | Device ID. <ul style="list-style-type: none"><li>• For an agent device, the device ID is the agent ID.</li><li>• For a queue or virtual device, the device ID is the queue ID configured on the configuration console or the ID of the network shared device corresponding to the virtual device.</li><li>• For other device types, the value is an internal ID.</li></ul> |
| callData    | String  | Call data.                                                                                                                                                                                                                                                                                                                                                                 |
| callDataLen | Integer | Valid length of call data.                                                                                                                                                                                                                                                                                                                                                 |
| callSkill   | String  | Call skill description.                                                                                                                                                                                                                                                                                                                                                    |

| Parameter         | Type    | Description                                                                                                                                            |
|-------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| partyNum          | Integer | Number of devices involved in a call track.                                                                                                            |
| callFeature       | String  | Call feature. For details, see <a href="#">Table 12-699</a> .                                                                                          |
| orgiCalledNum     | String  | Original called number. If the called number changes before the call accesses the system, this parameter records the number of the first called party. |
| mediaType         | String  | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                       |
| place             | Integer | User location (call access place).                                                                                                                     |
| waitTime          | Long    | Queuing time, in seconds.                                                                                                                              |
| totalTalkingTimes | Long    | Call duration, in seconds.                                                                                                                             |
| logonTimes        | Long    | Total sign-in duration, in seconds.                                                                                                                    |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters  

```
{
 "cclId":1,
 "vdn":1,
 "callId":"1453723531-574"
}
```

- Response parameters  

```

### 12.3.1.4.3 Querying CDRs of a Specified Call ID

#### Scenario

This interface is invoked to query CDRs by call SNs.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/calldata/querycalldetailbyid>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values.

In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-517** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-518** Parameters in the message body

| No. | Parameter | Value Type | Mandatory | Description                                                                                                                                                                        |
|-----|-----------|------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                                                                                                                          |
| 2   | isCallin  | String     | Yes       | Whether a call is an inbound call.<br>The options are as follows: <ul style="list-style-type: none"> <li><b>true:</b> inbound call</li> <li><b>false:</b> outbound call</li> </ul> |
| 3   | callId    | String     | Yes       | Call ID.                                                                                                                                                                           |

## Response Description

**Table 12-519** Parameters in the message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |
| 2   | resultCode  | String     | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p>                                                                                                                            |
| 3   | resultDatas | Object     | <p>Object in the returned result after a successful query.</p> <p>For details about the parameters of this object, see <a href="#">Table 12-520</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                                                |
| 2   | resultDesc  | Object     | <p>Object in the returned result after a successful query.</p> <p>For details about the parameters of this object, see <a href="#">Table 12-520</a>.</p>                                                                                                                                                                                                                                 |

**Table 12-520** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description     |
|-----|-----------|------------|-----------------|
| 2.1 | vdn       | Integer    | ID of a VDN.    |
| 2.2 | callId    | String     | Call ID.        |
| 2.3 | callerNo  | String     | Calling number. |
| 2.4 | calleeNo  | String     | Called number.  |

| No.      | Parameter     | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------|---------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.5      | callType      | Integer    | Call type. For details, see <a href="#">Table 12-697</a> .                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2.6      | agentId       | Integer    | Agent ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2.7      | skillId       | Integer    | Skill queue ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2.8      | anonyCall     | Integer    | Anonymous call identifier. (This parameter is valid only for inbound calls.)                                                                                                                                                                                                                                                                                                                                                                                     |
| 2.9      | queueWaitTime | Integer    | Queue waiting duration, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2.1<br>0 | ivrCallTime   | Integer    | IVR call duration, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 2.1<br>1 | ackTime       | Integer    | Ring duration, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2.1<br>2 | callTime      | Integer    | Call duration, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2.1<br>3 | releaseCause  | Integer    | Call release cause code. For details, see <a href="#">12.3.8.10 Cause Code</a> .                                                                                                                                                                                                                                                                                                                                                                                 |
| 2.1<br>4 | beginTime     | String     | Call start time. (This parameter is valid only for predicted and preempted outbound calls.)<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .                                                                                                                                                                                                                                                                                                                        |
| 2.1<br>5 | endTime       | String     | Call end time. (This parameter is valid only for predicted and preempted outbound calls.)<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .                                                                                                                                                                                                                                                                                                                          |
| 2.1<br>6 | result        | String     | Call result. (This parameter is valid only for predicted and preempted outbound calls.)<br><b>0000</b> : The OBS successfully makes an outbound call before the call is transferred to the automatic flow.<br><b>0900</b> : The OBS successfully makes an outbound call before the call is transferred to an agent.<br><b>0101</b> : The outbound call fails.<br><b>-1</b> : No number can be called in the current task.<br><b>0601</b> : The call is returned. |

| No.      | Parameter     | Value Type | Description                                                                                                                                                                                                                                                                                               |
|----------|---------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1<br>7 | resultCode    | String     | Call result code. (This parameter is valid only for predicted and preempted outbound calls.)<br>This parameter indicates an external result code corresponding to the failure cause code. The external result code can be customized. The failure cause code is associated with the external result code. |
| 2.1<br>8 | busiResult    | String     | Outbound call business result code. (This parameter is valid only for predicted and preempted outbound calls.)<br>For details about how to configure the iSales frontend page, see the operation guide.                                                                                                   |
| 2.1<br>9 | busiSubStatus | String     | Outbound call business result sub-status code. (This parameter is valid only for predicted and preempted outbound calls.)<br>For details about how to configure the iSales frontend page, see the operation guide.                                                                                        |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters  

```
{
 "queryParam":
 {
 "ccId":1,
 "isCallin":"true",
 "callId":"1000000000-0001"
 }
}
```

- Response parameters  

```
{
 "result": "0",
 "resultCode": "0100000",
 "resultDatas": {
 "vdn": 1,
 "callId": "1000000000-0001",
 "callerNo": "10000",
 "calleeNo": "10001",
 "callType": 0,
 "agentId": 100,
 "skillId": 1,
 "anonyCall": 0,
 }
}
```

```
"queueWaitTime": 10,
"ivrCallTime": 0,

## 12.3.2 Historical Data Query

### 12.3.2.1 Obtaining Historical Monitoring Indicators by VDN

#### Scenario

This interface is invoked to obtain historical monitoring indicators by VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip.port/rest/cmsapp/v1/openapi/hisindex/vdn`

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

Table 12-521 Parameters in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-522** Parameters in the request message body

| No. | Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |

| No. | Parameter    | Type    | Mandatory | Description                                                                                                                                                                                                                                                                              |
|-----|--------------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | vdnIds       | Array   | Yes       | Array of VDN IDs. The maximum length of the array is 100. The VDN ID is of the integer type.                                                                                                                                                                                             |
| 3   | indexIds     | Array   | Yes       | Array of indicators. The indicator is of the string type. For details, see <a href="#">Table 12-692</a> .                                                                                                                                                                                |
| 4   | timeGrain    | String  | No        | This parameter can be used to collect statistics on historical monitoring indicators by minute. The options are <b>15MIN</b> , <b>30MIN</b> , and <b>60MIN</b> . If this parameter is not passed, statistics on the current day in the time zone where the VDN is located are collected. |
| 5   | anonyCall    | Integer | No        | Anonymous call identifier. This parameter is available only for inbound calls. The value <b>1</b> indicates anonymous calls, and the value <b>0</b> indicates non-anonymous calls. If this parameter is not passed, all anonymous calls and non-anonymous calls are queried.             |
| 6   | calleeNo     | String  | No        | Called number.                                                                                                                                                                                                                                                                           |
| 7   | mediaType    | Integer | No        | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                                         |
| 8   | subMediaType | Integer | No        | Submedia type. For details, see <a href="#">Table 12-523</a> .                                                                                                                                                                                                                           |

| No. | Parameter    | Type   | Mandatory | Description                                                                                                                                                                                                                                      |
|-----|--------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9   | enableOffset | String | No        | The options are <b>Y</b> and <b>N</b> . If <b>Y</b> is transferred, the data of the previous day is queried. If <b>N</b> is transferred, the data of the current day is queried. If no value is transferred, the default value <b>N</b> is used. |

**Table 12-523** Submedia types

| No. | Description         |
|-----|---------------------|
| 1   | Web.                |
| 2   | WhatsApp.           |
| 3   | LINE.               |
| 4   | WeChat.             |
| 5   | Facebook Messenger. |
| 6   | Twitter.            |
| 7   | 5G message.         |
| 8   | Email.              |
| 9   | SMS message.        |

## Response Message

**Table 12-524** Parameters in the response message body

| No. | Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result    | String | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |

| No. | Parameter   | Type               | Description                                                                                                                                                                                                                                                                                   |
|-----|-------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultCode  | String             | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .                                              |
| 3   | resultDatas | List <JSON object> | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-525</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 4   | resultDesc  | List <JSON object> | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-525</a> .                                                                                                                             |

**Table 12-525** Parameters of resultDesc or resultDatas

| No. | Parameter | Type               | Description                                                                                                              |
|-----|-----------|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| 2.1 | id        | String             | ID of a VDN.                                                                                                             |
| 2.2 | idxs      | List <JSON object> | Group of indicators.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-526</a> . |

**Table 12-526** Parameters of idx

| No.   | Parameter | Type   | Description   |
|-------|-----------|--------|---------------|
| 2.1.1 | id        | String | Indicator ID. |

| No.   | Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.1.2 | val       | Object | <p>Indicator result collected by minute. The UTC time zone is used.</p> <p>The value is in the format of "<i>Time</i>":"<i>Indicator result</i>", indicating the indicator result collected in a time range starting from <i>Time</i>. The time range is determined by the <b>timeGrain</b> parameter in the request.</p> <p>For example, "2020-11-11 09:15:00.0": "1" indicates that the indicator result is 1 from 09:15 to 09:30. In this example, the value of <b>timeGrain</b> in the request is 15.</p> |

### 12.3.2.2 Querying Information About Missed Calls in a Specified VDN

#### Scenario

This interface is invoked to query information about all missed calls in a specified VDN.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/callin/queryMissedCalls`

If the CC-CMS is directly connected instead of passing through the NSLB, set *ip* to the IP address of the CC-CMS server and *port* to the HTTPS port number of the CC-CMS server.

If the CC-CMS passes through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-CMS service mapped on the NSLB.

#### Request Description

**Table 12-527** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-528** Parameters in the request body

| No. | Parameter | Type    | Mandatory | Description                              |
|-----|-----------|---------|-----------|------------------------------------------|
| 1   | vdn       | Integer | Yes       | VDN ID. The value ranges from 1 to 5000. |

| No. | Parameter | Type   | Mandatory | Description                                                                                                                           |
|-----|-----------|--------|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| 2   | offset    | Number | Yes       | Parameter for determining the start page of the query.<br>Value of <b>offset</b> = Value of <b>limit</b> x (Value of <b>page</b> - 1) |
| 3   | limit     | Number | Yes       | Number of queried records. A maximum of 5000 records can be queried at a time.                                                        |
| 4   | beginTime | String | No        | Start time for the query (zero-zone time).<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .                                              |
| 5   | endTime   | String | No        | End time for the query (zero-zone time).<br>The format is <i>yyyy-MM-dd HH:mm:ss</i> .                                                |

## Response Description

Table 12-529 Response parameters

| Parameter   | Type         | Mandatory | Description                                                                                                                                      |
|-------------|--------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| returnCode  | String       | Yes       | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> |
| total       | Number       | Yes       | Total number of missed calls.                                                                                                                    |
| missedCalls | MissedCall[] | Yes       | List of details about missed calls. For details, see <a href="#">Table 12-530</a> .                                                              |
| returnDesc  | String       | No        | Query result description.                                                                                                                        |

**Table 12-530** Parameters of MissedCall

| Parameter    | Type     | Mandatory | Description                                                    |
|--------------|----------|-----------|----------------------------------------------------------------|
| callId       | String   | Yes       | Call ID.                                                       |
| callerNo     | String   | Yes       | Calling number.                                                |
| calleeNo     | String   | Yes       | Called number.                                                 |
| waitBegin    | Datetime | Yes       | Call waiting start time.                                       |
| callEnd      | Datetime | Yes       | Call end time.                                                 |
| mediaType    | Integer  | No        | Media type. For details, see <a href="#">Table 12-695</a> .    |
| subMediaType | Integer  | No        | Submedia type. For details, see <a href="#">Table 12-696</a> . |

## Message Example

- Request header:  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters:

```
{
 "vdn":159,
 "offset":0,
 "limit":3,
 "beginTime":"2022-11-17 00:13:43",
 "endTime":"2022-11-17 23:44:13"
}
```
- Response parameters:

```
{
 "returnCode": "0",
 "total": 2,
 "missedCalls": [
 {
 "callId": "1668048253-16797218",
 "callerNo": "1659960139858526939",
 "calleeNo": "6300111010",
 "waitBegin": "2022-11-17 23:44:13",
 "callEnd": "2022-11-17 23:44:25",

 }
],
 "returnDesc": "query success"
}
```

### 12.3.2.3 Obtaining Historical IVR Monitoring Indicators

#### Scenario

This interface is invoked to obtain historical monitoring indicators by IVR.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip.port/rest/cmsapp/v1/openapi/hisindex/ivr`

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-531** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-532** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"><li>• In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li><li>• In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li></ul> |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter    | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|---------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| serviceNos   | Array   | Yes       | <p>Array of business type IDs. The maximum length of the array is 500. The business type is of the integer type.</p> <p>In public cloud mode, the value is <b>1</b> by default. To change the value, contact the system administrator.</p> <p>In independent deployment mode, log in to the WAS as a VDN administrator, choose <b>Web Configuration Console &gt; VDN1 Configuration &gt; Flow &gt; Flow</b>, and check the value of <b>Flow Service Type</b> corresponding to the IVR flow. For example, <b>1 Voice</b> indicates that the business type code corresponding to the IVR flow is <b>1</b>.</p> |
| indexIds     | Array   | Yes       | <p>Array of indicators. The indicator is of the string type. For details, see <a href="#">Table 12-694</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| timeGrain    | String  | No        | <p>This parameter can be used to collect statistics on historical monitoring indicators by minute. The options are <b>15MIN</b>, <b>30MIN</b>, and <b>60MIN</b>. If this parameter is not passed, statistics on the current day in the time zone where the VDN is located are collected.</p>                                                                                                                                                                                                                                                                                                                 |
| mediaType    | Integer | No        | <p>Call media type. For details, see <a href="#">Table 12-695</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter    | Type   | Mandatory | Description                                                                                                                                                                                                                                      |
|--------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| enableOffset | String | No        | The options are <b>Y</b> and <b>N</b> . If <b>Y</b> is transferred, the data of the previous day is queried. If <b>N</b> is transferred, the data of the current day is queried. If no value is transferred, the default value <b>N</b> is used. |

## Response Message

**Table 12-533** Parameters in the response message body

| Parameter   | Type                  | Description                                                                                                                                                                                                                                                                                                                                                            |
|-------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String                | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| resultCode  | String                | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .                                                                                                                       |
| resultDatas | List<br><JSON object> | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-534</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                          |
| resultDesc  | List<br><JSON object> | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-534</a> .                                                                                                                                                                                                      |

**Table 12-534** Parameters of resultDesc or resultDatas

| Parameter | Type               | Description                                                                                                              |
|-----------|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| id        | String             | Business type ID.                                                                                                        |
| idxs      | List <JSON object> | Group of indicators.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-535</a> . |

**Table 12-535** Parameters of idx

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | Indicator ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| val       | Object | Indicator result collected by minute. The UTC time zone is used.<br>The value is in the format of " <i>Time</i> ":" <i>Indicator result</i> ", indicating the indicator result collected in a time range starting from <i>Time</i> . The time range is determined by the <b>timeGrain</b> parameter in the request.<br>For example, " <b>2020-11-11 09:15:00.0</b> ": " <b>1</b> " indicates that the indicator result is 1 from 09:15 to 09:30. In this example, the value of <b>timeGrain</b> in the request is <b>15</b> . |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters  
{  
  "ccId":1,  
  "vdn":170,

```
"timeGrain": "15MIN",
"serviceNos": [3, 2],
"indexIds": ["IDX_COUNT_IVR_INBOUND_CALL"],
"mediaType": 53,
"subMediaType": 3
}
```

- Response parameters

```
{
 "result": "0",
 "resultCode": "0100000",
 "resultDatas": [
 {
 "idxs": [
 {
 "val": {
 "2020-11-11 09:15:00.0": "1",
 "2020-11-11 10:15:00.0": "1"
 },
 "id": "IDX_COUNT_IVR_INBOUND_CALL"
 }
],
 "id": "3"
 }
],
 "resultDesc": [
 {
 "idxs": [
 {
 "val": {
 "2020-11-11 09:15:00.0": "1",
 "2020-11-11 10:15:00.0": "1"
 },
 "id": "IDX_COUNT_IVR_INBOUND_CALL"
 }
],
 "id": "3"
 }
]
}
```

### 12.3.2.4 Obtaining Historical Monitoring Indicators by Skill

#### Scenario

This interface is invoked to query historical monitoring indicators by skill.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip.port/rest/cmsapp/v1/openapi/hisindex/skill>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-536** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-537** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>Call center ID. The value ranges from 1 to 65535.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | VDN ID. The value ranges from 1 to 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| timeGrain | String  | No        | This parameter can be used to collect statistics on historical monitoring indicators by minute. The options are <b>15MIN</b> , <b>30MIN</b> , and <b>60MIN</b> . If this parameter is not passed, statistics on the current day in the time zone where the VDN is located are collected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter    | Type           | Mandatory | Description                                                                                                                                                                                                                                      |
|--------------|----------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skillIds     | List <Integer> | Yes       | Array of skill queue IDs. The array contains a maximum of 1000 characters. The skill queue is of the integer type.                                                                                                                               |
| indexIds     | List <String>  | Yes       | Array of indicators. The indicator is of the string type. The maximum length of the array depends on the number of historical monitoring indicators by skill.<br><br>For details about the indicators, see <a href="#">Table 12-686</a> .        |
| mediaType    | Integer        | No        | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                 |
| subMediaType | Integer        | No        | Submedia type. For details, see <a href="#">Table 12-696</a> .                                                                                                                                                                                   |
| enableOffset | String         | No        | The options are <b>Y</b> and <b>N</b> . If <b>Y</b> is transferred, the data of the previous day is queried. If <b>N</b> is transferred, the data of the current day is queried. If no value is transferred, the default value <b>N</b> is used. |

## Response Message

**Table 12-538** Parameters in the response message body

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                |

|-------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode  | String             | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .                                              |
| resultDatas | List <JSON object> | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-539</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| resultDesc  | List <JSON object> | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-539</a> .                                                                                                                             |

**Table 12-539** Parameters of resultDesc or resultDatas

| Parameter | Type               | Description                                                                                                              |
|-----------|--------------------|--------------------------------------------------------------------------------------------------------------------------|
| id        | String             | Skill queue ID.                                                                                                          |
| idxs      | List <JSON object> | Group of indicators.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-686</a> . |

**Table 12-540** Parameters of idx

| Parameter | Type   | Description   |
|-----------|--------|---------------|
| id        | String | Indicator ID. |

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| val       | Object | <p>Indicator result collected by minute. The UTC time zone is used.</p> <p>The value is in the format of "<i>Time</i>":"<i>Indicator result</i>", indicating the indicator result collected in a time range starting from <i>Time</i>. The time range is determined by the <b>timeGrain</b> parameter in the request.</p> <p>For example, "<b>2020-11-11 09:15:00.0</b>": "<b>1</b>" indicates that the indicator result is 1 from 09:15 to 09:30. In this example, the value of <b>timeGrain</b> in the request is <b>15</b>.</p> |

## 12.3.2.5 Obtaining Historical Monitoring Indicators by Agent

### Scenario

This interface is invoked to query historical monitoring indicators by agent.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### Request URL

`https://ip.port/rest/cmsapp/v1/openapi/hisindex/agent`

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

### Request Description

**Table 12-541** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-542** Parameters in the request message body

| Parameter | Type           | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer        | No        | <p>Call center ID. The value ranges from 1 to 65535.</p> <ul style="list-style-type: none"><li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li><li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li></ul> |
| vdn       | Integer        | Yes       | VDN ID. The value ranges from 1 to 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| agentIds  | List <Integer> | Yes       | Array of agent IDs. The array can contain a maximum of 100 characters. The agent ID is of the integer type, and the value ranges from 0 to 99999.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter    | Type          | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| timeGrain    | String        | No        | This parameter can be used to collect statistics on historical monitoring indicators by minute. The options are <b>15MIN</b> , <b>30MIN</b> , and <b>60MIN</b> . If this parameter is not passed or left empty, statistics on the current day in the time zone where the VDN is located are collected. Some historical monitoring indicators of the agent operation type cannot be queried by minute. For details, see <a href="#">Table 12-689</a> . |
| indexIds     | List <String> | Yes       | Array of indicators. The indicator is of the string type. The maximum length of the array depends on the number of historical agent monitoring indicators. For details, see <a href="#">Table 12-689</a> .                                                                                                                                                                                                                                            |
| mediaType    | Integer       | No        | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                                                                                                                                                                                                      |
| subMediaType | Integer       | No        | Submedia type. For details, see <a href="#">Table 12-696</a> .                                                                                                                                                                                                                                                                                                                                                                                        |
| enableOffset | String        | No        | The options are <b>Y</b> and <b>N</b> . If <b>Y</b> is transferred, the data of the previous day is queried. If <b>N</b> is transferred, the data of the current day is queried. If no value is transferred, the default value <b>N</b> is used.                                                                                                                                                                                                      |

## Response Message

**Table 12-543** Parameters in the response message body

| Parameter   | Type   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p> |
| resultCode  | String | <p>Query result. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> <p>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</p>                                                                                                                            |
| resultDatas | Array  | <p>Object array in the returned result after a successful query.</p> <p>For details about the parameters of the object in this array, see <a href="#">Table 12-544</a>.</p> <p><b>NOTE</b><br/>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.</p>                                                                             |
| resultDesc  | Array  | <p>Object array in the returned result after a successful query.</p> <p>For details about the parameters of the object in this array, see <a href="#">Table 12-544</a>.</p>                                                                                                                                                                                                              |

**Table 12-544** Parameters of resultDesc or resultDatas

| Parameter | Type   | Description                                                                                                              |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------|
| id        | String | Agent ID.                                                                                                                |
| idxs      | Array  | Group of indicators.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-545</a> . |

**Table 12-545** Parameters of idx

| Parameter | Type   | Description                                  |
|-----------|--------|----------------------------------------------|
| id        | String | Indicator ID.                                |
| val       | Object | Indicator result. The UTC time zone is used. |

### 12.3.2.6 Obtaining Historical Monitoring Indicators in a Specified Time Range by Skill

#### Description

This interface is invoked to obtain historical monitoring indicators in specified time range by skill.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/hisindex/skillforday>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-546** Parameters in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-547** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter    | Type          | Mandatory | Description                                                                                                                                                                                                                                                                 |
|--------------|---------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skillIds     | List<Integer> | Yes       | Array of skill queue IDs. The array contains a maximum of 1000 characters. The skill queue is of the integer type.                                                                                                                                                          |
| indexIds     | List<String>  | Yes       | Indicator code array. The indicator is of the string type. The maximum length of the array depends on the number of historical monitoring indicators by skill.<br><br>For details about the indicators, see <a href="#">Table 12-686</a> and <a href="#">Table 12-688</a> . |
| beginDayTime | String        | Yes       | Start time, which is the time in the time zone where the VDN is located.                                                                                                                                                                                                    |
| endDayTime   | String        | Yes       | End time, which is the time in the time zone where the VDN is located.                                                                                                                                                                                                      |
| mediaType    | Integer       | No        | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                            |
| subMediaType | Integer       | No        | Submedia type. For details, see <a href="#">Table 12-696</a> .                                                                                                                                                                                                              |

## Response Message

**Table 12-548** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |

| Parameter  | Type              | Description                                                                                                                                                       |
|------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultDesc | List< JSONObject> | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-549</a> . |

**Table 12-549** Parameters of resultDesc

| Parameter | Type              | Description                                                                                                 |
|-----------|-------------------|-------------------------------------------------------------------------------------------------------------|
| id        | String            | Skill queue ID.                                                                                             |
| idxs      | List< JSONObject> | Group of indicators.<br>For details about the parameters of this object, see <a href="#">Table 12-550</a> . |

**Table 12-550** Parameters of idxs

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Indicator name.   |
| val       | object | Indicator result. |

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/hisindex/skillformonth>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-551** Parameters in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-552** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter      | Type          | Mandatory | Description                                                                                                                                                                                                                                                                |
|----------------|---------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| skillIds       | List<Integer> | Yes       | Array of skill queue IDs. The array contains a maximum of 1000 characters. The skill queue is of the integer type.                                                                                                                                                         |
| indexIds       | List<String>  | Yes       | Array of indicators. The indicator is of the string type. The maximum length of the array depends on the number of historical monitoring indicators by skill.<br><br>For details about the indicators, see <a href="#">Table 12-686</a> and <a href="#">Table 12-688</a> . |
| beginMonthTime | String        | Yes       | Start month. The time zone of the VDN is used.                                                                                                                                                                                                                             |
| endMonthTime   | String        | Yes       | End month. The time zone of the VDN is used.                                                                                                                                                                                                                               |
| mediaType      | Integer       | No        | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                           |
| subMediaType   | Integer       | No        | Submedia type. For details, see <a href="#">Table 12-696</a> .                                                                                                                                                                                                             |

## Response Message

**Table 12-553** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |

| Parameter  | Type              | Description                                                                                                                                                       |
|------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultDesc | List< JSONObject> | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-554</a> . |

**Table 12-554** Parameters of resultDesc

| Parameter | Type              | Description                                                                                                 |
|-----------|-------------------|-------------------------------------------------------------------------------------------------------------|
| id        | String            | Skill queue ID.                                                                                             |
| idxs      | List< JSONObject> | Group of indicators.<br>For details about the parameters of this object, see <a href="#">Table 12-555</a> . |

**Table 12-555** Parameters of idxs

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Indicator name.   |
| val       | Object | Indicator result. |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters
 

```
{
 "ccId":1,
 "vdn":4,
 "skillIds":[11,12],
 "indexIds":["IDX_DURATION_SKILL_AVG_ABANDON_ACK","IDX_COUNT_SKILL_REQUEST"],
 "beginMonthTime":"202007",
 "endMonthTime":"202008",
 "mediaType":53,
 "subMediaType":3
}
```
- Response parameters
 

```
{
 "resultCode": "0100000",
 "resultDesc": [
 {
 "idxs": [
 {
```

```

 "val": "3",
 "id": "IDX_COUNT_SKILL_REQUEST"
 },
 {
 "val": "35",
 "id": "IDX_DURATION_SKILL_AVG_ABANDON_ACK"
 }
],
"id": "11"
},
{
 "idxs": [
 {
 "val": "10",
 "id": "IDX_COUNT_SKILL_REQUEST"
 },
 {
 "val": "35",
 "id": "IDX_DURATION_SKILL_AVG_ABANDON_ACK"
 }
],
 "id": "12"
}
]
}

```

### 12.3.2.8 Obtaining Historical Monitoring Indicators in a Specified Time Range by Agent

#### Scenario

This interface is invoked to obtain historical monitoring indicators in specified time range by agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/hisindex/agentforday>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-556** Parameters in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-557** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. | vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter    | Type           | Mandatory | Description                                                                                                                                                                                                                                  |
|--------------|----------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agentIds     | List <Integer> | Yes       | Array of agent queue IDs. The array contains a maximum of 1000 characters. The agent queue is of the integer type, and the value ranges from 0 to 99999.                                                                                     |
| indexIds     | List <String>  | Yes       | Indicator code array. The indicator is of the string type. The maximum length of the array depends on the number of historical agent monitoring indicators. For details, see <a href="#">Table 12-689</a> and <a href="#">Table 12-691</a> . |
| beginDayTime | String         | Yes       | Start date. The time zone of the VDN is used.                                                                                                                                                                                                |
| endDayTime   | String         | Yes       | End date. The time zone of the VDN is used.                                                                                                                                                                                                  |
| mediaType    | Integer        | No        | Call media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                             |
| subMediaType | Integer        | No        | Submedia type. For details, see <a href="#">Table 12-696</a> .                                                                                                                                                                               |

## Response Message

**Table 12-558** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                   |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"><li>● <b>0100000</b>: success</li><li>● Other values: failure</li></ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |

| Parameter  | Type              | Description                                                                                                                                                           |
|------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultDesc | List <JSONObject> | Object array in the returned result after a successful query.<br><br>For details about the parameters of this object in the array, see <a href="#">Table 12-559</a> . |

**Table 12-559** Parameters of resultDesc

| Parameter | Type              | Description                                                                                                     |
|-----------|-------------------|-----------------------------------------------------------------------------------------------------------------|
| id        | String            | Agent ID.                                                                                                       |
| idxs      | List <JSONObject> | Group of indicators.<br><br>For details about the parameters of this object, see <a href="#">Table 12-560</a> . |

**Table 12-560** Parameters of idxs

| Parameter | Type   | Description       |
|-----------|--------|-------------------|
| id        | String | Indicator name.   |
| val       | Object | Indicator result. |

## Message Example

### 12.3.2.9 Obtaining Historical Monitoring Indicators in Specified Month by Agent

#### Scenario

This interface is invoked to obtain historical monitoring indicators in specified month by agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/hisindex/agentformonth>

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-561** Parameters in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-562** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter      | Type           | Mandatory | Description                                                                                                                                                                                                                                 |
|----------------|----------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agentIds       | List <Integer> | Yes       | Array of agent IDs. The array contains a maximum of 1000 characters. The agent queue is of the integer type, and the value ranges from 0 to 99999.                                                                                          |
| indexIds       | List <String>  | Yes       | Array of indicators. The indicator is of the string type. The maximum length of the array depends on the number of historical agent monitoring indicators. For details, see <a href="#">Table 12-689</a> and <a href="#">Table 12-691</a> . |
| beginMonthTime | String         | Yes       | Start month. The time zone of the VDN is used.                                                                                                                                                                                              |
| endMonthTime   | String         | Yes       | End month. The time zone of the VDN is used.                                                                                                                                                                                                |

### 12.3.2.10 Collecting Statistics on Result Sets in Daily Settlement Table for Inbound Calls

#### Scenario

This interface is invoked to collect statistics on result sets in the daily settlement table for inbound calls based on conditions.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/callinday/querymanualindexesbycondition>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-566** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-567** Parameters in the message body

| Parameter   | Type   | Mandatory | Description                                                                                                                                                  |
|-------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| calleeNos   | Array  | Yes       | Array of called numbers. The statistics are collected for each number in the array. The called number consists of only digits. The array size is up to 1000. |
| beginLogDay | String | Yes       | Start call time for statistics collection. The value must be in the <i>yyyy-MM-dd</i> format and in the time zone of the VDN.                                |
| endLogDay   | String | Yes       | End call time for statistics collection. The value must be in the <i>yyyy-MM-dd</i> format and in the time zone of the VDN.                                  |

| Parameter | Type    | Mandatory                                                             | Description                                                                                                                                                      |
|-----------|---------|-----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| callTypes | Array   | Yes                                                                   | Call type array of the integer type. Statistics are collected based on each type in the array. The call type is only the digit.<br>The array size is up to 1000. |
| skillIds  | Array   | No                                                                    | Skill queue IDs. An array of integers. Statistics are collected by type in the array. The array size is up to 1000.                                              |
| subCcNo   | Integer | Either this parameter or <b>tenantId</b> must be set.                 | Subsystem number.                                                                                                                                                |
| vdn       | Integer | Either this parameter or <b>tenantId</b> must be set.                 | ID of a VDN.                                                                                                                                                     |
| tenantId  | String  | Either this parameter or <b>subCcNo</b> (or <b>vdn</b> ) must be set. | Tenant ID.                                                                                                                                                       |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccId      | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator</li> </ul> |

| Parameter | Type | Mandatory | Description           |
|-----------|------|-----------|-----------------------|
|           |      |           | signs in to the AICC. |

## Response Message

**Table 12-568** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-569</a> .                                                                                                   |

**Table 12-569** Parameters of resultDesc

| Parameter   | Type    | Description                                                |
|-------------|---------|------------------------------------------------------------|
| beginLogDay | String  | Start call time, which is the same as the input parameter. |
| endLogDay   | String  | End call time, which is the same as the input parameter.   |
| calleeNo    | String  | Called number.                                             |
| callType    | Integer | Call type.                                                 |
| vdn         | Integer | ID of a VDN.                                               |
| serviceNo   | Integer | Business type.                                             |
| orgCcNo     | Integer | Subsystem number of the original call center.              |
| subCcNo     | Integer | Subsystem number.                                          |

| Parameter         | Type    | Description                                                                                                     |
|-------------------|---------|-----------------------------------------------------------------------------------------------------------------|
| serCcNo           | Integer | Subsystem number of the service party.                                                                          |
| currentAgentId    | Integer | Agent ID.<br>Agent ID in the last CDR of a call, which is not recommended for indicator settlement.             |
| currentSkillId    | Integer | Skill queue ID.<br>Skill queue ID in the last CDR of a call, which is not recommended for indicator settlement. |
| failQueueWaitNum  | Integer | Number of waits for lost calls.                                                                                 |
| failQueueWaitTime | Integer | Waiting duration of lost calls, in seconds.                                                                     |
| waitAnsNum        | Integer | Number of calls that are waiting for answers.                                                                   |
| waitAnsTime       | Integer | Ring duration, in seconds.                                                                                      |
| succWaitAnsTime   | Integer | Duration of waiting for the answer in a successful call, in seconds.                                            |
| noAckNum          | Integer | Number of calls that are not answered.                                                                          |
| succQueueWaitTime | Integer | Queuing duration of a successful call, in seconds.                                                              |
| succQueueWaitNum  | Integer | Number of queuing times for a successful call.                                                                  |
| queOverToIvrNum   | Integer | Number of hang-up calls transferred from a queue to the IVR.                                                    |
| queOverToIvrTime  | Integer | Total hang-up duration for transferring calls from a queue to the IVR, in seconds.                              |
| hangUpNum         | Integer | Number of manual-to-IVR calls.                                                                                  |
| hangUpTime        | Integer | Total duration of manual-to-IVR calls.                                                                          |
| hangUpReleaseNum  | Integer | Number of hang-up calls that are transferred from the manual service to the IVR.                                |
| inOccupyNum       | Integer | Number of manual requests.                                                                                      |
| inCallSuccNum     | Integer | Number of manual calls.                                                                                         |

| Parameter        | Type    | Description                                                                |
|------------------|---------|----------------------------------------------------------------------------|
| inCallTime       | Integer | Manual call duration, in seconds.                                          |
| maxQueueWaitTime | Integer | Maximum queuing duration, in seconds.                                      |
| minQueueWaitTime | Integer | Minimum queuing duration, in seconds.                                      |
| maxWaitAnsTime   | Integer | Maximum ring duration, in seconds.                                         |
| minWaitAnsTime   | Integer | Minimum ring duration, in seconds.                                         |
| maxCallTime      | Integer | Maximum call duration, in seconds.                                         |
| minCallTime      | Integer | Minimum call duration, in seconds.                                         |
| succAckTimeLt3   | Integer | Number of successful calls that are answered within 3 seconds.             |
| callTimeLt3      | Integer | Number of successful calls whose call duration is shorter than 3 seconds.  |
| failTimeLt3      | Integer | Number of failed calls whose waiting duration is shorter than 3 seconds.   |
| succAckTimeLt5   | Integer | Number of successful calls that are answered within 5 seconds.             |
| callTimeLt5      | Integer | Number of successful calls whose call duration is shorter than 5 seconds.  |
| failTimeLt5      | Integer | Number of failed calls whose waiting duration is shorter than 5 seconds.   |
| succAckTimeLt10  | Integer | Number of successful calls that are answered within 10 seconds.            |
| callTimeLt10     | Integer | Number of successful calls whose call duration is shorter than 10 seconds. |
| failTimeLt10     | Integer | Number of failed calls whose waiting duration is shorter than 10 seconds.  |
| succAckTimeLt30  | Integer | Number of successful calls that are answered within 30 seconds.            |
| callTimeLt30     | Integer | Number of successful calls whose call duration is shorter than 30 seconds. |

| Parameter           | Type    | Description                                                                |
|---------------------|---------|----------------------------------------------------------------------------|
| failTimeLt30        | Integer | Number of failed calls whose waiting duration is shorter than 30 seconds.  |
| succAckTimeLt60     | Integer | Number of successful calls that are answered within 60 seconds.            |
| callTimeLt60        | Integer | Number of successful calls whose call duration is shorter than 60 seconds. |
| failTimeLt60        | Integer | Number of failed calls whose waiting duration is shorter than 60 seconds.  |
| succAckTimeGt10     | Integer | Number of successful calls that are answered after 10 seconds.             |
| callTimeGt10        | Integer | Number of successful calls whose call duration is longer than 10 seconds.  |
| failTimeGt10        | Integer | Number of failed calls whose waiting duration is longer than 10 seconds.   |
| succAckTimeGt60     | Integer | Number of successful calls that are answered after 60 seconds.             |
| callTimeGt60        | Integer | Number of successful calls whose call duration is longer than 60 seconds.  |
| failTimeGt60        | Integer | Number of failed calls whose waiting duration is longer than 60 seconds.   |
| minIvrCallTime      | Integer | Minimum IVR call duration, in seconds.                                     |
| agentToQueueNum     | Integer | Number of manual-to-queue calls.                                           |
| inVdnTime           | Integer | Total duration of VDN occupation by inbound calls, in seconds.             |
| succWaitAnsNum      | Integer | Number of successful call responses.                                       |
| ivrOccupyNum        | Integer | Number of IVR inbound call requests.                                       |
| autoUserAbandon-Num | Integer | Number of calls that are hung up by users during IVR voice playing.        |
| autoAnsTime         | Integer | System-level IVR inbound call ringing duration, in seconds.                |

| Parameter           | Type    | Description                                                                                                      |
|---------------------|---------|------------------------------------------------------------------------------------------------------------------|
| ivrOnlySuccNum      | Integer | Number of successful calls that are connected using only the IVR.                                                |
| autoCallSuccNum     | Integer | Number of system-level IVR calls.                                                                                |
| maxIvrCallTime      | Integer | Maximum IVR call duration, in seconds.                                                                           |
| ivrOnlyTime         | Integer | Total duration of inbound calls that are connected using only the IVR, in seconds.                               |
| netCallSuccNum      | Integer | Number of successful inbound calls through network devices.                                                      |
| ivrOnlyNum          | Integer | Number of inbound calls that are connected using only the IVR.                                                   |
| autoCallNum         | Integer | Number of system-level IVR inbound calls.                                                                        |
| failWaitAnsTime     | Integer | Ring duration for lost calls, in seconds.                                                                        |
| queueWaitTime       | Integer | Queuing duration, in seconds.                                                                                    |
| ivrCallTime         | Integer | IVR inbound call duration, in seconds.                                                                           |
| netCallNum          | Integer | Number of inbound calls through network devices.                                                                 |
| ivrCallSuccNum      | Integer | Number of IVR inbound calls.                                                                                     |
| agentToAgentNum     | Integer | Number of calls that are transferred from the manual service to the manual service.                              |
| autoTransferNum     | Integer | Number of system-level IVR inbound calls that are transferred out.                                               |
| inCallCostMinute    | Integer | Charging duration of a manual call, in minutes.                                                                  |
| inCallAllCostMinute | Integer | Total charging duration of each call, in minutes, including the charging duration of manual calls and IVR calls. |

| Parameter                        | Type    | Description                                                                                                                                                                                                                                                                          |
|----------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| reserved_col1-<br>reserved_col20 | Integer | Reserved field. The service meaning is determined based on the configuration in the <b>t_cms_custom_indicator_config</b> table. By default, the reserved field <b>3</b> indicates the number of inbound calls whose waiting duration for answer is less than or equal to 15 seconds. |

### 12.3.2.11 Collecting Statistics on Result Sets in Daily Settlement Table for Outbound Calls

#### Interface Function

This interface is invoked to collect statistics on result sets in the daily settlement table for outbound calls based on conditions.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

`https://ip:port/rest/cmsapp/v1/calloutday/querymanualindexesbycondition`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-570** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-571** Parameters in the message body

| Parameter | Type  | Mandatory | Description                                                                                                                                                                            |
|-----------|-------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| callerNos | Array | Yes       | Array of calling numbers of a call. The statistics are collected by group based on each number in the array. The calling number consists of only digits. The array size is up to 1000. |

| Parameter   | Type    | Mandatory                                                             | Description                                                                                                                                                      |
|-------------|---------|-----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| beginLogDay | String  | Yes                                                                   | Start call time for statistics collection. The value must be in the <i>yyyy-MM-dd</i> format and in the time zone of the VDN.                                    |
| endLogDay   | String  | Yes                                                                   | End call time for statistics collection. The value must be in the <i>yyyy-MM-dd</i> format and in the time zone of the VDN.                                      |
| callTypes   | Array   | Yes                                                                   | Call type array of the integer type. Statistics are collected based on each type in the array. The call type is only the digit.<br>The array size is up to 1000. |
| skillIds    | Array   | No                                                                    | Skill queue IDs. An array of integers. Statistics are collected by type in the array.<br>The array size is up to 1000.                                           |
| subCcNo     | Integer | Either this parameter or <b>tenantId</b> must be set.                 | Subsystem number.                                                                                                                                                |
| vdn         | Integer | Either this parameter or <b>tenantId</b> must be set.                 | ID of a VDN.                                                                                                                                                     |
| tenantId    | String  | Either this parameter or <b>subCcNo</b> (or <b>vdn</b> ) must be set. | Tenant ID.                                                                                                                                                       |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ccId      | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator</li> </ul> |

| Parameter | Type | Mandatory | Description           |
|-----------|------|-----------|-----------------------|
|           |      |           | signs in to the AICC. |

## Response Message

**Table 12-572** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object in the returned result after a successful query. For details about the parameters of this object, see <a href="#">Table 12-573</a> .                                                                                                      |

**Table 12-573** Parameters of resultDesc

| Parameter   | Type    | Description                                                |
|-------------|---------|------------------------------------------------------------|
| beginLogDay | String  | Start call time, which is the same as the input parameter. |
| endLogDay   | String  | End call time, which is the same as the input parameter.   |
| callerNo    | String  | Calling number.                                            |
| callType    | Integer | Call type.                                                 |
| vdn         | Integer | ID of a VDN.                                               |
| serviceNo   | Integer | Business type.                                             |
| orgCcNo     | Integer | Subsystem number of the original call center.              |
| subCcNo     | Integer | Subsystem number.                                          |

| Parameter         | Type    | Description                                                                                                           |
|-------------------|---------|-----------------------------------------------------------------------------------------------------------------------|
| serCcNo           | Integer | Subsystem number of the service party.                                                                                |
| currentAgentId    | Integer | Outbound agent ID.<br>Outbound agent ID in the last CDR of a call, which is not recommended for indicator settlement. |
| currentSkillId    | Integer | Skill queue ID.<br>Skill queue ID in the last CDR of a call, which is not recommended for indicator settlement.       |
| obsServiceNo      | String  | ID of an outbound campaign.                                                                                           |
| failQueueWaitNum  | Integer | Number of waits for lost calls.                                                                                       |
| failQueueWaitTime | Integer | Waiting duration of lost calls, in seconds.                                                                           |
| outOccupyNum      | Integer | Number of manual outbound calls.                                                                                      |
| outSuccWaitAnsNum | Integer | Number of manual outbound calls that are answered.                                                                    |
| outCallSuccNum    | Integer | Number of successful manual outbound calls.                                                                           |
| outWaitAnsTime    | Integer | Ring duration for outbound calls, in seconds.                                                                         |
| outCallTime       | Integer | Outbound call duration, in seconds.                                                                                   |
| maxWaitAnsTime    | Integer | Maximum ring duration, in seconds.                                                                                    |
| minWaitAnsTime    | Integer | Minimum ring duration, in seconds.                                                                                    |
| maxCallTime       | Integer | Maximum call duration, in seconds.                                                                                    |
| minCallTime       | Integer | Minimum call duration, in seconds.                                                                                    |
| succAckTimeLt3    | Integer | Number of successful calls that are answered within 3 seconds.                                                        |
| callTimeLt3       | Integer | Number of successful calls whose call duration is shorter than 3 seconds.                                             |
| failTimeLt3       | Integer | Number of failed calls whose waiting duration is shorter than 3 seconds.                                              |
| succAckTimeLt5    | Integer | Number of successful calls that are answered within 5 seconds.                                                        |

| Parameter       | Type    | Description                                                                |
|-----------------|---------|----------------------------------------------------------------------------|
| callTimeLt5     | Integer | Number of successful calls whose call duration is shorter than 5 seconds.  |
| failTimeLt5     | Integer | Number of failed calls whose waiting duration is shorter than 5 seconds.   |
| succAckTimeLt10 | Integer | Number of successful calls that are answered within 10 seconds.            |
| callTimeLt10    | Integer | Number of successful calls whose call duration is shorter than 10 seconds. |
| failTimeLt10    | Integer | Number of failed calls whose waiting duration is shorter than 10 seconds.  |
| succAckTimeLt30 | Integer | Number of successful calls that are answered within 30 seconds.            |
| callTimeLt30    | Integer | Number of successful calls whose call duration is shorter than 30 seconds. |
| failTimeLt30    | Integer | Number of failed calls whose waiting duration is shorter than 30 seconds.  |
| succAckTimeLt60 | Integer | Number of successful calls that are answered within 60 seconds.            |
| callTimeLt60    | Integer | Number of successful calls whose call duration is shorter than 60 seconds. |
| failTimeLt60    | Integer | Number of failed calls whose waiting duration is shorter than 60 seconds.  |
| succAckTimeGt10 | Integer | Number of successful calls that are answered after 10 seconds.             |
| callTimeGt10    | Integer | Number of successful calls whose call duration is longer than 10 seconds.  |
| failTimeGt10    | Integer | Number of failed calls whose waiting duration is longer than 10 seconds.   |
| succAckTimeGt60 | Integer | Number of successful calls that are answered after 60 seconds.             |
| callTimeGt60    | Integer | Number of successful calls whose call duration is longer than 60 seconds.  |

| Parameter                | Type    | Description                                                                 |
|--------------------------|---------|-----------------------------------------------------------------------------|
| failTimeGt60             | Integer | Number of failed calls whose waiting duration is longer than 60 seconds.    |
| agentHangUpLt3           | Integer | Number of calls released by calling parties in less than 3 seconds.         |
| preAgentSuccNum          | Integer | Number of predicted outbound calls that are forwarded to agents.            |
| preViewedTransfer-Num    | Integer | Number of previewed outbound calls that are transferred by an agent.        |
| hangUpTime               | Integer | Total duration of manual-to-IVR calls.                                      |
| preOccupiedSuccAck Time  | Integer | Waiting duration before a preempted outbound call is connected, in seconds. |
| autoAnsTime              | Integer | System-level IVR outbound call ringing duration, in seconds.                |
| autoCallSuccNum          | Integer | Number of system-level IVR outbound calls.                                  |
| preOccupiedSucc-Num      | Integer | Waiting duration before a preempted outbound call is connected, in seconds. |
| hangUpNum                | Integer | Number of manual-to-IVR calls.                                              |
| preAgentNum              | Integer | Number of predicted outbound calls that are forwarded to agents.            |
| zeroNum                  | Integer | Number of calls with zero CDRs.                                             |
| preQueueWaitTime         | Integer | Waiting duration of a predicted outbound call in a queue, in seconds.       |
| preQueueWaitNum          | Integer | Number of queuing times for predicted outbound calls.                       |
| preViewedCallSucc-Num    | Integer | Number of previewed outbound calls that are connected.                      |
| preOccupiedCall-Num      | Integer | Total number of preempted outbound calls.                                   |
| preOccupiedAgent-SuccNum | Integer | Number of preempted outbound calls that are answered by agents.             |
| agentTransferNum         | Integer | Number of manual outbound calls that are transferred out.                   |
| autoCallNum              | Integer | Number of system-level IVR outbound calls.                                  |

| Parameter                 | Type    | Description                                                                               |
|---------------------------|---------|-------------------------------------------------------------------------------------------|
| hangUpReleaseNum          | Integer | Number of hang-up calls that are transferred from the manual service to the IVR.          |
| preTransferNum            | Integer | Number of predicted outbound calls that are transferred out.                              |
| preTotalTime              | Integer | Total duration of predicted outbound calls, in seconds.                                   |
| preFailQueueWait-Num      | Integer | Number of queuing times for lost predicted outbound calls.                                |
| preViewedSuccAck-Time     | Integer | Waiting duration before a previewed outbound call is connected, in seconds.               |
| preFailQueueWait-Time     | Integer | Waiting duration of a lost predicted outbound call in a queue, in seconds.                |
| preAbortQueueWait-Num     | Integer | Number of queuing times for predicted outbound calls that are released.                   |
| preNoAckNum               | Integer | Number of predicted outbound calls that are answered by users but not answered by agents. |
| succWaitAnsTime           | Integer | Duration of answering a successful call, in seconds.                                      |
| outVdnTime                | Integer | Total duration of VDN occupation by outbound calls, in seconds.                           |
| preViewedCallNum          | Integer | Total number of previewed outbound calls.                                                 |
| preCallSuccNum            | Integer | Number of predicted outbound calls that are connected.                                    |
| preOccupiedTransferNum    | Integer | Number of preempted outbound calls that are transferred by an agent.                      |
| preCallNum                | Integer | Number of predicted outbound calls.                                                       |
| preOccupiedAgent-SuccTime | Integer | Manual call duration of preempted outbound calls, in seconds.                             |
| autoTransferNum           | Integer | Number of system-level IVR outbound calls that are transferred out.                       |
| outCallCostMinute         | Integer | Charging duration of a manual call, in minutes.                                           |

| Parameter                    | Type    | Description                                                                                                                                                                                                                                                                      |
|------------------------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ivrCallSuccNum               | Integer | Number of IVR outbound calls.                                                                                                                                                                                                                                                    |
| ivrCallTime                  | Integer | IVR outbound call duration, in seconds.                                                                                                                                                                                                                                          |
| ivrOccupyNum                 | Integer | Number of IVR outbound call requests.                                                                                                                                                                                                                                            |
| ivrOnlyNum                   | Integer | Number of outbound calls connected using only the IVR.                                                                                                                                                                                                                           |
| ivrOnlySuccNum               | Integer | Number of successful calls that are connected using only the IVR.                                                                                                                                                                                                                |
| ivrOnlyTime                  | Integer | Duration of outbound calls connected using only the IVR, in seconds.                                                                                                                                                                                                             |
| outCallAllCostMinute         | Integer | Total charging duration of each call, in minutes, including the charging duration of manual calls and IVR calls.                                                                                                                                                                 |
| reserved_col1-reserved_col20 | Integer | Reserved field. The service meaning is determined based on the configuration in the <b>t/cms/custom/indicator/config</b> table.<br><br>By default, the reserved field <b>3</b> indicates the number of outbound calls whose call duration is longer than or equal to 15 seconds. |

## Message Example

## 12.3.3 Configuration Data Query

### 12.3.3.1 Querying Information about All VDNs in a Specified Call Center

#### Scenario

This interface is invoked to query information about all VDNs in a specified call center.

Note: This interface supports only the independent deployment environment and can be invoked only by the global AK and SK.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/configures/vdns>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values.

In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-574** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-575** Parameter in the request body

| No. | Parameter | Value Type | Mandatory | Description                                               |
|-----|-----------|------------|-----------|-----------------------------------------------------------|
| 1   | cclid     | Integer    | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |

## Response Description

**Table 12-576** Parameters in the response body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                     |
|-----|-------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| 2   | resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• 0100000: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .                                                                                                                       |
| 3   | resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-577</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                   |
| 4   | resultDesc  | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-577</a> .                                                                                                                                                                                               |

**Table 12-577** Parameters of resultDesc/resultDatas

| No. | Parameter | Value Type | Description  |
|-----|-----------|------------|--------------|
| 2.1 | vdn       | Integer    | ID of a VDN. |
| 2.2 | vdnName   | String     | VDN name.    |

### 12.3.3.2 Querying Information About All Agents by VDN ID

#### Scenario

This interface is invoked to query information about all agents by VDN ID. A tenant corresponds to a VDN after being created and configured.

## Interface Method

The request method must be set to GET. This interface supports only the GET method.

## Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/siteagentcallandskillinfobyagentids

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/configures/agents/{ccld}/{vdn}/{offset}/{limit}

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server. *{ccld}* indicates the call center ID, ranging from 1 to 65535; *{vdn}* indicates the VDN ID, ranging from 1 to 5000; *{offset}* indicates the start offset (optional); and *{limit}* indicates the number of records to be queried on each page (optional, and the maximum value is 100). *{offset}* and *{limit}* must be transferred at the same time.

## Request Description

**Table 12-578** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 12-579** Parameters in the response message body

| Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions. |
| resultCode  | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> .                                                                                                                       |
| count       | Integer    | Total number of agents. This parameter is returned only when <i>{offset}</i> and <i>{limit}</i> in the request take effect.                                                                                                                                                                                                                                            |
| resultDatas | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-580</a> .<br><b>NOTE</b><br>This field is reserved for compatibility with interface response parameters in 8.13 and earlier versions.                                                                          |
| resultDesc  | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-580</a> .                                                                                                                                                                                                      |

**Table 12-580** Parameters of resultDesc/resultDatas

| Parameter | Value Type | Description |
|-----------|------------|-------------|
| agentNo   | String     | Agent ID.   |
| agentName | String     | Agent name. |
| roleId    | String     | Agent role. |

| Parameter | Value Type | Description                                                                                                   |
|-----------|------------|---------------------------------------------------------------------------------------------------------------|
| skillId   | String     | Skill ID set. Multiple skill IDs are separated by semicolons (;), for example, <b>1;3;10;11;25;31;32;40</b> . |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters  
None

- Response parameters

```
{
 "result": "0",
 "resultCode": "0100000",
 "count": 101,
 "resultDatas": [
 {
 "agentNo": "10000",
 "agentName": "z1",
 "roleId": "1",
 "skillId": ""
 },
 {
 "agentNo": "101",
 "agentName": "z2",
 "roleId": "1",
 "skillId": "2;3"
 }
],
 "resultDesc": [
 {
 "agentNo": "10000",
 "agentName": "z1",
 "roleId": "1",

 "agentName": "z2",
 "roleId": "1",
 "skillId": "2;3"
 }
]
}
```

### 12.3.3.3 Obtaining All Called Routes in a VDN

#### Scenario

This interface is invoked to obtain all called routes in a VDN.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/configures/calledconfigs/{ccld}/{vdn}

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server. *{ccld}* indicates the call center ID and ranges from 1 to 65535; and *{vdn}* indicates the VDN ID and ranges from 1 to 5000.

## Request Description

**Table 12-581** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Description

**Table 12-582** Parameters in the response message body

| No. | Parameter | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 12.3.3.4 Querying Information About All Agents by Tenant Space ID

#### Description

This interface is used to query information about all agents of a tenant based on the tenant space ID.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

`https://ip:port/rest/cmsapp/v1/openapi/tenant/querytenantdetail`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-584** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-585** Parameters in the message body

| Parameter | Type   | Mandatory | Description      |
|-----------|--------|-----------|------------------|
| tenantId  | String | Yes       | Tenant space ID. |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>ID of a call center.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator</li> </ul> |

| Parameter | Type | Mandatory | Description           |
|-----------|------|-----------|-----------------------|
|           |      |           | signs in to the AICC. |

## Response Message

**Table 12-586** Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                   |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"><li>• <b>0100000</b>: success</li><li>• Other values: failure</li></ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see <a href="#">Table 12-587</a> .                                                                             |

**Table 12-587** Parameters of resultDesc

| Parameter       | Type    | Description                                                                                                                                  |
|-----------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------|
| cclId           | Integer | ID of a call center.                                                                                                                         |
| tenantId        | String  | Tenant space ID.                                                                                                                             |
| tenantSpaceName | String  | Tenant space name.                                                                                                                           |
| vdnId           | Integer | ID of a VDN.                                                                                                                                 |
| accessCodes     | Array   | Access number list.<br>For details about the parameters of the object in this array, see <a href="#">Table 4 Parameters of accessCodes</a> . |

| Parameter | Type  | Description                                                                                                       |
|-----------|-------|-------------------------------------------------------------------------------------------------------------------|
| agents    | Array | Agent list. For details about the parameters of <b>agents</b> , see <a href="#">Table 5 Parameters of agent</a> . |

**Table 12-588** Parameters of accessCodes

| Parameter  | Type    | Description                                                                                      |
|------------|---------|--------------------------------------------------------------------------------------------------|
| accessCode | String  | Access code.                                                                                     |
| isDefault  | Boolean | Default access code ID. This parameter can be set to <b>true</b> , <b>false</b> , or left empty. |

**Table 12-589** Parameters of agents

| Parameter   | Type    | Description                                                                                                                                            |
|-------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| workNo      | Integer | Agent ID.                                                                                                                                              |
| sipAccount  | String  | Softphone number.                                                                                                                                      |
| accountCode | String  | Agent account.                                                                                                                                         |
| agentType   | Integer | Agent type.<br><b>4</b> : voice agent; <b>5</b> : multimedia agent; <b>11</b> : video agent. This field is returned only during integrated deployment. |

### 12.3.3.5 Querying Skill Groups in a Specified VDN

#### Description

This interface is invoked to query the information about the skill groups in a specified VDN.

Note: This interface supports only the independent deployment environment and CTI 3.8.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/skillgroups/{ccld}/{vdnId}`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-590** Parameters in the request header

| No. | Parameter    | Value Type | Mandatory | Description                                                    |
|-----|--------------|------------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String     | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

No request body exists.

## Response Message

**Table 12-591** Parameters in the message body

| No. | Parameter  | Value Type | Description                                                                                                                                                                                                                                                |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> <li>• For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| 2   | resultDesc | Array      | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-592</a> .                                                                                          |

**Table 12-592** Parameters of resultDesc

| No. | Parameter | Value Type | Description                                                                                                                           |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 2.1 | id        | Integer    | Skill group ID.                                                                                                                       |
| 2.2 | skills    | Array      | Skill object array. The array contains skill objects. <a href="#">Table 12-593</a> describes the definition of a single skill object. |

| No. | Parameter | Value Type | Description                                                                                   |

### 12.3.3.6 Querying Information About All Tenants Accessible to an Access User

#### Description

This interface is invoked by an access user to query information about all accessible tenants based on the AK/SK.

 **NOTE**

This interface supports only the private AK/SK.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/tenant/querytenants`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-594** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-595** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Response Message

**Table 12-596** Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object array in the returned result after a successful query. <p>For details about the parameters of this object in the array, see <a href="#">Table 12-597</a>.</p>                                                                             |

**Table 12-597** Parameters of resultDesc

| Parameter       | Type    | Description                                                                                                                |
|-----------------|---------|----------------------------------------------------------------------------------------------------------------------------|
| cclId           | Integer | ID of a call center.                                                                                                       |
| tenantId        | String  | Tenant space ID.                                                                                                           |
| tenantSpaceName | String  | Tenant space name.                                                                                                         |
| vdnId           | Integer | ID of a VDN.                                                                                                               |
| accessCodes     | Array   | Access number list. <p>For details about the parameters of this object in the array, see <a href="#">Table 12-598</a>.</p> |

**Table 12-598** Parameters of accessCodes

| Parameter  | Type    | Description                                                                                      |
|------------|---------|--------------------------------------------------------------------------------------------------|
| accessCode | String  | Access code.                                                                                     |
| isDefault  | Boolean | Default access code ID. This parameter can be set to <b>true</b> , <b>false</b> , or left empty. |

## 12.3.4 Inspection Relationship Maintenance Interfaces

Note: The following interfaces support only the scenario where the CC-CMS is independently deployed.

### 12.3.4.1 Querying a User Group Member

#### Scenario

This interface is invoked to query members in a specified user group based on the VDN, group ID, and **workNo**.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/  
querygroupmemberbycondition

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-599** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-600** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | Call center ID. The value ranges from 1 to 65535. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                             |
| groupid   | String  | Yes       | User group ID.                                                                                                                                                                                                                                                                                                                                           |

| Parameter | Type    | Mandatory | Description                                                  |
|-----------|---------|-----------|--------------------------------------------------------------|
| workNo    | Integer | No        | Agent ID. The value ranges from 0 to 99999.                  |
| limit     | Integer | Yes       | Maximum number of query records on each page ( $\leq 100$ ). |
| offset    | Integer | Yes       | Offset.                                                      |

## Response Message

### 12.3.4.2 Deleting Members from a Group in Batches

#### Scenario

This interface is invoked to delete user group members in batches based on the VDN and agent ID set.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/batchdeletegroupmember>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-603** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-604** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | Call center ID. The value ranges from 1 to 65535. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| workNos   | Array   | No        | Agent ID set of user group members. If this parameter is left empty, all group members under the tenant corresponding to the VDN are deleted.<br>The value of agent ID ranges from 0 to 99999.                                                                                                                                                           |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                             |

## Response Description

**Table 12-605** Parameters in the message body

### 12.3.4.3 Adding Members to a Group in Batches

#### Scenario

This interface is invoked to add members to a specified user group in batches.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/batchaddgroupmember`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the

NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-606** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-607** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                            |

}
```

### 12.3.4.4 Querying All User Groups

#### Description

This interface is invoked to query all user groups in a VDN based on the VDN.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/queryallccgroup/{ccld}/{vdn}`

The **ccld** parameter is optional. If it is left empty, in the independent deployment environment, the default value is the value of **Default Call Center ID** on the

**Configuration Center > System Management > Parameter Settings** page after a system administrator signs in to the AICC.

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-609** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

## Response Message

**Table 12-610** Parameter description

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |

```

### 12.3.4.6 Deleting a User Group

#### Description

This interface is invoked to delete a user group based on the VDN and user group ID.

Note: If a user group has members and inspection relationships are configured for the user group, the members and configured inspection relationships are deleted with the user group.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/deleteusergroup

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-615** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-616** Parameter description

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | Call center ID. The value ranges from 1 to 65535. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | ID of a VDN.                                                                                                                                                                                                                                                                                                                                             |
| id        | String  | Yes       | User group ID.                                                                                                                                                                                                                                                                                                                                           |

### 12.3.4.8 Setting Inspection Relationships

#### Description

This interface is invoked to set the inspection relationships between a specified inspector group and a user group.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/configqcrelation`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the

administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-621** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-622** Parameter description

| Parameter         | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-------------------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId             | Integer | No        | Call center ID. The value ranges from 1 to 65535. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| qcGroupId         | Integer | Yes       | ID of an inspector group.                                                                                                                                                                                                                                                                                                                                |

### 12.3.4.9 Deleting Configured Inspection Relationships

#### Description

This interface is invoked to delete inspection relationships based on the IDs of the inspector group and inspected party group.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/deleteqcrelationconf`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the

administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-624** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-625** Parameter description

| Parameter         | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-------------------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The following table describes the parameters in the response message body of this interface.

### 12.3.4.10 Adding an Agent to a User Group

#### Scenario

The interface is invoked to add an agent to a user group on the CMS.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/joinusergroup`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the

administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-627** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-628** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | Call center ID. The value ranges from 1 to 65535. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdnId     | Integer | Yes       | ID of a virtual call center. The value ranges from 1 to 5000.                                                                                                                                                                                                                                                                                            |
| agentId   | Integer | Yes       | ID of an agent who joins a user group. The value ranges from 0 to 99999.                                                                                                                                                                                                                                                                                 |

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|---------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| groupId   | String  | No        | ID of the user group that the user joins.<br>If the group ID is not carried, a group is created using the name specified by <b>groupName</b> , and then the agent is added to the new group. If the agent already exists in another group, the agent is automatically removed from it.<br>If the group ID is carried, <b>groupName</b> is ignored, and the agent is added to the group corresponding to <b>groupId</b> . If the agent already exists in another group, the agent is automatically removed from it. |
| groupName | String  | No        | Name of the group. (The value cannot contain invalid characters and can contain a maximum of 100 characters.)                                                                                                                                                                                                                                                                                                                                                                                                      |
| groupType | Integer | No        | User group type. The default value is 2. The options are 2 (agent group) and 3 (inspector group). Other values are invalid.                                                                                                                                                                                                                                                                                                                                                                                        |

## Response Message

**Table 12-629** Parameters in the message body

| Parameter | Type   | Description  |
|-----------|--------|--------------|
| message   | String | Description. |

| Parameter | Type   | Description                                                                                                                                                             |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| retcode   | String | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure<br>For details about error code parameters, see <a href="#">Table 12-631</a> .   |
| result    | object | Object in the returned result after an agent is successfully added to a user group. For details about the parameters of this object, see <a href="#">Table 12-630</a> . |

**Table 12-630** Parameters of result

| Parameter | Type   | Description                                                                                                                                     |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| groupId   | String | ID of the user group to which an agent is added.                                                                                                |
| groupName | String | Name of the user group to which an agent is added.<br>(The value cannot contain invalid characters and can contain a maximum of 20 characters.) |

**Table 12-631** Error end codes

| Error End Code | Description                                                | Comments                                                                     |
|----------------|------------------------------------------------------------|------------------------------------------------------------------------------|
| 300-010        | <b>ccid</b> and <b>vdnid</b> of the VDN user do not match. | Check whether the input parameters are correct.                              |
| 300-016        | The agent does not exist in the VDN.                       | Check whether the agent exists in the VDN. If yes, try again 1 minute later. |
| 300-017        | The inspector group name already exists.                   | Change the name of the inspector group.                                      |

| Error End Code | Description                                              | Comments                                                                  |
|----------------|----------------------------------------------------------|---------------------------------------------------------------------------|
| 300-018        | The name of the inspector group is empty.                | Check whether the <b>groupName</b> parameter is carried or left empty.    |
| 300-019        | The inspector group does not exist.                      | Check whether the inspector group corresponding to <b>groupId</b> exists. |
| 1              | The parameter is invalid or the system reports an error. | Check whether the input parameters are correct.                           |

}
```

### 12.3.4.11 Updating Agent Names

This interface supports only the scenario where the CC-CMS is independently deployed.

#### Scenario

This interface is invoked to update an agent name.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/qcrelationconf/updateagentgroup>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-632** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-633** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                              |
|-----------|---------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | Call center ID. The value ranges from 1 to 65535. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdnId     | Integer | Yes       | ID of a virtual call center. The value ranges from 1 to 5000.                                                                                                                                                                                                                                                                                            |

| Parameter | Type    | Mandatory | Description                                                                                                                                                            |
|-----------|---------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agentId   | Integer | Yes       | Agent ID. The name of the VDN administrator cannot be changed, that is, the agent ID of the VDN administrator cannot be transferred. The value ranges from 0 to 99999. |
| agentName | String  | Yes       | Agent name. (The value cannot contain invalid characters.)                                                                                                             |

## Response Message

**Table 12-634** Parameters in the message body

| Parameter | Type   | Description                                                                                                                                                             |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message   | String | Description.                                                                                                                                                            |
| retcode   | String | Error code. The options are as follows:<br><b>0</b> : success<br><b>1</b> : failure                                                                                     |
| result    | object | Object in the returned result after an agent is successfully added to a user group. For details about the parameters of this object, see <a href="#">Table 12-635</a> . |

**Table 12-635** Parameters of result

| Parameter | Type    | Description               |
|-----------|---------|---------------------------|
| cclId     | Integer | VDN.                      |
| vdnId     | Integer | ID of an inspector group. |
| agentId   | Integer | New agent ID.             |
| agentName | String  | New agent name.           |

}
```

## 12.3.5 Querying Outbound Call Task Lists

### 12.3.5.1 Querying the Outbound Call Task List of a Tenant

#### Description

This interface is invoked to query the outbound call task list of a tenant and return task information.

Note: The iSales service module must be deployed for this interface.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/fromisales/querytasks>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-636** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-637** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclid     | Integer | No        | <p>Call center ID. The value ranges from 1 to 65535.</p> <ul style="list-style-type: none"> <li>In the integration environment, the default value is the value of <b>Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; CMS System Configuration</b> page after a system administrator signs in to the AICC. If this parameter is empty, the data whose <b>sys_key</b> is <b>default_cc_id</b> and <b>sys_type</b> is <b>cms_system_config</b> in the <b>t_cms_sysparam</b> database table is used.</li> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | Integer | Yes       | ID of a VDN. The value ranges from 1 to 5000.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| limit     | Integer | No        | Page size. The default value is <b>10</b> . A maximum of 100 records can be queried.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| offset    | Integer | No        | Pagination start position. If this parameter is not set, the default value <b>0</b> is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Response Message

**Table 12-638** Parameters in the message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                      |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | string | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0100000</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDesc | Array  | Object array in the returned result after a successful query. For details about the parameters of the response message body, see <a href="#">Table 12-639</a> .                                                                                  |

**Table 12-639** Parameters in the response message body

| Parameter | Type      | Description            |
|-----------|-----------|------------------------|
| count     | Integer   | Total number of tasks. |
| tasks     | JSONArray | Task list.             |

For details about the parameters of **tasks**, see [Table 12-640](#).

**Table 12-640** Parameters of tasks

| Parameter | Type   | Description                                                                                                                                                                                                                            |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskId    | String | Task ID.                                                                                                                                                                                                                               |
| taskName  | String | Task name.                                                                                                                                                                                                                             |
| taskType  | String | Task type. <ol style="list-style-type: none"> <li>1: Intelligent outbound call</li> <li>2: Predicted outbound calls</li> <li>3: Automatic outbound call</li> <li>4: Agent outbound call</li> <li>5: Previewed outbound call</li> </ol> |

| Parameter | Type   | Description                                                       |
|-----------|--------|-------------------------------------------------------------------|
| beginDate | String | Start time, which is written by the CC-iSales frontend user.      |
| endDate   | String | End time, which is written by the CC-iSales frontend user.        |
| status    | String | Task status.<br>2: Being executed<br>3: Suspended<br>4: Completed |

### Message Example

- Request header

 "taskId": "1312452402",
 "status": "1"
 }
]
 }
}
```

### 12.3.5.2 Querying the Daily Settlement Statistics of a Specified Task

#### Description

This interface is invoked to query the daily settlement statistics of a specified task and return the daily settlement statistics indicators.

Note: The iSales service module must be deployed for this interface.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

`https://ip:port/rest/cmsapp/v1/openapi/fromisales/dailystatistic`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-641** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-642** Parameters in the message body

| Parameter    | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------|---------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId        | Integer | No        | <p>Call center ID. ### 12.3.5.3 Querying the Real-Time Statistics of a Specified Task

#### Description

This interface is invoked to query the real-time statistics of a specified task and return the real-time statistics indicators.

Note: The iSales service module must be deployed for this interface.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/fromisales/realstatistic`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-645** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-646** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 12.3.6 Interfaces for Querying System Indicators

If the environment is in pool mode, query the information about two UAPs. If the environment is in single mode, query the information about a single UAP. The environment mode is set when the CMS is deployed. For details, see the CMS deployment document.

### 12.3.6.1 Querying UAP Performance Information

#### Prerequisites

You need to create the **Incoming Office measurement** task on the performance management tool. For details, see "Maintenance > Performance Specifications" in *UAP9600 Product Documentation*. This interface is invoked only for global AK/SK authentication.

Note: This interface supports only the independent deployment environment.

#### Description

This interface is invoked to query the performance data of the UAP in the latest 5 minutes, including the trunk usage information, such as the number of idle circuits, number of available circuits, and circuit usage.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/uap/queryUapPerfInfo`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-649** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-650** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ofcNo     | Array   | No        | Array of inbound numbers. If the array is null, all inbound numbers are queried. You can run the MML command <b>LST OFC</b> to obtain the inbound numbers.                                                                                                                                                                  |
| cclId     | Integer | No        | ID of a call center. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |

## Response Message

**Table 12-651** Parameters in the response message body

| Parameter     | Type   | Description                                                                                                                                                                                                                                                |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode    | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc    | List   | Object list in the returned result after a successful query.<br>For details about the parameters of the object, see the following table.                                                                                                                   |
| 10.xx.xx.xx#0 | String | <ul style="list-style-type: none"> <li>● <b>10.xx.xx.xx</b>: UAP IP address.</li> <li>● <b>#</b>: fixed separator.</li> <li>● <b>0</b>: UAP ID.</li> </ul>                                                                                                 |

**Table 12-652** Parameters of resultDesc

| Parameter             | Type   | Description                                               |
|-----------------------|--------|-----------------------------------------------------------|
| RET                   | String | End time of data collection.                              |
| RNAT12                | String | No answer times.                                          |
| busy circuits (TIMES) | String | Number of busy circuits.                                  |
| ASD32                 | String | Average occupation duration, in seconds.                  |
| ITAR19                | String | Incoming trunk available ratio.                           |
| CLBT40                | String | The called party (local call) is busy.                    |
| MEID                  | String | Device ID.                                                |
| UBC43                 | String | Number of blocked circuits.                               |
| CCT34                 | String | Number of failed calls due to congestion at the peer end. |

| Parameter          | Type   | Description                                                                                                                                    |
|--------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------|
| LCOICT7            | String | Call loss due to home office internal congestion.                                                                                              |
| IOCS44             | String | Inbound CAPS value.                                                                                                                            |
| MOIID              | String | Measurement object ID.                                                                                                                         |
| CCT3               | String | Number of connected calls.                                                                                                                     |
| CDA9               | String | Congestion duration auxiliary quantity.                                                                                                        |
| AART11             | String | Number of calls released before ringing, that is, the number of times that the calling party hangs up before the calls are connected or ended. |
| TAT6               | String | Number of answered transfer calls.<br>An answered transfer call indicates that the user who answers the call is not a local user.              |
| Period             | String | Period.                                                                                                                                        |
| TCAT5              | String | Intra-office answer times.<br>Intra-office answer indicates that a user who answers the call is a local user.                                  |
| AR21               | String | Answer rate.                                                                                                                                   |
| TCAT2              | String | Times of transfer seizure attempts.                                                                                                            |
| TCAT1              | String | Times of intra-office seizure attempts.                                                                                                        |
| ICN13              | String | Number of installed circuits.                                                                                                                  |
| ECT35              | String | Number of times that an unallocated number is dialed.                                                                                          |
| incoming direction | String | 0(anonymous): <b>0</b> indicates an inbound call ID, and <b>anonymous</b> indicates a call name.                                               |
| IBCN16             | String | Number of installed bi-directional circuits.                                                                                                   |
| ACN14              | String | Number of available circuits.                                                                                                                  |
| TCT42              | String | Transferring call seizure times.                                                                                                               |

| Parameter                        | Type   | Description                                                    |
|----------------------------------|--------|----------------------------------------------------------------|
| IAT36                            | String | Invalid address times.                                         |
| Credible                         | String | Trusted or not.                                                |
| CFORT39                          | String | The caller party does not have permission.                     |
| RT                               | String | Time of data collection.                                       |
| ST26                             | String | Seized call traffic volume.                                    |
| Time                             | String | Count.                                                         |
| average answer duration (SECOND) | String | Average connection duration.                                   |
| AT30                             | String | Answered call traffic.                                         |
| TUT37                            | String | Terminal incompatibility times.                                |
| BCN15                            | String | Number of blocked circuits.                                    |
| BBCR23                           | String | Bi-directional circuit block ratio.                            |
| CTBT41                           | String | Toll busy times of the called party.                           |
| BTST24                           | String | Traffic occupied by a bi-directional trunk.                    |
| BTSTA25                          | String | Traffic auxiliary quantity occupied by a bi-directional trunk. |
| ABCN17                           | String | Number of available bi-directional circuits.                   |
| CTA29                            | String | Connection traffic auxiliary quantity.                         |
| AT4                              | String | Number of answered calls.                                      |
| EROCC46                          | String | Circuit usage.                                                 |
| TET38                            | String | Terminal error times.                                          |
| CT28                             | String | Connected call traffic.                                        |
| SOIC45                           | String | Number of idle circuits.                                       |
| ST0                              | String | Seizure times.                                                 |
| BCR22                            | String | Block ratio.                                                   |
| ABRT33                           | String | Abandon times before ringing.                                  |
| CR20                             | String | Connection rate.                                               |

| Parameter                                 | Type   | Description                                             |
|-------------------------------------------|--------|---------------------------------------------------------|
| BBCN18                                    | String | Number of blocked bi-directional circuits.              |
| CD8                                       | String | Congestion duration.                                    |
| ATA31                                     | String | Answering traffic auxiliary quantity.                   |
| CBT10                                     | String | Busy called party.                                      |
| STA27                                     | String | Seized traffic auxiliary quantity.                      |
| average connection duration (MILLISECOND) | String | Average connection duration.                            |
| answer duration aux (TIMES)               | String | Total duration auxiliary quantity of answered sessions. |

### 12.3.6.2 Querying Key Information About Control Blocks

#### NOTICE

The number of concurrent requests for invoking the interface cannot exceed 10. Otherwise, the interface invoking times out due to deteriorated performance.

#### Prerequisites

This interface is invoked only for global AK/SK authentication.

Note: This interface supports only the independent deployment environment.

#### Description

This interface is invoked to query the running states of specified control blocks.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/uap/dsppidkey

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-653** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-654** Parameters in the request message body

| Parameter | Type   | Mandatory               | Description                                                                                                                   |
|-----------|--------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| MODTYP    | String | Yes                     | It specifies the type of a module. Currently, <b>CCU</b> and <b>MSU</b> are supported.                                        |
| PID       | String | Conditionally mandatory | CCU module ID. This parameter is valid only when the module type is set to <b>CCU</b> . It specifies the module ID of a CCU.  |
| PIDMSU    | String | Conditionally mandatory | MSU module ID. This parameter is valid only when the module type is set to <b>MSU</b> . It specifies the module ID of an MSU. |

| Parameter | Type    | Mandatory               | Description                                                                                                                                                                                                                                                                                                                    |
|-----------|---------|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MN        | String  | Conditionally mandatory | CCU module number.<br>This parameter is valid only when the module type is set to <b>CCU</b> and the CCU module ID is specified. It specifies the module number of a CCU. You can run the <b>LST APP</b> command to query the module number of a CCU.                                                                          |
| BICCTYPE  | String  | Conditionally mandatory | BICC type.<br>This parameter is valid only when the module type is set to <b>CCU</b> and the CCU module ID is set to <b>BICC</b> . It specifies the type of a BICC module.                                                                                                                                                     |
| MSUMN     | String  | Conditionally mandatory | MSU module number.<br>This parameter is valid only when the module type is set to <b>MSU</b> and the MSU module ID is specified. It specifies the module number of an MSU. You can run the <b>LST APP</b> command to query the module number of an MSU.                                                                        |
| ccId      | Integer | No                      | ID of a call center.<br><ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |

## Response Message

Table 12-655 Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                          |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li><b>0100000</b>: success</li> <li>Other values: failure</li> <li>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |

| Parameter     | Type   | Description                                                                                                                                                |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultDesc    | List   | Object list in the returned result after a successful query.<br><br>For details about the parameters of the object, see the following table.               |
| 10.xx.xx.xx#0 | String | <ul style="list-style-type: none"> <li>• <b>10.xx.xx.xx</b>: UAP IP address.</li> <li>• <b>#</b>: fixed separator.</li> <li>• <b>0</b>: UAP ID.</li> </ul> |

**Table 12-656** Parameters of the resultDesc object (Set the module type to CCU, CCU module ID to CCB, and CCU module number to 57.)

| Parameter                    | Type   | Description                                                    |
|------------------------------|--------|----------------------------------------------------------------|
| IDC switch index             | String | Online indication.                                             |
| Null CB number               | String | Number of control blocks in the <b>NULL</b> state.             |
| Booked CB number             | String | Number of busy circuits.                                       |
| Info receiving status number | String | Number of control blocks that are receiving information.       |
| Wait overlap CB number       | String | Number of control blocks in the <b>WAITOVERLAP</b> state.      |
| Overlap transmit number      | String | Number of control blocks in the <b>Overlap transmit</b> state. |
| Call proceeding number       | String | Number of control blocks in the <b>CALLPROCEEDIN</b> state.    |
| Alerting CB number           | String | Number of control blocks in the <b>ALERTING</b> state.         |
| Connection request CB number | String | Number of control blocks that are requesting connections.      |
| Active CB number             | String | Number of active control blocks.                               |
| Release guard CB number      | String | Number of control blocks in the <b>Release guard</b> state.    |
| Release waiting CB number    | String | Number of control blocks that are waiting to be released.      |
| Temply hold CB number        | String | Number of control blocks in the <b>Temply hold</b> state.      |

| Parameter                    | Type   | Description                                                    |
|------------------------------|--------|----------------------------------------------------------------|
| Wait tone CB number          | String | Number of control blocks that are in the waiting tone state.   |
| Null after combine CB number | String | Number of control blocks in the <b>NULLAFTERCOMBINE</b> state. |
| Call park CB number          | String | Number of control blocks in the <b>Call park</b> state.        |

**Table 12-657** Parameters of the resultDesc object (Set the module type to CCU, CCU module ID to INTESS, and CCU module number to 56.)

| Parameter                     | Type   | Description                                                  |
|-------------------------------|--------|--------------------------------------------------------------|
| Last allocated INTESS number  | String | ID of the INtess control block that was allocated last time. |
| Error stat flag               | String | Error cause statistics switch.                               |
| Error stat interval           | String | Error cause statistics period.                               |
| Message statistics flag       | String | Message statistics switch.                                   |
| Message statistics interval   | String | Message statistics period.                                   |
| Message statistics mask       | String | Message statistics mask.                                     |
| Idle CB number                | String | Number of control blocks in the <b>IDLE</b> state.           |
| Overlap CB number             | String | Number of control blocks in the <b>OVERLAP</b> state.        |
| Call delivered CB number      | String | Number of control blocks in the <b>CALLDELIVERED</b> state.  |
| Call present CB number        | String | Number of control blocks in the <b>CALLPRESENT</b> state.    |
| Call received                 | String | Number of control blocks in the <b>CALLRECEIVED</b> state.   |
| Connection request CB number  | String | Number of control blocks in the connection request state.    |
| Active CB number              | String | Number of control blocks in the <b>ACTIVE</b> state.         |
| SPACTIVE CB number            | String | Number of control blocks in the <b>SPACTIVE</b> state.       |
| CB number in INTESS_spy state | String | Number of control blocks in the <b>INTESS_SPY</b> state.     |

| Parameter          | Type   | Description                                           |
|--------------------|--------|-------------------------------------------------------|
| Wait REL CB number | String | Number of control blocks in the <b>WAITREL</b> state. |

**Table 12-658** Parameters of the resultDesc object (Set the module type to MSU, PID to BSI, and MSUMN module number to 472.)

| Parameter                                               | Type   | Description                                                         |
|---------------------------------------------------------|--------|---------------------------------------------------------------------|
| Total number of connections                             | String | Total number of connections.                                        |
| Total no of connection in IDLE state                    | String | Total number of idle connections.                                   |
| Total no of connection in CREATE CONNECT state          | String | Total number of connections that are being created.                 |
| Total no of connection in CONNECT state                 | String | Total number of connected connections.                              |
| Total no of connection in DELETE CONNECT state          | String | Total number of deleted connections.                                |
| Total no of connection in MODIFY CONNECT state          | String | Total number of modified connections.                               |
| Total no of connection having service type as IVR       | String | Total number of IVR business connections.                           |
| Total no of connection having service type as CONF      | String | Total number of conference site business connections.               |
| Total no of connection having service type as CONF CHAN | String | Total number of business connections of conference site channels.   |
| Total no of conf connection in IDLE state               | String | Total number of idle conference site connections.                   |
| Total number of Conf connections                        | String | Total number of conference site connections.                        |
| Total no of conf connection in CREATE CONF state        | String | Total number of conference site connections that are being created. |
| Total no of conf connection in CONF USING state         | String | Total number of conference site connections in use.                 |

| Parameter                                        | Type   | Description                                          |
|--------------------------------------------------|--------|------------------------------------------------------|
| Total no of conf connection in CONF DELETE state | String | Total number of deleted conference site connections. |

## Message Example

### 12.3.6.3 Querying the Registration Status of a Terminal

#### NOTICE

The number of concurrent requests for invoking the interface cannot exceed 10. Otherwise, the interface invoking times out due to deteriorated performance.

## Prerequisites

This interface is invoked only for global AK/SK authentication.

Note: This interface supports only the independent deployment environment.

## Description

This interface is invoked to query the registration status of a terminal.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## Request URL

`https://ip:port/rest/cmsapp/v1/openapi/uap/queryterminalstatus`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-659** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-660** Parameters in the request message body

| Parameter | Type    | Mandatory                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EID       | string  | Yes                                             | <p>It specifies the ID of the multimedia device to be operated.</p> <p>The rules for setting the parameter are as follows:</p> <p>For a multimedia device that adopts the SIP, the value is a string, which generally contains up to 32 digits, for example, 8780001.</p> <p>The asterisk (*) and percent (%) can match zero or multiple characters. For example, <b>6666*</b> and <b>6666%</b> match all character strings starting with <b>6666</b>.</p> <p>The question mark (?) matches only one character. For example, <b>6666?</b> matches only five-character strings starting with <b>6666</b>.</p> <p>The combination of the asterisk (*), question mark (?), and percent sign (%) is supported. For example, <b>%3?</b> matches all character strings whose penultimate character is <b>3</b>.</p> <p><b>NOTICE</b><br/>The number of wildcard matching results must be less than 200. Otherwise, UAP services are affected.</p> |
| limit     | Integer | <b>False</b> and <b>offset</b> appear in pairs. | Query quantity. The default value is <b>100</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Response Message

**Table 12-661** Parameters in the response message body

| Parameter     | Type   | Description                                                                                                                                                                                                                                          |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode    | string | Query result. The options are as follows: <ul style="list-style-type: none"> <li><b>0100000</b>: success</li> <li>Other values: failure</li> <li>For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc    | List   | Object list in the returned result after a successful query.<br>For details about the parameters of the object, see the following table.                                                                                                             |
| 10.xx.xx.xx#1 | String | <ul style="list-style-type: none"> <li><b>10.xx.xx.xx</b>: UAP IP address.</li> <li><b>#</b>: fixed separator.</li> <li><b>1</b>: UAP ID.</li> </ul>                                                                                                 |

**Table 12-662** Parameters of resultDesc

| Parameter | Type    | Description              |
|-----------|---------|--------------------------|
| data      | list    | Data result set.         |
| count     | Integer | Total number of records. |

**Table 12-663** Parameters of data

| Parameter       | Type   | Description                                                                                          |
|-----------------|--------|------------------------------------------------------------------------------------------------------|
| ccuModuleNumber | string | CCU module number.                                                                                   |
| terminationType | string | Terminal type.                                                                                       |
| equipmentId     | string | Equipment ID.                                                                                        |
| registerStatus  | string | Registration status. The value is <b>registered</b> or <b>not register</b> .                         |
| socketStatus    | string | Socket status. The value is <b>fault</b> , <b>normal</b> , <b>connecting</b> , or <b>uninstall</b> . |
| ipAndPort       | string | IP address and port number.                                                                          |
| monitorFlag     | string | Agent status monitoring flag. The value is <b>unstarted</b> or <b>started</b> .                      |
| protocolType    | string | Protocol type.                                                                                       |
| roamIpAndPort   | string | Roaming IP address and port number.                                                                  |
| tlsStatus       | string | TSL status. The value is <b>unconnect</b> , <b>connect</b> , or <b>uninstall</b> .                   |
| ipType          | string | IP address type.                                                                                     |

## Message Example

### 12.3.6.4 Interface for Querying UAP Performance Indicator Statistics

#### Prerequisites

This interface is invoked only for global AK/SK authentication.

Note: This interface supports only the independent deployment environment.

#### Description

This interface is invoked to query UAP performance indicator statistics.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

<https://ip:port/rest/cmsapp/v1/openapi/uap/perfindex>

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the

administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-664** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-665** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | ID of a call center. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| uapIP     | String  | No        | IP address of the UAP.                                                                                                                                                                                                                                                                                                      |
| ofcNo     | Integer | No        | Array of inbound call numbers.                                                                                                                                                                                                                                                                                              |
| beginDate | String  | Yes       | Query start time. The UTC time zone is used. The interval between the start time and end time cannot exceed 31 days (rounded up).                                                                                                                                                                                           |
| endDate   | String  | Yes       | Query end time. The UTC time zone is used.                                                                                                                                                                                                                                                                                  |
| limit     | Integer | No        | This parameter is optional. The default value is <b>100</b> .                                                                                                                                                                                                                                                               |
| offset    | Integer | No        | This parameter is optional. The default value is <b>0</b> .                                                                                                                                                                                                                                                                 |

## Response Message

**Table 12-666** Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                                |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | string | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc | List   | Object list in the returned result after a successful query.<br>For details about the parameters of the object, see the following table.                                                                                                                   |

**Table 12-667** Parameters of resultDesc

| Parameter      | Type    | Description                                                                                                |
|----------------|---------|------------------------------------------------------------------------------------------------------------|
| beginTime      | String  | Statistics start time, which is a timestamp in milliseconds (start time of a 5-minute statistical period). |
| cclId          | Integer | ID of a call center.                                                                                       |
| uaplP          | String  | IP address of the UAP.                                                                                     |
| ofcNo          | Integer | Array of inbound call numbers.                                                                             |
| systemInBound  | Integer | Number of system inbound calls.                                                                            |
| systemInSucc   | Integer | Number of system connected calls.                                                                          |
| systemCallRate | Integer | System call connection rate.                                                                               |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*

- Request parameters

```
{

 "uapIP":"1.1.1.1",
 "ofcNo":[0, 1],
 "beginDate":"2021-09-09 00:00:00",
 "endDate":"2021-09-11 23:00:00",
 "limit":"100",
 "offset":"0"
}
```

- Response parameters

```
{
 "resultCode": 0,
 "resultDesc": {
 "data": [
 {
 "beginTime": "1631594100000",
 "ccld": 1,
 "uapIp": "1.1.1.1",
 "ofcNo": 1,
 "systemInBound": 1,
 "systemInSucc": 1,
 "systemCallRate": 1
 }
],
 "count": 1
 }
}
```

### 12.3.6.5 Interface for Querying UAP Terminal Statistics

#### Prerequisites

This interface is invoked only for global AK/SK authentication.

Note: This interface supports only the independent deployment environment.

#### Scenario

This interface is invoked to query UAP terminal statistics.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip.port/rest/cmsapp/v1/openapi/uap/terminalindex`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values.

In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-668** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-669** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | ID of a call center. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| uapIP     | String  | No        | Array of VDN IDs. The maximum length of the array is 100.                                                                                                                                                                                                                                                                   |
| beginDate | String  | Yes       | Query start time. The UTC time zone is used. The interval between the start time and end time cannot exceed 31 days (rounded up).                                                                                                                                                                                           |
| endDate   | String  | Yes       | Query end time. The UTC time zone is used.                                                                                                                                                                                                                                                                                  |
| limit     | Integer | No        | This parameter is optional. The default value is <b>100</b> .                                                                                                                                                                                                                                                               |
| offset    | Integer | No        | This parameter is optional. The default value is <b>0</b> .                                                                                                                                                                                                                                                                 |

## Response Message

**Table 12-670** Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                                |
|------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0100000</b>: success</li> <li>● Other values: failure</li> <li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li> </ul> |
| resultDesc | List   | Object array in the returned result after a successful query.<br>For details about the parameters of the object in this array, see the following table.                                                                                                    |

**Table 12-671** Parameters of resultDesc

| Parameter        | Type    | Description                                                                                                |
|------------------|---------|------------------------------------------------------------------------------------------------------------|
| beginTime        | String  | Statistics start time, which is a timestamp in milliseconds (start time of a 5-minute statistical period). |
| cclId            | Integer | ID of a call center.                                                                                       |
| uapIp            | String  | IP address of the UAP.                                                                                     |
| agentOnlineCount | Integer | Number of registered softphone clients.                                                                    |

### 12.3.6.6 Interface for Querying CTI System Indicators

#### Prerequisites

This interface is invoked only for global AK/SK authentication.

Note: This interface supports only the independent deployment environment.

#### Description

This interface is invoked to query CTI system indicators.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/cti/sysindex`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-672** Parameters in the request header

| No. | Parameter    | Type   | Mandatory | Description                                                    |
|-----|--------------|--------|-----------|----------------------------------------------------------------|
| 1   | Content-Type | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> . |

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-673** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                                                                                                                                                                                                                                                                 |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cclId     | Integer | No        | ID of a call center. <ul style="list-style-type: none"> <li>In the independent deployment environment, the default value is the value of <b>Default Call Center ID</b> on the <b>Configuration Center &gt; System Management &gt; Parameter Settings</b> page after a system administrator signs in to the AICC.</li> </ul> |
| vdn       | list    | No        | Array of VDN IDs. The maximum length of the array is 100.                                                                                                                                                                                                                                                                   |
| beginDate | String  | Yes       | Query start time. The UTC time zone is used. The interval between the start time and end time cannot exceed 31 days (rounded up).                                                                                                                                                                                           |
| endDate   | String  | Yes       | Query end time. The UTC time zone is used.                                                                                                                                                                                                                                                                                  |
| limit     | Integer | No        | This parameter is optional. The default value is <b>100</b> .                                                                                                                                                                                                                                                               |
| offset    | Integer | No        | This parameter is optional. The default value is <b>0</b> .                                                                                                                                                                                                                                                                 |

## Response Message

**Table 12-674** Parameters in the response message body

| Parameter  | Type   | Description                                                                                                                                                                                                                                            |
|------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultCode | string | Query result. The options are as follows: <ul style="list-style-type: none"><li>● <b>0100000</b>: success</li><li>● Other values: failure</li><li>● For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a>.</li></ul> |
| resultDesc | List   | Object list in the returned result after a successful query.<br>For details about the parameters of the object, see the following table.                                                                                                               |

**Table 12-675** Parameters of resultDesc

| Parameter       | Type    | Description                                                                                                |
|-----------------|---------|------------------------------------------------------------------------------------------------------------|
| beginTime       | String  | Statistics start time, which is a timestamp in milliseconds (start time of a 5-minute statistical period). |
| cclId           | Integer | ID of a call center.                                                                                       |
| vdn             | Integer | ID of a VDN.                                                                                               |
| onlineAgentNums | Integer | Number of online agents (including agents who do not answer inbound calls).                                |
| talkingNums     | Integer | Number of talking agents (excluding the agents who do not answer inbound calls).                           |
| ideaAgentNum    | Integer | Number of idle agents (excluding agents who do not answer inbound calls).                                  |
| busyNums        | Integer | Number of agents who indicate busy (excluding the number of agents who do not answer inbound calls).       |

| Parameter   | Type    | Description                                                                          |
|-------------|---------|--------------------------------------------------------------------------------------|
| restNums    | Integer | Number of agents who take a rest (excluding agents who do not answer inbound calls). |
| incallNums  | Integer | Number of inbound calls within five minutes.                                         |
| rateNum     | Integer | Number of manual inbound calls connected within 5 minutes.                           |
| callRate    | Integer | Manual inbound call connection rate within 5 minutes.                                |
| callOutNums | Integer | Number of outbound calls within five minutes.                                        |

## Message Example

 }
}
```

### 12.3.6.7 Querying the Time of the CTI Platform Server

#### Scenario

This interface is invoked to query the time of the CTI platform server. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/queryctiservertime

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/configures/ctiservertime

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-676** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-677** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                              |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> . |

## Response Description

**Table 12-678** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 12.3.6.8 Querying the Current License Usage in the System

#### Scenario

This interface is invoked to query the current license usage in the system. (CTI 3.6 does not support this interface.)

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interface

BMS interface: /ccbms/ws/monitor/querysystemlicensestatus

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/configures/querysystemlicensestatus

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-679** Parameters in the request header

| No. | Parameter     | Value Type | Mandatory | Description                                                                                                                                            |
|-----|---------------|------------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | The value is fixed at <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-680** Parameters in the request message body

| No. | Parameter | Value Type | Mandatory | Description                                                              |
|-----|-----------|------------|-----------|--------------------------------------------------------------------------|
| 1   | cclId     | Integer    | Yes       | ID of a call center.<br>The value ranges from <b>1</b> to <b>65535</b> . |

## Response Description

**Table 12-681** Parameters in the response message body

| No. | Parameter   | Value Type | Description                                                                                                                                                                                                                                                                                                                                                            |
|-----|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | result      | String     | Query result. ## 12.3.7 Checking Cluster Health Status

### Description

This interface is invoked by a third-party system to check whether the CC-CMS runs properly.

### Interface Method

The request method must be set to POST. This interface supports only the POST method.

### URL

`https://ip:port/rest/cmsapp/v1/ping`

In a public cloud environment, *ip* indicates the IP address of the CC-CMS server, and *port* indicates the HTTPS port number of the CC-CMS server. Contact the administrator to obtain the values. In a non-public cloud environment where the NSLB service is configured, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

### Request Description

**Table 12-683** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | True      | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | True      | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 12-684** Parameters in the message body

| Parameter             | Type   | Mandatory | Description                                                                                           |
|-----------------------|--------|-----------|-------------------------------------------------------------------------------------------------------|
| say (can be modified) | Object | True      | Request packet. The code does not process the packet and writes it back to the response message body. |

## Response Description

**Table 12-685** If the response code is **200**, it indicates that the CMS runs properly. The following table describes the parameters in the response message.

| Parameter | Type   | Description                                                      |
|-----------|--------|------------------------------------------------------------------|
| status    | String | If the response is successful, <b>UP</b> is returned.            |
| request   | Object | Input parameter object returned when the response is successful. |

## Message Example

- Request header  
Content-Type: application/json;charset=UTF-8  
Authorization: \*\*\*\*\*
- Request parameters  
{  
  "say": "Hello world!"  
}
- Response parameters  
{  
  "request": {  
    "say": "Hello world!"  
  },  
  "status": "UP"  
}

## 12.3.8 Appendix

### 12.3.8.1 Indicator Code Reference

### 12.3.8.1.1 Skill Queue Monitoring Indicators

**Table 12-686** Historical monitoring indicators of skill queues

| Code                                                                                                                                                                                                                                                                                               | Indicat<br>or<br>Name                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_SKILL_REQUEST                                                                                                                                                                                                                                                                            | Number of manual inbound call requests           | Number of times that an inbound call requests the manual service. The number increases in the following cases: <ul style="list-style-type: none"> <li>• Inbound calls allocated to agents. (An inbound call that is transferred to an agent is counted repeatedly.)</li> <li>• Inbound call hangs up while queuing. (If a call is transferred from the current queue to another queue, the call is counted only once.)</li> </ul>                                                                                                                                                                                                                                |
| IDX_COUNT_SKILL_INCOMING_CALL<br><br><b>NOTE</b><br>IDX_COUNT_SKILL_INCOMING_CALL is a new indicator in AICC 22.100.0. For the interfaces for obtaining historical monitoring indicators of skills in a specified date and month, data in versions earlier than AICC 22.100.0 cannot be collected. | Number of manual inbound call requests           | Both <b>IDX_COUNT_SKILL_INCOMING_CALL</b> and <b>IDX_COUNT_SKILL_REQUEST</b> collect statistics on the number of manual inbound calls, but their statistics logic is different. <b>IDX_COUNT_SKILL_INCOMING_CALL</b> collects statistics only on the number of manual inbound calls in voice skill queues.<br><br>The number increases in the following cases: <ul style="list-style-type: none"> <li>• If an inbound call has been allocated to a skill queue, the number of skill queues to which the inbound call is first allocated increases by 1, and other skill queues to which the inbound call is transferred subsequently are not counted.</li> </ul> |
| IDX_COUNT_SKILL_CONNECTED                                                                                                                                                                                                                                                                          | Number of connected manual inbound call requests | Number of calls queuing in a skill queue and answered by agents in this skill queue or calls transferred to other skill queues and answered by agents in those skill queues. The duration of a call with an agent must be greater than 0.                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Code                               | Indicator Name                                             | Description                                                                                                                             |
|------------------------------------|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_SKILL_ABANDON            | Number of lost manual inbound call requests                | Number of lost manual inbound call requests = Number of manual inbound call requests – Number of connected manual inbound call requests |
| IDX_COUNT_SKILL_USER_ABANDON       | Number of abandoned manual inbound calls                   | Number of calls proactively abandoned by users during queuing and ringing.                                                              |
| IDX_COUNT_SKILL_AGENT_ABANDON      | Number of manual inbound calls hung up by agents           | Number of calls proactively hung up by agents during ringing.                                                                           |
| IDX_COUNT_SKILL_QUEUE_DISCONNECTED | Number of manual inbound calls that are released in queues | Number of times that calls are disconnected by the CTI platform when the calls are queuing.                                             |
| IDX_COUNT_SKILL_SYSTEM_LOST        | Number of interrupted manual inbound calls on the platform | Number of platform interruptions caused by reasons such as agent response timeout.                                                      |

| Code                           | Indicator Name                                                                 | Description                                                                                                                                                     |
|--------------------------------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_SKILL_LOST_RING      | Number of manual inbound calls that are not answered                           | Number of calls that are not answered after being allocated to agents. For the calls, the answer duration is greater than 0 and the conversation duration is 0. |
| IDX_COUNT_SKILL_TIME_OUT_QUEUE | Number of manual inbound calls that are transferred to a queue due to timeout  | Number of calls transferred from the original skill queue to other skill queues due to queuing timeout.                                                         |
| IDX_COUNT_SKILL_TIME_OUT_AGENT | Number of manual inbound calls that are transferred to an agent due to timeout | Number of calls transferred from the original skill queue to other agents due to queuing timeout.                                                               |
| IDX_COUNT_SKILL_OVERFLOW_QUEUE | Number of manual inbound calls that are transferred to a queue due to overflow | Number of calls transferred from the original skill queue to other queues due to overflow.                                                                      |

| Code                                | Indicator Name                                                                  | Description                                                                                                                                                                                 |
|-------------------------------------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_SKILL_OVER_AGENT          | Number of manual inbound calls that are transferred to an agent due to overflow | Number of calls transferred from the original skill queue to other agents due to overflow.                                                                                                  |
| IDX_COUNT_SKILL_CONNECTED_IN_(N)    | Number of calls connected manually within <i>N</i> seconds                      | The value of <i>N</i> can be <b>3, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, or 60</b> .                                                                                                   |
| IDX_COUNT_SKILL_ABANDON_IN_(N)      | Number of calls abandoned manually within <i>N</i> seconds                      | The value of <i>N</i> can be <b>3, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, or 60</b> . Query by minute is not supported (that is, the input parameter cannot contain <b>timeGrain</b> ). |
| IDX_COUNT_SKILL_CONNECTED_AFTER_(N) | Number of calls connected after <i>N</i> seconds                                | The value of <i>N</i> can be <b>3, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, or 60</b> . Query by minute is not supported (that is, the input parameter cannot contain <b>timeGrain</b> ). |
| IDX_COUNT_SKILL_ABANDON_AFTER_(N)   | Number of calls abandoned manually after <i>N</i> seconds                       | The value of <i>N</i> can be <b>3, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, or 60</b> . Query by minute is not supported (that is, the input parameter cannot contain <b>timeGrain</b> ). |

| Code                                      | Indicator Name                                                | Description                                                                    |
|-------------------------------------------|---------------------------------------------------------------|--------------------------------------------------------------------------------|
| IDX_COUNT_SKILL_USER_ABANDON_QUEUE        | Number of abandoned manual inbound calls during queuing       | Number of calls proactively abandoned by users during queuing.                 |
| IDX_COUNT_SKILL_USER_ABANDON_AGENT        | Number of abandoned manual inbound calls during ringing       | Number of calls proactively abandoned by users during ringing.                 |
| IDX_COUNT_SKILL_WAIT_FAIL_CONNECTED_QUEUE | Number of Waits for Lost Calls                                | Number of waits for lost calls on queue devices.                               |
| IDX_COUNT_SKILL_TIMEOUT_IVR               | Number of Calls Transferred to the IVR Due to Queuing Timeout | Number of calls that are transferred to IVR due to queuing timeout.            |
| IDX_COUNT_SKILL_OVERFLOW_IVR              | Number of Calls Transferred to IVR Due to Queue Overflow      | Number of times that a user transfers a call to the IVR in the queue overflow. |

| Code                             | Indicator Name                                         | Description                                                                                                                                                                                                                                                                                                             |
|----------------------------------|--------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_RATE_SKILL_CONNECTED         | Connected manual inbound call requests (%)             | Percentage of the number of connected manual inbound calls to the number of manual inbound call requests. This indicator shows the call processing capability of a skill queue.                                                                                                                                         |
| IDX_RATE_SKILL_ABANDON           | Lost manual inbound call requests (%)                  | Lost manual inbound call requests (%) = 100% - Connected manual inbound call requests (%). This indicator shows the percentage of calls that are abandoned when they are waiting to be answered. A high call loss rate indicates poor service quality. In this case, improve the agent usage, and add queues or agents. |
| IDX_RATE_SKILL_RING_CONNECT      | Manual inbound call answer rate (%)                    | Ringing rate of manual inbound answered calls = Number of ringing times of answered calls/Total number of ringing times                                                                                                                                                                                                 |
| IDX_DURATION_SKILL_AVG_CONNECTED | Average duration of connected manual inbound calls (s) | Average voice call duration. Average duration of connected manual inbound calls = Duration of connected manual inbound calls/Number of connected manual inbound calls                                                                                                                                                   |
| IDX_DURATION_SKILL_CONNECTED     | Manual inbound call duration (s)                       | Total voice call duration.                                                                                                                                                                                                                                                                                              |
| IDX_DURATION_SKILL_AVG_QUEUE_ACK | Average waiting duration of manual inbound calls (s)   | Average waiting duration of voice calls. This indicator shows the average waiting duration (queuing and ring duration) of all calls.                                                                                                                                                                                    |

| Code                                   | Indicator Name                                                                   | Description                                                                   |
|----------------------------------------|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| IDX_DURATION_SKILL_AVG_CONNECTED_ACK   | Average ring duration of connected manual inbound calls (s)                      | Average ring duration of all connected calls in a queue.                      |
| IDX_DURATION_SKILL_AVG_ABANDON_ACK     | Average ring duration of lost manual inbound calls (s)                           | Average ring duration of all unanswered calls.                                |
| IDX_DURATION_SKILL_AVG_CONNECTED_QUEUE | Average queueing duration of connected manual inbound calls (s)                  | Average queueing duration of all connected calls in a queue.                  |
| IDX_DURATION_SKILL_AVG_ABANDON_QUEUE   | Average queueing duration (s) of manual inbound calls connected but not answered | Average queueing duration of all calls connected but not answered in a queue. |

| Code                                  | Indicator Name                                                        | Description                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| IDX_DURATION_SKILL_MAX_QUEUE_ACK      | Maximum waiting duration of manual inbound calls (s)                  | This indicator shows the maximum waiting duration (queuing and ring duration) of all calls. |
| IDX_DURATION_SKILL_MIN_QUEUE_ACK      | Minimum waiting duration of manual inbound calls (s)                  | This indicator shows the minimum waiting duration (queuing and ring duration) of all calls. |
| IDX_DURATION_SKILL_USER_ABANDON_QUEUE | Queuing duration (s) of a call hung up by a user in the queue         | Queuing duration when a user hangs up in a queue.                                           |
| IDX_DURATION_SKILL_USER_ABANDON_AGENT | Waiting duration (s) of a call hung up by a user during agent ringing | Waiting duration for a user to hang up a call when the phone rings (queuing and ringing).   |
| IDX_DURATION_SKILL_ABANDON_QUEUE      | Ring Duration of Lost Calls (s)                                       | Queuing duration of all calls connected but not answered in a queue.                        |

| Code                                            | Indicator Name                     | Description                                               |
|-------------------------------------------------|------------------------------------|-----------------------------------------------------------|
| IDX_DURATION_SKILL_ABANDON_ACK                  | Queuing Duration of Lost Calls (s) | Ring duration of all unanswered calls.                    |
| IDX_DURATION_SKILL_WAIT_SUCCESS_CONNECTED_QUEUE | Waiting Duration Before Connection | Waiting duration of calls in a skill queue.               |
| IDX_DURATION_SKILL_SUCCESS_ACK                  | Ringing Duration Before Connection | Ringing duration of all calls connected in a skill queue. |
| IDX_DURATION_SKILL_ALL_ACK                      | Total Ringing Durations            | Ringing duration of calls in a skill queue.               |
| IDX_DURATION_SKILL_ALL_QUEUE                    | Total queuing duration             | Total queuing duration of calls in a skill queue.         |

 **NOTE**

All indicators that are used to query data by minute or on the current day (the input parameter does not contain **timeGrain**) in [Table 12-686](#) are real-time indicators.

**Table 12-687** Real-time monitoring indicators of skill queues

| Code                        | Indicator Name                  | Description                      |
|-----------------------------|---------------------------------|----------------------------------|
| IDX_COUNT_REAL_SKILL_QUEUE  | Number of queuing calls         | Number of queuing calls.         |
| IDX_COUNT_REAL_SKILL_HANDLE | Number of calls being processed | Number of calls being processed. |

| Code                             | Indicator Name                                                | Description                                                    |
|----------------------------------|---------------------------------------------------------------|----------------------------------------------------------------|
| IDX_DURATION_SKILL_MAX_QUEUE_ACK | Maximum waiting duration in a queue                           | Maximum waiting duration in a queue.                           |
| IDX_COUNT_20S_CALL_FOR_5MIN      | Number of calls connected in 20 seconds in the last 5 minutes | Number of calls connected in 20 seconds in the last 5 minutes. |
| IDX_COUNT_REAL_AGENT_SIGN_IN     | Number of sign-in agents                                      | Number of sign-in agents.                                      |
| IDX_COUNT_REAL_AGENT_CONNECT     | Number of agents in talking state                             | Number of agents in talking state.                             |
| IDX_COUNT_REAL_AGENT_SET_IDLE    | Number of agents in idle state                                | Number of agents in idle state.                                |
| IDX_COUNT_REAL_AGENT_USABLE      | Number of available agents                                    | Number of available agents.                                    |
| IDX_COUNT_REAL_AGENT_SET_BUSY    | Number of agents in busy state                                | Number of agents in busy state.                                |
| IDX_COUNT_REAL_AGENT_ACW         | Number of agents in wrap-up state                             | Number of agents in wrap-up state.                             |
| IDX_COUNT_REAL_AGENT_REST        | Number of agents in rest state                                | Number of agents in rest state.                                |
| IDX_COUNT_REAL_AGENT_STUDY       | Number of agents in learning state                            | Number of agents in learning state.                            |

**Table 12-688** Customized indicator of a skill queue

| Code                      | Indicator Name                                 | Description                    |
|---------------------------|------------------------------------------------|--------------------------------|
| IDX_SKILL_RESERVED_COL(N) | Customized indicator <i>N</i> of a skill queue | The value ranges from 1 to 20. |

### 12.3.8.1.2 Agent Monitoring Indicators

**Table 12-689** Historical agent monitoring indicators

| Code                      | Indicator Name                      | Description                                                                                                                                                                                          |
|---------------------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_AGENT_SIGN_IN   | Number of sign-in times             | Number of agent sign-in times.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.       |
| IDX_COUNT_AGENT_CONNECTED | Number of inbound calls             | Number of manual inbound calls.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators.          |
| IDX_COUNT_AGENT_CALL_OUT  | Number of outbound calls            | Number of outbound calls.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators.                |
| IDX_COUNT_AGENT_COLLATION | Number of wrap-up times after calls | Number of wrap-up times after calls.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators. |

| Code                               | Indicator Name                                      | Description                                                                                                                                                                                                             |
|------------------------------------|-----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_AGENT_COLLATION_CALL_IN  | Number of wrap-up times after inbound calls         | Number of wrap-up times after inbound calls.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.            |
| IDX_COUNT_AGENT_COLLATION_CALL_OUT | Number of wrap-up times after outbound calls        | Number of wrap-up times after outbound calls.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.           |
| IDX_COUNT_AGENT_REST               | Number of times that an agent enters the rest state | Number of times that an agent enters the rest state.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.    |
| IDX_COUNT_AGENT_HOLD               | Number of hold times                                | Number of times that an agent holds a call.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.             |
| IDX_COUNT_AGENT_SET_BUSY           | Number of times that an agent enters the busy state | Number of times that an agent enters the busy state.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.    |
| IDX_COUNT_AGENT_MOVE_INSIDE        | Number of internal transfers                        | Number of times that an agent transfers internal calls.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators. |

| Code                                | Indicator Name                                                              | Description                                                                                                                                                                                                                                  |
|-------------------------------------|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_AGENT_MOVE_OUT            | Number of transfer-out times                                                | Number of calls that an agent transfers out.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.                                 |
| IDX_COUNT_AGENT_MOVE_IVR            | Number of calls that an agent transfers to the IVR in hang-up transfer mode | Number of calls that an agent transfers to the IVR in hang-up transfer mode.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators. |
| IDX_COUNT_AGENT_3WC                 | Number of three-party call times                                            | Number of times that an agent performs three-party conversations.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.            |
| IDX_COUNT_AGENT_INSIDE_CALL         | Number of internal calls                                                    | Number of internal calls that an agent makes.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.                                |
| IDX_COUNT_AGENT_INSIDE_HELP_SEEKING | Number of internal help requests                                            | Number of times that an agent initiates internal help requests.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are non-real-time indicators.              |
| IDX_COUNT_AGENT_REQUEST             | Number of requests                                                          | Number of manual inbound call requests.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators.                                          |

| Code                          | Indicator Name                                                                | Description                                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_AGENT_ABA<br>NDON   | Number of<br>lost calls                                                       | Number of lost manual inbound<br>calls.<br><br>Indicators that are used to query<br>data by minute or on the current<br>day (the input parameters do not<br>contain <b>timeGrain</b> ) are real-time<br>indicators.                                               |
| IDX_COUNT_AGENT_WAI<br>T_ANS  | Number of<br>calls to be<br>answered after<br>ringing                         | Number of manual inbound calls<br>to be answered after ringing.<br><br>Indicators that are used to query<br>data by minute or on the current<br>day (the input parameters do not<br>contain <b>timeGrain</b> ) are real-time<br>indicators.                       |
| IDX_COUNT_AGENT_LOST<br>_RING | Number of<br>calls that are<br>not answered<br>after ringing                  | Number of manual inbound calls<br>that are not answered after<br>ringing.<br><br>Indicators that are used to query<br>data by minute or on the current<br>day (the input parameters do not<br>contain <b>timeGrain</b> ) are real-time<br>indicators.             |
| IDX_COUNT_AGENT_NO_<br>ACK    | Number of<br>calls that are<br>not answered<br>by an agent<br>for a long time | Number of manual inbound calls<br>that are not answered by agents<br>for a long time.<br><br>Indicators that are used to query<br>data by minute or on the current<br>day (the input parameters do not<br>contain <b>timeGrain</b> ) are real-time<br>indicators. |
| IDX_COUNT_AGENT_HAN<br>G_UP   | Number of<br>hang-up calls<br>(in answering<br>state)                         | Number of hang-up manual<br>inbound calls when they are<br>answered by agents.<br><br>Indicators that are used to query<br>data by minute or on the current<br>day (the input parameters do not<br>contain <b>timeGrain</b> ) are real-time<br>indicators.        |

| Code                                       | Indicator Name                                             | Description                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_AGENT_CONNECTED_IN_(N)           | Number of calls connected manually within <i>N</i> seconds | The value of <i>N</i> can be <b>3, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, or 60</b> . Query by minute is not supported (that is, the input parameters do not contain <b>timeGrain</b> ).<br><br>Indicators that are used to query data on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators. |
| IDX_COUNT_TOTAL_AGENT_CALL_OUT             | Total number of outbound calls                             | Total number of outbound calls, including the number of connected outbound calls and the number of failed outbound calls.<br><br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators.                                                       |

| IDX_DURATION_IVR_ONLY_INBOUND             | Total duration of inbound calls that are connected using only the IVR, in seconds | Query by minute is supported.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators. |
| IDX_COUNT_SYSTEM_INBOUND                  | Number of inbound calls on the platform                                           | Query by minute is supported.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators. |
| IDX_COUNT_SYSTEM_IN_SUCC                  | Number of connected calls on the platform                                         | Query by minute is supported.<br>Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators. |

| Code                     | Indicator Name                                   | Description                                                                                                                                                                            |
|--------------------------|--------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX_COUNT_AGENT_ASSIGNED | Number of manual connected calls on the platform | Query by minute is supported. Indicators that are used to query data by minute or on the current day (the input parameters do not contain <b>timeGrain</b> ) are real-time indicators. |

**Table 12-693** describes the real-time monitoring indicators by VDN.

**Table 12-693** VDN real-time monitoring indicator codes (unavailable in CTI 3.6)

| Code                          | Indicator Name                    | Description |
|-------------------------------|-----------------------------------|-------------|
| IDX_COUNT_REAL_VDN_CONNECT    | Number of VDN connected calls     | -           |
| IDX_COUNT_REAL_VDN_CALL       | Number of VDN calls               | -           |
| IDX_COUNT_REAL_IVR_HANDLE     | Number of calls processed by IVR  | -           |
| IDX_COUNT_REAL_SKILL_QUEUE    | Number of queuing calls           | -           |
| IDX_COUNT_REAL_AGENT_SIGN_IN  | Number of sign-in agents          | -           |
| IDX_COUNT_REAL_AGENT_SET_IDLE | Number of agents in idle state    | -           |
| IDX_COUNT_REAL_AGENT_SET_BUSY | Number of agents in busy state    | -           |
| IDX_COUNT_REAL_AGENT_CONNECT  | Number of agents in talking state | -           |

| Code                                 | Indicator Name                          | Description |
|--------------------------------------|-----------------------------------------|-------------|
| IDX_COUNT_REAL_A<br>GENT_STUDY       | Number of agents in learning state      | -           |
| IDX_COUNT_REAL_A<br>GENT_ACW         | Number of agents in wrap-up state       | -           |
| IDX_COUNT_REAL_A<br>GENT_ANSWER      | Number of agents in answering state     | -           |
| IDX_COUNT_REAL_A<br>GENT_PREOCCUPY   | Number of preoccupied agents            | -           |
| IDX_COUNT_REAL_A<br>GENT_OCCUPY      | Number of occupied agents               | -           |
| IDX_COUNT_REAL_A<br>GENT_NOT_SIGN_IN | Number of agents who have not signed in | -           |
| IDX_COUNT_REAL_A<br>GENT_REST        | Number of agents in rest state          | -           |

### 12.3.8.1.4 IVR Monitoring Indicators

**Table 12-694** IVR historical monitoring indicator codes

| Code                                | Indicator Name                        | Description                   |
|-------------------------------------|---------------------------------------|-------------------------------|
| IDX_COUNT_IVR_INB<br>OUND_CALL      | Number of IVR inbound call requests   | Query by minute is supported. |
| IDX_COUNT_IVR_INB<br>OUND_CONNECTED | Number of connected IVR inbound calls | Query by minute is supported. |

| Code                             | Indicator Name                          | Description                   |
|----------------------------------|-----------------------------------------|-------------------------------|
| IDX_COUNT_IVR_ABANDONED_CALL     | Number of lost IVR calls                | Query by minute is supported. |
| IDX_COUNT_IVR_INBOUND_FLOWOUT    | Number of transferred IVR inbound calls | Query by minute is supported. |
| IDX_COUNT_IVR_INBOUND_USER_ABORT | Number of released IVR inbound calls    | Query by minute is supported. |
| IDX_RATE_IVR_INBOUND_CONNECTED   | IVR inbound call connection rate        | Query by minute is supported. |
| IDX_DURATION_AVG_IVR_CONNECTED   | Average IVR call duration               | Query by minute is supported. |
| IDX_COUNT_IVR_TO_AGENT           | Number of IVR-to-manual calls           | Query by minute is supported. |

 NOTE

All indicators that are used to query data by minute or on the current day (the input parameter does not contain **timeGrain**) in [Table 12-694](#) are real-time indicators.

### 12.3.8.2 Error Code Reference

When an error is reported during interface invoking, the values of **resultCode** and **resultDesc** are returned. The following is an example:

```
{
 "resultCode": "0100002",
 "resultDesc": "Invalid parameter"
}
```

| Error Code | Description                            |
|------------|----------------------------------------|
| 0100000    | The interface is invoked successfully. |
| 0100001    | The interface fails to be invoked.     |

| Error Code | Description                                                                            |
|------------|----------------------------------------------------------------------------------------|
| 0100002    | The parameter is invalid.                                                              |
| 0100003    | The current interface supports only CTI V300R008. The current CTI version is V300R006. |
| 0100999    | Unknown error.                                                                         |
| 0101001    | The inspection relationship interface is abnormal.                                     |
| 0101002    | The number to be queried does not exist on the UAP.                                    |
| 0101003    | Insufficient permission.                                                               |

### 12.3.8.3 CTI Platform Agent Status Code Reference

| No. | Description    |
|-----|----------------|
| 0   | Not signed in. |
| 1   | Idle.          |
| 2   | Preoccupied.   |
| 3   | Occupied.      |
| 4   | Answering.     |
| 5   | Talking.       |
| 6   | Working.       |
| 7   | Showing busy.  |
| 8   | Rest           |
| 9   | Study          |
| 10  | Adjusting.     |

### 12.3.8.4 Description of Call Media Types

#### Media Type

Table 12-695 Media Type

| ID | Media Type      | Description |
|----|-----------------|-------------|
| 1  | MEDIA_TYPE_CHAT | Text chat   |

| ID | Media Type                       | Description                          |
|----|----------------------------------|--------------------------------------|
| 2  | MEDIA_TYPE_WEBPHONE              | click-to-dial                        |
| 3  | MEDIA_TYPE_ESCORT                | Escorted browsing and form sharing   |
| 4  | MEDIA_TYPE_CALLBACK              | Callback request call                |
| 5  | MEDIA_TYPE_PHONE                 | Common voice call                    |
| 6  | MEDIA_TYPE_EMAIL                 | Email call                           |
| 7  | MEDIA_TYPE_FAX                   | Fax call                             |
| 8  | MEDIA_TYPE_VIDEO                 | IP video call (H.323)                |
| 9  | MEDIA_TYPE_WB                    | Electronic white board               |
| 10 | MEDIA_TYPE_APP_SHARE             | Application sharing                  |
| 11 | MEDIA_TYPE_FILE_TRANSFER         | File transfer                        |
| 12 | MEDIA_TYPE_VIDEO_2B1D            | 2B+D ISDN video call                 |
| 13 | MEDIA_TYPE_VIDEO_6B1D            | 6B+D ISDN video call                 |
| 14 | MEDIA_TYPE_OPS                   | OPS call                             |
| 15 | MEDIA_TYPE_PREDICT_OUTBOUND      | Predict dialing                      |
| 16 | MEDIA_TYPE_PREVIEW_OUTBOUND      | Preview dialing                      |
| 17 | MEDIA_TYPE_MSG                   | Message media                        |
| 18 | MEDIA_TYPE_WEBPHONE_VIDEO        | Video click-to-dial                  |
| 19 | MEDIA_TYPE_PHONE_VIDEO           | Video call                           |
| 20 | MEDIA_TYPE_WEB_LEAVE_MESSAGE     | Non-real-time call                   |
| 21 | MEDIA_TYPE_DESKTOP_SHARE         | Desktop Sharing Media Type           |
| 22 | MEDIA_TYPE_VC_CALL               | Calling number in a skill queue      |
| 23 | CLASSIC_MEDIA_TYPE_NUM           | Total number of contact media types. |
| 50 | MEDIA_TYPE_MULTI_MEDIA_EMAILCHAT | E-mail chat                          |
| 51 | MEDIA_TYPE_MULTI_MEDIA_WEBCHAT   | Internet Chat                        |
| 52 | MEDIA_TYPE_MULTI_MEDIA_SMSCHAT   | SMS chat                             |

| ID | Media Type                        | Description |
|----|-----------------------------------|-------------|
| 53 | MEDIA_TYPE_MULTI_MEDIA_SOCIALCHAT | Text chat   |
| 54 | MEDIA_TYPE_MULTI_MEDIA_FAXCHAT    | Fax chat    |
| 55 | MEDIA_TYPE_MULTI_MEDIA_H5CHAT     | H5 video    |

### 12.3.8.5 Description of Call Submedia Types

**Table 12-696** Call submedia types (corresponding to call media type No. 53)

| No. | Submedia Type            | Description        |
|-----|--------------------------|--------------------|
| 1   | SUB_MEDIA_TYPE_WEB       | Web                |
| 2   | SUB_MEDIA_TYPE_WHATSAPP  | WhatsApp           |
| 3   | SUB_MEDIA_TYPE_LINE      | LINE               |
| 4   | SUB_MEDIA_TYPE_WECHAT    | WeChat             |
| 5   | SUB_MEDIA_TYPE_FACEBOOK  | FaceBook Messenger |
| 6   | SUB_MEDIA_TYPE_TWITTER   | Twitter            |
| 7   | SUB_MEDIA_TYPE_5GMESSAGE | 5G message         |
| 8   | SUB_MEDIA_TYPE_EMAIL     | Email              |
| 9   | SUB_MEDIA_TYPE_SMS       | SMS                |

### 12.3.8.6 Description of Call Types

#### Call Type

**Table 12-697** Call Type

| ID | Call Type      | Description          |
|----|----------------|----------------------|
| 0  | SP_CALL_NORMAL | Normal incoming call |
| 5  | SP_CALL_LONG   | Incoming toll call   |

| ID | Call Type            | Description                                                                                                                                                                                                                  |
|----|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6  | INTER_CALL           | Internal call<br>It refers to a call made by an agent to another agent. An internal call cannot be forwarded, or muted.                                                                                                      |
| 7  | SP_CALL_OUT          | Normal outgoing call<br>It refers to an outgoing call made by agents.                                                                                                                                                        |
| 8  | OP_CALL_OUT          | Agent outgoing call type                                                                                                                                                                                                     |
| 9  | OP_PRI_OUT           | Outgoing call in the PRI mode                                                                                                                                                                                                |
| 10 | IVR_CALL_OUT         | Outgoing call through IVR                                                                                                                                                                                                    |
| 11 | SELF_CALLOUT         | Outgoing call made by a Phone agent                                                                                                                                                                                          |
| 12 | IVR_PRI_CALL         | Outgoing call in the PRI mode through IVR                                                                                                                                                                                    |
| 13 | NIRC_CALL_IN         | Incoming call to a networked call center                                                                                                                                                                                     |
| 14 | NIRC_CALL_OUT        | Outgoing call of a networked call center                                                                                                                                                                                     |
| 15 | NIRC_SPY_CALL_IN     | QC incoming call to a networked call center                                                                                                                                                                                  |
| 16 | NIRC_SPY_CALL_OUT    | QC outgoing call of a networked call center                                                                                                                                                                                  |
| 17 | NIRC_INTER_CALL_IN   | Internal incoming network call to a virtual agent                                                                                                                                                                            |
| 18 | NIRC_INTER_CALL_OUT  | Internal outgoing network call of a virtual agent                                                                                                                                                                            |
| 20 | ICD_SP_OPS_AIDERCALL | Aid call                                                                                                                                                                                                                     |
| 21 | ICD_SP_OPS_INCALL    | Incoming call (international agent)                                                                                                                                                                                          |
| 22 | ICD_SP_OPS_PASSCALL  | Relay call                                                                                                                                                                                                                   |
| 23 | ICD_SP_OPS_GIVECALL  | Outgoing call (international agent)                                                                                                                                                                                          |
| 40 | OUTBOUND_CALL_OUT    | Ordering an outgoing call<br>The system queries the reserved outgoing call database regularly. After obtaining the reserved calls whose time is earlier than the current computer time, the system forcibly makes the calls. |

| ID | Call Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                              |
|----|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 41 | ICD_SP_OUTBO<br>UND_PRE_OCC<br>UPY     | Pre-occupied an outgoing call<br>The system occupies an idle agent and then makes an outgoing call. If making the outgoing call succeeds, the idle agent handles the call.                                                                                                                                                                                                                               |
| 42 | ICD_SP_OUTBO<br>UND_PRE_CON<br>NECT    | Pre-connecting an outgoing call<br>The system makes an outgoing call to a user. If making the call succeeds, the system connects the call to an agent when the phone of the user rings.                                                                                                                                                                                                                  |
| 43 | ICD_SP_OUTBO<br>UND_VIRTUAL_<br>CALLIN | Virtual incoming and outgoing calls<br>The system makes an outgoing call to a user. If making the call succeeds, the system connects the call to an agent after the user hooks off.                                                                                                                                                                                                                      |
| 44 | ICD_SP_OUTBO<br>UND_PREVIEW            | Previewing an outgoing call<br>It refers to a call that is made by an agent after the agent previews the outgoing call information.                                                                                                                                                                                                                                                                      |
| 45 | ICD_SP_OUTBO<br>UND_CALLBAC<br>K       | Callback request<br>If a Web user needs to contact a call center when browsing Web pages on Internet, the Web user can use the callback request service. An agent in the call center then dials the phone number specified by the Web user.<br>After the call is connected, the web user follows the voice instruction of the agent and at the same time enjoy other services such as escorted browsing. |
| 46 | ICD_SP_IDD                             | International incoming toll call                                                                                                                                                                                                                                                                                                                                                                         |
| 50 | ICD_SP_CBRT_C<br>ALL                   | RBT call                                                                                                                                                                                                                                                                                                                                                                                                 |
| 51 | ICD_SP_INTERN<br>AL_TWO_HELP           | Two-party help call<br>When answering an incoming call, an agent can ask for internal help. In the case of a two-party help, the call of the customer is held, and the agent talks with the asked-for-help agent.                                                                                                                                                                                        |
| 52 | ICD_SP_INTERN<br>AL_THREE_HEL<br>P     | Three-party help call<br>When answering an incoming call, an agent can ask for internal help. In the case of a three-party help, the customer, agent, and asked-for-help agent can talk with each other. In the case of a two-party help, a three-party help can be initiated to form a three-party conversation.                                                                                        |

| ID | Call Type                                           | Description                                         |

### 12.3.8.7 Description of Agent Types

#### Agent Type

Table 12-698 Agent Type

| Value | Agent Type                | Description                                      |
|-------|---------------------------|--------------------------------------------------|
| 0     | AGENT_TYPE_EXTENSION      | Extension                                        |
| 1     | AGENT_TYPE_USERLINE       | User line                                        |
| 3     | AGENT_TYPE_SINGLE_PHONE   | Single and non-permanently-connected phone agent |
| 4     | AGENT_TYPE_PC_PHONE       | PC+Phone agent                                   |
| 5     | AGENT_TYPE_ISDN_2BD       | 2B+D agent                                       |
| 6     | AGENT_TYPE_ISDN_6BD       | 6B+D agent                                       |
| 7     | AGENT_TYPE_1B1D_PHONE     | Phone agent                                      |
| 8     | AGENT_TYPE_MANAGER        | Configuration management agent                   |
| 9     | AGENT_TYPE_NB1D           | nB+D agent                                       |
| 10    | AGENT_TYPE_NET            | Network agent                                    |
| 11    | AGENT_TYPE_PC_PHONE_VIDEO | PC+Phone video agent                             |

| Value | Agent Type                        | Description              |
|-------|-----------------------------------|--------------------------|
| 12    | AGENT_TYPE_SINGLE_PHONE_VI<br>DEO | Single phone video agent |
| 12    | AGENT_TYPE_SINGLE_PHONE_VI<br>DEO | Single phone video agent |

### 12.3.8.8 Call Features

**Table 12-699** Call features

| Value | Description                                                    |
|-------|----------------------------------------------------------------|
| 0     | Call from a common customer                                    |
| 1     | Call from an agent                                             |
| 2     | Toll call from a customer                                      |
| 3     | Routing initiated after the CTI receives a routed network call |
| 4     | International inbound toll call                                |
| 40    | Reserved outbound call                                         |
| 41    | Preoccupied outbound call                                      |
| 42    | Pre-connected outbound call                                    |
| 43    | Virtual inbound or outbound call                               |
| 44    | Previewed outbound call                                        |
| 45    | Callback request                                               |
| 51    | Internal help call                                             |

### 12.3.8.9 Reasons for Leaving the Device of the Call

**Table 12-700** Reasons for leaving the device of the call

| Cause code | Description                     |
|------------|---------------------------------|
| 0          | Normal access/transfer.         |
| 1          | Overflow transfer.              |
| 2          | Timeout transfer.               |
| 3          | Transfer on no agent.           |
| 4          | Transfer on queue cancellation. |

| Cause code | Description                                                           |
|------------|-----------------------------------------------------------------------|
| 5          | Transfer because the agent does not answer the call.                  |
| 6          | Resume a suspended call.                                              |
| 7          | Connecting a held call.                                               |
| 8          | Three-party help.                                                     |
| 9          | Picking a held call.                                                  |
| 10         | Three-party conversation.                                             |
| 11         | The party requesting internal help releases the call.                 |
| 12         | The call is intercepted.                                              |
| 13         | The call is picked up.                                                |
| 14         | The analysis of the called is not configured.                         |
| 15         | The user releases the call.                                           |
| 16         | The agent releases the call.                                          |
| 17         | The call is transferred out.                                          |
| 18         | The call is held.                                                     |
| 19         | An internal processing error occurs.                                  |
| 20         | The called party is busy.                                             |
| 22         | The mobile phone is switched off.                                     |
| 23         | The mobile phone is out of the service area.                          |
| 24         | The called number does not exist.                                     |
| 25         | The ACD cannot distribute any resources for the call.                 |
| 26         | The user does not answer the call.                                    |
| 27         | The called party rejects the call.                                    |
| 28         | The call is successfully transferred to a skill queue.                |
| 29         | The three-party conversation is transferred to a skill queue.         |
| 30         | Transferring the call in the success transfer mode times out.         |
| 31         | Transferring the three-party conversation to a skill queue times out. |

| Cause code | Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------|
| 34         | If call timeout or queuing on busy or overflow occurs, the network call fails.                                    |
| 35         | The network call is directed to its original call center for queuing.                                             |
| 36         | The queued call is re-routed.                                                                                     |
| 37         | The call accesses the CDN through call routing.                                                                   |
| 38         | The call accesses the CDN through agent consultation.                                                             |
| 39         | The CDN properly returns a routing result.                                                                        |
| 40         | CDN routing times out.                                                                                            |
| 41         | An agent cancels the consultation call, or the routing fails.                                                     |
| 42         | The call accesses the PGR because CDN routing times out.                                                          |
| 43         | The call is properly returned by the CDN and is routed to the PGR.                                                |
| 44         | The call accesses the PGR through inbound routing.                                                                |
| 45         | The call accesses the PGR through agent consultation.                                                             |
| 46         | The agent is unreachable. The CDN reroutes the call.                                                              |
| 47         | The call is waiting in multiple queues.                                                                           |
| 48         | The primary-queue call is answered by numbers in the secondary queue.                                             |
| 50         | The agent rejects the call.                                                                                       |
| 51         | A user call joins in a conference call.                                                                           |
| 52         | A conference chairperson proactively releases a conference, or the conference is released due to a CCS exception. |
| 53         | The participant is removed from the conference.                                                                   |
| 54         | The call is transferred when the call completion rate is less than the threshold.                                 |
| 88         | After the agent answers the call, the user hangs up.                                                              |

| Cause code | Description                                          |
|------------|------------------------------------------------------|
| 89         | After the agent answers the call, the user hangs up. |

### 12.3.8.10 Cause Code

| Cause Code | Description                                                                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 80         | When a call is queuing in a skill queue, the call is transferred to the IVR flow for voice playback and digit collection. If a customer presses the cancel key, the flow uses this error code to request canceling the call queuing. |
| 256        | CCIVR/IVR normal call release.                                                                                                                                                                                                       |
| 263        | The CCIVR/IVR disconnects a call because of connection failure.                                                                                                                                                                      |
| 338        | The CCIVR/IVR disconnects a call because no flow can be found or an error occurs when parsing flows.                                                                                                                                 |
| 339        | The CCIVR/IVR disconnects a call because there is no sufficient control blocks.                                                                                                                                                      |
| 340        | The CCIVR/IVR disconnects a call because the MRF script type is incorrect.                                                                                                                                                           |
| 342        | The CCIVR/IVR disconnects a call because the conference name is incorrect (possibly too long).                                                                                                                                       |
| 346        | The CCIVR/IVR disconnects a call because waiting for the called party to pick up the phone times out after the CTIServer returns a call to the called party.                                                                         |
| 350        | The CCIVR/IVR disconnects a call because waiting for the business module to pick up the phone times out.                                                                                                                             |
| 354        | The CCIVR/IVR disconnects a call because the handshake with the CTIServer times out.                                                                                                                                                 |
| 356        | The CCIVR/IVR disconnects a call because the CCIVR outgoing call times out.                                                                                                                                                          |
| 357        | The CCIVR/IVR disconnects a call because the IVR fails to connect the calling party and called party.                                                                                                                                |
| 359        | The CCIVR/IVR disconnects a call because the maximum conversation duration is exceeded.                                                                                                                                              |
| 360        | The CCIVR/IVR disconnects a call because of other errors. For details, see the logs.                                                                                                                                                 |

| Cause Code | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 501        | Default call release cause. The cause could be any of the following:<br>1. The routing result from the CCS is not received after a call accesses the platform. As a result, the call is disconnected.<br>2. After a call accesses the IVR, a flow disconnects the call.                                                                                                                                                                                                                                                                                                      |
| 502        | The platform disconnects an outgoing call because waiting for the ringing of the ACD times out or waiting for call answer times out.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 503        | The platform disconnects a call because the handshake between the platform control block and ACD times out after the call is established between the ACD and the platform.                                                                                                                                                                                                                                                                                                                                                                                                   |
| 505        | The cause could be any of the following:<br>1. When a call is transferred back to the agent console after the agent console transfers the call to the IVR in suspension transfer mode, the agent console times out in responding to the suspension resuming message. As a result, the platform disconnects the call.<br>2. When a call is transferred back to the IVR after the IVR transfers the call to the agent console in suspension transfer mode, the IVR times out in responding to the suspension resuming message. As a result, the platform disconnects the call. |
| 506        | After an agent transfers a call to the IVR in suspension transfer mode, waiting for the CCS to return the routing result times out.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 507        | After a non-agent device transfers a call to the IVR in suspension transfer mode, waiting for the CCS to return the routing result times out.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 508        | When a call is transferred, waiting for the CCS DO_FORWARD times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 509        | When an internal call is successfully transferred, waiting for the CCS FORWARD_COMMIT times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 510        | When the platform initiates an outgoing call, waiting for the ACD SETUP_ACK message times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 511        | When the platform initiates an outgoing call, waiting for the CCS OCCUPY_ACK message times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 512        | A call is released because the number of calls waiting in a skill queue exceeds the maximum limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 513        | A call is released because the number of calls waiting in a skill queue exceeds the maximum limit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 514        | When a call is transferred from an agent to an automatic flow, waiting for the automatic flow to respond times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 515        | During call transfer, waiting for the transfer destination device to respond times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Cause Code | Description                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 516        | Waiting for the routing response from the CCS times out.                                                                                                       |
| 517        | Waiting for the ringing or response from the destination device times out.                                                                                     |
| 518        | The client disconnects a call.                                                                                                                                 |
| 519        | When a call is transferred in suspension mode, the address sent by the CCS to DO_FORWARD is incorrect.                                                         |
| 520        | When a call is transferred in suspension mode, the address sent by the CCS to DO_FORWARD is incorrect.                                                         |
| 521        | An agent initiates call redirection (a call is disconnected and transferred out).                                                                              |
| 522        | An automatic flow initiates call redirection (a call is disconnected and transferred out).                                                                     |
| 523        | When the platform initiates an outgoing call, the CCS returns a device occupation failure message.                                                             |
| 525        | The destination address in the routing result returned by the CCS is incorrect.                                                                                |
| 526        | The CCS returns a routing failure message.                                                                                                                     |
| 528        | During outgoing call preview, the CCS returns a failure message.                                                                                               |
| 529        | After a flow transfers a call to an agent in suspension mode, if the agent hangs up and transfers the call back to the IVR, the IVR returns a failure message. |
| 530        | The IVR initiates call combination.                                                                                                                            |
| 531        | A call is normally disconnected in the ACD.                                                                                                                    |
| 533        | When a flow transfers a call to another flow, the flow releases the call before ringing.                                                                       |
| 534        | When the CTIServer is disconnected from an ACD module, all the calls of the ACD module are released.                                                           |
| 535        | The CCS returns a routing failure message.                                                                                                                     |
| 536        | When a customer cancels queuing, the platform releases the call.                                                                                               |
| 537        | A call is disconnected in the ACD because the called party is busy.                                                                                            |
| 538        | A call is disconnected in the ACD because the called number does not exist.                                                                                    |
| 539        | A call is released after the CCS is switched.                                                                                                                  |
| 540        | A call is released after voice playing.                                                                                                                        |

| Cause Code | Description                                                                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 541        | A call is transferred in suspension mode to a device. After the destination device processes the call, and the call is returned to the suspension device, the CCS returns the RESUME_ACK error message.     |
| 542        | A call is transferred in suspension mode to a device. After the destination device processes and releases the call, the CCS returns the HUNG_RELEASE_ACK error message.                                     |
| 543        | A call is transferred in suspension mode to a device. After the destination device processes the call, waiting for the CCS to send RESUME_ACK to notify the suspension device of call resumption times out. |
| 544        | A call is transferred in suspension mode to a device. After the destination device processes and releases the call, waiting for the CCS to return the release result HUNG_RELEASE_ACK times out.            |
| 547        | When a call is transferred, the re-routing result returned by the CCS is not a virtual device, but the transfer indication address sent by the CCS is a virtual device.                                     |
| 548        | A call is disconnected in the ACD because the mobile phone of the called party is powered off.                                                                                                              |
| 549        | A call is disconnected in the ACD because the called party is out of the service area.                                                                                                                      |
| 550        | When a network call is transferred in suspension mode, after the destination device processes and releases the call, the CCS returns an error.                                                              |
| 551        | A call is disconnected in the ACD for another reason.                                                                                                                                                       |
| 552        | During a network call, the peer call center is abnormal.                                                                                                                                                    |
| 553        | During a network call, the destination call center times out in waiting for the network incoming call from the ACD.                                                                                         |
| 561        | A call is released due to queue overflow.                                                                                                                                                                   |
| 562        | No agent is on duty.                                                                                                                                                                                        |
| 564        | The number of concurrent calls exceeds the configured limit.                                                                                                                                                |
| 565        | The total number of automatic calls exceeds the limit.                                                                                                                                                      |
| 566        | The number of concurrent calls in the flow exceeds the maximum.                                                                                                                                             |
| 567        | The called number cannot be found.                                                                                                                                                                          |
| 568        | The customer level is incorrect.                                                                                                                                                                            |
| 601        | The ACD disconnects a call because the calling party hangs up before the call is answered.                                                                                                                  |

| Cause Code | Description                                                                                                                                                                                                                                 |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 602        | The ACD disconnects a call because no resource is available.                                                                                                                                                                                |
| 603        | The ACD disconnects a call because the called party does not answer the call.                                                                                                                                                               |
| 604        | The ACD disconnects a call because the called party rejects the call.                                                                                                                                                                       |
| 605        | The ACD disconnects a call because the line is busy.                                                                                                                                                                                        |
| 606        | The ACD disconnects a call because the call times out.                                                                                                                                                                                      |
| 607        | The ACD disconnects a call because the mail box is full or suspended. For details, see the UAP original call release code 5.                                                                                                                |
| 608        | The ACD disconnects a call because emails cannot be created for calls. For details, see the UAP original call release code 6.                                                                                                               |
| 609        | The ACD disconnects a call because the channel is reset.                                                                                                                                                                                    |
| 610        | The ACD disconnects a call because of abnormal UAP resource operations.                                                                                                                                                                     |
| 611        | The ACD disconnects a call because the Cp conference is faulty.                                                                                                                                                                             |
| 612        | The ACD disconnects a call because the Intess control block is faulty.                                                                                                                                                                      |
| 613~619    | The ACD disconnects a call.                                                                                                                                                                                                                 |
| 714        | Internal routing fails because IVR resources are occupied or no IVR access code is registered.                                                                                                                                              |
| 732        | The cause could be any of the following:<br>1. During a conference call, a participant is removed from the conference.<br>2. During a conference call, the conference moderator proactively releases the conference or the CCS is abnormal. |
| 852        | The client disconnects and rejects a call.                                                                                                                                                                                                  |
| 853        | A call is released because an agent does not answer the call for a long time.                                                                                                                                                               |
| 1057       | Failed to route the message leaving call.                                                                                                                                                                                                   |
| 1058       | Waiting for the routing result of the message leaving call times out.                                                                                                                                                                       |
| 1059       | Waiting of a message leaving call for the queuing message times out.                                                                                                                                                                        |
| 1060       | Waiting for an agent to answer a message leaving call times out.                                                                                                                                                                            |
| 1061       | The release of a message leaving call times out.                                                                                                                                                                                            |
| 1062       | The internal message leaving call times out.                                                                                                                                                                                                |

| Cause Code | Description                                                         |
|------------|---------------------------------------------------------------------|
| 1063       | The handshake of the message leaving call times out.                |
| 1064       | Failed to create the conference.                                    |
| 1065       | Conference creation times out.                                      |
| 1066       | Failed to join the conference.                                      |
| 1067       | Querying the enterprise ID times out.                               |
| 1068       | Failed to query the enterprise ID.                                  |
| 1069       | The value of <b>EnterPriseID</b> is empty.                          |
| 1070       | Querying conference information times out.                          |
| 1071       | Failed to query conference information.                             |
| 1072       | Obtaining conference data times out.                                |
| 1073       | Failed to obtain conference data.                                   |
| 1074       | Conference detection times out.                                     |
| 1075       | The number of participants in the conference is less than expected. |
| 1076       | Releasing the conference times out.                                 |
| 1077       | The call duration reaches the maximum.                              |

### 12.3.8.11 Device Types

Table 12-701 Device type

| Device type ID | Device type                                    |
|----------------|------------------------------------------------|
| 1              | Skill queue                                    |
| 2              | Agent                                          |
| 3              | IVR service flow                               |
| 5              | Call                                           |
| 7              | Temporary routing device                       |
| 8              | Virtual device                                 |
| 10             | CDN device                                     |
| 11             | MELCAS device                                  |
| 14             | PGR (default CDN route controlled by the SCAI) |

| Device type ID | Device type     |
|----------------|-----------------|
| 15             | Conference call |

### 12.3.8.12 Agent Operation Types

Table 12-702 Types of operations

| Operation Type                                                                                                                                                                                                                                         | Description | Operation Object | Operation Reason |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|------------------|------------------|
| <b>NOTE</b> <ul style="list-style-type: none"><li>In the following, - filled in the operation object and reason columns indicates that the corresponding operation does not write the agent operation bill.</li><li>US_NO_USE= 0xFFFF; 65535</li></ul> |             |                  |                  |

| Operation Type | Description                    | Operation Object | Operation Reason                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Bills are generated every five minutes starting from 00:00 to 23:55.</li> <li>0: The agent fully exits the conversation status.</li> </ul> <p><b>NOTE</b><br/>The conversation status covers all call types.<br/>Whether to record the conversation status bills is controlled by the license.</p> |

### 12.3.8.13 Interfaces of Earlier Versions (Versions Earlier Than 8.13.0)

 **NOTE**

The interfaces provided in CEC 8.13.0 or later have better performance than those described in this section. Therefore, the interfaces in this section are not recommended in CEC 8.13.0 or later.

#### 12.3.8.13.1 Querying Details of a Specified Agent

##### Description

This interface is invoked to query details of a specified agent.

##### Request Method

The request method must be set to POST. This interface supports only the POST method.

##### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/siteagentinfobyagentids

##### Request URL

https://ip:port/rest/cmsapp/v1/openapi/agentgroup/agentbyworkno

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-703** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

- Message header  
Content-Type:application/json; charset=UTF-8
- Message body  
The following provides an example of the request message body of this interface:

```
{
 "queryParam":
 {
 "ccId":1,
 "vdn":1,
 "agentId":101
 }
}
```

[Table 12-479](#) describes the parameters in the request message body of this interface.

**Table 12-704** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                               |
|-----------|---------|-----------|-----------------------------------------------------------|
| ccId      | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |
| agentId   | Integer | Yes       | Agent ID.<br>The value ranges from 101 to 59999.          |

## Response Message

The following provides an example of the response message body of this interface:

```
{
 "result": "0",
 "resultDatas": {
 "workno": 101,
 "vdnid": 1,
 "citStatus": 0,
 "name": "HW35154101",
 "phonenumber": null,
 "logindate": 4294967295000,
 "currentstatetime": 436879,
 "mediatype": 0,
 "status": 2
 }
}
```

**Table 12-480** describes the parameters in the response message body of this interface.

**Table 12-705** Parameters in the message body

| Parameter   | Type   | Description                                                                                                                                                                                                                                |
|-------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDatas | Object | Object in the returned result after a successful query. For details about the parameters of this object, see <a href="#">Table 12-481</a> .                                                                                                |

**Table 12-706** Parameters of resultDatas

| Parameter | Type    | Description                                                                                                       |
|-----------|---------|-------------------------------------------------------------------------------------------------------------------|
| workno    | Integer | Agent ID.                                                                                                         |
| vdnid     | Integer | ID of the VDN to which a call belongs.                                                                            |
| citStatus | Integer | Platform status of an agent. For details, see <a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> . |

| Parameter        | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name             | String  | Agent name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| logindate        | Long    | Sign-in time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| currentstatetime | Long    | Duration in the current state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| mediatype        | Integer | Agent media type. For details, see <a href="#">Table 12-695</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| status           | Integer | Agent status. The options are as follows:<br><b>0:</b> Whether the SGSN and MME are integrated is unknown. The value corresponds to status <b>9</b> on the CTT platform.<br><b>2:</b> sign-out The value corresponds to status <b>0</b> on the CTT platform.<br><b>3:</b> busy The value corresponds to status <b>7</b> on the CTI platform.<br><b>4:</b> idle The value corresponds to status <b>1</b> on the CTT platform.<br><b>5:</b> wrap-up The value corresponds to status <b>6</b> on the CTT platform.<br><b>7:</b> calling state. The value corresponds to states <b>2, 3, 4, and 5</b> on the CTT platform.<br><b>8:</b> rest The value corresponds to status <b>8</b> on the CTT platform. |

### 12.3.8.13.2 Querying System Status by Agent

#### Description

This interface is invoked to query system status by agent.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/teamagentstatusinfo

## Request URL

https://ip:port/rest/cmsapp/v1/openapi/querymonitor/systemstate

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-707** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

- Message header  
Content-Type:application/json; charset=UTF-8
- Message body  
The following provides an example of the request message body of this interface:

```
{
 "queryParam":
 {
 "cclId":1,
 "vdn":1
 }
}
```

**Table 12-493** describes the parameters in the request message body of this interface.

**Table 12-708** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                               |
|-----------|---------|-----------|-----------------------------------------------------------|
| cclId     | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Message

The following provides an example of the response message body of this interface:

```
{
 "result": "0",
 "resultDesc": {
 "busyagent": 0,
 "talkingnum": 0,
 "idleagent": 0,
 "totalloginagent": 0
 }
}
```

[Table 12-494](#) describes the parameters in the response message body of this interface.

**Table 12-709** Parameters in the message body

| Parameter   | Type   | Description                                                                                                                                                                                                                         |
|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDatas | Object | Object in the returned result after a successful query. For details about the parameters of this object, see <a href="#">Table 12-495</a> .                                                                                         |

**Table 12-710** Parameters of resultDatas

| Parameter       | Type    | Description                        |
|-----------------|---------|------------------------------------|
| busyagent       | Integer | Number of busy agents.             |
| talkingnum      | Integer | Number of agents in talking state. |
| idleagent       | Integer | Number of idle agents.             |
| totalloginagent | Integer | Number of sign-in agents.          |

### 12.3.8.13.3 Querying the Agent Information in Rest State

#### Description

This interface is invoked to query agent information in rest state.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interfaces:

- /ccbms/ws/monitor/teamrestinfo
- /ccbms/ws/monitor/teamrestagentinfo

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/agentgroup/agentrestinfo

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

Table 12-711 Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

- Message header  
Content-Type:application/json; charset=UTF-8
- Message body

The following provides an example of the request message body of this interface:

```
{
 "queryParam":
 {
 "cclid":1,
 "vdn":1
 }
}
```

```
}
}
```

**Table 12-484** describes the parameters in the request message body of this interface.

**Table 12-712** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                               |
|-----------|---------|-----------|-----------------------------------------------------------|
| cclId     | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |

## Response Message

The following provides an example of the response message body of this interface:

```
{
 "result": "0",
 "resultDatas":
 {
 "allowrestnum": 101,
 "onrestnum": 1,
 "waitrestnum": 0,
 "agentsrestdetails":
 {[
 "agentname": "z1",
 "workno":55001
 "cantrestreason":1
 "begintime":2345
 "restduration":22333
]}
 }
}
```

**Table 12-485** describes the parameters in the response message body of this interface.

**Table 12-713** Parameters in the message body

| Parameter | Type   | Description                                                                                                                                                                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result    | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |

| Parameter   | Type   | Description                                                                                                                                    |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------|
| resultDatas | Object | Object in the returned result after a successful query.<br>For details about the parameters of this object, see <a href="#">Table 12-486</a> . |

**Table 12-714** Parameters of resultDatas

| Parameter         | Type    | Description                                                                                                                                     |
|-------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| allowrestnum      | Integer | Number of agents who are allowed to have a rest but still at work.                                                                              |
| onrestnum         | Integer | Number of agents that are resting.                                                                                                              |
| waitrestnum       | Integer | Number of agents who apply for rest.                                                                                                            |
| agentsrestdetails | Array   | List of details about agents who take a rest in the VDN.<br>For details about the parameters of this object, see <a href="#">Table 12-487</a> . |

**Table 12-715** Parameters of agentsrestdetails

| Parameter      | Type    | Description                                                                                                                                                                                                             |
|----------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agentname      | String  | Agent name.                                                                                                                                                                                                             |
| workno         | Integer | Agent ID.                                                                                                                                                                                                               |
| cantrestreason | Integer | Reason why agents are not allowed to have a rest. This parameter is valid only for the agents who wait for a rest.<br>For details about the parameters of this object, see <a href="#">Table 12-716</a> .               |
| begintime      | Long    | Start time. For resting agents, this parameter indicates the rest start time. For agents who are not in rest, this parameter indicates the requested or approved rest start time. The value is in the timestamp format. |
| restduration   | Long    | Requested rest duration, in seconds.                                                                                                                                                                                    |

**Table 12-716** Reason for not allowing rest

| Value of the Reason for Not Allowing Rest | Description                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------|
| 0                                         | The agent is waiting for approval.                                                                   |
| 1                                         | The agent is in busy state.                                                                          |
| 2                                         | The number of agents who can take a rest in the VDN reaches the maximum.                             |
| 3                                         | The agent does not answer any inbound calls, because the agent does not sign in to any skill queues. |
| 4                                         | The number of resting agents in a skill queue the agent signs in reaches the maximum.                |

#### 12.3.8.13.4 Querying Statistics Details of Skill Queues in Batches

##### Description

This interface is invoked to query statistics details of skill queues in batches.

##### NOTE

- To invoke this interface in the integration environment, set **ccld** of the call center to **1**.

##### Interface Method

The request method must be set to POST. This interface supports only the POST method.

##### Internal Encapsulation Interfaces

BMS interfaces:

- `/ccbms/ws/monitor/querycurrentcallstatinfo`
- `/ccbms/ws/monitor/queryStatInfoOfEverySkill`

##### Request URL

`https://ip:port/rest/cmsapp/v1/openapi/realindex/skill/stateinfo`

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

## Request Description

**Table 12-717** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

- Message header  
Content-Type:application/json; charset=UTF-8
- Message body  
The following provides an example of the request message body of this interface:

```
{
 "queryParam":
 {
 "cclid":1,
 "vdn":1,
 "skillIds":[1,2]
 }
}
```

[Table 12-422](#) describes the parameters in the request message body of this interface.

**Table 12-718** Parameters in the request message body

| Parameter | Type    | Mandatory | Description                                                                             |
|-----------|---------|-----------|-----------------------------------------------------------------------------------------|
| cclid     | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535.                               |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.                                        |
| skillIds  | Array   | Yes       | Object array of skill queue ID information.<br>The array cannot exceed 1000 characters. |

## Response Message

The following provides an example of the response message body of this interface:

```

**Table 12-719** Parameters in the response message body

| Parameter | Type   | Description                                                                                                                                                                                                                                |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result    | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>● <b>0</b>: success</li> <li>● Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |

| Parameter   | Type  | Description                                                                                                                                                       |
|-------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| resultDatas | Array | Object array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-424</a> . |

**Table 12-720** Parameters of resultDatas

| Parameter           | Type    | Description                                                                                                                             |
|---------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------|
| skillId             | Integer | Skill queue ID.                                                                                                                         |
| agentLoginNums      | Integer | Number of sign-in agents.                                                                                                               |
| agentTalkingNums    | Integer | Number of agents in talking state.                                                                                                      |
| agentIdleNums       | Integer | Number of idle agents.                                                                                                                  |
| agentAvailableNums  | Integer | Number of available agents. The value may be different from the number of idle agents when an agent can have one-to-many conversations. |
| agentSetbusyNums    | Integer | Number of agents in busy state.                                                                                                         |
| agentRestNums       | Integer | Number of agents in rest state.                                                                                                         |
| agentMaxIdleTimeIn5 | Integer | Maximum idle duration of agents in 5 minutes.                                                                                           |
| agentWorkNums       | Integer | Number of agents in wrap-up state.                                                                                                      |
| agentStudyNums      | Integer | Number of agents in learning state.                                                                                                     |
| agentOccupyNums     | Integer | Number of agents in occupied state.                                                                                                     |
| agentPreOccupyNums  | Integer | Number of preoccupied agents.                                                                                                           |
| totalCallNums       | Integer | Total number of processed calls, including the calls that are being processed.                                                          |
| processingCallNums  | Integer | Number of calls that are being processed.                                                                                               |
| maxCallWaitTimeIn5  | Integer | Maximum time that a call can wait in 5 minutes.                                                                                         |
| callWaitNums        | Integer | Number of queuing calls (number of calls that are waiting).                                                                             |

| Parameter       | Type    | Description                                 |
|-----------------|---------|---------------------------------------------|
| evenCallTimeIn5 | Integer | Average call duration in 5 minutes.         |
| evenWaitTimeIn5 | Integer | Average call waiting duration in 5 minutes. |

### 12.3.8.13.5 Querying Details About Agents in Configured Skill Queues

#### Description

This interface is invoked to query details about agents in configured skill queues.

#### Request Method

The request method must be set to POST. This interface supports only the POST method.

#### Internal Encapsulation Interfaces

BMS interface: /ccbms/ws/monitor/agentstatusinfo

#### Request URL

https://ip:port/rest/cmsapp/v1/openapi/agentgroup/agentbyconfiguredskill

In the URL, *ip* indicates the IP address of the NSLB server, and *port* indicates the HTTPS port number of the CC-CMS service mapped on the NSLB server.

#### Request Description

**Table 12-721** Parameters in the request header

| No. | Parameter     | Type   | Mandatory | Description                                                                                                                                            |
|-----|---------------|--------|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String | Yes       | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String | Yes       | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

- Message header  
Content-Type:application/json; charset=UTF-8
- Message body

The following provides an example of the request message body of this interface:

```
{
 "queryParam":
 {
 "ccld":1,
 "vdn":1,
 "skillld":1
 }
}
```

**Table 12-440** describes the parameters in the request message body of this interface.

**Table 12-722** Parameters in the message body

| Parameter | Type    | Mandatory | Description                                               |
|-----------|---------|-----------|-----------------------------------------------------------|
| ccld      | Integer | Yes       | ID of a call center.<br>The value ranges from 1 to 65535. |
| vdn       | Integer | Yes       | ID of a VDN.<br>The value ranges from 1 to 5000.          |
| skillld   | Integer | Yes       | Skill queue ID.<br>The value ranges from 1 to 2000.       |

## Response Message

The following provides an example of the response message body of this interface:

```
{
 "result": "0",
 "resultDatas": [{
 "workno": 20011,
 "name": "20011",
 "status": 4,
 "ctiStatus": 1,
 "groupid": 1,
 "mediatype": 1,
 "vdnid": 1,
 "phonenum": "70942",
 "currentstatetime": 1505,
 "logindate": 1501125758000
 }]
}
```

**Table 12-441** describes the parameters in the message body of this interface.

**Table 12-723** Parameters in the message body

| Parameter   | Type   | Description                                                                                                                                                                                                                         |
|-------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result      | String | Query result. The options are as follows: <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: failure</li> </ul> For details about the failure causes, see <a href="#">12.3.8.2 Error Code Reference</a> . |
| resultDatas | Array  | Array in the returned result after a successful query.<br>For details about the parameters of this object in the array, see <a href="#">Table 12-442</a> .                                                                          |

**Table 12-724** Parameters of resultDatas

| Parameter        | Type    | Description                                                                                                 |
|------------------|---------|-------------------------------------------------------------------------------------------------------------|
| workno           | Integer | Agent ID.                                                                                                   |
| name             | String  | Agent name.                                                                                                 |
| status           | Integer | Agent status. For details, see <a href="#">Table 12-725</a> .                                               |
| ctiStatus        | Integer | Agent platform status. For details, see <a href="#">12.3.8.3 CTI Platform Agent Status Code Reference</a> . |
| groupid          | Integer | Agent group ID.                                                                                             |
| mediatype        | Integer | Agent media type. For details, see <a href="#">Table 12-695</a> .                                           |
| vdnid            | Integer | ID of the VDN to which a call belongs.                                                                      |
| phonenummer      | String  | Agent phone number.                                                                                         |
| currentstatetime | Long    | Duration in the current state.                                                                              |
| logindate        | Long    | Sign-in time.                                                                                               |

**Table 12-725** Agent status

| Value | Description                                                                                |
|-------|--------------------------------------------------------------------------------------------|
| 0     | Unknown. The value corresponds to status <b>9</b> on the CTI platform.                     |
| 2     | An exception occurs when the interface is invoked.                                         |
| 3     | Showing busy. The value corresponds to status <b>7</b> on the CTI platform.                |
| 4     | Idle. The value corresponds to status <b>1</b> on the CTI platform.                        |
| 5     | Wrap-up. The value corresponds to status <b>6</b> on the CTI platform.                     |
| 7     | Talking. The value corresponds to states <b>2, 3, 4,</b> and <b>5</b> on the CTI platform. |
| 8     | Rest. The value corresponds to status <b>8</b> on the CTI platform.                        |

# 13 Recording and CDR Interface Reference

---

[13.1 Recording](#)

[13.2 CDR Download and Recording Playback and Download](#)

## 13.1 Recording

### 13.1.1 Recording Playback

 **NOTE**

Currently, video calls are not supported.

#### 13.1.1.1 Starting Playing an Announcement

##### Prerequisites

- The agent has signed in.
- The agent is not in a call.

##### Description

This interface is used to start playing an announcement to an agent. (The agent's sign-in number receives a call. After the call is connected, the system plays the recording.)

 **NOTE**

Any recording file can be played by using this interface. Therefore, use this interface with caution in secondary development.

##### Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

## URI

https://ip:port/agentgateway/resource/recordplay/{agentid}/play

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-1** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

beginPlay

## Request Description

- Message header

**Table 13-2** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body

**Table 13-3** Parameters in the message body

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                               |
|-----|--------------|------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | voicepath    | string     | Yes                | File path. The value can contain a maximum of 100 characters.                                                                                             |
| 2   | startpostion | long       | No                 | Start position of the file to be played, in seconds.                                                                                                      |
| 3   | volumechange | string     | No                 | Playback volume. The default value is <b>50</b> . A maximum of five digits are allowed.                                                                   |
| 4   | speedchange  | string     | No                 | Playback speed. The default value is <b>50</b> . A maximum of five digits are allowed.                                                                    |
| 5   | times        | int        | No                 | Number of playback times. The default value is <b>1</b> .<br><b>NOTE</b><br>If this parameter is set to other values, the default value <b>1</b> is used. |
| 6   | codeformat   | int        | No                 | File coding format. The default value is <b>0</b> , which is the only value supported.                                                                    |
| 7   | locationId   | int        | No                 | ID of a distributed call center node.<br>The value of <b>locationId</b> is returned for a recording start event obtained through the polling interface.   |

## Response Description

**Table 13-4** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentMediaEvent\_Play
- AgentMediaEvent\_Play\_Succ
- AgentMediaEvent\_Play\_Fail
- AgentMediaEvent\_StopPlayDone

## Error Code

- 100-006
- 100-007
- 500-007

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "voicepath": "Y:/1/0/20180621/105/1406470.V3",
 "startpostion": 0,
 "volumechange": 20,
 "speedchange": 20,
 "times": 1,
 "codeformat": 0,
 "locationId": -1
}
```
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 13.1.1.2 Pausing an Announcement

#### Prerequisites

- The agent has signed in.
- The agent is not in a call.
- The agent is playing an announcement.

#### Description

This interface is used to pause an announcement.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

<https://ip:port/agentgateway/resource/recordplay/{agentid}/pauseplay>

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-5** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

### 13.1.1.3 Resuming an Announcement

#### Prerequisites

- The agent has signed in.
- The agent is not in a call.
- The agent has paused an announcement.

#### Description

This interface is used to resume an announcement for an agent.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/recordplay/{agentid}/resumeplay

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-8** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

resumePlay

## Request Description

- Message header

**Table 13-9** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 13-10** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentMediaEvent\_ResumePlayDone

## Error Code

- 100-006
- 100-007
- 500-005

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 13.1.1.4 Fast Forwarding

#### Prerequisites

- The agent has signed in.
- The agent is playing an announcement.

#### Description

This interface is used to fast forward the playback of a recorded file.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/recordplay/{agentid}/forefast/{time}

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-11** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                               |
|-----|-----------|-----------|--------------------|---------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                             |
| 2   | time      | string    | Yes                | Fast-forward duration, in seconds. The value ranges from 0 to 2147483647. |

## Method Name in Logs

foreFastPlay

## Request Description

- Message header

**Table 13-12** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Guid      | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 13-13** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentMediaEvent\_JumpPlayDone

## Error Code

- 100-006
- 100-007
- 500-002

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None

- Response parameter

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 13.1.1.5 Rewinding

#### Prerequisites

- The agent has signed in.
- The agent is playing an announcement.

#### Description

This interface is used to rewind the playback of a recorded file.

#### Interface Method

The request method must be set to POST. This interface supports only the POST method.

#### URI

`https://ip:port/agentgateway/resource/recordplay/{agentid}/backfast/{time}`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-14** Parameters in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                                               |
|-----|-----------|-----------|--------------------|---------------------------------------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999.                             |
| 2   | time      | string    | Yes                | Fast-forward duration, in seconds. The value ranges from 0 to 2147483647. |

#### Method Name in Logs

backFastPlay

## Request Description

- Message header

**Table 13-15** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 13-16** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentMediaEvent\_JumpPlayDone

## Error Code

- 100-006

 "retcode": "0"
}
```

### 13.1.1.7 Starting Screen Recording

#### NOTE

This interface is available only in private deployment mode.

## Prerequisites

- The agent has signed in.
- The VRC component has been successfully initialized on the agent side.

## Description

This interface is used to start screen recording for an agent.

## Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

## URI

<https://ip:port/agentgateway/resource/recordplay/{agentid}/startrecordscreen>

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 13-20** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

startRecordScreen

## Request Description

- Message header

**Table 13-21** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

**Table 13-22** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                                                                                    |
|-----|-----------|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                                                                                   |

## Triggered Event

- AgentMediaEvent\_StartRecordScreen\_Succ
- AgentMediaEvent\_StartRecordScreen\_Fail

## Error Code

- 100-006
- 100-007

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

### 13.1.1.8 Stopping Screen Recording

#### Prerequisites

- The agent has signed in.
- The VRC component has been successfully initialized on the agent side.
- The agent is recording the screen.

#### Description

This interface is used to stop screen recording for an agent.

#### Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

#### URI

<https://ip:port/agentgateway/resource/recordplay/{agentid}/stoprecordscreen>

In the URL, *ip* indicates the IP address of the agent gateway server, and *port* indicates the HTTPS port number of the agent gateway server.

**Table 13-23** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

stopRecordScreen

## Request Description

- Message header

**Table 13-24** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |

```

### 13.1.1.9 Starting Voice Recording

#### NOTE

- This interface is available only in private cloud mode.
- The inspector cannot perform recording operations in insertion, listening, or whispering mode.
- Video recording is not supported.
- The **IF\_ENABLE\_AGENT\_SELFRECORD** parameter in the **basic.properties** file determines whether the interface can be used.

## Prerequisites

- The agent has signed in.

## Description

This interface is used to start voice recording for an agent.

## Interface Method

The request method must be set to PUT. This interface supports only the PUT method.

## URI

`https://ip:port/agentgateway/resource/recordplay/{agentid}/record`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-26** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

beginRecord

## Request Description

## 13.1.1.10 Stopping Voice Recording

### Prerequisites

- The agent has signed in.
- The agent is recording.

### Description

This interface is used to stop voice recording for an agent.

## Interface Method

The request method must be set to DELETE. This interface supports only the DELETE method.

## URI

https://ip:port/agentgateway/resource/recordplay/{agentid}/stoprecord

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-31** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

stopRecord

## Request Description

- Message header

**Table 13-32** Parameters in the request message header

 "message": "success",
 "retcode": "0"
}
```

### 13.1.1.11 Playing Network Call Recordings

#### Prerequisites

- A network call center has been enabled.
- The agent has signed in.
- The agent is not in a three-party call.

## Description

In the network call scenario, the system starts to play voices to an agent. (After the agent sign-in number receives a call, the system plays the recording after the call is connected.)

### NOTE

Any recording file can be played by using this interface. Therefore, use this interface with caution in secondary development.

## Interface Method

The request method must be set to POST. This interface supports only the POST method.

## URI

https://ip:port/agentgateway/resource/recordplay/{agentid}/netplay

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-34** Parameter in the URI

| No. | Parameter | Data Type | Mandatory (Yes/No) | Description                                   |
|-----|-----------|-----------|--------------------|-----------------------------------------------|
| 1   | agentid   | string    | Yes                | Agent ID. The value ranges from 101 to 59999. |

## Method Name in Logs

beginNetPlay

## Request Description

- Message header

| 1   | fileName   | string     | Yes                | File path. The value can contain a maximum of 100 characters.                                                                                                                                                                                                                                      |
| 2   | position   | long       | No                 | Position where the playback starts, in seconds.                                                                                                                                                                                                                                                    |
| 3   | playTime   | int        | No                 | Number of playback times. The options are as follows: <ul style="list-style-type: none"> <li>• <b>1</b>: play once.</li> <li>• <b>0</b>: infinite loop.</li> </ul> The default value is <b>1</b> .<br><b>NOTE</b><br>If this parameter is set to other values, the default value <b>1</b> is used. |
| 4   | fileFormat | int        | No                 | File encoding format. The options are as follows: <ul style="list-style-type: none"> <li><b>0</b>: default format configured on the resource side.</li> <li><b>1</b>: 24K VOX format.</li> <li><b>2</b>: 32K VOX format.</li> </ul> The default value is <b>0</b> .                                |

| No. | Parameter  | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                |
|-----|------------|------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5   | cclid      | int        | Yes                | ID of the call center where an announcement file is located. To obtain the ID, log in to the WAS and choose <b>Web Configuration Console &gt; Configure NIRC &gt; CCS Type Client &gt; Client ID.</b>      |
| 6   | locationId | int        | No                 | ID of a distributed node, which is an input parameter. This parameter is valid only when a single UAP is deployed and the platform supports the distributed mode.<br><br>The value ranges from 0 to 65535. |

## Response Description

**Table 13-37** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

## Triggered Event

- AgentMediaEvent\_Play
- AgentMediaEvent\_Play\_Succ
- AgentMediaEvent\_Play\_Fail
- AgentMediaEvent\_StopPlayDone

## Error Code

- 100-006
- 100-007

- 100-018
- 500-007

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  

```
{
 "fileName": "Y:/12/0/20211019/155/1406470.V3",
 "position": "0",
 "playTime": "1",
 "fileFormat": "0",
 "cclid": "1",
 "locationId": "-1"
}
```
- Response parameter  

```
{
 "result": {},
 "message": "success",
 "retcode": "0"
}
```

## 13.1.2 Recording Download: record

### NOTE

The video recording file is not supported.

### 13.1.2.1 Downloading Recordings

#### Prerequisites

- The file server has been mounted to the gateway, and the recording download function has been enabled.
- The mapping has been configured for the CC-Gateway.
- The mount directory is configured in the configuration file.
- The agent has signed in.

#### Description

This interface is used to download recording files from the file server. (You are not advised to use this interface to download recording files larger than 30 MB.)

### NOTE

The downloaded data contains personal data. Exercise caution when processing the downloaded data to prevent personal data leakage and abuse.

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

https://ip:port/agentgateway/resource/recordfile/{agentid}?recordId=xxx&filetype=1

Example: https://ip:port/agentgateway/resource/recordfile/102?recordId=y:\1\0\20181217\120\1524488.V3

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-38** Parameters in the URI

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                           |
|-----|-----------|------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid   | String     | Yes                | ID of the agent who signs in.                                                                                                                                                                                                                                         |
| 2   | recordId  | String     | Yes                | Path and name of a recording file.<br>The path and name of the recording file are generated when <b>AgentMediaEvent_Record</b> is triggered and are returned in <b>fileName</b> .<br>For details about the recording file path format, see the following description. |

| No. | Parameter  | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----|------------|------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | filetype   | String     | No                 | <p>Type of a recording file. The options are as follows:</p> <ul style="list-style-type: none"> <li>• <b>1:</b> agent call recording file</li> <li>• <b>2:</b> IVR or third-party voice message recording file</li> </ul> <p><b>NOTE</b></p> <p>1. The format of the path of an IVR voice message recording file is as follows: <i>Drive letter:/VDN ID/record/****</i>.</p> <p>Example: <b>y:/1/record/20190412/playvoice1551276018824.wav</b></p> <p>2. The format of the path of a third-party voice message recording file is as follows: <i>Drive letter;/3rdfile/VDN ID/record/****</i>.</p> <p>Example: <b>y;/3rdfile/1/record/20190408/515/1633022.V3</b></p> <p>The default value is <b>1</b> (agent call recording file).</p> |
| 4   | locationId | Number     | No                 | <p>Node ID, which is mandatory in CTI pool mode and is generated when <b>AgentMediaEvent_Record</b> is triggered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Method Name in Logs

downloadRecordFile

## Request Description

- Message header

**Table 13-39** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |

| 1   | Content-Type | String     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | String     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

The following provides an example of the response message body of this interface:

- If the download fails:  
Message header: Content-Type: application/json;charset=UTF-8  
For details about the message body example, see [Example](#).

**Table 13-40** Parameters in the message body

| No. | Parameter | Value Type | Description  |
|-----|-----------|------------|--------------|
| 1   | message   | String     | Description. |

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 2   | retcode   | String     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | Object     | Reserved field.                                                                        |

- If the download is successful:  
Message header: Content-Type: application/octet-stream;charset=utf-8  
Message body: file stream

## Triggered Event

After an agent signs in, the recording download interface is invoked.

## Error Code

- 104-001
- 104-005
- 104-010

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "retcode": "000-003",
 "message": "no right to invite resource",
 "result": ""
}
```

### 13.1.2.2 Downloading Recordings (Extended)

#### Prerequisites

- The download function has been enabled for the CC-Gateway. (**VIDEO\_DOWNLOAD\_FLAG** has been set to **ON**. The configuration file path is **/home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties**.)
- The agent has signed in.
- The VoiceCyber recording mode is enabled. (All SRS-related configurations are enabled. The configuration file path is **/home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties**.) For details, see "Commissioning Guide > (Optional) Commissioning Advanced Businesses >

Commissioning the Connection Between the CC-Gateway and VoiceCyber Recording Server" in the product documentation.

## Description

This interface is used to download recorded voice and video files in VoiceCyber recording mode. It can download voice dual-track recording files and video recording files.

### NOTE

The downloaded data contains personal data. Exercise caution when processing the downloaded data to prevent personal data leakage and abuse.

## Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

`https://ip:port/agentgateway/resource/recordfile/{agentid}/recordfiledownloadEx?callId= xxx&hwFileName=1`

Example: `https://10.244.154.23:8043/agentgateway/resource/recordfile/4977/recordfiledownloadEx?callId=1621413752-2011&hwFileName=Y:/90/0/20210519/4977/1642329.mp4`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-41** Parameters in the URI

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                   |
|-----|-----------|------------|--------------------|-------------------------------|
| 1   | agentid   | String     | Yes                | ID of the agent who signs in. |
| 2   | callId    | String     | Yes                | Call ID.                      |

| No. | Parameter  | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                |
|-----|------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | hwFileName | String     | No                 | File path.<br>If the value of <b>hwFileName</b> is not transferred, an audio file is downloaded.<br>If <b>hwFileName</b> is specified, a video file is downloaded, for example, <b>Y:/90/0/20210519/4977/1642329.mp4</b> . |
| 4   | workNo     | String     | No                 | ID of an inspected agent.<br>This parameter must be transferred when the sign-in agent is an inspector and <b>hwFileName</b> is empty.                                                                                     |

## Method Name in Logs

recordfiledownloadEx

## Request Description

- Message header

**Table 13-42** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                    |
|-----|--------------|------------|--------------------|------------------------------------------------------------------------------------------------|
| 1   | Content-Type | String     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> . |

| No. | Parameter | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|-----------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | Guid      | String     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

The following describes the response of this interface:

- If the download fails:  
Message header: Content-Type: application/json;charset=UTF-8  
For details about the message body example, see [Example](#).

**Table 13-43** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | String     | Description.                                                                           |
| 2   | retcode   | String     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | Object     | Reserved field.                                                                        |

- If the download is successful:  
Message header: Content-Type: application/octet-stream;charset=utf-8  
Message body: file stream

## Triggered Event

- The agent signs in and invokes the recording download interface.

## Error Code

- 108-001

- 108-014
- 108-015
- 108-016
- 108-017

## Example

## 13.1.3 Video File Download: Video

### 13.1.3.1 Downloading Video Files

#### Prerequisites

- On the CC-Gateway, **VIDEO\_DOWNLOAD\_FLAG** and **IF\_SUPPORT\_VIDEO** have been set to **ON**, indicating that the video file download function and video event function have been enabled. The configuration file path is / **home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties**.
- The agent has signed in.

#### Description

This interface is used to download video files generated during video calls in MCU recording mode. (You are not advised to use this interface to download video files larger than 200 MB.)

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

#### URI

`https://ip:port/agentgateway/resource/recordfile/{agentid}/videofiledownload?confereceld=xxx&recordId=xxx&fileType=xxx`

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-44** Parameters in the URI

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                    |
|-----|--------------|------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid      | string     | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                                                                                                  |
| 2   | conferenceId | string     | Yes                | Indicates the conference ID.<br>Example:<br>7a008307-34ad-435b-bccd-222be5ac5385                                                                                                                                               |
| 3   | recordId     | string     | No                 | Indicates the video recording ID.<br>Example:<br>0a08082d-df1e-4c06-9a97-c7c6f7a4724e<br><b>NOTE</b><br>If <b>recordId</b> is not specified, the video file corresponding to the first recording URL is downloaded by default. |
| 4   | fileType     | string     | Yes                | File type. The options are as follows:<br><ul style="list-style-type: none"> <li>● <b>0</b>: HD file</li> <li>● <b>1</b>: SD file</li> <li>● <b>2</b>: videoAux</li> </ul>                                                     |

## Method Name in Logs

downloadVideoFile

## Request Description

- Message header

**Table 13-45** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

The following provides an example of the response message body of this interface:

- If the download fails:  
Message header: Content-Type: application/json;charset=UTF-8  
For details about the message body example, see [Example](#).

**Table 13-46** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

- If the download is successful:  
Message header: Content-Type: application/octet-stream;charset=utf-8  
Message body: file stream

## Triggered Event

- After an agent signs in, the video file download interface is invoked.

## Error Code

- 108-001
- 108-002
- 108-003
- 108-004
- 108-005
- 108-006
- 108-007
- 108-008
- 108-009

## Example

- Message header  
Content-Type:application/json; charset=UTF-8  
Guid: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx.AgentGateway1
- Request parameter  
None
- Response parameter  

```
{
 "retcode": "000-003",
 "message": "no right to invite resource",
 "result": ""
}
```

### 13.1.3.2 Downloading Video Files (Extended)

#### Prerequisites

- On the CC-Gateway, **VIDEO\_DOWNLOAD\_FLAG** and **IF\_SUPPORT\_VIDEO** have been set to **ON**, indicating that the video file download function and video event function have been enabled. The configuration file path is **/home/elpis/tomcat/webapps/agentgateway/WEB-INF/config/basic.properties**.
- The file server has been mounted to the CC-Gateway.
- The agent has signed in.
- The mount directory is configured in the configuration file.

#### Description

This interface is used to download video files generated during video calls. (You are not advised to use this interface to download video files larger than 200 MB.)

#### Interface Method

The request method must be set to GET. This interface supports only the GET method.

## URI

https://ip:port/agentgateway/resource/recordfile/{agentid}/videofiledownloadEx?recordId=xxx&locationId=xxx

Example:

In the URL, *ip* indicates the IP address of the CC-Gateway server, and *port* indicates the HTTPS port number of the CC-Gateway server.

**Table 13-47** Parameters in the URI

| No. | Parameter  | Value Type | Mandatory (Yes/No) | Description                                                                                                                                               |
|-----|------------|------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentid    | string     | Yes                | Agent ID. The value ranges from 101 to 59999.                                                                                                             |
| 2   | recordId   | string     | Yes                | Video file path.<br><b>NOTE</b><br>If <b>recordId</b> is not specified, the video file corresponding to the first recording URL is downloaded by default. |
| 3   | locationId | int        | No                 | Node ID. This parameter is mandatory in CTI Pool mode.                                                                                                    |

## Method Name in Logs

downloadVideoFileEx

## Request Description

- Message header

**Table 13-48** Parameters in the request message header

| No. | Parameter    | Value Type | Mandatory (Yes/No) | Description                                                                                                                                                                                                                            |
|-----|--------------|------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type | string     | Yes                | Coding mode of the message body. The default value is <b>application/json; charset=UTF-8</b> .                                                                                                                                         |
| 2   | Guid         | string     | Yes                | GUID returned by the sign-in interface during static authentication ( <b>AUTHMODE</b> is set to <b>1</b> ) or GUID returned by the polling event query interface during dynamic authentication ( <b>AUTHMODE</b> is set to <b>2</b> ). |

- Message body  
None

## Response Description

The following provides an example of the response message body of this interface:

- If the download fails:  
Message header: Content-Type: application/json;charset=UTF-8  
For details about the message body example, see [Example](#).

**Table 13-49** Parameters in the message body

| No. | Parameter | Value Type | Description                                                                            |
|-----|-----------|------------|----------------------------------------------------------------------------------------|
| 1   | message   | string     | Description.                                                                           |
| 2   | retcode   | string     | Error code. The options are as follows:<br><b>0</b> : success<br>Other values: failure |
| 3   | result    | object     | Reserved field.                                                                        |

- If the download is successful:  
Message header: Content-Type: application/octet-stream;charset=utf-8  
Message body: file stream

## Triggered Event

- After an agent signs in, the video file download interface is invoked.

## Error Code

- 108-001

 "message": "no right to invite resource",
 "result": ""
}
```

# 13.2 CDR Download and Recording Playback and Download

## 13.2.1 Data Access Interface

### 13.2.1.1 Obtaining a Recording Download and Playback URL

#### Description

This interface is invoked to upload a recording file on the CC-FS to OBS/LSS and obtain the recording download and playback URL from OBS/LSS.

- Prerequisites: Recording files have been synchronized to the CC-FS database by a scheduled task.
- Usage restrictions  
Developers can download only recordings under their own accounts. The developer account (**ak**) must correspond to the recording (**callid**).  
The developer account (**ak**) is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

**callId**, **beginTime**, and **endTime** uniquely identify a recording.

## Interface Method

POST

## URI

https://ip:port/CCFS/resource/ccfs/getRecordFileUrlFromObs

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-50** Parameters in the request header

| Parameter     | Mandatory | Value Type | Default Value | Description                                                                                                                                            |
|---------------|-----------|------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Content-Type  | Yes       | String     | None          | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| Authorization | Yes       | String     | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-51** Parameters in the request body

| Parameter | Mandatory | Value Type    | Default Value | Description                                                             |
|-----------|-----------|---------------|---------------|-------------------------------------------------------------------------|
| callId    | Yes       | String (1–25) | None          | Call ID.                                                                |
| beginTime | Yes       | String        | None          | Recording start time. The time is in <i>yyyy-MM-dd HH:mm:ss</i> format. |

| Parameter | Mandatory | Value Type | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|-----------|------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| endTime   | Yes       | String     | None          | Recording end time. The time is in <i>yyyy-MM-dd HH:mm:ss</i> format.<br>The interval between the recording start time and end time cannot exceed three days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| version   | No        | String     | None          | Current interface version, which is 2.0.<br><b>NOTICE</b> <ul style="list-style-type: none"> <li>Time zones other than GMT+8: <b>beginTime</b> and <b>endTime</b> must be set to time in the time zone where the tenant space is located, and <b>version</b> is mandatory.</li> <li>GMT+8 <ul style="list-style-type: none"> <li>When <b>beginTime</b> and <b>endTime</b> are set to time in the GMT+0 time zone, <b>version</b> is optional.<br/>For example, if the recording start time is 2022-01-02 10:00:00 in the GMT+8 time zone, you can set <b>beginTime</b> to 2022-01-02 02:00:00.</li> <li>When <b>beginTime</b> and <b>endTime</b> are set to time in the time zone where the tenant space is located, <b>version</b> is mandatory.</li> </ul> </li> </ul> |

## Response

Table 13-52 Parameters in the response

| Parameter  | Value Type | Description                                                                                  |
|------------|------------|----------------------------------------------------------------------------------------------|
| resultCode | String     | Result code returned.<br><b>0</b> : success<br>Other values: failure                         |

 },
 "resultCode": "0",
 "resultDesc": "success"
}
```

### 13.2.1.2 Generating CDRs and Recording Indexes

#### Description

This interface is invoked to generate CDR files and recording index files based on the specified conditions. After a file is generated, the file name (**billFileName**) is sent to the callback URL specified by **callBackURL** in callback mode.

The callback of the URL specified by **callBackURL** requires authentication. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

## Usage Description

- Prerequisites
  - The developer environment has been established and calls can be made properly. The developer has an independent server and the server has been bound to the callback URL (**callBackURL**).
  - **accountId**, **agentId**, and **callId** are optional parameters, which can be flexibly combined to generate CDRs and recording index files. If none of the three parameters is specified, the corresponding data records of the developer in the specified period are generated.
  - You have passed the authorization and obtained the access URL.
  - You have set **aicc.ssl.trustAll** in the CC-FS configuration file **/home/ccfsapp/webapps/ccfsapp/WEB-INF/classes/config/servicecloud.base.properties** is to **false** and performed the following steps to place the certificate:
    - i. Log in to the CC-FS server as an O&M user and switch to the **root** user.

```
su - root
```
    - ii. Upload the third-party certificate that needs to be loaded by the callback URL for notifying the index file generated by the CC-FS to the same directory (**\$HOME/conf**) as the **truststore.jks** certificate file of the AICC. The directory varies according to the actual environment.
    - iii. Change the owner group of the uploaded third-party certificate.

```
chown ccfsapp:ccfsapp XXX.jks
```
    - iv. Import the third-party certificate to **truststore.jks**.

```
keytool -import -alias xxx -file XXX.jks -keystore truststore.jks
```

Enter the password of the **truststore.jks** certificate file as prompted.
    - v. Delete the **XXX.jks** certificate from the environment.
    - vi. Restart the CC-FS.  
Go to the **/home/ccfsapp/bin** directory and run the following command:

```
./shutdown.sh;./startup.sh
```
- Usage restrictions

A developer can access only the data of the account. The developer account (**appId**) must correspond to the enterprise account (tenant space ID: **accountId**).

The developer account (**appId**) is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

## Interface Method

POST

## URI

https://ip:port/CCFS/resource/ccfs/queryBillData

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-53** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | No            | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | No            | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-54** request parameters in the request body

| No. | Name    | Value Type    | Mandatory | Default Value | Description                                                     |
|-----|---------|---------------|-----------|---------------|-----------------------------------------------------------------|
| 1   | version | String (1-32) | Yes       | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-55** msgBody parameters in the request body

| No. | Name      | Value Type    | Mandatory | Default Value | Description                                                                                                                                                                                                                           |
|-----|-----------|---------------|-----------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | beginTime | String        | Yes       | No            | Start time of CDRs and recordings, which is the time in the time zone where the tenant space is located. The interval between the start time and end time cannot exceed three days. The time is in <i>yyyy-MM-dd HH:mm:ss</i> format. |
| 2   | endTime   | String        | Yes       | No            | End time of CDRs and recordings, which is the time in the time zone where the tenant space is located. The interval between the start time and end time cannot exceed three days. The time is in <i>yyyy-MM-dd HH:mm:ss</i> format.   |
| 3   | accountId | String (1–20) | No        | No            | Enterprise account (tenant space ID).                                                                                                                                                                                                 |
| 4   | agentId   | String (1–20) | No        | No            | Agent ID.                                                                                                                                                                                                                             |
| 5   | callId    | String (1–25) | No        | No            | Call ID, which can be obtained from the file returned after the interface for downloading CDR and recording indexes is invoked.                                                                                                       |
| 6   | callerNo  | String (1–25) | No        | No            | Calling number.                                                                                                                                                                                                                       |
| 7   | calleeNo  | String (1–25) | No        | No            | Called number. If <b>calleeNo2</b> does not exist, the value is the called number. If <b>calleeNo2</b> exists, the value is the calling number.                                                                                       |
| 8   | calleeNo2 | String (1–25) | No        | No            | Called number 2.                                                                                                                                                                                                                      |

| No. | Name        | Value Type    | Mandatory | Default Value | Description                                                                                                                                                                                                                                     |
|-----|-------------|---------------|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9   | dataType    | String (1-11) | Yes       | None          | Type of the data record file to be generated. The options are as follows: <ul style="list-style-type: none"> <li>• <b>call</b>: CDR</li> <li>• <b>record</b>: recording index</li> <li>• <b>call_record</b>: CDR and recording index</li> </ul> |
| 10  | callbackURL | String        | Yes       | None          | Callback URL. After generating a data record file, the platform returns <b>billFileName</b> to the URL specified by this parameter.                                                                                                             |

## Response

The response obtained by invoking this interface consists of two parts:

(1) Response of the invoked party

(2) Response of the invoking part (response to third-party callback)

- Response of the invoked party  
[Table 13-56](#) describes the parameters in the response.
- Response of the invoking party (response to third-party callback): The response consists of **request** and **msgBody**.  
**request** contains **version** (2.0 by default).  
**msgBody** consists of **responseld** (part of the CDR file name), **billName** (name of the ZIP package of CDRs to be downloaded), and **accountId** (tenant space ID). [Table 13-57](#) describes **resultData** in the response.

**Table 13-56** Parameters in the response

| No. | Name       | Value Type | Description                                                                                                                  |
|-----|------------|------------|------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Result code returned. <ul style="list-style-type: none"> <li>• <b>0</b>: success</li> <li>• Other values: failure</li> </ul> |
| 2   | resultDesc | String     | Request result description. For details, see <a href="#">13.2.3.1 Error Code Reference</a> .                                 |
| 3   | resultData | Object     | Response data. For details, see <a href="#">Table 13-57</a> .                                                                |

| No. | Name     | Value Type | Description                                                                                                                                                     |
|-----|----------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | response | Object     | Request result object. For details, see <a href="#">Table 13-58</a> .<br>This field is reserved for compatibility with earlier versions and is not recommended. |

**Table 13-57** Description of responseData in the response message

| No. | Name       | Value Type | Description                                                                                     |
|-----|------------|------------|-------------------------------------------------------------------------------------------------|
| 3.1 | responseld | String     | Unique ID generated after the interface is successfully invoked. It is a part of the file name. |

**Table 13-58** Parameters in a response message

| No. | Name       | Value Type    | Description                                                                            |
|-----|------------|---------------|----------------------------------------------------------------------------------------|
| 4.1 | version    | String (1-32) | Protocol version, for example, 2.0.                                                    |
| 4.2 | resultCode | String (1-32) | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> . |
| 4.3 | resultMsg  | String        | Request result description.                                                            |

**Table 13-59** msgBody parameters in the callback response body

| No. | Name         | Value Type | Description                                                                                                                                                                                                                                                                                                                                                 |
|-----|--------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | responseld   | String     | Unique ID generated after the interface is successfully invoked. It is a part of the file name.                                                                                                                                                                                                                                                             |
| 2   | billFileName | String     | Name of a CDR or recording index file. The value is in <i>yyyyMMdd_{responseld}.zip</i> format.<br>For example, if the date when this interface is invoked is 2018-07-02 and the obtained value of <b>responseld</b> is <b>9239cb50-a838-4bb0-ab50-3441bf089446</b> , the value of this parameter is <b>20180702_9239cb50a8384bb0ab503441bf089446.zip</b> . |

| No. | Name      | Value Type | Description                                                                                                                                                                                                                               |
|-----|-----------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3   | accountId | String     | Enterprise account (tenant space ID). The enterprise account carried in the request parameter is used to associate the file name with an enterprise. If <b>accountId</b> is not set in the request parameter, this value is not returned. |

### 13.2.1.3 Downloading CDRs and Recording Indexes

#### Description

This interface is invoked to download the .zip file (*yyyymmdd\_responseId*) of the CDR or recording package. You can view the CDR description (*yyyymmddHHmmssSSS+ Three-digit random number\_call.csv*) and the detailed indexes (*yyyymmddHHmmssSSS+ Three-digit random number\_record.csv*) generated for each recording.

#### Usage Description

- Prerequisites
  - CDRs and recording index files have been generated at the backend by invoking the interface for generating CDRs and recording indexes.
  - You have passed the authorization and obtained the access URL.
- Usage restrictions

Developers can only download files under their own accounts. The developer account (**appId**) must correspond to the data record file name (**billFileName**).

The developer account (**appId**) is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

#### Interface Method

POST

#### URI

`https://ip:port/CCFS/resource/ccfs/downloadBillFile`

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-60** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | None          | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-61** request parameters in the request body

| No. | Name    | Value Type    | Mandatory | Default Value | Description                                                     |
|-----|---------|---------------|-----------|---------------|-----------------------------------------------------------------|
| 1   | version | String (1-32) | Yes       | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-62** msgBody parameters in the request body

| No. | Name         | Value Type    | Mandatory | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|--------------|---------------|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | billFileName | String (1-49) | Yes       | No            | Name of a CDR and recording index file, which has been obtained by invoking the interface for generating CDRs and recording indexes.<br>The value is in <i>yyyyMMdd_{responseId}.zip</i> format.<br>For example, if the interface for generating CDRs and recording indexes has been invoked on <b>2018-07-02</b> , and if the obtained recording index <b>responseId</b> is <b>9239cb50a8384bb0ab503441bf08944</b> , the value of this parameter is <b>20180702_9239cb50a8384bb0ab503441bf089446.zip</b> . |

## Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a CDR file. The file name extension is .zip. For details about the parameters in the file, see [13.2.2.1 Definitions of CDR and Recording Index Files](#). In the response message, the value of **content-type** is **Application/Octet-stream; charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-63](#). **resultData** is a reserved field and is left empty by default.

**Table 13-63** Parameters in the response

| No. | Name       | Value Type | Description                                                                                                                                                     |
|-----|------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> .                                                                          |
| 2   | resultDesc | String     | Request result description.                                                                                                                                     |
| 3   | resultData | Object     | Response data.                                                                                                                                                  |
| 4   | response   | Object     | Request result object. For details, see <a href="#">Table 13-64</a> .<br>This field is reserved for compatibility with earlier versions and is not recommended. |

**Table 13-64** Parameters in a response message

| No. | Name       | Value Type    | Description                         |
|-----|------------|---------------|-------------------------------------|
| 4.1 | version    | String (1-32) | Protocol version, for example, 2.0. |
| 4.2 | resultCode | String (1-32) | Result code returned.               |
| 4.3 | resultMsg  | String        | Request result description.         |

## Example

- Request header  

```
POST /CCFS/resource/ccfs/downloadBillFile HTTP/1.1
Authorization: auth-v2/ak/2018-07-02T02:43:08Z/content-length;content-type;host
/ae066c2f5d*****13a0afc161cb7e66f5d
Accept: */*
Content-Type: application/json;charset=UTF-8
Content-Length: 193
```
- Request parameters  

```
{
 "request": {
 "version": "2.0"
 },
 "msgBody": {
 "billFileName": "20180702_9239cb50a8384bb0ab503441bf089446.zip"
 }
}
```

### 13.2.1.4 Downloading a Recording File

#### Description

This interface is invoked to download a single recording file.

#### Usage Description

- Prerequisites
  - Recording index files have been obtained by invoking the interface for downloading CDRs and recording indexes.
  - You have passed the authorization and obtained the access URL.
- Usage restrictions
 

Developers can only download files under their own accounts. The developer account (**appId**) must correspond to the recording file name (**fileName**).

The developer account is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

#### Interface Method

POST

## URI

https://ip:port/CCFS/resource/ccfs/downloadRecordFile

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-65** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | No            | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | No            | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-66** request parameters in the request body

| No. | Name    | Value Type    | Mandatory | Default Value | Description                                                     |
|-----|---------|---------------|-----------|---------------|-----------------------------------------------------------------|
| 1   | version | String (1-32) | Yes       | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-67** msgBody parameters in the request body

| No. | Name     | Value Type     | Mandatory | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|----------|----------------|-----------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | fileName | String (1-225) | Yes       | None          | <p>Relative path of the recording file, which is obtained from the <b>file_name</b> field in the recording index file returned when the interface for downloading CDRs and recording indexes is invoked.</p> <p>The value is in the <i>/{nodeId}/{ccId}/record/{vdnId}/{yyyymmdd}/{agentId}/{original file name}.wav</i> format.</p> <p>Note: <i>{nodeId}</i> indicates the node ID, <i>{ccId}</i> indicates the call center ID, <i>{vdnId}</i> indicates the VDN ID, <i>{yyyymmdd}</i> indicates the date when the recording file is generated, <i>{agentId}</i> indicates the ID of the agent who generates the recording file, and <i>{original file name}</i> indicates the name of the recording file.</p> <p>Example: <b>/10/1/record/appld/100/15362/autoTest.wav</b></p> |

## Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a recording file. The file name extension is .wav. In the response message, the value of **content-type** is **Application/Octet-stream;charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-68](#). **resultData** is a reserved field and is left empty by default.

**Table 13-68** Parameters in the response

| No. | Name       | Value Type | Description                                                                            |
|-----|------------|------------|----------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> . |
| 2   | resultDesc | String     | Request result description.                                                            |
| 3   | resultData | Object     | Response data.                                                                         |

| No. | Name     | Value Type | Description                                                                                                                                                     |
|-----|----------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | response | Object     | Request result object. For details, see <a href="#">Table 13-69</a> .<br>This field is reserved for compatibility with earlier versions and is not recommended. |

**Table 13-69** Parameters in a response message

| No. | Name       | Value Type       | Description                                                                            |
|-----|------------|------------------|----------------------------------------------------------------------------------------|
| 4.1 | version    | String<br>(1-32) | Protocol version, for example, 2.0.                                                    |
| 4.2 | resultCode | String<br>(1-32) | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> . |
| 4.3 | resultMsg  | String           | Request result description.                                                            |

## Example

- Request header  

```
POST /CCFS/resource/ccfs/downloadRecordFile HTTP/1.1
Authorization: auth-v2/ak/2018-07-02T02:45:50Z/content-length;content-type;host/
eb453f68e85*****80196c509c4913
Accept: */*
Content-Type: application/json;charset=UTF-8
Content-Length: 193
```
- Request parameters  

```
{
 "request": {
 "version": "2.0"
 },
 "msgBody": {
 "fileName": "/10/1/record/appld/100/autoTest.wav"
 }
}
```

### 13.2.1.5 Downloading a Recording File (Extended)

#### Description

This interface is invoked to query and download a recording file by call ID or file name.

Intended audience: This interface is invoked by a third-party server and can be used in scenarios such as dumping.

#### Usage Description

- Prerequisites

- Recording index files have been obtained by invoking the interface for downloading CDRs and recording indexes.
- You have passed the authorization and obtained the access URL.
- Usage restrictions
 

Developers can only download files under their own accounts. The developer account (**appId**) must correspond to the original recording file name (**fileName**).

The developer account (**appId**) is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

## Interface Method

POST

## URI

`https://ip:port/CCFS/resource/ccfs/downloadRecord`

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-70** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | None          | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-71** request parameters in the request body

| No. | Name    | Value Type    | Mandatory | Default Value | Description                                                     |
|-----|---------|---------------|-----------|---------------|-----------------------------------------------------------------|
| 1   | version | String (1–32) | Yes       | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-72** msgBody parameters in the request body

| No. | Name     | Value Type     | Mandatory | Default Value | Description                                                                                                                                                                                                                                                                                                                        |
|-----|----------|----------------|-----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | fileName | String (1–225) | No        | No            | Recording file name, which is obtained from the <b>original_file_name</b> field in the recording index file returned when the interface for downloading CDRs and recording indexes is invoked.<br><br>For example, the value is <b>X:/4/0/20180416/512/1629533.V3</b> . Note: Either <b>fileName</b> or <b>callId</b> must be set. |
| 2   | callId   | String (1–25)  | No        | No            | Call ID. Note: At least one of <b>fileName</b> and <b>callId</b> must be set. If <b>callId</b> corresponds to multiple recording files, the .zip package will be downloaded.                                                                                                                                                       |
| 3   | cclid    | String (1–64)  | No        | No            | ID of a call center. The default value is <b>1</b> .                                                                                                                                                                                                                                                                               |

## Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a recording file. The file name extension is .wav. If multiple recording files are downloaded by **callId**, the file name extension is .zip. In the response message, the value of **content-type** is **Application/Octet-stream;charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-73](#). **resultData** is a reserved field and is left empty by default.

**Table 13-73** Parameters in the response

| No. | Name       | Value Type | Description                                                                                                                                                     |
|-----|------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> .                                                                          |
| 2   | resultDesc | String     | Request result description.                                                                                                                                     |
| 3   | resultData | Object     | Response data.                                                                                                                                                  |
| 4   | response   | Object     | Request result object. For details, see <a href="#">Table 13-74</a> .<br>This field is reserved for compatibility with earlier versions and is not recommended. |

**Table 13-74** Parameters in a response message

| No. | Name       | Value Type    | Description                                                                            |
|-----|------------|---------------|----------------------------------------------------------------------------------------|
| 4.1 | version    | String (1-32) | Protocol version, for example, 2.0.                                                    |
| 4.2 | resultCode | String (1-32) | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> . |
| 4.3 | resultMsg  | String        | Request result description.                                                            |

## Example

- Request header  
 POST /CCFS/resource/ccfs/downloadRecord HTTP/1.1  
 Authorization: auth-v2/ak/2018-07-02T02:44:42Z/content-length;content-type;host/f18f6dd19\*\*\*\*\*6b8ff99f6c5884  
 Accept: \*/\*  
 Host: 10.154.198.164  
 Content-Type: application/json;charset=UTF-8  
 Content-Length: 185
- Request parameters
 

```
{
 "request": {
 "version": "2.0"
 },
 "msgBody": {
 "fileName": "Y:/autoTest.V3",
 "callId": "autoTest-1",
 "ccId": "1"
 }
}
```

### 13.2.1.6 Generating Indexes of Agent Operation Details

#### Description

This interface is invoked to generate an index file of agent operation details based on the conditions. After a file is generated, the file name (**agentOprInfoFileName**) is sent to the callback URL carried by **callBackURL** in callback mode.

The callback of the URL specified by **callBackURL** requires authentication. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

#### Usage Description

- Prerequisites
  - The developer environment has been established and agents can sign in and perform operations properly. The developer has an independent server and the server has been bound to the callback URL (**callBackURL**).
  - The **accountId** and **agentId** can be freely combined to generate an index file for the agent operation details. If neither of the parameters is specified, the corresponding data records of the **appId** in the specified period are generated.
  - You have passed the authorization and obtained the access URL.
  - You have set **aicc.ssl.trustAll** in the CC-FS configuration file **/home/ccfsapp/webapps/ccfsapp/WEB-INF/classes/config/servicecloud.base.properties** is **false** and performed the following steps to place the certificate:
    - i. Log in to the CC-FS server as an O&M user and switch to the **root** user.

```
su - root
```
    - ii. Upload the third-party certificate that needs to be loaded by the callback URL for notifying the index file generated by the CC-FS to the same directory (**\$HOME/conf**) as the **truststore.jks** certificate file of the AICC. The directory varies according to the actual environment.
    - iii. Change the owner group of the uploaded third-party certificate.

```
chown ccfsapp:ccfsapp XXX.jks
```
    - iv. Import the third-party certificate to **truststore.jks**.

```
keytool -import -alias xxx -file XXX.jks -keystore truststore.jks
```

Enter the password of the **truststore.jks** certificate file as prompted.
    - v. Delete the **XXX.jks** certificate from the environment.
    - vi. Restart the CC-FS.  
Go to the **/home/ccfsapp/bin** directory and run the following command:

```
./shutdown.sh;./startup.sh
```
- Usage restrictions

A developer can access only the data of the account. The developer account (**appId**) must correspond to the enterprise account (**accountId**).

The developer account is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

## Interface Method

POST

## URI

https://ip:port/CCFS/resource/ccfs/queryAgentOprInfoData

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-75** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | None          | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-76** request parameters in the request body

| No. | Name    | Value Type    | Mandatory | Default Value | Description                                                     |
|-----|---------|---------------|-----------|---------------|-----------------------------------------------------------------|
| 1   | version | String (1-32) | Yes       | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-77** msgBody parameters in the request body

| No. | Name        | Value Type    | Mandatory | Default Value | Description                                                                                                                                                                                                                        |
|-----|-------------|---------------|-----------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | beginTime   | String        | Yes       | No            | Start time of agent operations, which is the time in the time zone where the tenant space is located. The interval between the start time and end time cannot exceed three days. The time is in <i>yyyy-MM-dd HH:mm:ss</i> format. |
| 2   | endTime     | String        | Yes       | No            | End time of agent operations, which is the time in the time zone where the tenant space is located. The interval between the start time and end time cannot exceed three days. The time is in <i>yyyy-MM-dd HH:mm:ss</i> format.   |
| 3   | accountId   | String (1–20) | No        | No            | Enterprise account (tenant space ID).                                                                                                                                                                                              |
| 4   | agentId     | String (1–20) | No        | No            | Agent ID.                                                                                                                                                                                                                          |
| 5   | callbackURL | String        | Yes       | No            | Callback URL. After generating a data record file, the platform returns <b>fileName</b> to the URL specified by this parameter.                                                                                                    |

## Response

The response obtained by invoking this interface consists of two parts:

- (1) Response of the invoked party
- (2) Response of the invoking part (response to third-party callback)

- Response of the invoked party  
**Table 13-78** describes the parameters in the response.
- Response of the invoking party (response to third-party callback)  
The response consists **request** and **msgBody**. **Table 13-81** describes **msgBody** parameters.  
**request** contains **version** (2.0 by default).  
**msgBody** consists of **responseId** (part of the agent operation details file name), **fileName** (name of the ZIP package of agent operation details to be downloaded), and **accountId** (tenant space ID).

**Table 13-78** Parameters in the response

| No. | Name       | Value Type | Description                                                                                                                                                                   |
|-----|------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Result code returned. <ul style="list-style-type: none"> <li>• 0: success</li> <li>• Other values: For details, see <a href="#">13.2.3.1 Error Code Reference</a>.</li> </ul> |
| 2   | resultDesc | String     | Request result description.                                                                                                                                                   |
| 3   | resultData | Object     | For the description about parameters in <b>resultData</b> , see <a href="#">Table 13-79</a> .                                                                                 |
| 4   | response   | Object     | Request result object. For details, see <a href="#">Table 13-80</a> .<br>This field is reserved for compatibility with earlier versions and is not recommended.               |

**Table 13-79** Description of resultData in the response message

| No. | Name       | Value Type | Description                                                                                     |
|-----|------------|------------|-------------------------------------------------------------------------------------------------|
| 3.1 | responseld | String     | Unique ID generated after the interface is successfully invoked. It is a part of the file name. |

**Table 13-80** Parameters in a response message

| No. | Name       | Value Type    | Description                                                                            |
|-----|------------|---------------|----------------------------------------------------------------------------------------|
| 4.1 | version    | String (1-32) | Protocol version, for example, 2.0.                                                    |
| 4.2 | resultCode | String (1-32) | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> . |
| 4.3 | resultMsg  | String        | Request result description.                                                            |

**Table 13-81** msgBody parameters in the callback response body

| No. | Name       | Value Type | Description                                                                                     |
|-----|------------|------------|-------------------------------------------------------------------------------------------------|
| 1   | responseld | String     | Unique ID generated after the interface is successfully invoked. It is a part of the file name. |

| No. | Name      | Value Type | Description                                                                                                                                                                                                                                                                                                                                             |
|-----|-----------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | fileName  | String     | Name of a CDR or recording index file. The value is in <i>yyyyMMdd_{responseId}.zip</i> format.<br>For example, if the date when this interface is invoked is 2018-07-02 and the obtained value of <b>responseId</b> is <b>9239cb50a8384bb0ab503441bf089446</b> , the value of this parameter is <b>20180702_9239cb50a8384bb0ab503441bf089446.zip</b> . |
| 3   | accountId | String     | Enterprise account (tenant space ID). The enterprise account carried in the request parameter is used to associate the file name with an enterprise. If <b>accountId</b> is not set in the request parameter, this value is not returned.                                                                                                               |

## Example

- Request header**  
 POST /CCFS/resource/ccfs/queryAgentOprInfoData HTTP/1.1

 },
 "msgBody": {
 "responselId": "9239cb50a8384bb0ab503441bf089446",
 "agentOprInfoFileName": "20180702_9239cb50a8384bb0ab503441bf089446.zip"
 }
}
```

### 13.2.1.7 Downloading Indexes of Agent Operation Details

#### Description

This interface is invoked to download the .zip package of agent operation detail record indexes (*yyyymmdd\_responselId*). You can view the agent operation details (*yyyymmddhhmmsSSS+ Three-digit random number\_agentOprInfo.csv*) corresponding to each .zip package.

#### Usage Description

- Prerequisites
  - Files have been generated at the backend by invoking the interface for generating indexes of agent operation details.
  - You have passed the authorization and obtained the access URL.
- Usage restrictions

Developers can only download files under their own accounts. The developer account (**appId**) must correspond to the data record file name (**agentOprInfoFileName**).

The developer account (**appId**) is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

#### Interface Method

POST

#### URI

<https://ip:port/CCFS/resource/ccfs/downloadAgentOprInfoFile>

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-82** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | None          | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | None          | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-83** request parameters in the request body

| No. | Name    | Mandatory | Value Type    | Default Value | Description                                                     |
|-----|---------|-----------|---------------|---------------|-----------------------------------------------------------------|
| 1   | version | Yes       | String (1-32) | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-84** msgBody parameters in the request body

| No. | Name                | Mandatory | Value Type    | Default Value | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----|---------------------|-----------|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | agentOpInfoFileName | Yes       | String (1-49) | No            | Index file name of agent operation details. The name is obtained by invoking the interface for generating indexes of agent operation details.<br><br>The value is in <i>yyyyMMdd_{responseId}.zip</i> format.<br><br>For example, if the interface for generating indexes of agent operation details has been invoked on <b>2018-07-02</b> , and if the obtained recording index <b>responseId</b> is <b>9239cb50a8384bb0ab503441bf08944</b> , the value of this parameter is <b>20180702_9239cb50a8384bb0ab503441bf089446.zip</b> . |

## Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a CDR file. The file name extension is .zip. For details about the parameters in the file, see [13.2.2.1 Definitions of CDR and Recording Index Files](#). In the response message, the value of **content-type** is **Application/Octet-stream;charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-85](#). **resultData** is a reserved field and is left empty by default.

**Table 13-85** Parameters in the response

| No. | Name       | Value Type | Description                                                                            |

Accept: */*
Host: 10.154.198.164
Content-Type: application/json;charset=UTF-8
Content-Length: 193
```
- Request parameters  

```
{
 "request": {
 "version": "2.0"
 },
 "msgBody": {
 "agentOprInfoFileName": "20180702_9239cb50a8384bb0ab503441bf089446.zip"
 }
}
```

### 13.2.1.8 Requesting to Play Back a Recording File

#### Description

After this API is invoked, the backend verifies the recording file name. If the verification is successful, a token is returned for [13.2.1.9 Playing Back a Recording File](#).

#### Usage Description

- Prerequisites

- Recording index files have been obtained by invoking the interface for downloading CDRs and recording indexes.
- You have passed the authorization and obtained the access URL.
- Usage restrictions
 

Developers can only play recording files under their own accounts. The developer account (**appId**) must correspond to the recording file name (**fileName**).

The developer account (**appId**) is contained in the authentication string. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

## Interface Method

POST

## URI

`https://ip:port/CCFS/resource/ccfs/requestPlayVoice`

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

## Request

**Table 13-87** Parameters in the request header

| No. | Name          | Value Type | Mandatory | Default Value | Description                                                                                                                                            |
|-----|---------------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Content-Type  | String     | Yes       | No            | The value is fixed to <b>application/json; charset=UTF-8</b> .                                                                                         |
| 2   | Authorization | String     | Yes       | No            | For details about the generation mode, see <a href="#">4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication</a> . |

**Table 13-88** request parameters in the request body

| No. | Name    | Value Type    | Mandatory | Default Value | Description                                                     |
|-----|---------|---------------|-----------|---------------|-----------------------------------------------------------------|
| 1   | version | String (1-32) | Yes       | 2.0           | Protocol version. Currently, the value is fixed to <b>2.0</b> . |

**Table 13-89** msgBody parameters in the request body

| No. | Name     | Value Type | Mandatory | Default Value | Description                                                                                                                                                                                                                                                                                      |
|-----|----------|------------|-----------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | fileName | String     | Yes       | None          | Relative path of the recording file, which is obtained from the <b>original_file_name</b> field in the recording index file returned when the interface for downloading CDRs and recording indexes is invoked.<br>Note: The backslash (\) in <b>fileName</b> needs to be changed to a slash (/). |

## Response

If the interface is invoked successfully, a response is returned. In the response, the value of **resultCode** is **0**, and the value of **resultMsg** is **success**.

For details about the response data structure, see [Table 13-90](#). The **resultData** parameter carries the token.

If the interface fails to be invoked, an error code is returned. The default value of **resultData** is **null**.

**Table 13-90** Parameters in the response

| No. | Name       | Value Type | Description                                                                                                                                                                      |
|-----|------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | resultCode | String     | Result code returned. <ul style="list-style-type: none"> <li><b>0</b>: success</li> <li>Other values: For details, see <a href="#">13.2.3.1 Error Code Reference</a>.</li> </ul> |

| No. | Name       | Value Type | Description                                                                                                                                                     |
|-----|------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2   | resultDesc | String     | Request result description.                                                                                                                                     |
| 3   | resultData | Object     | Response data. For details, see <a href="#">Table 13-91</a> .                                                                                                   |
| 4   | response   | Object     | Request result object. For details, see <a href="#">Table 13-92</a> .<br>This field is reserved for compatibility with earlier versions and is not recommended. |

**Table 13-91** Description of resultData in the response message

| No. | Name  | Value Type | Description                                                                                                                                                                        |
|-----|-------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.1 | token | String     | After this interface is successfully invoked, the token is used for authentication for <a href="#">13.2.1.9 Playing Back a Recording File</a> . The token is valid for 30 minutes. |

**Table 13-92** Parameters in a response message

| No. | Name       | Value Type       | Description                                                                            |
|-----|------------|------------------|----------------------------------------------------------------------------------------|
| 4.1 | version    | String<br>(1-32) | Protocol version, for example, 2.0.                                                    |
| 4.2 | resultCode | String<br>(1-32) | Result code returned. For details, see <a href="#">13.2.3.1 Error Code Reference</a> . |
| 4.3 | resultMsg  | String           | Request result description.                                                            |

## Example

13.2.1.9 Playing Back a Recording File

Description

This interface is invoked by the Windows Media Player to play recording files in URL mode.

Usage Description

- Prerequisites
 - You have obtained the token by invoking the interface described in [13.2.1.8 Requesting to Play Back a Recording File](#).
 - The access URL has been obtained.
- Usage restrictions
Developers can only download files under their own accounts. The developer account (**appId**) must correspond to the recording file name (**fileName**).

Interface Method

GET

URI

https://ip:port/CCFS/resource/ccfs/playVoice

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Request

Table 13-93 Parameters in the request

No.	Name	Value Type	Mandatory	Default Value	Description
1	t	String	Yes	None	To prevent data cache, you are advised to use the current timestamp.
2	version	String	Yes	2.0	Protocol version. The default value is 2.0 .
3	st	String	Yes	None	Token returned when the interface described in 13.2.1.8 Requesting to Play Back a Recording File is invoked.

Response

If this interface is successfully invoked, the binary data stream of the corresponding recording file is returned, which can be directly played using the Windows media player.

If the interface fails to be invoked, an error code is returned. In the response, the value of **content-type** is **application/octet-stream;charset=UTF-8**. For details about the error code response data structure, see [Table 13-94](#). **resultData** is a reserved field and is defaulted to **null**.

Table 13-94 Parameters in a response message

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .
2	resultDesc	String	Request result description.
3	resultData	Object	Response data.
4	response	Object	Request result object. For details, see Table 13-95 . This field is reserved for compatibility with earlier versions and is not recommended.

Table 13-95 Parameters in a response message

No.	Name	Value Type	Description
4.1	version	String (1-32)	Protocol version, for example, 2.0.
4.2	resultCode	String (1-32)	Result code returned. For details, see 13.2.3.1 Error Code Reference .
4.3	resultMsg	String	Request result description.

Example

- Request
GET https://ip:port/CCFS/resource/ccfs/playVoice?t=1596677685425&version=2.0&st=7D41CF5DE98948979AAE063114C8AF3
- Response header
HTTP/1.1 200 OK
Content-Type: application/octet-stream;charset=UTF-8
Date: Mon, 02 Jul 2018 02:43:03 GMT
- Response parameters

```
{
  "resultData": null,
  "resultCode": "010106",
  "resultDesc": "Parameter token is empty."
}
```

13.2.1.10 Downloading an Intelligent IVR Recording File

Description

This interface is invoked to download an intelligent IVR recording file.

Usage Description

- Prerequisites
 - You have passed the authorization and obtained the access URL.
- Usage restrictions

Developers can download only files under their own accounts. The VDN ID corresponding to the developer account (**appId**) must contain the VDN ID in the intelligent IVR recording file name (**fileName**).

Interface Method

POST

URI

https://ip:port/CCFS/resource/ccfs/downloadOiapRecord?locationId={locationId}

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Table 13-96 Parameters in the URL

No.	Name	Value Type	Mandatory	Description
1	locationid	Integer	No	Node ID. The value can be obtained using the session record query interface <code>https://IP.PORT/oifde/rest/api/queryRecordHistory</code> .

Request

Table 13-97 Parameters in the request

No.	Name	Value Type	Mandatory	Default Value	Description
1	Content-Type	String	Yes	No	The value is fixed to application/json; charset=UTF-8 .
2	Authorization	String	Yes	No	For details about the generation mode, see 4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication .

Table 13-98 request parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	version	String (1-32)	Yes	2.0	Protocol version. Currently, the value is fixed to 2.0 .

Table 13-99 msgBody parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	fileName	String (1-127)	Yes	None	<p>Name of an intelligent IVR recording file.</p> <p>Parameter format:</p> <p>1: <i>{Recording drive letter}:/{record}/{VDN ID}/{odfsrecord}/{yyyymmdd}/{Main file name}.wav</i></p> <p>Example: Y:/record/39/odfsrecord/20201015/10233946082696733.wav</p> <p>2: <i>{Recording drive letter}:/{VDN ID}/{odfsrecord}/{yyyymmdd}/{Main file name}.wav</i></p> <p>Example: Y:/39/odfsrecord/20201015/10233946082696733.wav</p> <p>3: <i>{Recording drive letter}:/{record}/{VDN ID}/{yyyymmdd}/{Main file name}.wav</i></p> <p>Example: Y:/record/39/20201015/10233946082696733.wav</p> <p>4: <i>{Recording drive letter}:/{VDN ID}/{transferrecord}/{yyyymmdd}/{Main file name}.wav</i></p> <p>Example: Y:/39/transferrecord/20201015/10233946082696733.wav</p> <p>Note: <i>{VDN ID}</i> indicates the VDN ID, <i>{yyyymmdd}</i> indicates the date when the intelligent IVR recording file is generated, and <i>{Main file name}</i> indicates the name of the recording file.</p>

Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a recording file. The file name extension is .wav. In the response message, the value of **content-type** is **Application/Octet-stream;charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-100](#). **resultData** is a reserved field and is left empty by default.

Table 13-100 Parameters in the response

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .
2	resultDesc	String	Request result description.
3	responseData	Object	Response data.
4	response	Object	Request result object. For details, see Table 13-101 . This field is reserved for compatibility with earlier versions and is not recommended.

Table 13-101 Parameters in a response message

No.	Name	Value Type	Description
4.1	version	String (1-32)	Protocol version, for example, 2.0.
4.2	resultCode	String (1-32)	Result code returned. For details, see 13.2.3.1 Error Code Reference .
4.3	resultMsg	String	Request result description.

Example

- Request header

```
POST /CCFS/resource/ccfs/downloadOiapRecordHTTP/1.1
Authorization: auth-v2/ak/2018-07-02T02:45:50Z/content-length;content-type;host/
eb453f68e*****96c509c4913
Accept: */*
Content-Type: application/json;charset=UTF-8
Content-Length: 193
```
- Request parameters

```
{

```

13.2.1.11 Downloading IVR Voice Messages

Description

This interface is invoked to download a recording file of IVR voice messages.

Usage Description

- Prerequisites
 - You have passed the authorization and obtained the access URL.
- Usage restrictions

Developers can download only files under their own accounts. The VDN ID corresponding to the developer account (**appid**) must contain the VDN ID in the recording file name (**fileName**) of IVR voice messages.

Interface Method

POST

URI

<https://ip:port/CCFS/resource/ccfs/downloadIVRRecordFile?locationId={locationId}>

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Table 13-102 Parameters in the URL

No.	Name	Value Type	Mandatory	Description
1	locationId	Integer	No	Node ID. The value can be obtained using the session record query interface https://IP.PORT/oifde/rest/api/queryRecordHistory .

Request

Table 13-103 Parameters in the request header

No.	Name	Value Type	Mandatory	Default Value	Description
1	Content-Type	String	Yes	No	The value is fixed to application/json; charset=UTF-8 .

No.	Name	Value Type	Mandatory	Default Value	Description
2	Authorization	String	Yes	None	For details about the generation mode, see 4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication .

Table 13-104 request parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	version	String (1-32)	Yes	2.0	Protocol version. Currently, the value is fixed to 2.0 .

Table 13-105 msgBody parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	fileName	String (1-225)	Yes	None	Recording file name of IVR voice messages. Parameter format: <i>{Recording drive letter}:[{VDN ID}]record/{yyyymmdd}{Main file name}.wav</i> Example: Y:/39/record/20201015/10233946082696733.wav Note: <i>{VDN ID}</i> indicates the VDN ID, <i>{yyyymmdd}</i> indicates the date when the recording file of IVR voice messages is generated, and <i>{Main file name}</i> indicates the name of the recording file. The directory after <i>{VDN ID}</i> must be the value of the system parameter Directory next to vdnld in IVR message recording files . Contact the system administrator to obtain the value of the system parameter in Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Directory next to vdnld in IVR message recording files . The default value is record .

Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a recording file. The file name extension is .wav. In the response message, the value of **content-type** is **Application/Octet-stream;charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see the following table. **resultData** is a reserved field and is left empty by default.

Table 13-106 Parameters in the response

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .

No.	Name	Value Type	Description
2	resultDesc	String	Request result description.
3	resultData	Object	Response data.

Example

- Request header

```
POST /CCFS/resource/ccfs/downloadRecordFile HTTP/1.1
Authorization: auth-v2/ak/2018-07-02T02:45:50Z/content-length;content-type;host/
eb453f68e858*****196c509c4913
Accept: */*
Content-Type: application/json;charset=UTF-8
Content-Length: 193
```
- Request parameters

```
{
  "request": {
    "version": "2.0"
  },
  "msgBody": {
    "fileName": "Y:/39/record/20201015/10233946082696733.wav"
  }
}
```

13.2.1.12 Downloading a Recording File as a Third Party

Description

This interface is invoked by a third-party to download a recording file. The third-party system is connected to the IVR system by loading a customized JAR package.

Usage Description

- Prerequisites
 - You have passed the authorization.
- Usage restrictions
 Developers can download only files whose path is the value of the system parameter **Third-Party Recording Download Path Rule** under their own accounts. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#). Contact the system administrator to obtain the value of the system parameter in **Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Third-Party Recording Download Path Rule**.

Interface Method

POST

URI

https://ip:port/CCFS/resource/ccfs/ivr/downloadFile

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Request

Table 13-107 Parameters in the request header

No.	Name	Value Type	Mandatory	Default Value	Description
1	Content-Type	String	Yes	None	The value is fixed to application/json; charset=UTF-8 .
2	Authorization	String	Yes	None	For details about the generation mode, see 4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication .

Table 13-108 request parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	version	String (1-32)	Yes	2.0	Protocol version. Currently, the value is fixed to 2.0 .

Table 13-109 msgBody parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	filePath	String	Yes	None	<p>If mode is set to 1, filePath indicates the path of the folder where the file is located, for example, Y:/voice/1/IVRrecordFile.</p> <p>If mode is not specified or is set to another value, the value of filePath must be a full file path, for example, Y:/voice/1/IVRrecordFile/xx.wav.</p> <p>Note: The file path is specified by the system parameter Third-Party Recording Download Path Rule. Contact the system administrator to obtain the value of the system parameter in Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Third-Party Recording Download Path Rule. Default value: /voice/ %VDNNO %/IVRrecordFile;/3rdfile/ %VDNNO %/IVRrecordFile;/3rdfile/ %VDNNO %/thirdvoicebotfile.</p>
2	mode	Integer	No	None	<p>If mode is set to 1, the value of filePath is a directory that contains a unique file. If the directory does not contain any file or contains multiple files, a failure message is returned. If mode is not specified or is set to another value, the value of filePath must be a full file path containing the file name.</p>

Response

If the interface is successfully invoked, the system obtains the binary data of the file from the HTTP response message to generate a recording file. The file name extension is .wav. In the response message, the value of **content-type** is **Application/Octet-stream;charset=UTF-8**.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-110](#). **resultData** is a reserved field and is left empty by default.

Table 13-110 Parameters in the response

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .
2	resultDesc	String	Request result description.
3	resultData	Object	Response data.

Example

- Request header
 POST /CCFS/resource/ccfs/ivr/downloadFile HTTP/1.1
 Authorization: auth-v2/ak/2021-08-31T09:38:50.872Z/content-length;content-type;host/c12f0ed0*****94941bdd106
 Accept: */*
 Content-Type: application/json;charset=UTF-8
 Content-Length: 193
- Request parameters

```
{
  "request": {
    "version": "2.0"
  },
  "msgBody": {
    "filePath": "Y:/3rdfile/53/thirdvoicebotfile",
    "mode": "1"
  }
}
```

13.2.1.13 Uploading a File as a Third Party

Description

This interface is invoked by a third party to upload a file for a third-party chatbot. The third-party system is connected to the IVR system by loading a customized JAR package. The SaaS and OP deployment modes are supported.

Usage Description

- Prerequisites
 - You have passed the authorization.
- Usage restrictions

Developers can upload files to only folders under their own accounts. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

Contact the system administrator to obtain the upload path in **Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Third-Party Recording Download Path Rule**.

Interface Method

POST

URI

https://ip:port/CCFS/resource/ccfs/ivr/uploadFile?vdnId={vdnId}

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Table 13-111 Parameters in the URL

No.	Name	Value Type	Mandatory	Description
1	vdnId	Integer	Yes	ID of a VDN.

Request

Table 13-112 Parameters in the request header

No.	Name	Value Type	Mandatory	Default Value	Description
1	Content-Type	String	Yes	None	The value is fixed to application/json; charset=UTF-8 .
2	Authorization	String	Yes	None	For details about the generation mode, see 4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication .

Table 13-113 request parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	version	String (1-32)	Yes	2.0	Protocol version. Currently, the value is fixed to 2.0 .

Table 13-114 msgBody parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	data	String	Yes	None	Base64 code of the file to be uploaded. Note: Only WAV voice files in the following format are supported: 8 bit, 8000 Hz, 64 kbit/s, and mono. The file size is specified by the system parameter Third-Party Upload File Size Limit , in MB. The default value is 5 . To modify the file size, contact the system administrator to set the system parameter in Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Resource allocation > Third-Party Upload File Size Limit .

Response

If this interface is successfully invoked, **0** and the message "operate success" are returned.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-73](#). **resultData** is a reserved field and is left empty by default.

Table 13-115 Parameters in the response

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .
2	resultDesc	String	Request result description.
3	resultData	Object	Response data. For details, see Table 13-116 .

Table 13-116 Description of resultData in the response message

No.	Name	Value Type	Description
3.1	fileName	String	Name of the file to be uploaded. The file name must be the value of the system parameter Third-Party Upload File Path Rule . Contact the system administrator to obtain the value of the system parameter in Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Third-Party Upload File Path Rule . The default value is <code>/3rdfile/%VDNNO%/thirdvoicebotfile/</code> . Example: <code>{Drive letter}:/3rdfile/{VDN ID}/thirdvoicebotfile/xxx.wav</code>
3.2	locationId	List <String>	In CTI pool mode, the information is displayed if the upload is successful:

Example

- Request header**
 POST /CCFS/resource/ccfs/ivr/upload?vdnId=xx HTTP/1.1
 Authorization: auth-v2/ak/2021-08-31T09:38:50.872Z/content-length;content-type;host/c12f0ed*****941bdd106
 Accept: */*
 Content-Type: application/json;charset=UTF-8
 Content-Length: 193
- Request parameters**

```
{
  "request": {
    "version": "2.0"
  },
  "msgBody": {
    "data": "base64"
  }
}
```
- Response parameters**

```
{
  "resultData": {
    "fileName": "Y:/3rdfile/53/thirdvoicebotfile/8fSsBaEb_1631869974029.wav",

```

```

    "locationId": [
      "0",
      "256"
    ]
  },
  "resultCode": "0",
  "resultDesc": "success"
}

```

13.2.1.14 Generating a File Hash Value as a Third Party

Description

This API is invoked by a third party to generate the hash value of an uploaded file. The third-party system is connected to the IVR system by loading a customized JAR package.

Usage Description

- Prerequisites
 - You have passed the authorization.
- Usage restrictions

Developers can obtain only the hash values of the files under their own accounts. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

Interface Method

POST

URI

`https://ip:port/CCFS/resource/ccfs/ivr/getFileHash`

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Request

Table 13-117 Parameters in the request header

No.	Name	Value Type	Mandatory	Default Value	Description
1	Content-Type	String	Yes	None	The value is fixed to application/json; charset=UTF-8 .

No.	Name	Value Type	Mandatory	Default Value	Description
2	Authorization	String	Yes	None	For details about the generation mode, see 4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication .

Table 13-118 request parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	version	String (1-32)	Yes	2.0	Protocol version. Currently, the value is fixed to 2.0 .

Table 13-119 msgBody parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	fileName	String	Yes	None	Full path of the file whose hash value needs to be obtained. The file path is specified by the system parameter Third-Party Upload File Path Rule . Contact the system administrator to obtain the value of the system parameter in Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Third-Party Upload File Path Rule . The default value is <code>/3rdfile/%VDNNO%/thirdvoicebotfile/</code> . Example: <code>{Drive letter}:/3rdfile/{VDN ID}/thirdvoicebotfile/xxx.wav</code>

No.	Name	Value Type	Mandatory	Default Value	Description
2	locationId	String	No	None	This parameter is valid only in CTI pool mode.

Response

If this interface is successfully invoked, **0** and the message "operate success" are returned.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-73](#). **resultData** is a reserved field and is left empty by default.

Table 13-120 Parameters in the response

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .
2	resultDesc	String	Request result description.
3	resultData	Object	Response data. For details, see Table 13-121 .

Table 13-121 Description of resultData in the response message

No.	Name	Value Type	Description
3.1	hashValue	String	String of the voice file after SHA256 encoding.

Example

- Request header
 POST /CCFS/resource/ccfs/ivr/getFileHash HTTP/1.1
 Authorization: auth-v2/ak/2021-08-31T09:38:50.872Z/content-length;content-type;host/c12f0ed0*****494941bdd106
 Accept: */*
 Content-Type: application/json;charset=UTF-8
 Content-Length: 193
- Request parameters

```
{
  "request": {
    "version": "2.0"
  },
  "msgBody": {
```

```
    "fileName": "Y:/3rdfile/2/thirdvoicebotfile/5dckNDei_1647502396161.wav"  
  }  
}
```

- Response parameters

```
{  
  "resultData": {  
    "hashValue": "2b67748fe335617*****cf19f28bb8"  
  },  
  "resultCode": "0",  
  "resultDesc": "success"  
}
```

13.2.1.15 Deleting an Uploaded File as a Third Party

Description

This API is invoked by a third party to delete an uploaded file. The third-party system is connected to the IVR system by loading a customized JAR package.

Usage Description

- Prerequisites
 - You have passed the authorization.
- Usage restrictions

Developers can delete only files under their own accounts. For details, see [4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication](#).

Interface Method

POST

URI

`https://ip:port/CCFS/resource/ccfs/ivr/deleteFile`

Set *ip* to the IP address of the server where the CC-FS is installed and *port* to the HTTPS port number of the CC-FS.

If the request is routed through the NSLB, set *ip* to the IP address of the NSLB server and *port* to the HTTPS port number of the CC-FS service mapped on the NSLB.

Request

Table 13-122 Parameters in the request header

No.	Name	Value Type	Mandatory	Default Value	Description
1	Content-Type	String	Yes	None	The value is fixed to application/json; charset=UTF-8 .
2	Authorization	String	Yes	None	For details about the generation mode, see 4.3 C2 Monitoring, System Outbound Call, CDR, and Knowledge Base Interface Authentication .

Table 13-123 request parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	version	String (1–32)	Yes	2.0	Protocol version. Currently, the value is fixed to 2.0 .

Table 13-124 msgBody parameters in the request body

No.	Name	Value Type	Mandatory	Default Value	Description
1	fileName	String	Yes	None	File to be deleted. The file path is specified by the system parameter Third-Party Upload File Path Rule . Contact the system administrator to obtain the value of the system parameter in Configuration Center > System Management > System Parameter Configuration > System parameters > File storage service > Path Configuration > Third-Party Upload File Path Rule . The default value is <code>/3rdfile/%VDNNO%/thirdvoicebotfile/</code> . Example: <code>{Drive letter}:/3rdfile/{VDN ID}/thirdvoicebotfile/xxx.wav</code>
2	locationId	String	No	None	This parameter is valid only in CTI pool mode. If locationId has a value, delete the files in the path specified by uapId corresponding to locationId . If locationId is empty, delete all files.

Response

If this interface is successfully invoked, **0** and the message "operate success" are returned.

If the interface fails to be invoked, an error code is returned. For details about the error code data structure, see [Table 13-73](#). **resultData** is a reserved field and is left empty by default.

Table 13-125 Parameters in the response

No.	Name	Value Type	Description
1	resultCode	String	Result code returned. For details, see 13.2.3.1 Error Code Reference .
2	resultDesc	String	Request result description.
3	resultData	Object	Response data.

Example

- Request header**

```
POST /CCFS/resource/ccfs/ivr/deleteFile HTTP/1.1
Authorization: auth-v2/ak/2021-08-31T09:38:50.872Z/content-length;content-type;host/c12f0ed0*****941bdd106
Accept: */*
Content-Type: application/json;charset=UTF-8
Content-Length: 193
```
- Request parameters**

```
{
  "request": {
    "version": "2.0"
  },
  "msgBody": {
    "fileName": "Y:/3rdfile/2/thirdvoicebotfile/5dckNDei_1647502396161.wav"
  }
}
```
- Response parameters**

```
{
  "resultData": null,
  "resultCode": "0",
  "resultDesc": "success"
}
```

13.2.2 Index File Definition

13.2.2.1 Definitions of CDR and Recording Index Files

Definitions of Recording Index Files (yyymmddhhmmssSSS+3-digit random number_record_file sequence number.csv)

In the exported .csv recording file, each line indicates a piece of data. The data in each line is sorted by column. The following table describes the data in each line.

No.	Parameter	Type	Description
1	developer	String (1-64)	ID of a developer.
2	account_id	String (1-64)	Enterprise account.
3	cc_id	String (1-64)	ID of a call center.
4	agent_id	String (1-32)	Agent ID.
5	call_id	String (1-25)	Call ID.
6	caller_number	String (1-25)	Calling number.

No.	Parameter	Type	Description
7	callee_no	String (1-25)	Called number.
8	call_begin	Date	Start time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
9	call_end	Date	End time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
10	file_name	String (1-255)	Name of a recording file, for example, /10/1/record/100/13533/0903379.wav .
11	task_status	String (1-20)	Indicates whether to convert a recording file to a text file. The options are 1 (yes) and 0 (no).
12	task_result	String (1-20)	Whether a recording file is successfully converted into a text file. The options are success and failed .
13	original_file_name	String (1-129)	Path to the original recording file. Example: X:\17\0\20180903\15470\2043295.V3
14	vdn_id	String (1-64)	ID of the VDN that processes a call.
15	call_type	String (1-64)	Call type. For details, see 13.2.3.6 Description of Call Types .
16	media_type	String (1-64)	Media type. For details, see 13.2.3.5 Media Type .
17	user_wanted_skill_id	String (1-64)	Direction skill.
18	current_skill_id	String (1-64)	ID of the skill queue that processes a call.

Definitions of CDR Files (yyymmddhhmmssSSS+3-digit random number_call_File sequence number.csv)

In the exported .csv CDR file, each line indicates a piece of data. The data in each line is sorted by column. The following table describes the data in each line.

No.	Parameter	Type	Description
1	developer	String (1-64)	ID of a developer.
2	account_id	String (1-64)	Enterprise account.
3	cc_id	String (1-64)	ID of a call center.
4	agent_id	String (1-32)	Agent ID.
5	call_id	String (1-25)	Call ID.
6	caller_no	String (1-26)	Calling number.
7	callee_no	String (1-26)	Called number.
8	wait_begin	Date	Waiting start time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
9	wait_end	Date	Waiting end time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
10	ack_begin	Date	Response start time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
11	ack_end	Date	Response end time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
12	call_begin	Date	Call start time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
13	call_end	Date	Call end time. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
14	device_type	Integer (1-4)	Device type. The options are 1 (skill queue), 2 (agent), and 3 (IVR flow).

No.	Parameter	Type	Description
15	device_no	Integer (1-5)	Device number. If the device type is skill queue, the device number is the skill queue ID. If the device type is agent, the device number is the agent ID. If the device type is IVR, the device ID is the IVR flow ID.
16	call_type	Integer (1-4)	Call type. For details, see 13.2.3.6 Description of Call Types .
17	release_cause	Integer (1-5)	Call release cause. For details, see 13.2.3.3 Cause Code . For the bill in which the value of CallIDNUM is -1 (refer to item 18 in this table), this field indicates the call release reason. In other cases, this field is meaningless.
18	call_id_num	Integer (1-4)	Sequence number of a call ID. If there is only one call ID, that is, the call ID is unique, the sequence number is -1 . If there are multiple records with the same call ID, the sequence number of the last record is -1 , and those of other records are numbered in sequence. For example, if four records have the same call ID, and the values of callidnum are 1, 2, 3, and -1 .
19	vdn_id	String (1-32)	ID of the VDN that processes a call.
20	pre_device_type	String (1-32)	Type of the previous device that a call passes through. The options are 1 (skill queue), 2 (agent), and 3 (IVR).
21	pre_device_no	String (1-32)	ID of the previous device that a call passes through.
22	skill_id	String (1-32)	ID of the skill queue to which a call belongs. When a call is transferred because the skill queue to which the call belongs overflows or no agent is on duty, the value is the ID of the first skill queue that the call enters.
23	current_skill_id	String (1-32)	ID of the skill queue that processes a call.

No.	Parameter	Type	Description
24	device_in	String (1-32)	<p>Description of the current device.</p> <ul style="list-style-type: none"> For a skill queue, the value is DEVICE_QUEUE. For an agent, the value is DEVICE_AGENT. When the value of DeviceType is IVR process (3), the value is the IVR flow access code. For a call, the value is a phone number. For a temporary routing device, the value is DEVICE_ROUTE. For a virtual device, the value is DEVICE_VNR. When the value of DeviceType is CDN device (10), the value is the CDN number. When the value of DeviceType is PGR (14), the value is the PGR access code.
25	pre_device_in	String (1-32)	<p>Description of the previous device. The values are as follows:</p> <ul style="list-style-type: none"> For a skill queue, the value is DEVICE_QUEUE. For an agent, the value is DEVICE_AGENT. When the value of DeviceType is IVR process (3), the value is the IVR flow access code. For a call, the value is a phone number. For a temporary routing device, the value is DEVICE_ROUTE. For a virtual device, the value is DEVICE_VNR. When the value of DeviceType is CDN device (10), the value is the CDN number. When the value of DeviceType is PGR (14), the value is the PGR access code.
26	service_no	String (1-32)	Business type. Type of the business currently provided by a device.
27	leave_reason	String (1-32)	Reason why a call is disconnected from a device. For details, see 13.2.3.7 Reasons for Leaving the Device of the Call .
28	media_type	String (1-32)	Media type of a call. For details, see 13.2.3.8 Description of Call Media Types .
29	sub_media_type	String (1-32)	<p>Submedia type. For details, see Table 13-133.</p> <p>This parameter is valid only when media_type (call media type) is set to MEDIA_TYPE_WEB_LEAVE_MESSAGE (20).</p>

13.2.2.2 Definition of Index Files for Agent Operation Details

Definitions of Agent Operation Bill Index Files (yyymmddhhmmssSSS+3-digit random number_agentOprInfo_file sequence number.csv)

In the exported .csv file, each line indicates a piece of data. The data in each line is sorted by column. The following table describes the data in each line.

No.	Parameter	Type	Description
1	id	String (1-32)	Unique ID.
2	developer_id	String (1-64)	ID of a developer.
3	account_id	String (1-64)	Enterprise account.
4	agent_id	String (1-32)	Agent ID.
5	service_no	String (1-25)	Business type ID.
6	skill_id	String (1-25)	ID of a skill queue.
7	call_id	String (1-25)	Call ID.
8	begin_time	DATE	Start time of an operation. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
9	end_time	DATE	End time of an operation. The time format is <i>YYYY-MM-DD hh:mm:ss</i> , for example, 2015-02-08 20:23:30 .
10	op_type	String (1-20)	Operation type. For details, see Table 13-128 .
11	op_object	String (1-20)	Operation object.
12	op_cause	String (1-20)	Operation reason.
13	media_type	String (1-20)	Media type.
14	vdn_id	String (1-20)	VDN ID
15	cc_id	String (1-20)	ID of a call center.
16	agent_type	String (1-20)	Agent type or customer level.
17	phone_no	String (1-32)	Agent IP address, agent phone number, called number, or conference ID.

No.	Parameter	Type	Description
18	callIn_out	String (1-20)	Incoming or outgoing call flag. The options are as follows: <ul style="list-style-type: none"> • Incoming • Outgoing • Outbound call made by IVR • Outbound
19	location_id	String (1-20)	Distributed node ID.
20	logon_sn	String (1-25)	Sign-in SN.
21	skillInfo_sn	String (1-25)	Index of the skill list that an agent has when the agent performs the current operations. If the parameter value is blank, the agent does not have any skills. For example, the parameter value is blank when the agent logs in to the platform.

13.2.3 Reference Description

13.2.3.1 Error Code Reference

Response Code	Result Code	Description	Handling Method
200	0	success	No handling is required.
200	0300001	The value of {param} cannot be null.	Check whether the parameter value in the request string is an empty string.
200	0300002	The value of {param} cannot be an empty string.	Check whether the parameter value in the request string is an empty string.
200	0300003	The length of {param} is too long.	Check whether the parameter value is greater than the maximum length specified in the document.
200	0300004	The format of {param} is incorrect.	Check whether the parameter complies with the format described in the document.

Response Code	Result Code	Description	Handling Method
200	0300005	The length of {param} is too short.	Check whether the parameter value is less than the maximum length specified in the document.
200	0300006	The value of version is error, current version is {param} .	Check whether the version number parameter is correct.
200	0300007	The params of requestBody is null.	Check whether the parameter length is matched.
200	0300008	Reached the download flow control threshold.	The maximum number of download requests that can be processed by the system is reached. Try again later.
200	0300009	Reached the query flow control threshold.	The maximum number of query requests that can be processed by the system is reached. Try again later.
200	0300010	The date in the value of fileName is in an incorrect format.	Check whether the file name in the request string is valid. The file name format is <i>/{Node ID}/{Call center ID}/record/{App ID}/{Account ID}/{yyyymmdd}/{Agent ID}/{Original file name}. {File name extension}</i> . Check whether <i>{yyyymmdd}</i> is correct.
200	0300011	The file does not exist.	The requested file does not exist. Check whether the requested file is correct.
200	0300012	No data found.	Check whether the value of fileName is correct. The file name format is as follows: <i>{Drive letter};/{VDN ID}/{0 (inbound call) or 1 (outbound call)}/{Date}/{Agent ID}/{Current time, in milliseconds}.V3</i>
200	0300013	The beginTime cannot be later than the endTime.	Check the values of beginTime and endTime in the request.

Response Code	Result Code	Description	Handling Method
200	0300014	The maximum duration between the beginTime and endTime is {param} days.	Check whether the time range specified by beginTime and endTime in the request string is valid. The maximum time range is 3 days by default.
200	0300015	The local storage or voice path does not exist.	The following configuration items in the configuration file must be properly set: ccfs.common.local.store.path ccfs.common.local.voice.path
200	0300016	The value of {param} is greater than current time.	Check the query interval.
200	0300017	Specify cclid.	Multiple data records are found. The cclid parameter needs to be specified for more accurate query.
200	0300018	This record belongs to another developer.	The developer information in the recording to be queried does not match the developer information in the request. Check whether the value of appld is correct.
200	0300019	Specify at least one of fileName and callld.	Check whether fileName or callld is set.
200	0300020	Only one record is required but multiple records are obtained.	Multiple records are found based on the search criteria. However, only one record is required. Contact the administrator.
200	0300021	The {param} in fileName does not match the {param} in the directory.	Check whether the file name in the request string is valid. The file name format is <i>{Node ID}/{Call center ID}/record/{App ID}/{Account ID}/{yyyymmdd}/{Agent ID}/{Original file name}.{File name extension}</i> . Check whether <i>{App ID}</i> , record , and <i>{Node ID}</i> are correct.

Response Code	Result Code	Description	Handling Method
200	0300022	The parameter {param} value contains illegal characters.	<p>The value of the request parameter contains invalid special characters. Examples are as follows:</p> <p>The value of billFileName in the interface for downloading CDRs and recording indexes can contain only letters, digits, periods (.), hyphens (-), and underscores (_).</p> <p>The value of fileName in the interface for downloading recording files can contain only letters, digits, slashes (/), and periods (.).</p> <p>The value of fileName in the interface for downloading STT files can contain only letters, digits, slashes (/), and periods (.).</p> <p>The value of fileName in the interface for querying and downloading recording files can contain only letters, digits, colons (:), slashes (/), and periods (.)</p>
200	0300023	The file name does not match the path configured in the configuration file.	During the download of IVR voice messages, the directory after the VDN ID in the path specified by the request parameter fileName does not match the value of the system parameter Directory next to vdnId in IVR message recording files . Set the system parameter to a proper file path.
200	0300024	The file path is not canonical path.	Check whether the path is a standard path.
200	0300025	Internal system error.	Contact the administrator.
200	0300026	Authentication failed.	Check whether the account ID or VDN ID is correct.
200	0300027	Parameter {param} is empty.	Check whether the parameter value is empty or an empty string.

Response Code	Result Code	Description	Handling Method
200	0300028	Parameter {param} is error.	Check whether the parameter meets the requirements described in the document.
200	0300029	File does not exist.	Check whether the value of fileName is correct. The file requested by the interfaces for requesting and playing back recording files does not exist.
200	0300030	Failure of system processing.	Contact the administrator.
200	0300031	Invalid oiap fileName, fileName Length is not legal.	Check the value length of fileName .
200	0300032	file path is invalid.	Check whether the file path is valid.
200	0300033	locationId is empty	Check whether the parameter value is empty or an empty string.
200	0300034	tenantId is empty	Check whether the parameter value is empty or an empty string.
200	0300035	audio file type should be wav.	Check the file format. Only audio files in WAV format are supported.
200	0300036	audio file channel should be mono.	Check the audio file channel.
200	0300037	audio file fileSampleSizeInBits should be 8000Hz.	Check the number of frames in a file.
200	0300038	audio file fileSampleRate should be 8000Hz.	Check the audio file sampling rate.
200	0300039	Failed to read the audio file format.	Check whether the uploaded audio file format meets requirements.
200	0300040	An exception occurred during file deletion.	Check whether the file permission is correct.

Response Code	Result Code	Description	Handling Method
200	0300041	The file size exceeds the limit.	Check the file size.
200	0300042	file path config miss parameter %VDNNO%	Add the VDNNO variable to the path rule configuration item.
200	0300043	file path configuration should refer to the example.	Check the path content configuration item.
200	0300044	The directory contains multiple files.	Check whether the folder contains only one WAV file.
200	0300045	Failed to compress the recording files.	Check whether the recording files exist.
200	0300046	The mount path corresponding to the drive letter does not exist.	Check the file path.
200	0300047	Upload file to OBS/LSS failed	Check whether the OBS/LSS service is normal.
200	0300048	In CTI pool mode,the value of ccfs.uap.id cannot be empty	Check whether the value of ccfs.uap.id in the /home/ccfsapp/webapps/ccfsapp/WEB-INF/classes/config/servicecloud.base.properties configuration file is empty.
200	0300049	In CTI pool mode,the value format of ccfs.uap.id is incorrect	Check whether the value format of ccfs.uap.id in the /home/ccfsapp/webapps/ccfsapp/WEB-INF/classes/config/servicecloud.base.properties configuration file is correct. The value format is <i>{Mount directory},{UAP node ID}</i> .

13.2.3.2 Status Code Description

In the response, the status code is 200, indicating that the business is normal. Other status codes are returned as exception information.

Table 13-126 Status code description

Status Code	Description	Remarks
200	The business is normal.	For details, see the preceding interfaces.
401	Unauthorized access to the interface.	Check whether the authentication character string and request parameters are correct by referring to the interface authentication algorithm and Table 13-127 . For any questions, contact the administrator.
403	The IP address is locked. The number of times that the authentication string carried in the request is incorrect exceeds the maximum number of allowed errors in a period.	Check whether the authentication character string and request parameters are correct by referring to the interface authentication algorithm and Table 13-127 . For any questions, contact the administrator.

Table 13-127 Abnormal status code description

Parameter	Mandatory/Optional	Value Type	Remarks
timestamp	Mandatory	Long	Timestamp. Example: 1532142010247 .
status	Mandatory	int	Status code. Example: 401, 403
error	Mandatory	String	Error type. For example, Forbidden indicates that the permission is forbidden, and Unauthorized indicates that the permission is unauthorized.
message	Mandatory	String	Prompt message. Example: No message available .

Parameter	Mandatory/Optional	Value Type	Remarks
path	Mandatory	String	Requested path. Example: /CCFS/resource/ccfs/queryBillData

- Example of the returned error code

```
{"timestamp":1532142010247,"status":403,"error":"Forbidden","message":"Nomessageavailable","path":"/CCFS/resource/ccfs/queryBillData"}
```

13.2.3.3 Cause Code

Cause Code	Description
80	When a call is queuing in a skill queue, the call is transferred to the IVR flow for voice playback and digit collection. If a customer presses the cancel key, the flow uses this error code to request canceling the call queuing.
256	CCIVR/IVR normal call release.
263	The CCIVR/IVR disconnects a call because of connection failure.
338	The CCIVR/IVR disconnects a call because no flow can be found or an error occurs when parsing flows.
339	The CCIVR/IVR disconnects a call because there is no sufficient control blocks.
340	The CCIVR/IVR disconnects a call because the MRF script type is incorrect.
342	The CCIVR/IVR disconnects a call because the conference name is incorrect (possibly too long).
346	The CCIVR/IVR disconnects a call because waiting for the called party to pick up the phone times out after the CTIServer returns a call to the called party.
350	The CCIVR/IVR disconnects a call because waiting for the business module to pick up the phone times out.
354	The CCIVR/IVR disconnects a call because the handshake with the CTIServer times out.
356	The CCIVR/IVR disconnects a call because the CCIVR outgoing call times out.
357	The CCIVR/IVR disconnects a call because the IVR fails to connect the calling party and called party.

Cause Code	Description
359	The CCIVR/IVR disconnects a call because the maximum conversation duration is exceeded.
360	The CCIVR/IVR disconnects a call because of other errors. For details, see the logs.
501	Default call release cause. The cause could be any of the following: 1. The routing result from the CCS is not received after a call accesses the platform. As a result, the call is disconnected. 2. After a call accesses the IVR, a flow disconnects the call.
502	The platform disconnects an outgoing call because waiting for the ringing of the ACD times out or waiting for call answer times out.
503	The platform disconnects a call because the handshake between the platform control block and ACD times out after the call is established between the ACD and the platform.
505	The cause could be any of the following: 1. When a call is transferred back to the agent console after the agent console transfers the call to the IVR in suspension transfer mode, the agent console times out in responding to the suspension resuming message. As a result, the platform disconnects the call. 2. When a call is transferred back to the IVR after the IVR transfers the call to the agent console in suspension transfer mode, the IVR times out in responding to the suspension resuming message. As a result, the platform disconnects the call.
506	After an agent transfers a call to the IVR in suspension transfer mode, waiting for the CCS to return the routing result times out.
507	After a non-agent device transfers a call to the IVR in suspension transfer mode, waiting for the CCS to return the routing result times out.
508	When a call is transferred, waiting for the CCS DO_FORWARD times out.
509	When an internal call is successfully transferred, waiting for the CCS FORWARD_COMMIT times out.
510	When the platform initiates an outgoing call, waiting for the ACD SETUP_ACK message times out.
511	When the platform initiates an outgoing call, waiting for the CCS OCCUPY_ACK message times out.
512	A call is released because the number of calls waiting in a skill queue exceeds the maximum limit.
513	A call is released because the number of calls waiting in a skill queue exceeds the maximum limit.

Cause Code	Description
514	When a call is transferred from an agent to an automatic flow, waiting for the automatic flow to respond times out.
515	During call transfer, waiting for the transfer destination device to respond times out.
516	Waiting for the routing response from the CCS times out.
517	Waiting for the ringing or response from the destination device times out.
518	The client disconnects a call.
519	When a call is transferred in suspension mode, the address sent by the CCS to DO_FORWARD is incorrect.
520	When a call is transferred in suspension mode, the address sent by the CCS to DO_FORWARD is incorrect.
521	An agent initiates call redirection (a call is disconnected and transferred out).
522	An automatic flow initiates call redirection (a call is disconnected and transferred out).
523	When the platform initiates an outgoing call, the CCS returns a device occupation failure message.
525	The destination address in the routing result returned by the CCS is incorrect.
526	The CCS returns a routing failure message.
528	During outgoing call preview, the CCS returns a failure message.
529	After a flow transfers a call to an agent in suspension mode, if the agent hangs up and transfers the call back to the IVR, the IVR returns a failure message.
530	The IVR initiates call combination.
531	A call is normally disconnected in the ACD.
533	When a flow transfers a call to another flow, the flow releases the call before ringing.
534	When the CTIServer is disconnected from an ACD module, all the calls of the ACD module are released.
535	The CCS returns a routing failure message.
536	When a customer cancels queuing, the platform releases the call.
537	A call is disconnected in the ACD because the called party is busy.

Cause Code	Description
538	A call is disconnected in the ACD because the called number does not exist.
539	A call is released after the CCS is switched.
540	A call is released after voice playing.
541	A call is transferred in suspension mode to a device. After the destination device processes the call, and the call is returned to the suspension device, the CCS returns the RESUME_ACK error message.
542	A call is transferred in suspension mode to a device. After the destination device processes and releases the call, the CCS returns the HUNG_RELEASE_ACK error message.
543	A call is transferred in suspension mode to a device. After the destination device processes the call, waiting for the CCS to send RESUME_ACK to notify the suspension device of call resumption times out.
544	A call is transferred in suspension mode to a device. After the destination device processes and releases the call, waiting for the CCS to return the release result HUNG_RELEASE_ACK times out.
547	When a call is transferred, the re-routing result returned by the CCS is not a virtual device, but the transfer indication address sent by the CCS is a virtual device.
548	A call is disconnected in the ACD because the mobile phone of the called party is powered off.
549	A call is disconnected in the ACD because the called party is out of the service area.
550	When a network call is transferred in suspension mode, after the destination device processes and releases the call, the CCS returns an error.
551	A call is disconnected in the ACD for another reason.
552	During a network call, the peer call center is abnormal.
553	During a network call, the destination call center times out in waiting for the network incoming call from the ACD.
561	A call is released due to queue overflow.
562	No agent is on duty.
564	The number of concurrent calls exceeds the configured limit.
565	The total number of automatic calls exceeds the limit.
566	The number of concurrent calls in the flow exceeds the maximum.

Cause Code	Description
567	The called number cannot be found.
568	The customer level is incorrect.
601	The ACD disconnects a call because the calling party hangs up before the call is answered.
602	The ACD disconnects a call because no resource is available.
603	The ACD disconnects a call because the called party does not answer the call.
604	The ACD disconnects a call because the called party rejects the call.
605	The ACD disconnects a call because the line is busy.
606	The ACD disconnects a call because the call times out.
607	The ACD disconnects a call because the mail box is full or suspended. For details, see the UAP original call release code 5.
608	The ACD disconnects a call because emails cannot be created for calls. For details, see the UAP original call release code 6.
609	The ACD disconnects a call because the channel is reset.
610	The ACD disconnects a call because of abnormal UAP resource operations.
611	The ACD disconnects a call because the Cp conference is faulty.
612	The ACD disconnects a call because the Intess control block is faulty.
613~619	The ACD disconnects a call.
714	Internal routing fails because IVR resources are occupied or no IVR access code is registered.
732	The cause could be any of the following: 1. During a conference call, a participant is removed from the conference. 2. During a conference call, the conference moderator proactively releases the conference or the CCS is abnormal.
852	The client disconnects and rejects a call.
853	A call is released because an agent does not answer the call for a long time.
1057	Failed to route the message leaving call.
1058	Waiting for the routing result of the message leaving call times out.
1059	Waiting of a message leaving call for the queuing message times out.

Cause Code	Description
1060	Waiting for an agent to answer a message leaving call times out.
1061	The release of a message leaving call times out.
1062	The internal message leaving call times out.
1063	The handshake of the message leaving call times out.
1064	Failed to create the conference.
1065	Conference creation times out.
1066	Failed to join the conference.
1067	Querying the enterprise ID times out.
1068	Failed to query the enterprise ID.
1069	The value of EnterPriseID is empty.
1070	Querying conference information times out.
1071	Failed to query conference information.
1072	Obtaining conference data times out.
1073	Failed to obtain conference data.
1074	Conference detection times out.
1075	The number of participants in the conference is less than expected.
1076	Releasing the conference times out.
1077	The call duration reaches the maximum.

13.2.3.4 Agent Operation Type

Table 13-128 Agent operation type

Operation Type	Description	Operation Object	Operation Reason
0	The agent signs out of CCS.	-1	1-255: The error is caused by the client. 256: The agent is disconnected from the platform. 257: The agent is forcibly signed out by the inspector. 258: The agent signs out. 259: The agent signs out before signs in again. 260: The handshake between the agent control blocks time out between the media server and the CCS. 261: The CCS detects that the handshake with the UIS about the agent control block times out. 262: The handshake between the media server and the CCS is disconnected. As a result, the agent signs out. 263: The handshake between the UIS and the agent times out. 264: An agent with the same employee ID is forcibly signing in to a new client. As a result, the agent is forcibly signed out.
1	An agent signs in.	-1	-1
2	Idle.	-1	-1

Operation Type	Description	Operation Object	Operation Reason
3	Busy.	-1	1: Indicates that an agent indicates busy. 2: An agent does not answer a call in a long period, so the agent is forced to show busy. 3: An agent is forced to show busy by a QC inspector. 4: Indicates that an agent takes a rest. 5: The phone of an agent is unavailable. 7: An agent rejects a call. 200-250: error codes customized by the service side.
4	Talking.	-1	1: The agent does not really exit the conversation status. Bills are generated every five minutes starting from 00:00 to 23:55. 0: The agent fully exits the conversation status. The conversation status in these bills refers to only text conversations.
10	Three-party conversation.	Employee ID.	-1
13	Manual station to automatic station (an agent be in the Suspended state).	-1	-1
20	Listening/ Insert/ Whisper	Employee ID.	0
22	Play voice.	-1	-1

Operation Type	Description	Operation Object	Operation Reason
26	Be on holiday or take a rest.	Employee ID.	The rest cause code is specified when the client invokes CCC_REQUEST_REST_EX_Msg. The default cause code is 0.
27	Work status.	-1	0: after-call processing. The business side is set to automatically enter the on-work state. 0-255: manual adjustment. An agent manually enters the on-work state by invoking the interface. The default value is 0, indicating the after-call processing state.
29	Forcibly sign out an agent.	Employee ID.	-1
30	Forcibly show an idle state for an agent.	Employee ID.	-1
31	Forcibly show a busy state for an agent.	Employee ID.	-1
32	Perform mute-on on a customer.	-1	-1
38	Hold a call by an agent.	Employee ID.	-1

Operation Type	Description	Operation Object	Operation Reason
40	Initiate an internal help request by an agent.	Employee ID.	<p>0: Indicates no help between uncertain parties.</p> <p>1: Indicates a two-party internal help.</p> <p>2: Indicates a three-party internal help.</p> <p>3: In speak transfer mode, the called party talks with the agent after answering the call; the called party is connected to the calling party when the agent releases the call.</p> <p>4: In three-party conversation transfer mode, the three-party conversation is set up when the called party answers the call; the called party is connected to the calling party when the agent releases the call.</p> <p>5: Indicates a three-party conversation.</p> <p>6: Indicates that the call is to be connected.</p>
41	Initiate an internal call by an agent.	Employee ID.	-1
43	Intercept a call.	Employee ID.	-1
44	Suspend voice playing.	-1	-1
45	Internal transfer.	Employee ID.	-1
46	Transfer-out.	-1	-1
47	Sign in to the media server.	-1	-1

Operation Type	Description	Operation Object	Operation Reason
52	Sign out of the media server.	-1	-1
53	Transfer a call that is queuing in a public queue.	-1	-1
54	Release transfer	-1	-1
55	Transfer to another device.	-1	-1
57	Hold the call when seeking internal help.	-1	-1
58	The agent enters the conference state.	Agent ID.	-1

13.2.3.5 Media Type

Table 13-129 Media type

Media Type	Description
1	Text chat
5	Common voice call

13.2.3.6 Description of Call Types

Call Type

Table 13-130 Call Type

ID	Call Type	Description
0	SP_CALL_NORMAL	Normal incoming call
5	SP_CALL_LONG	Incoming toll call
6	INTER_CALL	Internal call It refers to a call made by an agent to another agent. An internal call cannot be forwarded, or muted.
7	SP_CALL_OUT	Normal outgoing call It refers to an outgoing call made by agents.
8	OP_CALL_OUT	Agent outgoing call type
9	OP_PRI_OUT	Outgoing call in the PRI mode
10	IVR_CALL_OUT	Outgoing call through IVR
11	SELF_CALLOUT	Outgoing call made by a Phone agent
12	IVR_PRI_CALL	Outgoing call in the PRI mode through IVR
13	NIRC_CALL_IN	Incoming call to a networked call center
14	NIRC_CALL_OUT	Outgoing call of a networked call center
15	NIRC_SPY_CALL_IN	QC incoming call to a networked call center
16	NIRC_SPY_CALL_OUT	QC outgoing call of a networked call center
17	NIRC_INTER_CALL_IN	Internal incoming network call to a virtual agent
18	NIRC_INTER_CALL_OUT	Internal outgoing network call of a virtual agent
20	ICD_SP_OPS_AIDERCALL	Aid call
21	ICD_SP_OPS_INCALL	Incoming call (international agent)
22	ICD_SP_OPS_PASSCALL	Relay call

ID	Call Type	Description
23	ICD_SP_OPS_GI VECALL	Outgoing call (international agent)
40	OUTBOUND_C ALL_OUT	Ordering an outgoing call The system queries the reserved outgoing call database regularly. After obtaining the reserved calls whose time is earlier than the current computer time, the system forcibly makes the calls.
41	ICD_SP_OUTBO UND_PRE_OCC UPY	Pre-occupied an outgoing call The system occupies an idle agent and then makes an outgoing call. If making the outgoing call succeeds, the idle agent handles the call.
42	ICD_SP_OUTBO UND_PRE_CON NECT	Pre-connecting an outgoing call The system makes an outgoing call to a user. If making the call succeeds, the system connects the call to an agent when the phone of the user rings.
43	ICD_SP_OUTBO UND_VIRTUAL_ CALLIN	Virtual incoming and outgoing calls The system makes an outgoing call to a user. If making the call succeeds, the system connects the call to an agent after the user hooks off.
44	ICD_SP_OUTBO UND_PREVIEW	Previewing an outgoing call It refers to a call that is made by an agent after the agent previews the outgoing call information.
45	ICD_SP_OUTBO UND_CALLBAC K	Callback request If a Web user needs to contact a call center when browsing Web pages on Internet, the Web user can use the callback request service. An agent in the call center then dials the phone number specified by the Web user. After the call is connected, the web user follows the voice instruction of the agent and at the same time enjoy other services such as escorted browsing.
46	ICD_SP_IDD	International incoming toll call
50	ICD_SP_CBRT_C ALL	RBT call
51	ICD_SP_INTERN AL_TWO_HELP	Two-party help call When answering an incoming call, an agent can ask for internal help. In the case of a two-party help, the call of the customer is held, and the agent talks with the asked-for-help agent.

ID	Call Type	Description
52	ICD_SP_INTERNAL_THREE_HELP	Three-party help call When answering an incoming call, an agent can ask for internal help. In the case of a three-party help, the customer, agent, and asked-for-help agent can talk with each other. In the case of a two-party help, a three-party help can be initiated to form a three-party conversation.
60	ICD_SP_OUTBOUND_PRE_OCCUPY_PRI_CALL	Pre-occupied an outgoing call in the PRI mode
61	ICD_SP_OUTBOUND_PRE_CONNECT_PRI_CALL	Pre-connecting an outgoing call in the PRI mode
62	ICD_SP_OUTBOUND_VIRTUAL_CALLIN_PRI_CALL	Virtual incoming and outgoing calls in the PRI mode
63	ICD_SP_OUTBOUND_PREVIEW_PRI_CALL	Previewing an outgoing call in the PRI mode
64	ICD_SP_OUTBOUND_CALLBACK_PRI_CALL	Callback request in the PRI mode

13.2.3.7 Reasons for Leaving the Device of the Call

Table 13-131 Reasons for leaving the device of the call

Cause code	Description
0	Normal access/transfer.
1	Overflow transfer.
2	Timeout transfer.
3	Transfer on no agent.
4	Transfer on queue cancellation.
5	Transfer because the agent does not answer the call.
6	Resume a suspended call.
7	Connecting a held call.

Cause code	Description
8	Three-party help.
9	Picking a held call.
10	Three-party conversation.
11	The party requesting internal help releases the call.
12	The call is intercepted.
13	The call is picked up.
14	The analysis of the called is not configured.
15	The user releases the call.
16	The agent releases the call.
17	The call is transferred out.
18	The call is held.
19	An internal processing error occurs.
20	The called party is busy.
22	The mobile phone is switched off.
23	The mobile phone is out of the service area.
24	The called number does not exist.
25	The ACD cannot distribute any resources for the call.
26	The user does not answer the call.
27	The called party rejects the call.
28	The call is successfully transferred to a skill queue.
29	The three-party conversation is transferred to a skill queue.
30	Transferring the call in the success transfer mode times out.
31	Transferring the three-party conversation to a skill queue times out.
34	If call timeout or queuing on busy or overflow occurs, the network call fails.
35	The network call is directed to its original call center for queuing.

Cause code	Description
36	The queued call is re-routed.
37	The call accesses the CDN through call routing.
38	The call accesses the CDN through agent consultation.
39	The CDN properly returns a routing result.
40	CDN routing times out.
41	An agent cancels the consultation call, or the routing fails.
42	The call accesses the PGR because CDN routing times out.
43	The call is properly returned by the CDN and is routed to the PGR.
44	The call accesses the PGR through inbound routing.
45	The call accesses the PGR through agent consultation.
46	The agent is unreachable. The CDN reroutes the call.
47	The call is waiting in multiple queues.
48	The primary-queue call is answered by numbers in the secondary queue.
50	The agent rejects the call.
51	A user call joins in a conference call.
52	A conference chairperson proactively releases a conference, or the conference is released due to a CCS exception.
53	The participant is removed from the conference.
54	The call is transferred when the call completion rate is less than the threshold.
88	After the agent answers the call, the user hangs up.
89	After the agent answers the call, the user hangs up.

13.2.3.8 Description of Call Media Types

Media Type

Table 13-132 Media Type

ID	Media Type	Description
1	MEDIA_TYPE_CHAT	Text chat
2	MEDIA_TYPE_WEBPHONE	click-to-dial
3	MEDIA_TYPE_ESCORT	Escorted browsing and form sharing
4	MEDIA_TYPE_CALLBACK	Callback request call
5	MEDIA_TYPE_PHONE	Common voice call
6	MEDIA_TYPE_EMAIL	Email call
7	MEDIA_TYPE_FAX	Fax call
8	MEDIA_TYPE_VIDEO	IP video call (H.323)
9	MEDIA_TYPE_WB	Electronic white board
10	MEDIA_TYPE_APP_SHARE	Application sharing
11	MEDIA_TYPE_FILE_TRANSFER	File transfer
12	MEDIA_TYPE_VIDEO_2B1D	2B+D ISDN video call
13	MEDIA_TYPE_VIDEO_6B1D	6B+D ISDN video call
14	MEDIA_TYPE_OPS	OPS call
15	MEDIA_TYPE_PREDICT_OUTBOUND	Predict dialing
16	MEDIA_TYPE_PREVIEW_OUTBOUND	Preview dialing
17	MEDIA_TYPE_MSG	Message media
18	MEDIA_TYPE_WEBPHONE_VIDEO	Video click-to-dial
19	MEDIA_TYPE_PHONE_VIDEO	Video call
20	MEDIA_TYPE_WEB_LEAVE_MESSAGE	Non-real-time call
21	MEDIA_TYPE_DESKTOP_SHARE	Desktop Sharing Media Type
22	MEDIA_TYPE_VC_CALL	Calling number in a skill queue
23	CLASSIC_MEDIA_TYPE_NUM	Total number of contact media types.

ID	Media Type	Description
50	MEDIA_TYPE_MULTI_MEDIA_E MAILCHAT	E-mail chat
51	MEDIA_TYPE_MULTI_MEDIA_W EBCHAT	Internet Chat
52	MEDIA_TYPE_MULTI_MEDIA_S MSCHAT	SMS chat
53	MEDIA_TYPE_MULTI_MEDIA_S OCIALCHAT	Text chat
54	MEDIA_TYPE_MULTI_MEDIA_F AXCHAT	Fax chat
55	MEDIA_TYPE_MULTI_MEDIA_H 5CHAT	H5 video

13.2.3.9 Description of Call Submedia Types

Table 13-133 Call submedia types (corresponding to call media type No. 53)

No.	Submedia Type	Description
1	SUB_MEDIA_TYPE_WEB	Web
2	SUB_MEDIA_TYPE_WHATSAPP	WhatsApp
3	SUB_MEDIA_TYPE_LINE	LINE
4	SUB_MEDIA_TYPE_WECHAT	WeChat
5	SUB_MEDIA_TYPE_FACEBOOK	FaceBook Messenger
6	SUB_MEDIA_TYPE_TWITTER	Twitter
7	SUB_MEDIA_TYPE_5GMESSAGE	5G message
8	SUB_MEDIA_TYPE_EAMIL	Email
9	SUB_MEDIA_TYPE_SMS	SMS

14 Voice Notification Interface Reference

[14.1 Querying Voice Notification Recording Files \(queryVoiceNotificationRecording\)](#)

[14.2 Creating a Voice Notification \(V1.0.0\) \(createVoiceNotification\)](#)

[14.3 Creating a Voice Notification \(V2.0.0\) \(createVoiceNotification\)](#)

[14.4 Callback APIs](#)

14.1 Querying Voice Notification Recording Files (queryVoiceNotificationRecording)

Scenario

This API is invoked to query voice notification recording data, and queries only approved voice notification data.

To configure recording files, a system administrator can sign in to the AICC and choose **Configuration Center > Resource Management and Configuration > Audio and video Resource Management** to configure them, or invoke the API for uploading IVR voice files.

Method

POST

URI

<https://Domain name/apiaccess/rest/voiceNotification/v1/queryVoiceNotificationRecording>. For example, the domain name is service.besclouds.com.

Request Description

Table 14-1 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	Yes	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .) For details about the generation mode, see 4.2 C1 System Configuration Interface Authentication .

Table 14-2 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	reqBody	Object	Yes	-

No.	Parameter	Type	Mandatory or Not	Description
1.1	offset	Integer	No	<p>Start line number for query in pagination mode.</p> <p>The value 0 is transferred for the first query.</p> <p>Sequence number of the first record on the page when other pages are queried. The sequence number of the first record is 0, and the sequence numbers of subsequent records increase in order. For example, if 50 records are listed on each page, 50 is transferred for the first record on the second page.</p> <p>If this parameter is not transferred, the default value 0 is used, and there is no upper limit.</p>
1.2	limit	Integer	No	<p>Number of records on each page during pagination query. The value is a positive integer. If this parameter is not transferred, the default value 100 is used. The maximum value is 100. If a value greater than 100 is transferred, the value is converted to 100.</p>
1.3	type	Integer	No	<p>Recording file type. The options are 0 (audio) and 2 (text).</p>

Response Description

- **Status code: 200**

Table 14-3 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-
1.1	returnCode	String	Yes	Return code. 0 : success; other values: failure (1 : incorrect request parameter type)
1.2	description	String	No	Return result description.
1.3	voicelInfo	Object	No	Recording information.
1.3.1	tenant_id	String	Yes	Tenant ID.
1.3.2	uploaddate	Number	Yes	Upload time, in timestamp format.
1.3.3	voice_id	String	Yes	Voice ID.
1.3.4	name	String	Yes	Recording name.
1.3.5	voicecontent	String	No	Voice content.
1.3.6	type	Number	Yes	The options are 0 (audio) and 2 (text).
1.3.7	tenantSpaceName	String	No	Tenant name.
1.3.8	auditaccount	String	No	Reviewer account.
1.3.9	noReference	boolean	No	Whether the prompt tone and fault tone are referenced.
1.3.10	auditcomments	String	No	Review comment.
1.3.11	auditdate	Number	No	Review time, in timestamp format.
1.3.12	scene	Number	No	Application scenario.
1.3.13	uploadaccount	String	No	Upload account.
1.3.14	isUpdateRec	Number	No	Whether the record is updated.

No.	Parameter	Type	Mandatory or Not	Description
1.3.1 5	status	Number	No	Callback status.
1.3.1 6	callbackTimes	Number	No	Number of callback times.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{
  "Content-Type": application/json
  "x-app-key": *****
  "Authorization": Bearer *****
}
```

Request parameters:

```
{
  "offset":0,
  "limit":10,
  "type":2
}
```

Response parameters:

```
{
  "returnCode": "0",
  "description": "query success",
  "voiceInfo": [
    {
      "tenant_id": "20*****234",
      "uploaddate": "163*****4000",
      "voice_id": "113379*****9999",
      "name": "welcome",
      "voicecontent": "{\"0\":{\"languageId\":\"0\",\"textcontent\":\"Welcome\"}}",
    }
  ]
}
```

```

        "type": 2,
        "tenantSpaceName": "*****"
    },
]
}

```

14.2 Creating a Voice Notification (V1.0.0) (createVoiceNotification)

Scenario

When the voice notification function is used, this API is invoked to request the voice call platform to play a voice notification to a specified user.

Method

POST

URI

`https://Domain name/apiaccess/rest/voiceNotification/v1/createVoiceNotification`
(For example, the domain name is `service.besclouds.com`.)

Request Description

Table 14-4 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	Yes	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .) For details about the generation mode, see 4.2 C1 System Configuration Interface Authentication .

Table 14-5 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	reqBody	Object	Yes	-
1.1	voiceContent	String	Yes	<p>The value contains a maximum of 1000 characters.</p> <ul style="list-style-type: none"> • Voice IDs can be transferred. The voice IDs are separated by tildes (~), and can be queried using the /rest/voiceNotification/v1/queryVoiceNotificationRecording interface. If you upload a voice file on the AICC, the voice ID is the value of Voice Id on the IVR Voice page. • Texts can be transferred. The format is <i>#{Text}</i>#\$. The texts are separated by tildes (~), for example, <i>\$Tom\$~\$Jack\$</i>. • Voice IDs and texts can be transferred together. The format is <i>{Voice ID}~#{Text}</i> <i>\$~{Voice ID}</i>, for example, <i>1133*****999~\$Tom\$~2225*****149</i>.

No.	Parameter	Type	Mandatory or Not	Description
1.2	callerPresent	String	No	Calling number displayed on the user side. If this parameter is not carried, the access code of the tenant space is used by default. If this parameter is carried, the access code must be carried. If a non-access code number needs to be transferred, contact O&M personnel to enable the calling number anonymization feature. After this feature is enabled, the number verification rule is as follows: access code or a number of 11 to 14 digits.
1.3	called	String	Yes	Called number.

No.	Parameter	Type	Mandatory or Not	Description
1.4	callbackUrl	String	No	<p>URL for a customer to receive status reports.</p> <p>Use Base64 to encrypt this parameter using the UTF-8 standard character set.</p> <p>The AICC pushes the call status information during business triggering to the server, and the client server determines the user status based on the call status information.</p> <p>The URL can be set to https://IP address.Port number or a domain name. The domain name is recommended. HTTP and HTTPS are supported. The domain name can correspond to multiple servers to ensure that notifications can be received when a single point of failure occurs.</p> <p>HTTP involves security risks and is not recommended.</p> <p>The URL can contain only letters, digits , and the following special characters: -./_#?&</p> <p>The IP address and port number, or domain name of the URL must have been added to the mobile agent callback URL trustlist by the system administrator.</p>

No.	Parameter	Type	Mandatory or Not	Description
1.5	priority	String	No	Playback priority of a voice notification. The value is an integer ranging from 1 to 9. The default value is 9 . A smaller value indicates a higher priority.

 **NOTE**

If TTS is involved, sign in to the AICC as a system administrator, choose **Configuration Center > Flow Configuration > Intelligent IVR > System Management > TTS/ASR Management**, and specify the TTS vendor. The configuration takes effect one minute later.

Response Description

- **Status code: 200**

Table 14-6 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-

No.	Parameter	Type	Mandatory or Not	Description
1.1	retCode	String	Yes	<p>Returned code (0 indicates success).</p> <p>1: A task is in progress. Try again later.</p> <p>2: The value length of callData exceeds 1024 characters.</p> <p>3: Creation failed. No call SN is generated.</p> <p>4: The format of softphone does not match the rule.</p> <p>5: The value of caller or called is not transferred, or the format does not match the rule.</p> <p>6: The VDN is not enabled.</p> <p>7: callerPresent or agentPresent fails to pass the verification.</p> <p>8: The value of voiceContent is empty, exceeds the upper limit, or does not exist.</p> <p>9: The value of callbackUrl does not meet the requirements.</p> <p>16: The tenant is in trial commercial use state, and the called number is not in the trustlist.</p> <p>36: The value of priority is in an incorrect format.</p>
1.2	retMsg	String	No	Return result description.

No.	Parameter	Type	Mandatory or Not	Description
1.3	result	Object	No	This parameter is mandatory when retCode is set to 0 .
1.3.1	callSerialNo	String	Yes	Call SN.

- Status code: 400**
 Incorrect request. Check the request path and parameters.
- Status code: 401**
 Unauthorized operation.
 - Check whether you have purchased related services.
 - Contact customer service to check the status of your account.
- Status code: 403**
 Authentication fails.
- Status code: 404**
 The requested content is not found. Check the request path.
- Status code: 500**
 Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{
  "Content-Type": application/json
  "x-app-key": ****
  "Authorization": Bearer ****
}
```

Request parameters:

```
{
  "voiceContent": "1133*****999~$Tom$~2225*****149",
  "callerPresent": null,
  "called": "88880000"
}
```

Response parameters:

```
{
  "result": {
    "callSerialNo": "11827*****7090"
  },
  "retCode": "0",
  "retMsg": "Created successfully."
}
```

14.3 Creating a Voice Notification (V2.0.0) (createVoiceNotification)

Scenario

When the voice notification function is used, this API is invoked to request the voice call platform to play a voice notification to a specified user.

Compared with the original API for creating voice notification, the voice file setting method in the request parameters of the API for creating voice notification (V2) is different. In this version, the text-to-speech (TTS) template and template variables can be set. In addition, users can set the timbre, speed, and volume of the voice when using the TTS function.

Method

POST

URI

`https://Domain name/apiaccess/rest/voiceNotification/v2/createVoiceNotification.`
For example, the domain name is `service.besclouds.com`.

Request Description

Table 14-7 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	Yes	App key field, which is the user ID. Contact the operation personnel to obtain the app key.
2	Authorization	String	Yes	Authentication field. The format is Bearer <i>{Value of AccessToken returned by the <code>tokenByAkSk</code> interface}</i> . (A space is required after Bearer .) For details about the generation mode, see 4.2 C1 System Configuration Interface Authentication .

Table 14-8 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestBody	Object	Yes	-
1.1	callerPresent	String	No	Calling number displayed on the user side. If this parameter is not carried, the access code of the tenant space is used by default. If this parameter is carried, the access code must be carried. If a non-access code number needs to be transferred, contact O&M personnel to enable the calling number anonymization feature. After this feature is enabled, the number verification rule is as follows: access code or a number of 11 to 14 digits.
1.2	called	String	Yes	Called number.

No.	Parameter	Type	Mandatory or Not	Description
1.3	callbackUrl	String	No	<p>URL for a customer to receive status reports.</p> <p>Use Base64 to encrypt this parameter using the UTF-8 standard character set.</p> <p>The AICC pushes the call status information during business triggering to the server, and the client server determines the user status based on the call status information.</p> <p>The URL can be set to https://IP address.Port number or a domain name. The domain name is recommended. HTTP and HTTPS are supported. The domain name can correspond to multiple servers to ensure that notifications can be received when a single point of failure occurs.</p> <p>HTTP involves security risks and is not recommended.</p> <p>The URL can contain only letters, digits , and the following special characters: -./_#?&</p> <p>The IP address and port number, or domain name of the URL must have been added to the mobile agent callback URL trustlist by the system administrator.</p>

No.	Parameter	Type	Mandatory or Not	Description
1.4	playList	Array [Object]	Yes	Playback information list. A maximum of five playback information records are supported.
1.4.1	voiceId	String	No	<p>Voice ID.</p> <p>You can invoke the /rest/voiceNotification/v1/queryVoiceNotificationRecording API to query the value of voice_id whose recording file type is voice.</p> <p>If you upload a voice file on the AICC, the voice ID is the value of Voice Id whose Usage Scenario is Voice notification and Type is Voice on the IVR Voice page. For details about the upload procedure, see Configuring a Voice File.</p>

No.	Parameter	Type	Mandatory or Not	Description
1.4.2	voiceFileName	String	No	<p>IVR voice name.</p> <ul style="list-style-type: none">• If you upload an IVR voice file through the /rest/cc-management/v1/importVoiceFile/upload API, the IVR voice name is the value of voiceFileName in the request body.• If you upload a voice file on the AICC, the IVR voice name is the value of Name whose Usage Scenario is Voice notification on the IVR Voice page. For details about the upload procedure, see Configuring a Voice File.

No.	Parameter	Type	Mandatory or Not	Description
1.4.3	templated	String	No	<p>TTS template ID.</p> <ul style="list-style-type: none"> • If you upload a TTS template on the AICC, the template ID is the value of Voice Id whose Usage Scenario is Voice notification and Type is Voice on the IVR Voice page. For details about the upload procedure, see Configuring a Voice File. • If you use the /rest/cc-management/v1/createVoiceTemplate API to upload the TTS template file, the template ID is the value of templated in the response parameters.

No.	Parameter	Type	Mandatory or Not	Description
1.4.4	templateParams	Array	No	<p>List of variable values in the TTS template. This parameter is used to fill in the variables specified by templateId in sequence.</p> <p>The parameter value must be encoded in UTF-8 format and cannot contain the following characters: \$ {}</p> <p>The number and length of variables in the list must be the same as those defined in the template specified by templateId. For example, if the template specified by templateId has two variables whose lengths are 5 and 6 respectively, you need to set two variable values whose lengths are less than or equal to 5 and 6 respectively.</p> <p>If the template content is You have \$ {NUM_2} parcels delivered to \$ {TXT_32}, this parameter can be set to "3", "main gate of People's Park".</p>
1.5	playTimes	Integer	No	<p>Number of times that the playback information list is repeatedly played. The value ranges from 1 to 5. The default value is 1.</p>

No.	Parameter	Type	Mandatory or Not	Description
1.6	priority	String	No	Playback priority of a voice notification. The value is an integer ranging from 1 to 9. The default value is 9 . A smaller value indicates a higher priority.

 NOTE

If TTS is involved, sign in to the AICC as a system administrator, choose **Configuration Center > Flow Configuration > Intelligent IVR > System Management > TTS/ASR Management**, and specify the TTS vendor. The configuration takes effect one minute later.

Response Description

- **Status code: 200**

Table 14-9 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-
1.1	retCode	String	Yes	Return code. For details, see Table 14-10 .
1.2	retMsg	String	No	Return result description.
1.3	result	Object	No	This parameter is mandatory when retCode is set to 0 .
1.3.1	callSerialNo	String	Yes	Call SN.

Table 14-10 Return codes

No.	Return Code	Description
1.1.1	0	Success.

No.	Return Code	Description
1.1.2	1	A task is in progress. Try again later.
1.1.3	3	Creation failed. No call SN is generated.
1.1.4	4	The format of softphone does not match the rule.
1.1.5	5	The value of called is not transferred, or the format does not match the rule.
1.1.6	6	The VDN is not enabled.
1.1.7	7	callerPresent fails to pass the verification.
1.1.8	9	The value of callBackUrl does not meet the requirements.
1.1.9	10	The value of playTimes must be greater than or equal to 1 and less than or equal to 5.
1.1.10	11	The playList array is empty or the array size is greater than 5.
1.1.11	12	Both voiceld and templated are empty.
1.1.12	13	The length of a single variable exceeds 32 bytes.
1.1.13	14	The format of the parameter value in templateParams is incorrect. The parameter value contains at least one of the following characters: \${}.
1.1.14	15	The templateParams array is empty or the array size is greater than 10.
1.1.15	16	The tenant is in trial commercial use state, and the called number is not in the trustlist.
1.1.16	17	The voice or TTS file data does not exist.
1.1.17	18	The recording or TTS text files are not used in voice notification scenarios.
1.1.18	19	The recording or TTS text file is not submitted.
1.1.19	20	The recording or TTS text file is submitted but not approved.
1.1.20	21	The recording or TTS text file is rejected.
1.1.21	22	The file type corresponding to templated is not text.

No.	Return Code	Description
1.1.2 2	23	The file type corresponding to voiceld is not voice.
1.1.2 3	24	The recording file or TTS file data does not exist in the database.
1.1.2 4	25	The size of the templateParams array is different from the number of variables defined in the template corresponding to templated .
1.1.2 5	26	The date format of the parameter value in templateParams is incorrect.
1.1.2 6	27	The time format of the parameter value in templateParams is incorrect.
1.1.2 7	28	The format of the voice notification template is incorrect.
1.1.2 8	29	The length of the parameter value in templateParams cannot be greater than that of the variable defined in the template specified by templated . For example, if the variable defined in the template is NUM_6 (6 indicates that the maximum length is 6) and the corresponding input parameter value is 1234567 , the verification fails.
1.1.2 9	30	The byte length of the parameter value in templateParams cannot be greater than that of the variable defined in the template specified by templated . For example, the variable defined in the template is NUM_14 (14 indicates that the maximum byte length is 14).
1.1.3 0	31	The value of the variable NUM_Number in templateParams can be only a digit.
1.1.3 1	32	The value length of the variable NUM_Number in templateParams is greater than 9.
1.1.3 2	33	The value of voiceFileName does not exist.
1.1.3 3	34	The file type corresponding to the input parameter voiceFileName is not voice.
1.1.3 4	35	The values of elements in the templateParams array cannot be empty.
1.1.3 5	36	The value of priority is in an incorrect format.

- **Status code: 400**

Incorrect request. Check the request path and parameters.

- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{
  "Content-Type": application/json
  "x-app-key": ****
  "Authorization": Bearer ****
}
```

Request parameters:

```
{
  "callerPresent": null,
  "called": "88880000",
  "playlist": [
    {
      "voicelid": "1201763136043459597"
    },
    {
      "templatelid": "1226170940666061826",
      "templateParams": [
        "3",
        "Main Gate of People's Park"
      ]
    }
  ]
}
```

Response parameters:

```
{
  "result": {
    "callSerialNo": "11827*****7090"
  },
  "retCode": "0",
  "retMsg": "Created successfully."
}
```

14.4 Callback APIs

14.4.1 Callback API Description

The AICC can call back the URL provided by a third-party system to push the current call event to the third-party system.

Due to the continuous evolution of the system, the callback URL of the voice notification can be configured in either of the following methods:

- Configuration on the GUI: A tenant administrator can choose **Configuration Center > Expansion Management > Voice Notification** and set **Hang-up Callback URL** under **VOICE NOTIFICATION CALLBACK CONFIGURATION**.
- Configuration using the API for creating a voice notification: Pass the request parameter **callbackUrl** when invoking the API for creating a voice notification.

NOTE

- For configuration of the callback URL on the GUI, no URL authentication is performed, which may cause security risks. Exercise caution when using this mode.
- If the callback URL is configured in both methods, the URL passed by the API is preferred. You are advised to pass the **callbackUrl** parameter using the API, and configure the shared key.

Signature Algorithm of the Voice Notification Callback API

- **Signature algorithm (authentication) prerequisites**
When the URL is passed through the voice notification creation API and **Shared Key** is configured on the **Callback Url Configuration** page, verify the signature by referring to this section.
- **Authentication procedure**
 - a. The following fields are added to the request input parameters of the release event callback API:
timestamp: current timestamp
nonce: random string
signature: authentication signature
 - b. After the customer receives the callback request, an authentication signature is generated based on the signature algorithm and will be verified based on **signature** in the input parameter. The verification passes upon consistency.
- **Signature string generation method**
 - a. Sort all request parameters (except **timestamp**, **nonce**, and **signature**) in lexicographic order based on parameter names and combine them into a string using commas (.). For example, the parameters in **{"b":"2", "a":1}** are sorted and combined into the string **"a=1, b=2"**.
 - b. Generate the values of **timestamp** (timestamp) and **nonce** (random string) and combine them with the value of **appSecret** (shared key configured on the GUI) and the string generated in **a** using underscores (_). The format is **{Value of appSecret}_{Value of timestamp}_{Value of nonce}_{String generated in a}**.
 - c. Encrypt the value into a byte array using the SHA256 algorithm and encode the array using Base64.

- **Reference code**

```
import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;

private String generateSignature(TreeMap<String, Object> callbackParameters, String nonce, long
timestamp, String appSecret) {
    // {Value of appSecret}_{Value of timestamp}_{Value of nonce}_Parameters
    // For example, the parameters in {"b":2", "a":1} are sorted and combined into the string "a=1,
b=2".
    String paramStr = callbackParameters.toString().replace(" ", "");
    String toSignString = appSecret + "_" + timestamp + "_" + nonce + "_" +
        paramStr.substring(1, paramStr.length() - 1);
    return
Base64.encodeBase64String(tokenByHmacSha256(toSignString.getBytes(StandardCharsets.UTF_8),
appSecret));
}

public static byte[] tokenByHmacSha256(byte[] dataBytes, String appSecret) {
    try {
        Mac mac = Mac.getInstance("HmacSHA256");
        byte[] key = appSecret.getBytes(StandardCharsets.UTF_8);
        SecretKeySpec secretKey = new SecretKeySpec(key, "HmacSHA256");
        mac.init(secretKey);return mac.doFinal(dataBytes);
    } catch (Exception e) {
        LOGGER.error("tokenByHmacSha256 failed: ", e);throw new RuntimeException("HmacSha256
run failed.");
    }
}
```

14.4.2 Release Event Callback API

Scenario

This API is invoked to push a call release event.

Method

POST

URL

Defined by a third-party system.

The voice notification callback URL can be configured in either of the following methods:

- Configuration on the GUI: A tenant administrator can choose **Configuration Center > Expansion Management > Voice Notification** and set **Hang-up Callback URL** under **VOICE NOTIFICATION CALLBACK CONFIGURATION**.
- Configuration using the API for creating a voice notification: Pass the request parameter **callbackUrl** when invoking the API for creating a voice notification.

Request Description

- Request header parameters
None
- Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	callSerialNo	String	Yes	Call SN. Length limit: string (50)
2	called	String	Yes	Called number.
3	signature	String	No	Signature. This parameter is mandatory when the callback URL is passed using the API for creating a voice notification and Shared Key is configured on the Callback Url Configuration page.
4	timestamp	String	No	Timestamp. This parameter is mandatory when the callback URL is passed using the API for creating a voice notification and Shared Key is configured on the Callback Url Configuration page.
5	nonce	String	No	Random number. This parameter is mandatory when the callback URL is passed using the API for creating a voice notification and Shared Key is configured on the Callback Url Configuration page.
6	callerPresent	String	No	CLIP number of the calling party.
7	createCallTime	String	No	Time when a call is initiated, for example, 2022/02/17,13:10:06:836 .

No.	Parameter	Type	Mandatory or Not	Description
8	alertingTime	String	No	Ring time of the user's phone.
9	talkingTime	String	No	Call connection time.
10	releaseTime	String	No	Call release time.
11	talkDuration	String	No	Call duration.
12	recordfile	String	No	Path to the voice recording file.
13	locationId	String	No	Voice recording node.
14	releaseReason	String	No	<p>Call release cause code. The options are as follows:</p> <p>0: The called party releases the call after the call is connected.</p> <p>1: After the call is connected, the system automatically releases the call when the voice notification is finished.</p> <p>4: The called party rejects the call or does not answer the call within the specified period after ringing.</p> <p>6: The call fails before ringing.</p> <p>8: No resource is available.</p> <p>9: The ACD times out.</p> <p>10: The call is restricted.</p> <p>999: The UAP fails to initiate a recording conference.</p>

Response Description

Response code: 200

- Response message

No.	Parameter	Type	Mandatory or Not	Description
1	retCode	String	Yes	Result code. The value 0 indicates success, and other values indicate failure.
2	retMsg	String	Yes	Failure cause.

Example

Request parameters:

```
{
  alertingTime=2022/02/22,10:04:29:004,
  callSerialNo=1197765398201387012,
  called=88880067,
  callerPresent=960003,
  createCallTime=2022/02/22,10:04:28:823,
  locationId=0,
  nonce=-1482421808053124529,
  recordfile=Y:/2/mobileAgent/20220222/1645524268-824.wav,
  releaseReason=0,
  releaseTime=2022/02/22,10:04:36:318,
  signature=+lk*****50=,
  talkDuration=0,
  talkingTime=2022/02/22,10:04:30:418,
  timestamp=1645524163326
}
```

Response parameters:

```
{
  "retCode": "0",
  "retMsg": "success"
}
```

15 OMA Interface Reference

15.1 Business Software Mall Connection Interfaces

15.1 Business Software Mall Connection Interfaces

15.1.1 Querying Customer Information

Description

This interface is invoked by the business software mall to query business software mall customer information stored on the OMA. (Currently, this interface is provided for the business software mall official website for trial use.)

Method

GET

URI

<https://Domain name/rest/oma/softwareconsole/tenant/querytenantbasic> (For example, the domain name is service.besclouds.com.)

Request Description

Table 15-1 Request header parameter

No.	Parameter	Type	Mandatory or Not	Description
1	X-Auth-Token	String	Yes	Value of access-token of a business software mall user

Response Description

- **Status code: 200**

Table 15-2 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	Success response code, which indicates that the query is successful
1.1	mobilePhone	String	Yes	Customer mobile number, which has been masked
1.2	company	String	Yes	Customer company name, which has been masked
1.3	customerName	String	Yes	Contact name, which has been masked
1.4	email	String	Yes	Email address, which has been masked
1.5	vdn	String	Yes	VDN
1.6	createDate	Number	Yes	Creation time
1.7	tenantSpaces	String	Yes	Tenant space status
1.8	portalUrl	String	Yes	URL for signing in to the AICC

- **Status code: 401**

Table 15-3 Response body parameter

No.	Parameter	Type	Mandatory or Not	Description
1	schema	String	Yes	Unauthorized operation. 1. Check whether you have purchased services related to the AICC. 2. Sign in to the AICC as a system administrator and check whether the value of Business Software Mall Official Website under System parameters > Unified Public Configuration > Cloud Customers is correct. 3. Check whether the request header parameter is correctly set.

- **Response status code: 502**

Table 15-4 Response body parameter

No.	Parameter	Type	Mandatory or Not	Description
1	schema	String	Yes	The business fails.

Example

- Scenario: The business software mall invokes this interface to query customer information.
URL: /rest/oma/softwareconsole/tenant/querytenantbasic
- Request header

```
{
  "X-Auth-Token": "000000000srLl4pnoBc*****9DvgIB87KzYpxMdE9+vvzLZqYlw="
}
```
- Response header

```
{
  "connection": "keep-alive",
  "Content-Length": "16",
  "Content-Type": "application/json%3Bcharset=UTF-8"
}
```
- Response body

```
{
  "mobilePhone": "153****0991",
```

```

"company": "Huawei XXXXXXXXX",
"customerName": "zXXXXXX",
"email": "sunk***@huawei.com",
"vdn": "150",
"createDate": "1681203525000",
"tenantSpaceStatus": "2",
"portalUrl": "https://software.huawei.com/auth?client_id=xxxx&redirect_uri=https://xxx.com/service-cloud/sm/login/portal.html"
}
    
```

15.1.2 Querying Subscription Information

Description

This interface is invoked by the business software mall to query business software mall subscription information stored on the OMA. (Currently, this interface is provided for the business software mall official website for trial use.)

Method

POST

URI

<https://Domain name/rest/oma/softwareconsole/tenant/queryresource> (For example, the domain name is service.besclouds.com.)

Request Description

Table 15-5 Request header parameter

No.	Parameter	Type	Mandatory or Not	Description
1	X-Auth-Token	String	Yes	Value of access-token of a business software mall user

Request parameters

No.	Parameter	Type	Mandatory or Not	Description
1	limit	Integer	Yes	Number of records on each page. The value must be less than 100.
2	offset	Integer	Yes	Offset. The value must be greater than or equal to 0.
3	startDate	Long	No	Subscription start timestamp

No.	Parameter	Type	Mandatory or Not	Description
4	endDate	Long	No	Subscription end timestamp

Response Description

- Status code: 200

Table 15-6 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	result	Object []	Yes	Result
1.1	orderId	String	Yes	Order ID
1.2	opType	String	Yes	Type
1.3	remark	String	Yes	Remarks
1.4	skuName	String	Yes	Product type
1.5	modifyTime	String	Yes	Modification time
1.6	orderAmount	String	Yes	Order amount
1.7	procutName	String	Yes	Charging mode
1.8	vdnId	String	Yes	VDN ID
1.9	customerId	String	Yes	Customer ID
1.10	company	String	Yes	Company
1.11	id	String	Yes	ID
1.12	manualStatus	String	Yes	Processing status
1.13	cecTenantId	String	Yes	CEC tenant ID
1.14	amount	String	Yes	Number of subscriptions
1.15	periodNumber	String	Yes	Number of subscription periods
1.16	productId	String	Yes	Charging mode code
1.17	autoStatus	String	Yes	Automatic processing status
1.18	customerName	String	Yes	Customer name

No.	Parameter	Type	Mandatory or Not	Description
1.19	cecExpireTime	String	Yes	Expiration time manually calculated
1.20	cecTenantName	String	Yes	CEC tenant name
1.21	createSource	String	Yes	Source
1.22	periodType	String	Yes	Subscription unit
1.23	expireTime	String	Yes	Expiration time
1.24	createTime	String	Yes	Subscription time
1.25	skuCode	String	Yes	SKU code
1.26	cecFeatureType	String	Yes	Feature type
1.27	trialFlag	Integer	Yes	Trial use or not
1.28	retryTimes	String	Yes	Maximum number of retry times
1.29	status	String	Yes	Order instance status <ul style="list-style-type: none">● 2: effective● 8: expired● 9: historical
2	count	String	Yes	Total number of records
3	returnCode	String	Yes	Returned response code
4	description	String	Yes	Description

- **Status code: 401**

Table 15-7 Response body parameter

No.	Parameter	Type	Mandatory or Not	Description
1	schema	String	Yes	Unauthorized operation. 1. Check whether you have purchased services related to the AICC. 2. Sign in to the AICC as the system administrator and check whether the value of Business Software Mall Official Website under System parameters > Unified Public Configuration > Cloud Customers is correct. 3. Check whether the request header parameter is correctly set.

- **Response status code: 502**

Table 15-8 Response body parameter

No.	Parameter	Type	Mandatory or Not	Description
1	schema	String	Yes	Business failure

Example

- Scenario: The business software mall invokes this interface to query subscription information.

URL: /rest/oma/softwareconsole/tenant/queryresource

- Request header

```
{
  "X-Auth-Token":"000000000srLl4pnoBc*****9DvgIB87KzYpxMdE9+vvzLZqYlw="
}
```

- Request body

```

```

15.1.3 Calling Back Data by the Huawei IMC

Description

This interface is invoked by the Huawei IMC to call back data.

Method

POST

URI

<https://Domain name/apiaccess/rest/oma/v1/imcopenapi/callback> (For example, the domain name is service.besclouds.com.)

Request Description

Table 15-9 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	reqBody	Object	No	-
1.1	data	String	No	Encrypted message body, which needs to be decrypted to obtain the message content. The sent data varies according to the event type.
1.2	signature	String	No	Message signature, which is used to verify whether the request comes from the IMC

Response Description

- **Status code: 200**

Table 15-10 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	No	Returned message
1.1	code	String	No	Return code. The value 200 indicates success.
1.2	message	String	No	Return code description
1.3	data	String	No	Encrypted message body, which needs to be decrypted to obtain the message content. The sent data varies according to the event type.

- **Status code: 400**

Incorrect request. Check the request path and parameters.

- **Status code: 401**
Unauthorized operation. Check whether related services are authorized.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header: none

Request parameters:

```
{  
  "data": "XXXXX",  
  "signature": "YYYYYY"  
}
```

Response parameters:

```
{  
  code: "200",  
  message: "success",  
  data: "XXXXX"  
}
```

15.1.4 Querying Basic Trial Tenant Information by the Business Software Mall

Description

This interface is invoked to query basic trial tenant information. It is open to the business software mall official website.

Method

GET

URI

<https://Domain name/rest/oma/softwareconsole/trialtenant/querytenantinfo> (For example, the domain name is software.huawei.com.)

Request Description

Table 15-11 Request header parameter

No.	Parameter	Type	Mandatory or Not	Description
1	X-Auth-Token	String	Yes	Value of access-token of a business software mall user

Response Description

- **Status code: 200**

Table 15-12 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	createDate	Number	Yes	Creation time
2	expiryDate	Number	Yes	Expiration time
3	company	String	Yes	Customer company name, which has been masked
4	customerName	String	Yes	Contact name, which has been masked
5	email	String	Yes	Email address, which has been masked
6	mobilePhone	String	Yes	Customer mobile number, which has been masked
7	tenantSpaceStatus	String	Yes	Tenant space status
8	portalUrl	String	Yes	URL for signing in to the AICC

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. Check whether related services are authorized.
- **Status code: 404**
The requested content is not found. Check the request path.

- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{  
  "X-Auth-Token": "*****"  
}
```

Response parameters:

```
{  
  "expiryDate": 1684650886000,  
  "mobilePhone": "132****7077",  
  "portalUrl": "https://software.huawei.com/auth?client_id=xxxxx&redirect_uri=https://xxx.com/service-  
cloud/sm/login/portal.html",  
  "company": "xxx",  
  "tenantSpaceStatus": "5",  
  "customerName": "xxx",  
  "email": "wanf****@huawei.com",  
  "createDate": 1681203525000  
}
```

15.1.5 Querying System Parameters by the Business Software Mall

Description

This interface is invoked to query system parameters. It is open to the business software mall official website.

Method

GET

URI

`https://Domain name/rest/oma/softwareconsole/system/querysoftwaresysparams`
(For example, the domain name is software.huawei.com.)

Request Description

Table 15-13 Request header parameter

No.	Parameter	Type	Mandatory or Not	Description
1	X-Auth-Token	String	Yes	Token of the business software mall official website

Response Description

- **Status code: 200**

Table 15-14 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	softwareCloudUrl	String	Yes	URL of the connected business software mall official website
2	clientId	String	Yes	Client ID of the connected business software mall official website
3	privacyStatementId	String	Yes	ID of the AICC privacy statement on the business software mall official website
4	privacyStatementUrl	String	Yes	URL of the AICC privacy statement on the business software mall official website

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. Check whether related services are authorized.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**

Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header:

```
{  
  "X-Auth-Token": "*****"  
}
```

Response parameters:

```
{  
  "clientId": "xxx",  
  "privacyStatementUrl": "xxx",  
  "privacyStatementId": "xxx",  
  "softwareCloudUrl": "https://software.huawei.com"  
}
```

16 DataProcess Interface Reference

16.1 Querying Call Result Data

16.1 Querying Call Result Data

Scenario

This interface is invoked to query CDR data and satisfaction information from Elasticsearch.

Method

POST

URI

`https://Domain name/apiaccess/rest/dataprocess/v1/openapp/queryCallManualDetailInfo`

For example, the domain name is `service.besclouds.com`.

Request Description

Table 16-1 Request header parameters

No.	Parameter	Type	Mandatory or Not	Description
1	X-APP-Key	String	No	App key ID. Obtain the value from the APP Service > APP Management page.

No.	Parameter	Type	Mandatory or Not	Description
2	Authorization	String	Yes	Authentication field. The format is Bearer {Value of AccessToken returned by the <i>tokenByAkSk</i> interface}. (A space is required after Bearer .)

Table 16-2 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	subCcNo	String	Yes	Call center ID
2	vdn	String	Yes	Tenant VDN ID
3	callId	String	No	<ul style="list-style-type: none"> If the value of callId is not empty, beginDate and endDate are optional. If the value of callId is empty, either beginDate or endDate must be set.
4	callerNo	String	No	Calling number
5	calleeNo	String	No	Called number
6	beginDate	String	No	<ul style="list-style-type: none"> If the value of callId is not empty, beginDate and endDate are optional. If the value of callId is empty, either beginDate or endDate must be set.

No.	Parameter	Type	Mandatory or Not	Description
7	endDate	String	No	<ul style="list-style-type: none"> • If the value of callId is not empty, beginDate and endDate are optional. • If the value of callId is empty, either beginDate or endDate must be set.
8	callType	String	No	Call type <ul style="list-style-type: none"> • 0: inbound call • 1: outbound call • 2: predicted outbound call • 3: previewed outbound call • 4: preempted outbound call • 10: bidirectional call • 11: collaborative call • 12: click-to-dial call
9	mediaType	String	No	Multimedia type <ul style="list-style-type: none"> 2: voice click-to-dial 5: voice 18: video click-to-dial 19: video 53: multimedia
10	evaluationValue	String	No	Satisfaction evaluation value The options are the satisfaction levels configured on the Configuration Center > Workbench Configuration > Satisfaction Survey page.

Response Description

- Status code: 200

Table 16-3 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1.1	total	String	No	Total number of returned results
1.2	results	object	No	Returned results
1.2.1	logDate	String	No	Daily settlement time
1.2.2	callerNo	String	No	Calling number
1.2.3	calleeNo	String	No	Called number
1.2.4	callId	String	No	Call ID
1.2.5	callType	String	No	Call type <ul style="list-style-type: none"> • 0: inbound call • 1: outbound call • 2: predicted outbound call • 3: previewed outbound call • 4: preempted outbound call • 10: bidirectional call • 11: collaborative call • 12: click-to-dial call
1.2.6	mediatype	String	No	Multimedia type <ul style="list-style-type: none"> 2: voice click-to-dial 5: voice 18: video click-to-dial 19: video 53: multimedia
1.2.7	waitBegin	String	No	Call waiting start time
1.2.8	ackBegin	String	No	Call answering start time
1.2.9	callBegin	String	No	Call start time
1.2.10	callEnd	String	No	Call end time

No.	Parameter	Type	Mandatory or Not	Description
1.2.11	vdn	String	No	Tenant VDN ID
1.2.12	leaveReason	String	No	Reason why a call is disconnected from a device
1.2.13	evaluationValue	String	No	Satisfaction evaluation value The options are the satisfaction levels configured on the Configuration Center > Workbench Configuration > Satisfaction Survey page.

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

- Query CDR data and satisfaction information from Elasticsearch.

Request header:

```
X-TenantSpaceID:202101134979
Authorization:Bearer 3b5d****23c9
X-app-key:b7bd****cb8c
```

Request parameters:

```
{
  "subCcNo": "0",
  "vdn": "0",
  "callId": "0",
  "callerNo": "0",
  "calleeNo": "",
  "beginDate": "1658102400000",
  "endDate": "1658188800000",
  "callType": "0",
```

```
"mediaType": "10",  
"evaluationValue": "10"  
}
```

Response parameters:

```
{  
  "total":2,  
  "results":[  
    {  
      "callId":"1669464198-17002955",  
      "vdn":1,  
      "evaluationValue":"1",  
      "callBegin":"100010"  
    },  
    {  
      "callId":"1669463446-17002406",  
      "vdn":1,  
      "evaluationValue":"5",  
      "callBegin":"100010"  
    }  
  ]  
}
```

17.1 Verifying Token Information

Scenario

This interface is invoked to verify token information. It is used in the scenario where the mobile app interconnects with the AppCube. After obtaining a token from the mobile app, the AppCube invokes this interface to parse the token to obtain user information and open the AppCube page.

Method

POST

URI

<https://Domain name/apiaccess/rest/service-pub/authentication> (For example, the domain name is service.besclouds.com.)

Request Description

Table 17-1 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestBody	Object	Yes	-
1.1	token	String	Yes	Token information

Response Description

- **Status code: 200**

Table 17-2 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	Returned message
1.1	returnCode	String	Yes	Return code 0 : success 1 : empty token 2 : invalid token 3 : expired token 4 : system error
1.2	returnMsg	String	No	Description
1.3	data	Object	No	User information
1.3.1	userAccount	String	No	User account
1.3.2	userId	String	No	Unique user ID
1.3.3	tenantId	String	No	Unique tenant ID
1.3.4	tenantSpaceId	String	No	Tenant space ID
1.3.5	locale	String	No	Language information

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header: none

Request parameters:

```
{"token":"*****"}
```

Response parameters:

```
{
  "returnCode":"0",
  "returnMsg":"success",
  "data":{
    "userAccount":"xx",
    "userId":"xx",
    "tenantId":"xx",
    "tenantSpaceId":"xx",
    "locale":"en_US",
  }
}
```

17.2 Generating a Verification Code for One-Click Trial Use

Scenario

This interface is invoked to generate a verification code for one-click trial use. It is opened to the Huawei Cloud website.

Method

POST

URI

<https://Domain name/apiaccess/rest/ipccprovision/v1/applyTry/generateverifycode>
(For example, the domain name is service.besclouds.com.)

Request Description

Table 17-3 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestBody	Object	Yes	-
1.1	phone	String	Yes	Mobile number

Response Description

- **Status code: 200**

Table 17-4 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	-
1.1	retCode	String	No	Return code <ul style="list-style-type: none"> ● 200: The verification code is sent successfully. ● 201: The verification code already exists. Send it later. ● 202: The SMS verification code fails to be sent. Contact operations personnel. ● 204: The SMS message fails to be sent. Contact operations personnel. ● 205: The number of emails sent today has reached the threshold. Contact operations personnel to change the threshold.
1.2	retMsg	String	No	Return description

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header: none

Request parameters:

```
{  
  "phone": "1667328xxxx"  
}
```

Response parameters:

```
retCode: "200"  
retMsg: "The short message is sent successfully."
```

17.3 Applying for One-Click Trial Use of a Tenant

Scenario

This interface is invoked to apply for one-click trial use of a tenant. It is opened to the Huawei Cloud website.

Method

POST

URI

<https://Domain name/apiaccess/rest/ipccprovision/v1/applyTry/applyTenant> (For example, the domain name is service.besclouds.com.)

Request Description

Table 17-5 Request body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	requestBody	Object	Yes	-
1.1	companyName	String	Yes	Company name
1.2	phone	String	Yes	Mobile number
1.3	phoneVerifyCode	String	Yes	SMS verification code
1.4	email	String	Yes	Email address

Response Description

- **Status code: 200**

Table 17-6 Response body parameters

No.	Parameter	Type	Mandatory or Not	Description
1	schema	Object	Yes	Returned message

No.	Parameter	Type	Mandatory or Not	Description
1.1	returnCode	String	Yes	<p>Return code</p> <ul style="list-style-type: none">● 000: The application is successful. Check the email to obtain the account information. If no email is received, contact operations personnel.● 001: The verification code does not exist or has expired. Obtain a new one.● 002: Incorrect verification code.● 003: An exception occurs during the verification of the verification code. Contact operations personnel.● 004: The trial use application fails because a tenant in trial commercial use or commercial use already exists. Contact operations personnel.● 005: Resource conflict. Try again 1 minute later.● 006: The trial use application fails because there is no voice or multimedia access code for trial use.

No.	Parameter	Type	Mandatory or Not	Description
				Contact operations personnel. • 205: The number of emails sent today has reached the threshold. Contact operations personnel to change the threshold.
1.2	returnMsg	String	No	Description

- **Status code: 400**
Incorrect request. Check the request path and parameters.
- **Status code: 401**
Unauthorized operation. 1. Check whether you have purchased related services. 2. Contact customer service to check the status of your account.
- **Status code: 403**
Authentication fails.
- **Status code: 404**
The requested content is not found. Check the request path.
- **Status code: 500**
Business failure. Check the values of parameters in the request.

Error Codes

None

Example

Request header: none

Request parameters:

```
{
  "companyName":"Company that applies for one-click trial use",
  "phone":"1667328xxxx",
  "phoneVerifyCode":"123456",
  "email":"zhangxxx@*****.com"
}
```

Response parameters:

```
retCode: "000"
retMsg: "success"
```

17.4 API Fabric Interfaces Provided for AICC Internal NEs

17.4.1 Verifying the Third-Party System During Connection Bar Integration

Scenario

This interface is invoked to verify the third-party system during connection bar integration.

Method

POST

URI

`https://Domain name/apiaccess/ccbar/v1/thirdparty/thirdPartyValidate` (For example, the domain name is `service.besclouds.com`.)

For details about the interface specifications, see [Developing a Token Generation Mechanism and Verification API](#).

17.4.2 Querying Third-Party Customer Information

Scenario

This interface is invoked to query third-party customer information.

Method

POST

URI

`https://Domain name/apiaccess/ccmanagement/v1/thirdParty/queryThirdpartyCustomerInfo` (For example, the domain name is `service.besclouds.com`.)

For details about the interface specifications, see [API Description](#).
